Under ASC 350, all business combinations, except for those involving not-for-profit entities and combinations of entities under common control (e.g., parent/subsidiary and brother/sister mergers), were required to be accounted for as purchases. Goodwill arising from earlier purchase business combinations already amortized was not to be restored, but the unamortized balance as of the effective date of the new standards was no longer subject to amortization. Poolings completed before the effective date of FAS 141 did not, however, need to be restated—and, as a practical matter, developing fair value information about long-ago combinations accounted for as poolings would have been an impossible task.

While goodwill impairment must be regularly assessed, the actual application of ASC 350 results in recognizing goodwill created by the reporting entity subsequent to the purchase combination, to the extent that this replaces or offsets impaired goodwill, so in many cases impairments will not be recognized even when the value of the acquired operations has declined. This approach—which effectively reverses the longstanding ban on recognizing internally created (as opposed to purchased) goodwill—was necessitated by the virtual impossibility of separately identifying elements of goodwill having alternative derivations. Even with this simplified approach, measurement of goodwill impairment is a fairly difficult task, often requiring the services of independent valuation consultants.

ASC 805 and ASC 810 are to be effective *prospectively* for business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after December 15, 2008. IASB issued a revised version of its corresponding standard, IFRS 3, in early 2008. While the revised US standards more closely resemble the International standards, differences still remain between the two, and accoun-

tants that are responsible for preparing financial statements using both sets of standards—or are responsible for reconciling or converting financial statements—will still need to be cognizant of these differences.

This chapter addresses the application of the acquisition method of accounting (formerly referred to as the purchase method) for business combinations in detail, and the accounting for goodwill to a lesser extent. Chapter 11 addresses the accounting for all intangible assets, including goodwill, with greater specificity. This chapter retains, in an appendix, the guidance that will ultimately be nullified or amended when ASC 805 and ASC 810 become effective, because this guidance still applies to business combinations that predate the effective date of the new standards, and will continue to apply to those business combinations, since they are not required (or permitted) to be restated to conform to the new acquisition-method rules.

While the presentation of consolidated financial statements is required under GAAP, there is no parallel requirement to present combined financial statements for entities under common control (brother/sister entities). However, in certain cases, it is desirable that combined financial statements be prepared for such entities. This process is very similar to an accounting consolidation using the formerly permitted pooling accounting, except that the equity accounts for the combining entities are carried forward intact.

The major accounting issues in business combinations and in the preparation and presentation of consolidated or combined financial statements are as follows:

1. The proper accounting basis for the assets and liabilities of the combining entities
2. The accounting for goodwill or negative goodwill, if any exists
3. The elimination of intercompany balances and transactions in the preparation of consolidated or combined statements

Consolidation of many of what were formerly called "special-purpose entities" (SPE)—now renamed "variable interest entities" (VIE) by ASC 810—has increased substantially under these requirements, which were spurred on by the financial reporting scandals of the early 2000s. Rules governing consolidation of VIE are complex and are continuing to evolve further in response to an ongoing credit market turmoil that is still being experienced in early 2009 worldwide.

The accounting for the assets and liabilities of entities acquired in a business combination is largely dependent on the fair values assigned to them at the transaction date. (The now-obsolete pooling method relied upon book values.) ASC 820, *Fair Value Measurements and Disclosures,* introduced a framework for measuring fair value, and its provisions provide important guidance when assigning values as part of a business combination. In essence, it favors valuations determined on the open market, but allows other methodologies if open market valuation is not practicable. The fair value concepts and procedures are discussed in greater detail in Chapter 6.

The accounting procedures for combinations of not-for-profit organizations remain unaddressed. ASC 805 did expand the scope of FAS 141 to include mutual entities, and FASB currently plans to issue guidance applicable to not-for-profit mergers and acquisitions in the first quarter of 2009.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
350	Intangibles—Goodwill and Other
360	Property, Plant, and Equipment

Liabilities	
420	Exit or Disposal Cost Obligations
480	Distinguishing Liabilities from Equity
Expenses	
715-30	Compensation—Retirement Benefits—Defined Benefit Plans—Pension
715-60	Compensation—Retirement Benefits—Defined Benefit Plans—Other Postretirement
718	Compensation—Stock Compensation
740	Income Taxes
Broad Transactions	
805	Business Combinations
810	Consolidation
820	Fair Value Measurements and Disclosures
845	Nonmonetary Transactions
Industry	
915	Development Stage Entities

DEFINITIONS OF TERMS

Acquiree. One or more businesses in which an acquirer obtains control in a business combination.

Acquirer. An entity that obtains control over one or more businesses in a business combination. When the acquiree is a variable interest entity (VIE), the primary beneficiary of the VIE is always the acquirer.

Acquisition date. The date on which control of the acquiree is obtained by the acquirer.

Acquisition-related costs. Expenses incurred by an acquirer to enter into a business combination.

Assembled workforce. An existing group of employees that permits an acquirer to continue operating a business that it acquires on and after the acquisition date without having to hire and train new employees to perform their functions.

Asset. A reporting entity recognizes an asset if both of the following criteria are met at the balance sheet date (CON 6):

1. The reporting entity has obtained or controls future economic benefits that result from transactions or events that occurred in the past.
2. Receipt of those future economic benefits by the reporting entity is probable.

Business. An integrated set of assets and activities capable of being conducted and managed in order to provide a return directly to investors or other owners, members, or participants. The return can be in the form of dividends, lower costs, or other economic benefits. A development stage enterprise (ASC 915) is not precluded from qualifying as a business under this definition and the guidance that accompanies it in ASC 805.

Business combination. A transaction or event that results in an acquirer obtaining control over one or more businesses. It is important to note that transactions that are sometimes referred to as "mergers of equals" or as "true mergers" are nevertheless considered to be business combinations with an acquirer and one or more acquirees.

Closing date. The day on which an acquirer legally transfers consideration, acquires the assets, and assumes the liabilities of an acquiree.

Combined financial statements. Financial statements that present the collective results of operations and financial position of a group of entities under common management or control as if the group were a single economic entity. The presentation of the combined group excludes the party or parties that control or manage it.

Consolidated financial statements. The financial statements of a parent and all of its subsidiaries presented as a single economic entity.

Consolidated group. A parent and all of its subsidiaries.

Contingency. An existing, unresolved condition, situation, or set of circumstances that will eventually be resolved by the occurrence or nonoccurrence of one or more future events. A potential gain or loss to the reporting entity can result from the contingency's resolution.

Contingent consideration. Generally, an acquirer's obligation to transfer additional assets or equity interests to the acquiree's former owners if specified future events occur or conditions are met. The contingent obligation is incurred as part of a business combination in order to obtain control of an acquiree.

Contingent consideration might also arise when the terms of the business combination provide a requirement that the acquiree's former owners return previously transferred assets or equity interests to the acquirer under certain specified conditions.

Control (or controlling financial interest). Control of an entity can be obtained either (1) by obtaining ownership of a majority of its outstanding voting interests (the controlled entity being referred to as a voting interest entity), or (2) by obtaining contractual rights to receive the majority of the financial benefits and/or by assuming contractual obligations to bear the majority of the financial consequences that occur in the future from the entity outperforming or underperforming its expectations (the controlled entity being referred to as a variable interest entity or VIE). These conditions are mutually exclusive (i.e., an entity is either a voting interest entity controlled by the holders of a voting majority of its equity or is a variable interest entity controlled individually or collectively by one or more other parties referred to as holders of variable interests). In the latter instance, when a single party has control, the party is referred to as the primary beneficiary of the VIE.

Entities that might otherwise be considered voting interest entities nevertheless might not be controlled by the holders of the majority of the voting interests in situations where, for example, the entity is in legal reorganization, subject to bankruptcy proceedings, or operating subject to governmental restrictions (e.g., foreign exchange restrictions or other controls) that impose uncertainties on the entity whose severity casts significant doubt regarding the voting owner's ability to control the entity.

Dual-listed corporation or **Dual-listed company.** A contractual arrangement between two or more businesses in which they agree to retain their separate legal identities while operating as if they were a single economic unit. Unlike a stapling arrangement (defined below), dual listed entities' equity shares are traded separately.

Equity interests. In an investor-owned entity, instruments evidencing rights of ownership. In a mutual entity, instruments evidencing ownership, membership, or participation rights.

Expected losses and expected residual returns. Expected losses represent the expected negative variability in the fair value of an enterprise's net assets exclusive of variable interests. Expected residual returns represent the expected positive variability in the fair value of an enterprise's net assets exclusive of variable interests. The expected variability (separately defined below and illustrated in this chapter) in an enterprise's net income or loss is included in the determination of expected losses and expected residual returns.

Expected variability. When estimating an entity's expected future cash flows in accordance with CON 7, *Using Cash Flow Information and Present Value in Accounting Measurements* (discussed more fully in Chapter 1), a range of probability-weighted expected outcomes is used. Mathematically, this is simply a weighted-average calculation. The expected variability of the cash flows included in that calculation is computed by: (1) computing the difference between each individual estimated outcome and the weighted-average, (2) multi-

plying each difference computed in the previous step by the probability of occurrence assigned to that individual outcome, and (3) separately summing the positive variations (expected residual returns) and negative variations (expected losses). The absolute value of the expected residual returns will always equal the absolute value of the expected losses. The sum of the absolute values of the expected residual returns and the expected losses represents the expected variability in both directions associated with that estimate of probability-weighted expected cash flows.

Fair value. The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Although GAAP literature has primarily focused on fair value in the context of assets and liabilities, the definition also applies to instruments classified in equity.

Favorable contract. From the perspective of a counterparty, a contract is favorable if its terms are more lucrative than current market terms.

Goodwill. An intangible asset acquired in a business combination that reflects the future economic benefits expected to be derived from the business combination that are not allocated to other individually identifiable, separately recognizable assets acquired.

Identifiable asset. An asset that (1) represents a legal and/or contractual right or (2) is separable from the entity that holds it. A legal and/or contractual right is considered identifiable irrespective of whether it is transferrable or separable from the entity or from other rights and obligations. An asset is considered separable if it is capable of being separated or divided from the entity that holds it for the purpose of the asset's sale, transfer, license, rental, or exchange, by itself or together with a related contract, or other identifiable asset, or liability, irrespective of whether management of the entity intends to do so.

Intangible asset. A nonfinancial asset that lacks physical substance.

Liability. A reporting entity has incurred a liability if both of the following criteria are met at the balance sheet date (CON 6):

1. The reporting entity has a present obligation to sacrifice economic benefits in the future by providing services or transferring assets to others resulting from transactions or events that occurred in the past.
2. The future sacrifice of economic benefits by the reporting entity is probable.

Market participants. Buyers and sellers in the principal or most advantageous market for an asset or liability who are

1. Independent of the reporting entity (i.e., they are not related parties).
2. Knowledgeable to the extent that they have a reasonable understanding about the asset or liability and the transaction based on all available information, including information that is obtainable through the performance of usual and customary due diligence efforts.
3. Able to buy or sell the asset or liability.
4. Willing to enter into a transaction for the asset or liability (i.e., they are not under duress that would force or compel them to enter into the transaction).

More likely than not (MLTN). A likelihood or probability of more than fifty percent.

Mutual entity. An enterprise that is not investor-owned, organized for the purpose of providing dividends, reduced costs, or other economic benefits directly to its owners, members, or participants. Examples of mutual entities include mutual insurance companies, credit unions, and cooperative entities.

Noncontrolling interest. The equity or net assets in a subsidiary not directly or indirectly attributable to its parent. Noncontrolling interests were formerly referred to in accounting literature as minority interests.

Owners. Holders of ownership interests (equity interests) in investor-owned or mutual entities. Owners include parties referred to as shareholders, partners, proprietors, members, or participants.

Parent. An entity that possesses a controlling financial interest in one or more subsidiaries including an entity that is the primary beneficiary of a variable interest entity.

Primary beneficiary. A variable interest holder that is required to consolidate a variable interest entity (VIE). Under ASC 805, this party is also referred to as a "parent" and the VIE is also referred to as a "subsidiary."

Consolidation is required when the holder of one or more variable interests would absorb a majority of the VIE's expected losses, receive a majority of the VIE's expected residual returns, or both. If one holder would absorb a majority of the VIE's expected losses and another holder would receive a majority of the VIE's expected residual returns, the holder absorbing the majority of the expected losses is the primary beneficiary and is thus required to consolidate the VIE.

Reacquired right. A right previously granted by the acquirer to the acquiree that allowed the acquiree to use one or more of the acquirer's assets. The applicable asset may be recognized or unrecognized for accounting purposes in the acquirer/grantor's financial statements.

Reporting unit. An operating segment or one level below that (called a component), that is used to perform goodwill impairment testing.

Reverse acquisition. An acquisition when one entity, nominally the acquirer, issues so many shares to the former owners of the target entity that they become the majority owners of the successor entity.

Reverse spin-off. A spin-off transaction in which the nominal or legal spinnor is to be accounted for as the spinnee, in order to reflect the economic reality of the spin-off transaction.

Roll-up or Put-together transaction. A business combination that is effected by two or more entities transferring the net assets of their businesses to a newly formed entity. These transactions can also be effected by the owners of the entities transferring their equity interests in those entities to the newly formed entity.

Stapling arrangement. An arrangement in which two or more legal entities contractually agree to combine their securities so that they are quoted at a single price and cannot be traded or transferred independently.

Step acquisition (a business combination achieved in stages). A business combination in which the acquirer held an equity interest in the acquiree prior to the acquisition date on which the acquirer obtained control.

Subordinated financial support. Variable interests that absorb some or all of an entity's expected losses.

Subsidiary. An entity, including unincorporated entities such as partnerships or trusts, in which another entity, referred to as its parent, holds a controlling financial interest. A variable interest entity that is consolidated by a primary beneficiary is also included in this definition.

Total at-risk equity investment. The following criteria are set forth in ASC 810 for determining the total at-risk equity investment in an entity:

1. *Include* only equity investments that participate significantly in profits and losses, even if the investments have no voting rights.
2. *Exclude* equity interests issued by the entity in exchange for subordinated interests in other variable interest entities.

3. *Exclude* amounts provided to the equity investor (e.g., fees, charitable contributions, or other payments) directly or indirectly by the entity or other parties involved with the entity unless the provider is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.
4. *Exclude* amounts financed for the equity investor (e.g., by loans or guarantees of loans) directly by the entity or by other parties involved with the entity, unless the party is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.

There is a rebuttable presumption that an equity investment of less than 10% of an entity's total assets is insufficient to permit the entity to finance its activities without additional subordinated financial support. In order to overcome this presumption, one or more of the following conditions must be present:

1. *Performance*—The entity has demonstrated that it can finance its activities without additional subordinated financial support.
2. *Comparability*—The entity's invested equity is at least as much as other entities holding similar assets of similar quality in similar amounts and who operate without additional subordinated financial support.
3. *Reasonable forecast*—Based on reasonable quantitative evidence, the entity's invested equity exceeds the estimate of the entity's expected losses.

This 10% threshold was intended by FASB to apply only in one direction (i.e., an investment of less than 10% is considered insufficient, but an investment of 10% or more is not necessarily presumed to be sufficient). Many entities engaged in high-risk activities, holding high-risk assets, or carrying significant off-balance-sheet exposures require more than 10% equity investment in order to finance their activities. Consequently, irrespective of the 10% threshold, an evaluation must be done to determine whether a particular entity with which the enterprise is involved requires an equity investment of 10% or greater in order to finance its activities without additional subordinated financial support.

Unfavorable contract. From the perspective of a counterparty, a contract is unfavorable if its terms are less lucrative than current market terms. An unfavorable contract is not necessarily a contract that will result in a loss to the counterparty.

Unrealized intercompany profit. The excess of the transaction price over the carrying value of an item (usually inventory or plant assets) transferred from (or to) a parent to (or from) the subsidiary (or among subsidiaries) and not sold to an outside entity. For purposes of consolidated financial statements, recognition must be deferred until subsequent realization through a transaction with an unrelated party.

Variable interest. Ownership, contractual, or other monetary interests in an entity that are either entitled to receive expected positive variability (referred to as expected residual returns) or obligated to absorb expected negative variability (referred to as expected losses).

Variable interest entity. An entity for which an analysis of the at-risk investments of the holders of its voting interests would not be effective in establishing the party or parties that hold a controlling financial interest in the entity. This situation arises either (1) because the entity is not adequately capitalized by at-risk equity sufficient to absorb its expected losses or (2) because the at-risk equity holders do not receive or bear all of the financial benefits or detriments that would provide those holders with a controlling financial interest in the entity.

CONCEPTS, RULES, AND EXAMPLES

ASC 805 and ASC 810 and Convergence with International Standards

ASC 805, *Business Combinations,* and ASC 810, *Consolidation,* were the product of the first major joint project undertaken by FASB and the International Accounting Standards Board (IASB). In January 2008, IASB published the counterpart international standard, IFRS 3 (revised), *Business Combinations,* and IAS 27 (as revised in 2007), *Consolidated and Separate Financial Statements*. The tandem sets of standards substantially converge US GAAP and International GAAP, however differences still remain between them as the two standards setters did not agree on all of their conclusions (See Appendix B, *International vs. US Accounting Standards,* for a summary of the remaining differences).

Organization of This Chapter and Its Appendix

In general, ASC 805 and ASC 810 prohibit the retrospective remeasurement of business combinations that occurred prior to their effective date. Furthermore, special transition provisions, to apply to mutual entities and guidance applicable to mergers and acquisitions by not-for profit organizations, are not expected to be issued until at least the first quarter of 2009. Consequently, guidance included in many of the pronouncements that were nullified or amended by the new standards will continue to apply to those business combinations predating the new standards or to not-for-profit organizations that are awaiting a final determination by FASB as to how, if at all, the changes in ASC 805 and ASC 810 might be applied to their combination transactions.

To aid the reader/researcher in navigating this maze, we have divided this chapter into two discrete sections. The main portion of the chapter is devoted to the interpretation and application of ASC 805 and ASC 810, and assumes that the nullifications and amendments of predecessor standards that they prescribe have occurred.

To augment the main portion of the chapter to provide the currently applicable guidance to those who still are required to follow it, we have placed guidance regarding the former standards in Appendix A. We recognize this may, to some extent be duplicative, but we believe that this method of organizing the material will result in the most effective and complete research relative to a given aspect of the standards.

Effective Date and Transition Provisions

ASC 805 and ASC 810 are to be applied prospectively to business combinations with acquisition dates on or after the beginning of the first annual reporting period beginning after December 15, 2008. Early application is not permitted. Thus, reporting entities with fiscal years ending December 31, 2009, and thereafter are required to apply the new pronouncements to business combinations made at any time during those fiscal years. Further, reporting entities are not permitted to retrospectively adjust the carrying amounts of assets and liabilities from previously recognized business combinations for the effects of the new pronouncements. Special transition provisions apply to mutual entities and with respect to amendments made to ASC 740 governing the accounting for current and deferred income taxes, respectively. These are discussed later in this chapter and in Chapter 17, *Income Taxes*.

Objectives

ASC 805 and ASC 810 follow a revised drafting convention, intended to be more principles-based than rules-based in tone. Thus, each major section of these pronouncements is preceded by a prominent statement of the main principles embodied by that section, presented in a bold-faced font for emphasis. It is pointed out, however, that all paragraphs and the appendices containing implementation guidance are of equal authority.

The overriding objective of the new standards is to improve the relevance, representational faithfulness, transparency, and comparability of information provided in financial statements about business combinations and their effects on the reporting entity by establishing principles and requirements with respect to how an acquirer, in its consolidated financial statements

1. Recognizes and measures identifiable assets acquired, liabilities assumed, and the noncontrolling interest in the acquiree, if any,
2. Recognizes and measures acquired goodwill or a gain from a bargain purchase,
3. Determines the nature and extent of disclosures sufficient to enable the reader to evaluate the nature of the business combination and its financial effects on the consolidated reporting entity,
4. Accounts for and reports noncontrolling interests in subsidiaries, and
5. Deconsolidates a subsidiary when it ceases to hold a controlling interest in it.

Scope

Transactions or other events that meet the definition of a business combination are subject to ASC 805 and ASC 810. Excluded from the scope of these standards, however, are

1. Formation of a joint venture
2. Acquisition of an asset or group of assets that does not represent a business, as that term is newly defined
3. Combinations between entities or businesses under common control
4. Combinations between not-for-profit organizations or the acquisition of a for-profit business by a not-for-profit organization, the accounting for which was still being deliberated by FASB when this publication went to press

Transactions and Events Accounted for as Business Combinations

A business combination results from the occurrence of a transaction or other event that results in an acquirer obtaining control of one or more businesses. This can occur in many different ways that include the following examples individually or in some cases, in combination:

1. Transfer of cash, cash equivalents, or other assets, including the transfer of assets of another business of the acquirer
2. Incurring liabilities
3. Issuance of equity instruments
4. Obtaining variable interests in an acquiree variable interest entity (VIE) that is a business, resulting in the acquirer becoming the VIE's primary beneficiary/parent, under the provisions of ASC 810, *Consolidation*
5. By contract alone without the transfer of consideration, such as when
   a. An acquiree business repurchases enough of its own shares to cause one of its existing investors (the acquirer) to obtain control over it
   b. There is a lapse of minority veto rights that had previously prevented the acquirer from controlling an acquiree in which it held a majority voting interest
   c. An acquirer and acquiree contractually agree to combine their businesses without a transfer of consideration between them

Qualifying as a Business

ASC 805 substantively revises the previous definition of a business. Further, it clarifies that the initial consolidation of a VIE that is a business is considered to be a business combination. This effectively provides parity between the accounting for business combinations and any related noncontrolling interests involving voting interest entities and those involving variable interest entities.

In order to be considered a business, an integrated group of activities and assets must be *capable* of being conducted and managed to provide a return directly to investors, *owners, members, or participants*. The return can be in the form of dividends, reduced costs, or other economic benefits. The word *capable* was added to emphasize the fact that the definition does not preclude a development stage enterprise (as defined in ASC 915) from qualifying as a business. *Other owners, members, or participants* were included to emphasize the applicability of ASC 805 to mutual entities that previously used the pooling-of-interests method of accounting for business combinations and to noncorporate entities.

The definition and related guidance elaborate further that a business consists of inputs and processes applied to those inputs that have the ability to create outputs. Clarification is provided that, while outputs are usually present in a business, they are not required to qualify as a business as long as there is the *ability* to create them.

An input is an economic resource that creates or has the ability to create outputs when one or more processes are applied to it. Examples of inputs include fixed assets, intangible rights to use fixed assets, intellectual property or other intangible assets, and access to markets in which to hire employees or purchase materials.

A process is a system, protocol, convention, or rule with the ability to create outputs when applied to one or more inputs. Processes are usually documented; however, an organized workforce with the requisite skills and experience may apply processes necessary to create outputs by following established rules and conventions. In evaluating whether an activity is a process, ASC 805 indicates that functions such as accounting, billing, payroll, and other administrative systems do not meet the definition. Thus, processes are the types of activities that an entity engages in to produce the products and/or services that it provides to the marketplace rather than the internal activities it follows in operating its business.

An output is simply the by-product resulting from applying processes to inputs. An output provides, or has the ability to provide, the desired return to the investors, members, participants, or other owners.

In analyzing a transaction or event to determine whether it is a business combination, it is not necessary that the acquirer retain, postcombination, all of the inputs or processes used by the seller in operating the business. Using the "market participant" approach to analyzing the facts, as defined in ASC 820, *Fair Value Measurements and Disclosures*, if market participants could, for example, acquire the business in an arm's-length transaction and continue to produce outputs by integrating the business with their own inputs and processes, then that subset of remaining inputs and processes still meets the definition of a business from the standpoint of the acquirer.

The guidance in ASC 805 provides additional flexibility by providing that it is not necessary that a business have liabilities, although that situation is expected to be rare.

As discussed previously, development stage enterprises are not precluded from meeting the criteria to be a business. This is true even if they do not yet produce outputs. If there are no outputs being produced, the acquirer is to determine whether the enterprise constitutes a business by considering whether it

1. Has started its planned principal activities,
2. Has hired employees,

3. Has obtained intellectual property,
4. Has obtained other inputs,
5. Has implemented processes that could be applied to its inputs,
6. Is pursuing a plan to produce outputs,
7. Will have the ability to obtain access to customers that will purchase the outputs.

It is important to note, however, that it is not required that all of these factors be present for a given set of development stage activities and assets to qualify as a business. Again, the relevant question to ask is whether a market participant would be capable of conducting or managing the set of activities and assets as a business irrespective of whether the seller did so or the acquirer intends to do so.

Finally, ASC 805 provided what it acknowledged was circular logic in asserting that, absent evidence to the contrary, if goodwill is included in a set of assets and activities, it can be presumed to be a business. The circularity arises from the fact that, in order to apply GAAP to determine whether to initially recognize goodwill, the accountant would be required to first determine whether there had, in fact, been an acquisition of a business. Otherwise, it would not be permitted to recognize goodwill. It is not necessary, however, that goodwill be present in order to consider a set of assets and activities to be a business.

Techniques for Structuring Business Combinations

A business combination can be structured in a number of different ways that satisfy the acquirer's strategic, operational, legal, tax, and risk management objectives. Some of the more frequently used structures are

1. One or more businesses become subsidiaries of the acquirer. As subsidiaries, they continue to operate as legal entities.
2. The net assets of one or more businesses are legally merged into the acquirer. In this case, the acquiree entity ceases to exist (in legal vernacular, this is referred to as a statutory merger and normally the transaction is subject to approval by a majority of the outstanding voting shares of the acquiree).
3. The owners of the acquiree transfer their equity interests to the acquirer entity or to the owners of the acquirer entity in exchange for equity interests in the acquirer.
4. All of the combining entities transfer their net assets (or their owners transfer their equity interests into a new entity formed for the purpose of the transaction). This is sometimes referred to as a roll-up or put-together transaction.
5. A former owner or group of former owners of one of the combining entities obtains control of the combined entities collectively.
6. An acquirer might hold a noncontrolling equity interest in an entity and subsequently purchase additional equity interests sufficient to give it control over the investee. These transactions are referred to as step acquisitions or business combinations achieved in stages.
7. A business owner organizes a partnership, S corporation, or LLC to hold real estate. The real estate is the principal location of the commonly owned business and that business entity leases the real estate from the separate entity.

Accounting for Business Combinations under the Acquisition Method

The acquirer is to account for a business combination using the acquisition method. This term, new to US GAAP, represents an expansion of the now-outdated term, "purchase method." The change in terminology was made in order to emphasize that a business combination can occur even when a purchase transaction is not involved.

The following steps are required to apply the acquisition method:

1. Identify the acquirer.
2. Determine the acquisition date.
3. Identify the assets and liabilities, if any, requiring separate accounting because they result from transactions that are not part of the business combination, and account for them in accordance with their nature and the applicable GAAP.
4. Identify assets and liabilities that require acquisition date classification or designation decisions to facilitate application of GAAP in postcombination financial statements and make those classifications or designations based on (a) contractual terms, (b) economic conditions, (c) acquirer operating or accounting policies, and (d) other pertinent conditions existing at the acquisition date.
5. Recognize and measure the identifiable tangible and intangible assets acquired and liabilities assumed.
6. Recognize and measure any noncontrolling interest in the acquiree.
7. Measure the consideration transferred.
8. Recognize and measure goodwill or, if the business combination results in a bargain purchase, recognize a gain.

Step 1—Identify the acquirer. ASC 805 strongly emphasizes the concept that every business combination has an acquirer. In the "basis for conclusions" that accompanies ASC 805, FASB asserted that

> *…"true mergers" or "mergers of equals" in which none of the combining entities obtain control of the others are so rare as to be virtually nonexistent…*

The determination of the acquirer is based on application of the provisions of ASC 810 regarding the party that possesses a controlling financial interest in another entity. While ASC 810 provides that in general, direct or indirect ownership of a majority of the outstanding voting interests in another entity "...is a condition pointing toward consolidation," this is not an absolute rule to be applied in all cases. In fact, ASC 810 explicitly provides that majority owned entities are not to be consolidated if the majority owner does not hold a controlling financial interest in the entity. Exceptions to the general majority ownership rule include, but are not limited to the following situations:

1. An entity that is in legal reorganization or bankruptcy
2. An entity subject to uncertainties due to government-imposed restrictions, such as foreign exchange restrictions or controls, whose severity casts doubt on the majority interest owner's ability to control the entity
3. If the acquiree is a variable interest entity (VIE), the primary beneficiary of the VIE is always considered to be the acquirer. Accounting for VIEs is discussed later in this chapter.

If applying the guidance in ASC 810 does not clearly indicate the party that is the acquirer, ASC 805 provides factors to consider in making that determination under different facts and circumstances:

1. *Relative size*—Generally, the acquirer is the entity whose relative size is significantly larger than that of the other entity or entities. Size can be compared by using measures such as assets, revenues, or net income.
2. *Initiator of the transaction*—When more than two entities are involved, another factor to consider (besides relative size) is which of the entities initiated the transaction.
3. *Roll-ups or put-together transactions*—When a new entity is formed to issue equity interests to effect a business combination, one of the preexisting entities is to be identified as the acquirer. If, instead, a newly formed entity transfers cash or other

assets, or incurs liabilities as consideration to effect a business combination, that new entity may be considered to be the acquirer.

4. *Nonequity consideration*—In business combinations accomplished primarily by the transfer of cash or other assets, or by incurring liabilities, the entity that transfers the cash or other assets, or incurs the liabilities is usually the acquirer.
5. *Exchange of equity interests*—In business combinations accomplished primarily by the exchange of equity interests, the entity that issues its equity interests is generally considered to be the acquirer. One notable exception that occurs frequently in practice is sometimes referred to as a reverse acquisition, discussed in detail later in this chapter. In a reverse acquisition, the entity issuing equity interests is legally the acquirer, but for accounting purposes is considered the acquiree. There are, however, other factors that should be considered in identifying the acquirer when equity interests are exchanged. These include
   a. *Relative voting rights in the combined entity after the business combination*—Generally, the acquirer is the entity whose owners, as a group, retain or obtain the largest portion of the voting rights in the consolidated entity. This determination must take into consideration the existence of any unusual or special voting arrangements as well as any options, warrants, or convertible securities.
   b. *The existence of a large minority voting interest in the combined entity in the event no other owner or organized group of owners possesses a significant voting interest*—Generally, the acquirer is the entity whose owner or organized group of owners holds the largest minority voting interest in the combined entity.
   c. *The composition of the governing body of the combined entity*—Generally, the acquirer is the entity whose owners have the ability to elect, appoint, or remove a majority of members of the governing body of the combined entity.
   d. *The composition of the senior management of the combined entity*—Generally the acquirer is the entity whose former management dominates the management of the combined entity.
   e. *Terms of the equity exchange*—Generally, the acquirer is the entity that pays a premium over the precombination fair value of the equity interests of the other entity or entities.

Step 2—Determine the acquisition date. By definition, the acquisition date is that on which the acquirer obtains control of the acquiree. As discussed previously, this concept of control (or, more precisely, controlling financial interest) is not always evidenced by voting ownership. Thus, control can be obtained contractually by an acquirer absent that party holding any voting ownership interests.

The general rule is that the acquisition date is the date on which the acquirer legally transfers consideration, acquires the assets, and assumes the liabilities of the acquiree. This date, in a relatively straightforward transaction, is referred to as the closing date. Not all transactions are that straightforward, however. All pertinent facts and circumstances are to be considered in determining the acquisition date. The parties to a business combination might, for example, execute a contract that entitles the acquirer to the rights and obligates the acquirer with respect to the obligations of the acquiree prior to the actual date of the closing. Thus, in evaluating economic substance over legal form, the acquirer will have contractually acquired the target on the date it executed the contract.

Example of acquisition date preceding closing date

In 2005, Fortune Brands, Inc. (FB), a US-based holding company (NYSE Symbol: FO) purchased more than 25 spirit and wine brands and specified distribution assets from a French company. In its annual report, FB disclosed that the acquired assets were transferred to a subsidiary of the seller, in which FB received, in connection with the transaction, economic rights (these were structured as "tracker shares" in the holding subsidiary of the seller) with respect to the acquired assets prior to their actual legal transfer to the company. In addition, FB obtained the contractual right to manage the acquired assets prior to their legal transfer to FB. Among the reasons FB cited for entering into these arrangements was their commercial desire to obtain the economic benefits associated with owning and operating the acquired assets as soon as possible after funding the purchase price for them.

Until the assets were legally transferred to FB, the transaction was accounted for under ASC 810 and consequently, FB's interests in the tracker shares of the seller's subsidiary were consolidated since FB was considered the primary beneficiary of that subsidiary. The seller's residual interest in the holding subsidiary was reported in the consolidated financial statements of FB as a noncontrolling interest.[1]

Step 3—Identify assets and liabilities requiring separate accounting. ASC 805 provides a basic recognition principle that, as of the acquisition date, the acquirer is to recognize, separately from goodwill, the identifiable assets acquired (whether tangible or intangible), the liabilities assumed, and, if applicable, any noncontrolling interest (previously referred to as "minority interest") in the acquiree.

In applying the recognition principle to a business combination, the acquirer may recognize assets and liabilities that had not been recognized by the acquiree in its precombination financial statements. Under ASC 805, GAAP continues to permit recognition of acquired intangibles (e.g., patents, customer lists) that would not be granted recognition if they were internally developed.

The pronouncement elaborates on the basic principle by providing that recognition is subject to the following conditions:

1. At the acquisition date, the identifiable assets acquired and liabilities assumed must meet the definitions of assets and liabilities as set forth in CON 6, *Elements of Financial Statements.*[2]
2. The assets and liabilities recognized must be part of the exchange transaction between the acquirer and the acquiree (or the acquiree's former owners) and not part of a separate transaction or transactions.

Restructuring or exit activities. Frequently, in a business combination, the acquirer's plans include the future exit of one or more of the activities of the acquiree or the termination or relocation of employees of the acquiree. Since these exit activities are discretionary on the part of the acquirer and the acquirer is not obligated to incur the associated costs, the costs do not meet the definition of a liability and are not recognized at the acquisition date. Rather, the costs will be recognized in postcombination financial statements in accordance with ASC 420, *Exit or Disposal Cost Obligations,* and discussed in detail in Chapter 3.

---

1 *Fortune Brands, Inc. Form 10-K for the fiscal year ended December 31, 2006. US Securities and Exchange Commission Web site. Filing date March 1, 2007. http://www.sec.gov/Archives/edgar/data/789073/000104746907001501/a2176419z10-k.htm/*

2 *Assets are defined as "probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events" (CON 6, par. 25). Liabilities are defined as "probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events" (CON 6, par. 35).*

Boundaries of the exchange transaction. Preexisting relationships and arrangements often exist between the acquirer and acquiree prior to beginning negotiations to enter into a business combination. Furthermore, while conducting the negotiations, the parties may enter into separate business arrangements. In either case, the acquirer is responsible for identifying amounts that are not part of the exchange for the acquiree. Recognition under the acquisition method is only given to the consideration transferred for the acquiree and the assets acquired and liabilities assumed in exchange for that consideration. Other transactions outside the scope of the business combination are to be recognized by applying other relevant GAAP.

The acquirer is to analyze the business combination transaction and other transactions with the acquiree and its former owners to identify the components that comprise the transaction in which the acquirer obtained control over the acquiree. This distinction is important to ensure that each component is accounted for according to its economic substance irrespective of its legal form.

The imposition of this condition was based on an observation that, upon becoming involved in negotiations for a business combination, the parties may exhibit characteristics of related parties. In so doing, they may be willing to execute agreements designed *primarily* for the benefit of the acquirer of the combined entity that might be designed to achieve a desired financial reporting outcome after the business combination has been consummated. Thus, the imposition of this condition is expected to curb such abuses.

In analyzing a transaction to determine inclusion or exclusion from a business combination, consideration should be given to which of the parties will reap its benefits. If a precombination transaction is entered into by the acquirer, or on behalf of the acquirer, or *primarily* to benefit the acquirer (or to benefit the to-be-combined entity as a whole) rather than for the benefit of the acquiree or its former owners, the transaction most likely would be considered to be a "separate transaction" outside the boundaries of the business combination and for which the acquisition method would not apply.

The acquirer is to consider the following factors, which FASB indicates "are neither mutually exclusive nor individually conclusive," in determining whether a transaction is a part of the exchange transaction or recognized separately:

1. *Purpose of the transaction*—Typically, there are many parties involved in the management, ownership, operation, and financing of the various entities involved in a business combination transaction. Of course, there are the acquirer and acquiree entities, but there are also owners, directors, management, and various parties acting as agents representing their respective interests. Understanding the motivations of the parties in entering into a particular transaction potentially provides insight into whether or not the transaction is a part of the business combination or a separate transaction.
2. *Initiator of the transaction*—Identifying the party that initiated the transaction may provide insight into whether or not it should be recognized separately from the business combination. FASB believes that if the transaction was initiated by the acquirer, it would be less likely to be part of the business combination and, conversely, if it were initiated by the acquiree or its former owners, it would be more likely to be part of the business combination.
3. *Timing of the transaction*—Examining the timing of the transaction may provide insight into whether, for example, the transaction was executed in contemplation of the future business combination in order to provide benefits to the acquirer or the postcombination entity. FASB believes that transactions that take place during the negotiation of the terms of a business combination may be entered into in contemplation of the eventual combination for the purpose of providing future economic

benefits *primarily* to the acquirer of the to-be-combined entity and, therefore, should be accounted for separately.

ASC 805 provides the following presumption after analyzing the economic benefits of a precombination transaction:

***Primarily** for the benefit of*	*Transaction likely to be*
Acquirer or combined entity	Separate transaction
Acquiree or its former owners	Part of the business combination

ASC 805 provides three examples of separate transactions that *are not* to be included in applying the acquisition method, each of which will be discussed in further detail:

1. Reimbursement to the acquiree or its former owners for paying the acquirer's acquisition-related costs,
2. A settlement of a preexisting relationship between acquirer and acquiree, and
3. Compensation to employees or former owners of the acquiree for future services

Acquisition-related costs. In a departure from the previous US GAAP for business combinations, acquisition-related costs, under ASC 805, are to be charged to expense of the period in which the costs are incurred and the related services received. Examples of these costs include

Accounting fees	Internal acquisitions department
Advisory fees	Legal fees
Consulting fees	Other professional fees
Finder's fees	Valuation fees

ASC 805 makes an exception to the general rule with respect to costs to register and issue equity or debt securities. These costs are to be recognized in accordance with other applicable GAAP. Stock issuance costs are normally charged against the gross proceeds of the issuance (See Chapter 19). Debt issuance costs are, under CON 6, to be either treated as a reduction of the amount borrowed or treated as an expense of the period in which they are incurred; however, some reporting entities have treated these costs as deferred charges and amortized them to income during the term of the debt. (See Chapter 15)

Settlements of preexisting relationships between acquirer and acquiree. Prior to pursuing a business combination, business may have been transacted between the parties. The nature of the transactions may have been contractual, such as the purchase of goods and/or services, or the licensing of intellectual property. Alternatively, the parties may have had an adversarial relationship whereby they were plaintiff and defendant in pending litigation. If a business combination in effect settles such a preexisting relationship, the acquirer is to recognize a gain or loss measured in the following manner:

1. If the relationship is noncontractual (e.g., litigation), measure at fair value
2. If the relationship is contractual, measure at the lesser of
   a. The amount by which, from the acquirer's perspective, the contract is favorable or unfavorable, or
   b. The amount of any settlement provisions stated in the contract that are available to the counterparty for which the contract is unfavorable.

If 2.b. is less than 2.a., the difference is to be included as part of the accounting for the business combination.

In determining whether a contract is favorable or unfavorable to a party, the terms of the contract are compared to current market terms. It is important to note that a contract can be unfavorable to the acquirer and yet not result in a loss.

The amount of the gain or loss measured as a result of settling a preexisting relationship will, of course, depend on whether the acquirer had previously recognized related assets or liabilities with respect to that relationship.

Example of settlement of preexisting contractual supplier relationship; contract unfavorable to acquirer

Meyer Corporation (MC) and Henning, Inc. (HI) are parties to a 3-year supply contract that contains the following provisions:

1. MC is required to annually purchase 3,000 flat-panel displays from HI at a fixed price of $400 per unit for an aggregate purchase price of $1,200,000 for each of the three years.
2. MC is required to pay HI the annual $1,200,000 irrespective of whether it takes delivery of all 3,000 units and the required payment is nonrefundable.
3. The contract contains a penalty provision that would permit MC to cancel it at the end of the second year for a lump sum payment of $500,000.
4. In each of the first two years of the contract, MC took delivery of the full 3,000 units.

At December 31, 2008, the supply contract was unfavorable to MC because MC would be able to purchase flat-panel displays with similar specifications and of similar quality from another supplier for $350 per unit. Therefore, in accordance with ARB 43, MC accrued a loss of $150,000 (3,000 units remaining under the firm purchase commitment × $50 loss per unit).

On January 1, 2009, MC acquires HI for $30 million, which reflects the fair value of HI based on what other marketplace participants would be willing to pay. On the acquisition date, the $30 million fair value of HI includes $750,000 related to the contract with MC that consists of

Identifiable intangibles[3]	$600,000	Representing the remaining year of the contract, at prevailing market prices
Favorable pricing	150,000	Representing the portion of the contract price that is favorable to HI and unfavorable to MC
	$750,000	

HI has no other identifiable assets or liabilities related to the supply contract with MC. MC would compute its gain or loss on settlement of this preexisting relationship as follows:

1. Amount of unfavorability to acquirer (MC) at acquisition date	$150,000
2. Lump-sum settlement amount available to MC	500,000
3. Lesser of 1. or 2.	150,000
4. Amount by which 1. exceeds 2.	N/A

Since MC had already recognized an unrealized loss on the firm purchase commitment as of December 31, 2008, upon its acquisition of HI, its loss of $150,000 from recognizing the lesser of 1. and 2. above would be offset by the elimination of the liability for the unrealized loss on the firm purchase commitment in the same amount of $150,000. Thus, under these circumstances, MC would have neither a gain nor a loss on the settlement of its preexisting relationship with HI. The entries to record these events are not considered part of the business combination accounting. It is important to note that, from the perspective of MC, when it applies the acquisition method to record the business combination, it will characterize the $600,000 "at-market" component of the contract as part of goodwill and not as identifiable intangibles. This is the case because of the obvious fallacy of MC recognizing customer-relationship intangible assets that represent a relationship with itself.

[3] *In computing the valuation of HI, these amounts would represent such identifiable customer-related intangible assets as customer contract, related customer relationship, production backlog, etc.*

Example of settlement of preexisting contractual supplier relationship; contract favorable to acquirer

Using the same facts as the MC/HI example above, assume that, instead of the contract being unfavorable to the acquirer MC, it was unfavorable to HI in the amount of $150,000 and that there was a cancellation provision in the contract that would permit HI to pay a penalty after year two of $100,000 to cancel the remainder of the contract.

On the acquisition date, the $30 million fair value of HI, under this scenario would include $450,000 related to the contract with MC that consists of

Identifiable intangibles	$600,000	Representing the remaining year of the contract, at prevailing market prices
Unfavorable pricing	(150,000)	Representing the portion of the contract price that is unfavorable to HI and favorable to MC
	$450,000	

Under these changed assumptions, MC would not have incurred or recorded an unrealized loss on the firm purchase commitment with HI since the contract terms were favorable to MC. The determination of MC's gain or loss would be as follows:

1.	Amount of favorability to acquirer (MC) at acquisition date	$150,000
2.	Lump-sum settlement amount available to HI	100,000
3.	Lesser of 1. or 2.	100,000
4.	Amount by which 1. exceeds 2.	50,000

Under this scenario, unless HI believed that the market would change in the near term, it would be economically advantageous, absent a business combination, for HI to settle the remaining contract at the acquisition date by paying the $100,000 penalty because HI would be able to sell the remaining 3,000 units covered by the contract for an aggregate price of $150,000 more than it was committed to sell those units to MC.

At the acquisition date, MC would record a gain of $100,000 to settle its preexisting relationship with HI. The entry to record the gain is not considered part of the business combination accounting.

In addition, however, since 2. is less than 1., the $50,000 difference is included in the accounting for the business combination, since economically, postcombination, the combined entity will not benefit from that portion of the acquisition date favorability of the contract.

As was the case in the first example, the portion of the purchase price allocated to the contract in the business combination accounting would be accounted for as goodwill for the same reason.

Contingent payments to employees or former owners of the acquiree. The acquirer is to assess whether arrangements to make contingent payments to employees or selling owners of the acquiree represent contingent consideration that is part of the business combination transaction or represent separate transactions to be excluded from the application of the acquisition method to the business combination. In general, the acquirer is to consider the reasons why the terms of the acquisition include the payment provision, the party that initiated the arrangement, and when (at what stage of the negotiations) the arrangement was entered into by the parties. When those considerations do not provide clarity regarding whether the transaction is separate from the business combination, the acquirer considers the following indicators:

1. *Postcombination employment*—Consideration is to be given to the terms under which the selling owners will be providing services as key employees of the combined entity. The terms may be evidenced by a formal employment contract, by provisions included in the acquisition documents, or by other documents. If the arrangement provides that the contingent payments are automatically forfeited upon

termination of employment, the consideration is to be characterized as compensation for postcombination services. If, instead, the contingent payments are not affected by termination of employment, this would be an indicator that the contingent payments represent additional consideration that is part of the business combination transaction and not compensation for services.

2. *Duration of postcombination employment*—If the employee is contractually bound to remain employed for a period that equals or exceeds the period during which the contingent payments are due, this may be an indicator that the contingent payments represent compensation for services.
3. *Amount of compensation*—If the amount of the employee's compensation that is not contingent is considered to be reasonable in relation to other key employees of the combined entity, this may indicate that the contingent amounts represent additional consideration and not compensation for services.
4. *Differential between amounts paid to employees and selling owners who do not become employees of the combined entity*—If, on a per-share basis, the contingent payments due to former owners of the acquiree that did not become employees are lower than the contingent payments due to the former owners that did become employees of the combined entity, this may indicate that the incremental amounts paid to the employees are compensation.
5. *Extent of ownership*—The relative ownership percentages (e.g., number of shares, units, percentage of membership interest) owned by the selling owners who remain employees of the combined entity serve as an indicator of how to characterize the substance of the contingent consideration. If, for example, the former owners of substantially all of the ownership interests in the acquiree are continuing to serve as key employees of the combined entity, this may be an indicator that the contingent payment arrangement is substantively a profit-sharing vehicle designed with the intent of providing compensation for services to be performed postcombination. Conversely, if the former owners that remained employed by the combined entity collectively owned only a nominal ownership interest in the acquiree and all of the former owners received the same amount of contingent basis on a per-share basis, this may be an indicator that the contingent payments represent additional consideration. In considering the applicability of this indicator, care must be exercised to closely examine the effects, if any, of transactions, ownership interests, and employment relationships, precombination and postcombination, with respect to parties related to the selling owners of the acquiree.
6. *Relationship of contingent arrangements to the valuation approach used*—The payment terms negotiated in many business combinations provide that the amount of the acquisition date transfer of consideration from acquirer to acquiree (or the acquiree's former owners) is computed near the lower end of a range of valuation estimates the acquirer used in valuing the acquiree. Furthermore, the formula for determining future contingent payments is derived from or related to that valuation approach. When this is the case, it may be an indicator that the contingent payments represent additional consideration. Conversely, if the formula for determining future contingent payments more closely resembles prior profit-sharing arrangements, this may be an indicator that the substance of the contingent payment arrangement is to provide compensation for services.
7. *Formula prescribed for determining contingent consideration*—Analyzing the formula to be used to determine the contingent consideration may provide insight into the substance of the arrangement. Contingent payments that are determined on the basis of a multiple of earnings may be indicative of being, in substance, contingent

consideration that is part of the business combination transaction. Alternatively, contingent consideration that is determined as a prespecified percentage of earnings would be more suggestive of a routine profit-sharing arrangement for the purposes of providing additional compensation to employees for postcombination services rendered.

8. *Other considerations*—Given the complexity of a business combination transaction and the sheer number and girth of the legal documents necessary to affect it, the financial statement preparer is charged with the daunting, but unavoidable task of performing a comprehensive review of the terms of all of the associated agreements. These can take the form of noncompete agreements, consulting agreements, leases, guarantees, indemnifications, and, of course, the formal agreement to combine the businesses. Particular attention should be paid to the applicable income tax treatment afforded to the contingent payments. The income tax treatment of these payments may be an indicator that tax avoidance was a primary motivator in characterizing them in the manner that they are structured. An acquirer might, for example, simultaneous to a business combination, execute a property lease with one of the key owners of the acquiree. If the lease payments were below market, some or all of the contingent payments to that key owner/lessor under the provisions of the other legal agreements might, in substance, be making up the shortfall in the lease and thus, should be recharacterized as lease payments and accounted for separately from the business combination in the combined entity's postcombination financial statements. If this were not the case, and the lease payments were reflective of the market, this would be an indicator pointing to a greater likelihood that the contingent payment arrangements actually did represent contingent consideration associated with the business combination transaction.

Step 4—Classify or designate identifiable assets acquired and liabilities assumed. In order to facilitate the combined entity's future application of GAAP in its postcombination financial statements, management is required to make decisions on the acquisition date relative to the classification or designation of certain items. These decisions are to be based on the contractual terms, economic and other conditions, and the acquirer's operating and accounting policies as they exist *on the acquisition date*. Examples include, but are not limited to, the following:

1. Classification of investments in certain debt and equity securities as trading, available for sale, or held to maturity under ASC 320, *Investments—Debt and Equity Securities*
2. Designation of a derivative instrument as a hedging instrument under the provisions of ASC 815, *Derivatives and Hedging*
3. Assessment of whether an embedded derivative is to be separated from the host contract under ASC 815

In applying Step 4, specific exceptions are provided for lease contracts and insurance contracts. Generally, these contracts are to be classified by reference to the contractual terms and other factors that were applicable *at their inception* rather than at the acquisition date. If, however, the contracts were modified subsequent to their inception and those modifications would change their classification at that date, then the accounting for the contracts will be determined by the modification date facts and circumstances. Under these circumstances, the modification date could be the same as the acquisition date.

Step 5—Recognize and measure the identifiable tangible and intangible assets acquired and liabilities assumed. In general, the acquirer measures the identifiable tangible and intangible assets acquired, liabilities assumed, and, if applicable, noncontrolling interest at fair value on the acquisition date. The following guidance is to be followed in applying the recognition and measurement principles (subject to certain specified exceptions).

Operating leases. Irrespective of whether the acquiree is the lessee or lessor, the acquirer is to evaluate, as of the acquisition date, each of the acquiree's operating leases to determine whether its terms are favorable or unfavorable compared to the market terms of leases of identical or similar items. If the lease terms are favorable, the acquirer is to recognize an intangible asset; if the lease terms are unfavorable, the acquirer is to recognize a liability.

Even when the lease is considered to be at market terms, there nevertheless may be an identifiable intangible associated with it. This would be the case if market participants would be willing to pay to obtain it (i.e., to obtain the rights and privileges associated with it). Examples of this situation are leases for favorably positioned airport gates, and prime retail space in an economically favorable location. If, from the perspective of marketplace participants, acquiring the lease would entitle them to future economic benefits that qualify as identifiable intangible assets (discussed later in this chapter), the acquirer would recognize, separately from goodwill, the associated identifiable intangible asset.

Operating lease assets owned by an acquiree/lessor. The fair value of assets owned by the acquiree that are subject to operating leases with the acquiree being the lessor are to be measured separately from the underlying lease to which they are subject.

Assets with uncertain cash flows. Since fair value measurements take into account the effects of uncertainty regarding the amounts and timing of future cash flows, the acquirer is not to recognize a separate valuation allowance for assets subject to such uncertainties.

Assets the acquirer plans to idle or to use in a manner that is not their highest and best use. The measurement of the identifiable assets acquired at fair value is to be made in accordance with the requirements of ASC 820, which is discussed in detail in Chapter 6. One of those requirements is that the measurement is to assume the highest and best use of the asset by market participants. In applying this requirement to assets that are acquired in a business combination, this assumption is to be used even if it differs from the manner in which the acquiree was using the assets or the manner in which the acquirer intends to use the assets. Thus, even if the acquirer intends, for competitive or other business reasons to idle an acquired asset or use it in a manner that is not its highest and best use, the acquirer is still required to initially measure the fair value of that asset using the assumption of its highest and best use and to continue to use that assumption for the purposes of subsequently testing the asset for impairment.

Identifiable intangibles to be recognized separately from goodwill. Intangible assets acquired in a business combination are to be recognized separately from goodwill if they meet either of two criteria to be considered *identifiable.* These criteria are

1. *Separability criterion*—The intangible asset is capable of being separated or divided from the entity that holds it, and sold, transferred, licensed, rented, or exchanged, regardless of the acquirer's intent to do so. An intangible asset meets this criterion even if its transfer would not be alone, but instead would be accompanied or bundled with a related contract, other identifiable asset, or a liability.
2. *Legal/contractual criterion*—The intangible asset results from contractual or other legal rights. An intangible asset meets this criterion even if the rights are not transferable or separable from the acquiree or from other rights and obligations of the acquiree.

Appendix A to ASC 805-20-55 contains a listing of intangible assets that FASB believes have characteristics that meet one of these two criteria (legal/contractual or separability). A logical approach in practice would be for the acquirer to first consider whether the intangibles specifically included on the FASB list are applicable to the particular acquiree and then to consider whether there may be other unlisted intangibles included in the acquisition that meet one or both of the criteria for separate recognition.

ASC 805-20-55 organizes groups of identifiable intangibles into categories related to or based on

1. Marketing
2. Customers or clients
3. Artistic works
4. Contractual
5. Technological

These categorizations are somewhat arbitrary. Consequently, some of the items listed could fall into more than one of the categories. Examples of identifiable intangibles included in each of the categories are as follows:

Marketing-related intangible assets.

1. *Newspaper mastheads.* The unique appearance of the title page of a newspaper or other periodical.
2. *Trademarks, service marks, trade names, collective marks, certification marks.* A trademark represents the right to use a name, word, logo, or symbol that differentiates a product from products of other entities. A service mark is the equivalent of a trademark for a service offering instead of a product. A collective mark is used to identify products or services offered by members affiliated with each other. A certification mark is used to designate a particular attribute of a product or service such as its geographic source (e.g., Columbian coffee or Florida orange juice) or the standards under which it was produced (e.g., ISO 9000 Certified).
3. *Trade dress.* The overall appearance and image (unique color, shape, or package design) of a product.
4. *Internet domain names.* The unique name that identifies an address on the Internet. Domain names must be registered with an Internet registry and are renewable.
5. *Noncompetition agreements.* Rights to assurances that companies or individuals will refrain from conducting similar businesses or selling to specific customers for an agreed-upon period of time.

Customer-related intangible assets.

1. *Customer lists.* Names, contact information, order histories, and other information about a company's customers, that a third party, such as a competitor or a telemarketing firm would want to use in its own business.
2. *Customer contracts and related customer relationships.* When a company's relationships with its customers arise primarily through contracts and are of value to buyers who can "step into the shoes" of the sellers and assume their remaining rights and duties under the contracts, and which hold the promise that the customers will place future orders with the entity or relationships between entities and their customers for which
   a. The entities have information about the customers and have regular contacts with the customers, and
   b. The customers have the ability to make direct contact with the entity.

3. *Noncontractual customer relationships.* Customer relationships that arise through means such as regular contacts by sales or service representatives, the value of which are derived from the prospect of the customers placing future orders with the entity.
4. *Order or production backlogs.* Unfilled sales orders for goods and services in amounts that exceed the quantity of finished goods and work-in-process on hand for filling the orders.

Artistic-related intangible assets.

1. *Plays, operas, ballets.*
2. *Books, magazines, newspapers, and other literary works.*
3. *Musical works such as compositions, song lyrics, and advertising jingles.*
4. *Photographs, drawings, and clip art.*
5. *Audiovisual material including motion pictures, music videos, television programs.*

Contract-based intangible assets.

1. *License, royalty, standstill agreements.* License agreements represent the right, on the part of the licensee, to access or use property that is owned by the licensor for a specified period of time at an agreed-upon price. A royalty agreement entitles its holder to a contractually agreed-upon portion of the income earned from the sale or license of a work covered by patent or copyright. A standstill agreement conveys assurances that a company or individual will refrain from engaging in certain activities for specified periods of time.
2. *Advertising contracts.* A contract with a newspaper, broadcaster, or Internet site to provide specified advertising services to the acquiree.
3. *Lease agreements.* (irrespective of whether the acquiree is the lessee or lessor)
4. *Construction permits.* Rights to build a specified structure at a specified location
5. *Construction contracts.* Rights to become the contractor responsible for completing a construction project and benefit from the profits it produces, subject to the remaining obligations associated with performance (including any past-due payments to suppliers and/or subcontractors).
6. *Construction management, service, or supply contracts.* Rights to manage a construction project for a fee, procure specified services at a specified fee, or purchase specified products at contractually agreed-upon prices.
7. *Broadcast rights.* Legal permission to transmit electronic signals using specified bandwidth in the radio frequency spectrum, granted by the operation of communication laws.
8. *Franchise rights.* Legal rights to engage in a trade-named business, to sell a trademarked good, or to sell a service-marked service in a particular geographic area.
9. *Operating rights.* Permits to operate in a certain manner, such as those granted to a carrier to transport specified commodities.
10. *Use rights.* Permits to use specified land, property, or air space in a particular manner, such as the right to cut timber, expel emissions, or to land airplanes at specified gates at an airport.
11. *Servicing contracts.* The contractual right to service a loan. Servicing entails activities such as collecting principal and interest payments from the borrower, maintaining escrow accounts, paying taxes and insurance premiums when due, and pursuing collection of delinquent payments.
12. *Employment contract.* The right to succeed the acquiree as the employer under a formal contract to obtain an employee's services in exchange for fulfilling the em-

ployer's remaining duties, such as payment of salaries and benefits, as specified by the contract.

Technology-based intangible assets.

1. *Patented or copyrighted software.* Computer software source code, program specifications, procedures, and associated documentation that is legally protected by patent or copyright.
2. *Mask works.* Software permanently stored on a read-only memory chip as a series of stencils or integrated circuitry. Mask works may be provided statutory protection in some countries.
3. *Unpatented technology.* Access to knowledge about the proprietary processes and workflows followed by the acquiree to accomplish desired business results.
4. *Databases.* Databases are collections of information generally stored digitally in an organized manner. A database can be protected by copyright (e.g., the database contained on the CD-ROM version of this publication). Many databases, however, represent information accumulated as a natural by-product of a company conducting its normal operating activities. Examples of these databases are plentiful and include title plants, scientific data, and credit histories. Title plants (discussed in detail in Chapter 25) represent historical records with respect to real estate parcels in a specified geographic location.
5. *Trade secrets.* Trade secrets are proprietary, confidential information, such as a formula, process, or recipe.

One commonly cited intangible asset deliberately omitted by the FASB from its list of identifiable intangibles is an "assembled workforce." FASB decided that the replacement cost technique that is often used to measure the fair value of an assembled workforce is not a representationally faithful measure of the fair value of the intellectual capital acquired. It was thus decided that an exception to the recognition criteria would be made, and that the fair value of an acquired assembled workforce would remain part of goodwill.

Research and development assets. ASC 805 requires the acquirer to recognize and measure all tangible and intangible assets used in research and development (R&D) activities acquired individually or in a group of assets as part of the business combination. This prescribed treatment is to be followed even if the assets are judged to have no alternative future use. These assets are to be measured at their acquisition-date fair values. Fair value measurements, consistent with ASC 820, are to be made based on the assumptions that would be made by market participants in pricing the asset. Assets that the acquirer does not intend to use or intends to use in a manner that is not their highest and best use are, nevertheless, required to be measured at fair value.

Intangible R&D assets. Upon initial recognition, the *intangible* R&D assets are to be classified as indefinite-lived assets until the related R&D efforts are either completed or abandoned. In the reporting periods during which the R&D intangible assets are classified as indefinite-lived, they are not to be amortized. Instead, they are to be tested for impairment in the same manner as other indefinite-lived intangibles. Upon completion or abandonment of the related R&D efforts, management is to determine the remaining useful life of the intangibles and amortize them accordingly. In applying these requirements, assets that are temporarily idled are not to be considered abandoned.

Tangible R&D assets. Tangible R&D assets acquired in a business combination are to be accounted for according to their nature (e.g., supplies, inventory, depreciable assets).

Exceptions to the recognition and/or measurement principles. ASC 805 provides certain exceptions to its general principles for recognizing assets acquired and liabilities assumed at their acquisition date fair values. These can be summarized as follows:

Nature of exception	*Recognition*	*Measurement*
Assets held for sale		x
Contingent assets and liabilities of the acquiree	x	
Indemnification assets	x	x
Reacquired rights		x
Employee benefits	x	x
Share-based payment awards		x
Income taxes	x	x

Assets held for sale. Assets classified as held for sale individually or as part of a disposal group are to be measured at acquisition date fair value less cost to sell consistent with ASC 360 (discussed in detail in Chapter 11).

In postacquisition periods, long-lived assets classified as held for sale are not to be depreciated *or* amortized. If the assets are part of a disposal group (discussed in detail in Chapter 11), interest and other expenses related to the liabilities included in the disposal group are to continue to be accrued.

In determining fair value less cost to sell, it is important to differentiate costs to sell from expected future losses associated with the operation of the long-lived asset or disposal group to which it belongs.

Costs to sell are defined as the incremental direct costs necessary to transact a sale. To qualify as costs to sell, the costs must result directly from the sale transaction, incurring them needs to be considered essential to the transaction, and the costs would not have been incurred by the entity absent the decision to sell the assets. Examples of costs to sell include brokerage commissions, legal fees, title transfer fees, and closing costs necessary to effect the transfer of legal title. Costs to sell are expressly not permitted to include any future losses that are expected to result from operating the assets (or disposal group) while it is classified as held for sale. If the expected timing of the sale exceeds one year from the balance sheet date, which is permitted in limited situations by ASC 360-10-45, the costs to sell are to be discounted to their present value.

Should a loss be recognized in subsequent periods due to declines in the fair value less cost to sell, such *losses* are permitted to be restored by future periods gains only to the extent to which the losses have been recognized cumulatively from the date the asset (or disposal group) was classified as held for sale.

During its deliberations on ASC 805, FASB's tentative conclusion was that assets held for sale *should* be measured in the same manner as other acquired assets—that is, at their acquisition-date fair value. If the final standard had contained this provision, however, it would have caused a practical dilemma because, technically, on the day after the acquisition date, the new consolidated reporting entity would be required to apply ASC 360-10-35 and write down the newly acquired assets to their fair value less cost to sell, resulting in recognizing a loss equal to the selling costs. FASB referred to this as a "Day 2 loss." This anomaly could have been remedied by incorporating an amendment to ASC 360, but FASB believed such an amendment should be made in a separate project in order to provide its constituents an opportunity to submit comments on the proposed change.

The FASB thus deemed this treatment to be a *temporary* exception to the measurement principle under ASC 805. As of mid-2008, however, FASB and IASB had each removed from their respective agendas similar projects that would have, in the case of the FASB standards, amended ASC 360 to require assets held for sale to be measured at fair value and pre-

sumably remove the temporary exception to the measurement principle currently included in ASC 805. Thus, this measurement principle exception will not be resolved in the near future.

Contingent assets and liabilities of the acquiree. A gain or loss contingency is defined in the Master Glossary as an existing, unresolved condition, situation, or set of circumstances that will eventually be resolved by the occurrence or nonoccurrence of one or more future events. A potential gain or loss to the reporting entity can result from the contingency's resolution.

Acquisition-date considerations. For the purposes of determining recognition of a contingent asset or liability by an acquirer under ASC 805, contingencies are classified as either contractual or noncontractual in nature.

Examples of contractual contingencies include

- A lessee's obligation to pay additional rent based on a percentage of its sales that exceed a certain base amount, referred to as percentage rent or contingent rent
- A contingent asset representing the contractual right to receive life insurance proceeds upon the death of the insured
- A loan guarantee representing a contingent commitment to repay a loan if the debtor defaults on its obligation
- A product warranty representing a contingent commitment to repair or replace a defective product

Examples of noncontractual contingencies include

- Environmental remediation obligations
- Favorable or unfavorable outcomes from litigation
- Assessments of back taxes, penalties, and interest by a taxing authority
- Penalties and fines imposed by regulators

FASB's conclusions with respect to recognition of contingent assets and liabilities by an acquirer are best illustrated by reference to the decision diagram on the next page.

Assets and liabilities arising from contractual contingencies are to be recognized and measured on the acquisition date at their fair value at that date.

If the nature of the contingency is noncontractual, management of the acquirer is required to assess whether

- For a contingent asset, it is more likely than not (MLTN) that the acquirer has obtained, or controls, on the acquisition date, future economic benefits as a result of a past transaction or event, or
- For a contingent liability, it is MLTN that the acquirer has an obligation on the acquisition date to sacrifice future economic benefits as a result of a past transaction or event.

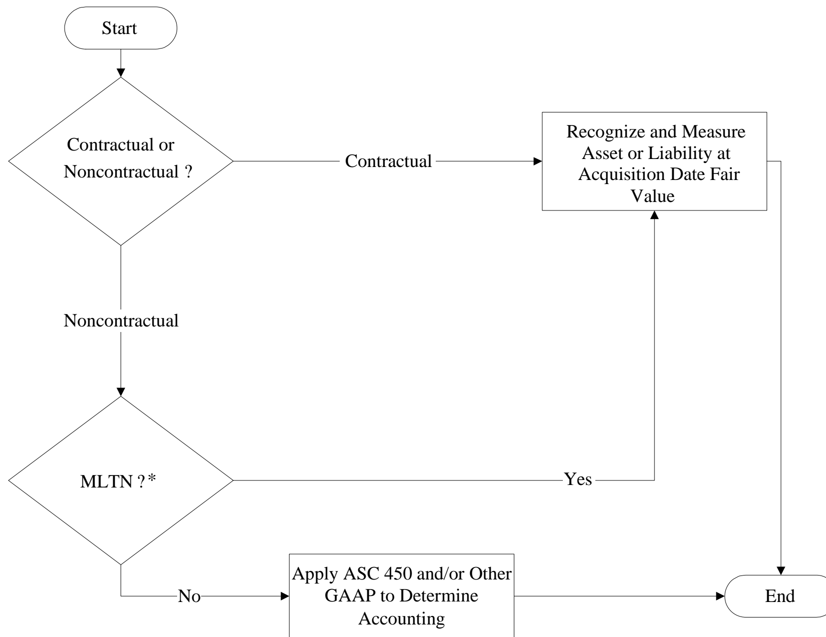
If an asset or liability associated with a noncontractual contingency meets the applicable more-likely-than-not criterion, it is recognized and measured in the same manner as a contractual contingency—that is, it is recognized and measured at its acquisition date fair value.

If a noncontractual contingency does not meet the applicable MLTN criterion, then it is not recognized in the financial statements of the consolidated entity on the acquisition date. Instead, subsequent to the acquisition date, management is to apply other applicable GAAP, including ASC 450, if applicable, in determining how and when to account for the contingency.

The consideration of whether there is a probability of "more likely than not" (i.e., a probability of more than 50%) is to be made in a very specific manner as described above and in the accompanying decision diagram. FASB differentiates the application of MLTN for

this purpose from the way in which probability is considered in the definitions of assets and liabilities in CON 6.

Contingent Assets and Liabilities of the Acquiree



Definitions from CON 6

Asset. A reporting entity recognizes an asset if both of the following criteria are met at the balance sheet date (CON 6)

1. The reporting entity has obtained or controls future economic benefits that result from transactions or events that occurred in the past.
2. Receipt of those future economic benefits by the reporting entity is probable.

Liability. A reporting entity has incurred a liability if both of the following criteria are met at the balance sheet date (CON 6):

1. The reporting entity has a present obligation to sacrifice economic benefits in the future by providing services or transferring assets to others resulting from transactions or events that occurred in the past.
2. The future sacrifice of economic benefits by the reporting entity is probable.

*MLTN = More Likely Than Not

To make this decision with respect to contingent assets, evaluate whether it is MLTN that the acquirer has obtained or controls future economic benefits as the result of a past transaction or event (criterion 1. from the definition). To make this decision with respect to contingent liabilities, evaluate whether it is MLTN that the acquirer has a present obligation to sacrifice future economic benefits as a result of a past transaction or event (criterion 1. from the definition).

Financial statement element	*Consideration of probability for the purpose of* Applying the MLTN recognition criteria in ASC 805	*Determination of whether an element is an asset or liability in CON 6*
Asset	Applies to whether, on the acquisition date, the acquirer has obtained or controls future economic benefits as a result of past transactions or events.	Applies to whether the reporting entity will receive economic benefits in the future.
Liability	Applies to whether, on the acquisition date, the acquirer is obligated to provide services or transfer assets in the future as a result of past transactions or events.	Applies to whether services will be provided or assets transferred by the reporting entity in the future.

Postacquisition considerations. The subsequent accounting for contingent assets and liabilities of the acquiree that are recognized by the acquirer on the acquisition date depends on the nature and timing of new information received by management of the acquiree regarding the possible outcome of the contingency. In the absence of such information, the acquirer is to continue to account for the asset or liability at acquisition-date fair value. When new information is obtained regarding the contingency's possible outcome, management of the acquirer is to evaluate the information and measure the asset or liability as follows:

1. A liability is to be measured at the *higher* of
   a. Acquisition-date fair value, *or*
   b. The amount that would be recognized if applying ASC 450.
2. An asset is to be measured at the *lower* of
   a. Acquisition-date fair value, *or*
   b. The best estimate of the future settlement amount.

Only upon resolution of a contingency is the acquirer permitted to derecognize an asset or liability that the contingency gives rise to. Thus, derecognition could occur, for example, if the acquirer collects cash, sells the right to receive the future cash flows associated with a contingent asset, or settles a contingent liability in full. Derecognition of a contingent liability is also permitted if the obligation is cancelled or expires.

Indemnification assets. Indemnification provisions are usually included in the voluminous closing documents necessary to effect a business combination. Indemnifications are contractual terms designed to fully or partially protect the acquirer from the potential adverse effects of an unfavorable future resolution of a contingency or uncertainty that exists at the acquisition date. Frequently the indemnification is structured to protect the acquirer by limiting the maximum amount of postcombination loss that the acquirer would bear in the event of an adverse outcome. A contractual indemnification provision results in the acquirer obtaining, as a part of the acquisition, an indemnification asset and simultaneously assuming a contingent liability of the acquiree.

Acquisition-date considerations. ASC 805 requires the acquirer to recognize and measure the indemnification asset using the same measurement basis it uses to measure the indemnified obligation.

In measuring an indemnification asset, management is to take into account any uncertainty in the amounts or timing of expected future cash flows. If the asset is measured at acquisition-date fair value, those effects are included in the measure of fair value and, therefore, a separate valuation allowance is not recognized.

Some indemnifications relate to assets or liabilities that are exceptions to the recognition or measurement principles. Indemnifications may, for example, be related to noncontractual contingencies that do not meet the more-likely-than-not criterion for recognition in the acquisition-date financial statements. Other indemnifications may be related to uncertain income tax positions that are measured, under ASC 740, as the maximum amount that is estimated to be more likely than not of being sustained upon examination by the relevant taxing jurisdiction. In cases such as these, the indemnification asset is to be recognized and measured using assumptions consistent with those used to measure the item being indemnified. Since uncertainty with respect to the collectibility of the indemnification asset is not directly included in its measurement, collectibility is considered separately and, to the extent necessary, reflected in a valuation allowance to reduce the carrying amount of the indemnification asset.

Postacquisition considerations. At each reporting date subsequent to the acquisition date, the acquirer is to measure an indemnification asset recognized as part of the business combination using the same basis as the indemnified item, subject to any limitations imposed contractually on the amount of the indemnification. If an indemnification asset is not subsequently measured at fair value (because to do so would be inconsistent with the basis used to measure the indemnified item), management is to assess the collectibility of the asset and, to the extent necessary, a valuation allowance should be established or adjusted. An indemnification asset is derecognized only when the asset is collected, the rights to receive the asset are sold, or the acquirer otherwise loses its right to receive it.

Reacquired rights. An acquirer and acquiree may have engaged in preacquisition business transactions such as leases, licenses, or franchises that resulted in the acquiree paying consideration to the acquirer to use tangible and/or intangible assets of the acquirer in the acquiree's business.

Acquisition-date considerations. Upon consummation of the business combination, the acquirer may reacquire a previously granted right. Upon reacquisition, the acquirer is to account for the right as an identifiable, amortizable intangible asset separate from goodwill.

If the terms of the contract that give rise to the reacquired right are either favorable or unfavorable to the acquirer compared to current market transactions for identical or similar rights, the acquirer is to recognize a gain or loss computed as the lesser of

1. The amount by which, from the acquirer's perspective, the contract is favorable or unfavorable, or
2. The amount of any settlement provisions stated in the contract that are available to the counterparty for which the contract is unfavorable.

If 2. is less than 1., the difference is to be included as part of the accounting for the business combination.

Postacquisition considerations. Reacquired rights recognized at the acquisition date are amortized, postcombination, on the basis of the remaining, unexpired term of the related contract. The remaining contractual term is to be used for this purpose even if market participants would consider potential future contract renewals in determining the fair value of the contract.

Should the acquirer subsequently sell the reacquired right to a third party, the carrying amount of the intangible asset is to be included in the determination of gain or loss on the sale.

Employee benefits. Liabilities (and assets, if applicable), associated with acquiree employee benefit arrangements are to be recognized and measured under other GAAP, as applicable.

Types of benefits	*Applicable GAAP*	*Amended by ASC 805*	*Covered in Wiley GAAP Chapter*
Deferred compensation contracts including postretirement benefit aspects of split-dollar life insurance arrangements	ASC 710-10-25 ASC 715-60		18
Compensated absences and sabbatical leaves	ASC 710-10-15 ASC 710-10-25		14
Pensions, plan curtailments, and termination benefits	ASC 715-30 ASC 715-20	x	18
Postretirement benefits other than pensions including postretirement benefit aspects of split-dollar life insurance arrangements	ASC 715-60 ASC 715-20	x	18
Postemployment benefits (benefits provided to inactive or former employees, their beneficiaries, and covered dependents after employment but before retirement) including, but not limited to • Salary continuation • Supplemental unemployment benefits • Severance benefits • Disability-related benefits including workers' compensation • Job training and counseling (e.g., outplacement) • Continuation of benefits such as health care and life insurance	ASC 712		18
Onetime termination benefits	ASC 420	x	3, 18

In researching the application of these pronouncements, it is important to consider the amendments to them made by ASC 805. For example,

1. ASC 715-30, *Compensation—Retirement Benefits—Defined Benefit Plans—Pension,* and ASC 715-60, *Compensation—Retirement Benefits—Defined Benefit Plans–Other Postretirement*, are amended to clarify that
   a. The acquirer is to recognize, as part of the business combination, an asset or liability that represents the funded status of a single-employer defined benefit pension plan and/or a single-employer defined benefit postretirement plan. In determining the funded status, the acquirer is to disregard the effects of expected plan amendments, terminations, or curtailments that it has no obligation to make at the acquisition date.
   b. The projected benefit obligation assumed for a single-employer defined benefit pension plan or the accumulated postretirement benefit obligation assumed for a single-employer defined benefit postretirement plan are to reflect any other necessary changes in assumptions based on an assessment by the acquirer of relevant future events.
   c. If the acquiree participates in a multiemployer defined benefit pension or postretirement plan, and at the acquisition date it is probable that the acquirer will withdraw from that plan, the acquirer is to recognize a withdrawal liability as of the acquisition date under ASC 450.

2. ASC 420, *Exit or Disposal Cost Obligations,* is amended to expand its scope to cover exit activities associated with entities that are acquired in a business combination.

Acquirer share-based payment awards exchanged for acquiree awards held by its employees. In connection with a business combination, the acquirer often awards share-based payments to the employees of the acquiree in exchange for the employees' acquiree awards. Obviously, there are many valid business reasons for the exchange, not the least of which is ensuring smooth transition and integration as well as retention of valued employees.

The discussion that follows uses concepts and terminology from ASC 718, *Compensation—Stock Compensation,* discussed in greater detail in Chapter 19.

Acquirer not obligated to exchange. Accounting for the replacement awards under ASC 805 is dependent on whether the acquirer is obligated to replace the acquiree awards. The acquirer is obligated to replace the acquiree awards if the acquiree or its employees can enforce replacement through rights obtained from the terms of the acquisition agreement, the acquiree awards, or applicable laws or regulations.

If the acquirer is not obligated to replace the acquiree awards, all of the fair-value-based measure (FVBM)[4] of the replacement awards is recognized as compensation cost in the postcombination financial statements.

Example of acquirer replacing acquiree awards without the obligation to do so

New Parent, Inc. (NP) acquired New Subsidiary, Inc. (NS) on January 1, 2009. Because of the business combination, the share-based payment awards that had been previously granted by NS to its employees expired on the acquisition date.

Although NP was not obligated, legally or contractually to replace the expired awards, its Board of Directors approved a grant of NP awards designed so that the employees of NS would not be financially disadvantaged by the acquisition transaction.

Since the replacement awards were voluntary on the part of NP, the fair-value-based measure of the replacement award is attributed wholly to the postcombination consolidated financial statements of NP and Subsidiary.

Acquirer obligated to replace acquiree awards. If the acquirer is obligated to replace the awards of the acquiree, either all or a portion of the fair-value-based measure of the replacement awards is included in measuring the consideration transferred by the acquirer in the business combination. To the extent a portion of the replacement awards is not allocated to consideration transferred, it is accounted for as compensation for postcombination services in the acquirer's consolidated financial statements.

For the purposes of illustrating the allocation computations, the following conventions and abbreviations are used:

$FVBM_{RA}$	Acquisition date fair-value-based measure of acquirer replacement award
$FVBM_{AA}$	Acquisition date fair-value-based measure of acquiree award that is being replaced by the acquirer
RSP_{AA}	Original requisite service period[5] of acquiree awards at their grant date
RSP_{RA}	Requisite service period of the acquirer replacement awards at acquisition date

---

[4] *Although the accompanying guidance uses the term "fair-value-based measure" to refer to the measurement of share-based awards, the guidance also applies to awards of both the acquirer and acquiree that are measured using either the calculated value method or intrinsic value method.*

[5] *The term "requisite service period" includes explicit, implicit, and derived service periods during which employees are required to provide services in exchange for the award. These terms are defined in ASC 718, discussed in detail in Chapter 19.*

$CRSP_{AA}$	Portion of requisite service period completed at the acquisition date by employees under the acquiree awards
TSP	Total service period—the service period already satisfied by the employees at the acquisition date under the acquiree awards plus the requisite service period, if any, required by the acquirer replacement awards
PRE	Portion of $FVBM_{RA}$ attributable to precombination services performed by the employees of the acquiree
PCC	Postcombination compensation cost

$$TSP = CRSP_{AA} + RSP_{RA}$$

The following steps are followed to determine the portion of the fair-value-based measure of the replacement award that is to be included as part of the consideration transferred by the acquirer:

1. Compute both $FVBM_{RA}$ and $FVBM_{AA}$ by following the provisions of ASC 718, as discussed in detail in Chapter 19.
2. Compute the portion of the replacement award that is attributable to precombination services rendered by the acquiree's employees as follows:
   a. If $RSP_{AA} > TSP$, then

$$PRE = FVBM_{AA}\left(\frac{CRSP_{AA}}{RSP_{AA}}\right)$$

   b. If $RSP_{AA} \leq TSP$, then

$$PRE = FVBM_{AA}\left(\frac{CRSP_{AA}}{TSP}\right)$$

3. Compute the portion of the nonvested replacement award attributable to postcombination service as follows:

$$PCC = FVBM_{RA} - PRE$$

   This amount is to be recognized as compensation cost in the postcombination financial statements since, at the acquisition date, the requisite service conditions had not been met.

The following examples are adapted from the implementation guidance for ASC 805.

Example of acquirer replacement awards requiring no postcombination services exchanges for fully vested acquiree awards where the employees have rendered all required services by the acquisition date

New Parent, Inc. (NP) acquired New Subsidiary, Inc. (NS) on January 1, 2009. In accordance with the acquisition agreement, NP agreed to replace share-based awards that had previously been issued by NS. Details are as follows:

		a. Acquiree Awards	*b. Acquirer Awards*
1.	Acquisition date fair-value-based measure of awards	$FVBM_{AA}$ = \$100	$FVBM_{RA}$ = \$110
2.	Original requisite service period of acquiree awards at their grant date	RSP_{AA} = 4 years	--
3.	Portion of 2a. completed by the acquisition date by employees of the acquiree	$CRSP_{AA}$ =4 years	--
4.	Requisite service period of acquirer replacement awards at the acquisition date	--	RSP_{RA} = 0
5.	Total service period (3a. + 4b.)	--	TSP = 4 years
6.	The greater of the total service period (5b.) or the original requisite service period of the acquiree awards (2a.)	--	4 years

Since the acquiree's employees had completed all of the services required under the prior awards, applying the formula yields a result that attributes 100% of the fair value of the acquiree award that is being replaced to precombination services rendered.

$$PRE = 1a. \left(\frac{3a.}{6b.}\right)$$

$$PRE = \$100 \left(\frac{4\ years}{4\ years}\right)$$

$$PRE = \$100$$

The $100 result, attributed to precombination services, is included by the acquirer in its computation of the consideration transferred in exchange for control of the acquiree.

The final step in the computation is to account for the difference between the acquisition date fair values of the replacement awards and the acquiree awards as follows:

Fair value of replacement awards—$FVBM_{RA}$	$110
– Allocated to consideration per above	100
Additional compensation cost recognized immediately in postcombination financial statements	$ 10

This result illustrates the basic principle in ASC 805 that any excess of FVBMRA over the $FVBM_{AA}$ is to be attributed to postcombination services and recognized as compensation cost in the postcombination financial statements.

Example of acquirer replacement awards requiring performance of postcombination services exchanged for acquiree awards for which all requisite services had been rendered by the acquiree's employees as of the acquisition date

The acquisition agreement referred to in the previous example governing the NP acquisition of NS that occurred on January 1, 2009, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

		a. Acquiree Awards	b. Acquirer Awards
1.	Acquisition date fair-value-based measure of awards	$FVBM_{AA}$ = $100	$FVBM_{RA}$ = $100
2.	Original requisite service period of acquiree awards at their grant date	RSP_{AA} = 4 years	--
3.	Portion of 2a. completed by the acquisition date by employees of the acquiree (the acquiree employees in this example had actually completed a total of 7 years of services by the acquisition date)	$CRSP_{AA}$ = 4 years	--
4.	Requisite service period of acquirer replacement awards at the acquisition date	--	RSP_{RA} = 1 year
5.	Total service period (3a. + 4b.)	--	TSP = 5 years
6.	The greater of the total service period (5b.) or the original requisite service period of the acquiree awards (2a.)	--	5 years

Even though the acquiree's employees had completed all of the requisite service required by the acquiree's awards three years prior to the acquisition, the imposition of an additional year of required service by the acquirer's replacement awards results in an allocation between precombination compensation cost and postcombination compensation cost as follows:

$$PRE = 1a. \left(\frac{3a.}{6b.}\right)$$

$$PRE = \$100 \left(\frac{4\ years}{5\ years}\right)$$

$$PRE = \$80$$

The $80 result, attributed to precombination services, is included by the acquirer in its computation of the consideration transferred in exchange for control of the acquirer.

The $20 difference between the $100 fair value of the replacement awards and the $80 allocated to precombination services (and included in consideration transferred) is accounted for as compensation cost in the postcombination consolidated financial statements of NP and Subsidiary under the provisions of ASC 718.

Example of acquirer replacement awards requiring performance of postcombination services exchanged for acquiree awards with remaining unsatisfied requisite service period as of the acquisition date

The acquisition agreement referred to in the previous examples governing the NP acquisition of NS that occurred on January 1, 2009, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

		a. Acquiree Awards	b. Acquirer Awards
1.	Acquisition date fair-value-based measure of awards	$FVBM_{AA}$ = $100	$FVBM_{RA}$ = $100
2.	Original requisite service period of acquiree awards at their grant date	RSP_{AA} = 4 years	--
3.	Portion of 2a. completed by the acquisition date by employees of the acquiree	$CRSP_{AA}$ = 2 years	--
4.	Requisite service period of acquirer replacement awards at the acquisition date	--	RSP_{RA} = 1 year
5.	Total service period (3a. + 4b.)	--	TSP = 3 years
6.	The greater of the total service period (5b.) or the original requisite service period of the acquiree awards (2a.)	--	4 years

The portion of the fair-value-based measure of the replacement awards attributable to precombination services already rendered by the acquiree employees is computed as follows:

$$PRE = 1a. \left(\frac{3a.}{6b.}\right)$$

$$PRE = \$100 \left(\frac{2\ years}{4\ years}\right)$$

$$PRE = \$50$$

Based on the computation above, at the acquisition date, NP, the acquirer, includes $50 as consideration transferred to obtain control of NS, the acquiree. The remaining $50 is attributed to postcombination services and, accordingly, recognized as compensation cost in the consolidated postcombination financial statements of NP and Subsidiary.

Example of acquirer replacement awards that do not require postcombination services exchanged for acquiree awards for which the acquiree's employees had not yet completed all of the requisite services by the acquisition date

The acquisition agreement referred to in the previous examples governing the NP acquisition of NS that occurred on January 1, 2009, contained the following provisions regarding exchange of outstanding NS awards at acquisition date for NP replacement awards:

		a. Acquiree Awards	*b. Acquirer Awards*
1.	Acquisition date fair-value-based measure of awards	$FVBM_{AA}$ = \$100	$FVBM_{RA}$ = \$100
2.	Original requisite service period of acquiree awards at their grant date	RSP_{AA} = 4 years	--
3.	Portion of 2a. completed by the acquisition date by employees of the acquiree	$CRSP_{AA}$ = 2 years	--
4.	Requisite service period of acquirer replacement awards at the acquisition date	--	RSP_{RA} = 0
5.	Total service period (3a. + 4b.)	--	TSP = 2 years
6.	The greater of the total service period (5b.) or the original requisite service period of the acquiree awards (2a.)	--	4 years

Under this scenario, the terms of the awards previously granted by NS, the acquiree, did not contain a change-in-control provision that would have fully vested them upon the acquisition by NP. If this had been the case, the outcome would be the same as the example above where neither the acquiree awards nor the replacement rewards required the completion of any service on the part of the acquiree's employees.

Since, at the acquisition date, the acquiree employees had completed only two out of the four years of required services and the replacement awards do not extend the duration of services required postcombination, the total service period (TSP) in 5b. is the 2 years already completed by the acquiree's employees under their original awards in 3a. ($CRSP_{AA}$).

The portion of the fair-value-based measure of the replacement awards attributable to precombination services already rendered by the acquiree employees is computed as follows:

$$PRE = 1a. \left(\frac{3a.}{6b.}\right)$$

$$PRE = \$100 \left(\frac{2 \text{ years}}{4 \text{ years}}\right)$$

$$PRE = \$50$$

Consequently, \$50 of the fair-value-based measure of the replacement awards is attributable to precombination services already performed by the acquiree employees and is, therefore, included in computing the consideration transferred in exchange for obtaining control of the acquiree.

The remaining \$50 of the fair-value-based measure of the replacement awards is attributable to postcombination service. However, since the acquiree's employees are not required to provide any postcombination services under the terms of the replacement awards, the entire \$50 is immediately recognized by NP, the acquirer, in its postcombination consolidated financial statements.

Although not illustrated in the preceding examples, ASC 805 requires the acquirer to estimate the number of its replacement awards for which the requisite service is expected to occur. To the extent that service is not expected to occur due to employees terminating prior to meeting the replacement award's requisite service requirements, the portion of the fair-value-based measure of the replacement awards included in consideration transferred in the business combination is to be reduced accordingly.

If the replacement award is subject to a graded vesting schedule, the acquirer is to recognize the related compensation cost in accordance with its policy election for other awards in accordance with ASC 718-10-35. Compensation cost is either (1) recognized using the "graded vesting attribution method" that separates the award into tranches according to the year in which they vest and treats each tranche as if it had been a separate award, or (2) recognized using a straight-line attribution method over the graded vesting period. If option (2) is elected, compensation cost at any date must equal at least the amount attributable to options that actually vested on or before that date.

Finally, it is important to note that the same requirements for apportioning the replacement award between precombination and postcombination service apply to replacement awards that are classified as equity or as liabilities. All post-acquisition-date changes in the fair-value-based measure of liability awards (and their related income tax effects) are recognized in the acquirer's postcombination financial statements in the periods in which the changes occur.

Income taxes. The final exception to the general fair-value-based recognition and measurement provisions of ASC 805 is the accounting for income taxes. Since recognition and measurement of income tax assets and liabilities under US GAAP has not historically used fair value measurement or discounted present value techniques, FASB was loath to make fundamental changes to this complex area of accounting. In addition, FASB and IASB are currently pursuing a joint project to converge US and International accounting standards with respect to accounting for income taxes, and that project will be subject to the Boards' due process procedures that provide constituents an opportunity to provide feedback.

The remainder of this section is devoted to describing the provisions of those standards and other related interpretive guidance related to accounting for income taxes in connection with business combinations. Accounting for income taxes is covered in detail in Chapter 17.

Basic principle. The basic principle that applies to income tax accounting in a business combination (carried forward without change by ASC 805) is that the acquirer is to recognize, as of the acquisition date, deferred income tax assets or liabilities for the future effects of temporary differences and carryforwards of the acquiree that either

1. Exist on the acquisition date *or*
2. Are generated by the acquisition itself

ASC 805 also amends ASC 740 to clarify its applicability to business combinations as follows:

1. In computing the acquisition date amount of currently payable or refundable income taxes from a particular taxing jurisdiction, management is to apply the recognition and measurement provisions of ASC 740 to evaluate the amounts to record relative to prior income tax positions taken by the acquiree.
2. As a result of management's evaluation of prior tax positions and the amounts recognized in 1., management is to adjust the income tax bases used in computing the deferred income tax assets and liabilities associated with the business combination at the acquisition date.
3. New information regarding the facts and circumstances that existed at the acquisition date that comes to the attention of management regarding those income tax positions is treated as follows:
   a. If the information results in a change during the measurement period, the adjustment is made to goodwill. If goodwill is reduced to zero, any remaining portion of the adjustment is recorded as a bargain purchase gain.

b. If the information results in a post-measurement-period change, the change is accounted for in the same manner as any other ASC 740 changes.

ASC 740 is discussed in detail in Chapter 17.

Valuation allowances. To the extent applicable, deferred income tax assets are to be reduced by a valuation allowance for the portion of the asset not deemed more-likely-than-not to be realized.

On the acquisition date, any benefits of future deductible temporary differences or net operating loss carryforwards (NOLs) of an acquired entity are to be recognized if the acquirer is permitted to utilize those benefits on a consolidated income tax return under the existing income tax law. The income tax benefits will be recorded gross with an offsetting valuation allowance if it is more likely than not that the deferred income tax asset will not be realized by the reporting entity (for example, if it is estimated that there will not be sufficient future taxable income to utilize the NOL prior to its expiration).

Some jurisdictions restrict the future use of income tax benefits of the acquiree and only permit those benefits to be applied to subsequent taxable income generated by the acquiree even though the entities are permitted to file a consolidated income tax return. When this is the case, or when the acquiree is expected to file a separate income tax return, management of the consolidated reporting entity is to assess the need for a valuation allowance for those benefits based only on the acquiree's separate past and expected future taxable income.

As a result of the acquisition and the permissibility of filing a consolidated income tax return in a particular jurisdiction, the acquirer may be able to use future taxable income generated by the acquiree to obtain the tax benefits of its own net operating loss carryforwards for which the acquirer had previously recognized a valuation allowance. If, based on the weight of available evidence, management of the acquirer concludes that its previously recognized valuation allowance can be reduced or eliminated, the adjustment is not considered part of the accounting for the business combination. Instead, the benefit is recognized as a component of income tax expense in the period of the acquisition.

Post-acquisition-date changes in a valuation allowance with respect to an acquiree's deferred income tax asset are to be recognized as follows:

1. If the change in judgment occurs during the measurement period (as defined in ASC 805) that is not to exceed one year from the acquisition date, and results from new information bearing on facts and circumstances that existed at the acquisition date, the change is to be recognized as an adjustment to goodwill. Should the adjustment reduce goodwill to zero, the acquirer is to recognize any further reduction in the valuation allowance as a gain from a bargain purchase.
2. If the change in judgment occurs subsequent to the measurement period, it is reported as an increase or decrease in income tax expense or benefit of the period in which the judgment changed. Exceptions to this treatment are provided for changes attributable to dividends on unallocated shares of an Employee Stock Ownership Plan (ESOP), employee stock options, and certain quasi reorganizations. Accounting for these exceptions results in adjustments directly to contributed capital rather than to income tax expense.

Goodwill. Historically, amortization of goodwill was not an allowable deduction for US federal income tax purposes. To the extent that goodwill amortization is nondeductible in any applicable taxing jurisdiction, the nondeductible goodwill does not represent a temporary difference between GAAP and tax and consequently does not give rise to deferred income taxes.

The 1993 Tax Reconciliation Act amended US federal income tax law to permit the amortization of goodwill and other specified acquired intangibles over a statutory 15-year period (IRC §197). The method of determining the amount of goodwill to recognize for income tax purposes, however, differs from the method prescribed by ASC 805 for financial reporting purposes. Further complicating matters, other taxing jurisdictions to which the reporting entity is subject may not recognize goodwill amortization as deductible. This can result in onerous recordkeeping of book/tax differences in the carrying amounts of goodwill in each of the major jurisdictions in which the reporting entity is taxed.

When goodwill amortization is tax-deductible in a particular jurisdiction, it does result in a temporary difference between the income tax basis and GAAP carrying amount of the goodwill. GAAP goodwill is only written off if it becomes partially or fully impaired whereas tax goodwill is subject to periodic amortization until its income tax basis is reduced to zero.

Since goodwill represents a residual amount after considering all identifiable assets acquired and liabilities assumed in the business combination, any deferred income tax asset associated with goodwill would necessarily have to be computed in order to determine the residual. Thus, FASB prescribed the use of a simultaneous equation method to compute goodwill net of the deferred income tax asset associated with it. In order to operationalize this requirement, ASC 805-74-55 describes and illustrates it. This matter is more fully discussed and examples are provided in Chapter 17.

Step 6—Recognize and measure any noncontrolling interest in the acquiree. The term "noncontrolling interest" replaces the term, "minority interest" to refer to the portion of the acquiree, if any, that is not controlled by the parent. The term "minority interest" became an inadequate descriptor because, under ASC 805 and ASC 810, an entity can possess a controlling financial interest in another entity without possessing a majority of the voting interests of that entity. Thus it would be inaccurate, in many cases, to refer to the party that does not possess a controlling financial interest as a "minority" since that party could, in fact, hold a majority of the voting equity of the acquiree.

ASC 805 requires the noncontrolling interest in the acquiree to be measured at fair value at the acquisition date. If the acquirer is not acquiring all of the shares in the acquiree and there is an active market for the remaining outstanding shares in the acquiree, the acquirer may be able to use the market price to measure the fair value of the noncontrolling interest. Otherwise, the acquirer would measure fair value using other valuation techniques.

In applying the appropriate valuation technique to determine the fair value of the noncontrolling interest, it is likely that there will be a difference in the fair value per share of that interest and the fair value per share of the controlling interest. This difference arises from what has been referred to as a "minority interest discount" applicable to the noncontrolling shares. Obviously, an investor would be unwilling to pay the same amount per share for equity shares in an entity that did not convey control of that entity than it would pay for shares that did convey control.

Example of fair value of noncontrolling interest adjusted for minority interest discount

Shirley Corporation (SC) is considering acquiring an 80% interest in Jake Industries Inc. (JI), a privately held corporation. SC engages a valuation specialist to determine the fair value of JI whose shares do not trade in an active market.

The specialist's findings with respect to JI as a whole were as follows:

Aggregate fair value of JI	$15 million
Number of outstanding shares	375,000
Aggregate fair value per share	$40

In valuing the noncontrolling interest, however, the specialist made the following additional assumptions:

Aggregate fair value per share	$ 40
Estimated minority interest discount per share	10
Estimated fair value per share of noncontrolling interest	$30

Fair value of noncontrolling interest	
Fair value per noncontrolling share	$30
× # of noncontrolling shares outstanding	× 75,000
	$2,250,000

It is important to note from this analysis that, from the perspective of the acquirer, the computation of the acquisition-date fair value of the noncontrolling interest in the acquiree is not computed by simply multiplying the same fair value per share that the acquirer used to value the entity by the percentage voting interest retained collectively by the noncontrolling stockholders. Such a simplistic calculation would have yielded a different result:

$15 million aggregate fair value × 20% noncontrolling shares = $3 million.

If this method had been used, the noncontrolling interest would be overvalued by $750,000 (the difference between $3 million and $2,250,000.

ASC 810-10-45 settles the controversial issue of how the noncontrolling interest is to be classified in the consolidated balance sheet by requiring that it be reported within the equity section, separately from the equity of the parent company, and clearly identified with a caption such as "noncontrolling interest in subsidiaries." Should there be noncontrolling interests attributable to more than one consolidated subsidiary, the amounts may be aggregated in the consolidated balance sheet.

Only equity-classified instruments issued by the subsidiary may be classified as equity in this manner. If, for example, the subsidiary had issued a financial instrument that, under applicable GAAP, was classified as a liability in the subsidiary's financial statements, that instrument would not be classified as a noncontrolling interest since it does not represent an ownership interest.

Step 7—Measure the consideration transferred. In general, consideration transferred by the acquiree is measured at its acquisition-date fair value. Examples of consideration that could be transferred include cash, other assets, a business, a subsidiary of the acquirer, contingent consideration, common or preferred equity instruments, options, and warrants. The aggregate consideration transferred is the sum of the following elements measured at the acquisition date:

1. The fair value of the assets transferred by the acquirer,
2. The fair value of the liabilities incurred by the acquirer to the former owners of the acquiree, and
3. The fair value of the equity interests issued by the acquirer subject to the measurement exception discussed earlier in this chapter for the portion, if applicable, of acquirer share-based awards exchanged for awards held by employees of the acquiree that is included in consideration transferred.

To the extent the acquirer transfers consideration in the form of assets or liabilities with carrying amounts that differ from their fair values at the acquisition date, the acquirer is to remeasure them at fair value and recognize a gain or loss on the acquisition date. If, however, the transferred assets or liabilities remain within the consolidated entity postcombination with the acquirer retaining control of them, no gain or loss is recognized, and the assets or liabilities are measured at their carrying amounts to the acquirer immediately prior to the acquisition date. This situation can occur, for example, when the acquirer transfers assets or liabilities to the entity being acquired rather than to its former owners.

The structure of the transaction may involve the exchange of equity interests between the acquirer and either the acquiree or the acquiree's former owners. If the acquisition-date fair value of the acquiree’s equity interests is more reliably measurable than the equity interests of the acquirer, the fair value of the acquiree’s equity interests is to be used to measure the consideration transferred.

Contingent consideration. Contingent consideration arrangements in connection with business combinations can be structured in many different ways and can result in the recognition of either assets or liabilities under ASC 805. In either case, the acquirer is to include contingent assets and liabilities as part of the consideration transferred, measured at acquisition-date fair value.

If the contingent consideration includes a future payment obligation, that obligation is to be classified as either a liability or equity under the provisions of

- ASC 480, *Distinguishing Liabilities from Equity,*
- ASC 815-40, *Contracts in Entity’s Own Equity,* or
- Other applicable GAAP

The acquirer is to carefully consider information obtained subsequent to the acquisition-date measurement of contingent consideration. Additional information obtained during the measurement period that relates to the facts and circumstances that existed at the acquisition date result in measurement period adjustments to the recognized amount of contingent consideration and a corresponding adjustment to goodwill or gain from bargain purchase. Changes that result from events occurring after the acquisition date, such as meeting a specified earnings target, reaching a specified share price, or reaching an agreed-upon milestone on a research and development project, do not constitute measurement period adjustments. Changes in the fair value of contingent consideration that do not result from measurement period adjustments are to be accounted for as follows:

1. If the contingent consideration is classified as equity, it is not to be remeasured and subsequent settlement of the contingency is to be reflected within equity.
2. If the contingent consideration is classified as an asset or liability, it is to be remeasured at fair value at each reporting date until resolution of the contingency. Changes in the fair value between reporting dates are to be recognized in net income unless the arrangement is a hedging instrument for which ASC 815, as amended by ASC 805 requires the changes to be initially recognized in other comprehensive income.

Step 8—Recognize and measure goodwill or gain on a bargain purchase. The last step in applying the acquisition method is the measurement of goodwill or a gain from a bargain purchase. Goodwill represents an intangible that is not specifically identifiable. It results from situations when the amount the acquirer is willing to pay to obtain its controlling interest exceeds the aggregate recognized values of the net assets acquired measured following the principles of ASC 805. Goodwill’s elusive nature as an unidentifiable, residual asset means that it cannot be measured directly but rather can only be measured by reference to the other amounts measured as a part of the business combination:

GW	=	Goodwill
NG	=	Negative goodwill
NI	=	Noncontrolling interest in the acquiree, if any, measured at fair value
CT	=	Consideration transferred, generally measured at acquisition-date fair value

PE	=	Fair value of the acquirer's previously held interest in the acquiree if the acquisition was achieved in stages
NA	=	Net assets acquired at the acquisition date—consisting of the identifiable assets acquired and liabilities assumed, measured as described in this chapter
(CT + NI + PE) – NA	=	GW or (NG)

Thus, when application of the formula yields an excess of the consideration transferred, noncontrolling interest, and fair value of previously held interests over the net assets acquired, the acquirer has paid a premium for the acquisition and that premium is characterized as goodwill.

When the opposite is true, that is, when the formula yields a negative result, sometimes referred to as negative goodwill, the acquirer has, in fact, obtained a bargain purchase, as the value the acquirer obtained in the exchange exceeded the fair value of what it surrendered.

In a business combination in which no consideration is transferred, the acquirer is to use one or more valuation techniques to measure the acquisition-date fair value of its interest in the acquiree and substitute that measurement in the formula for "CT," the consideration transferred. The techniques selected require the availability of sufficient data to properly apply them and are to be appropriate for the circumstances. If more than one technique is used, management of the acquirer is to evaluate the results of applying the techniques including the extent of data available and how relevant and reliable the inputs (assumptions) used are. Guidance on the use of valuation techniques is provided in ASC 820, *Fair Value Measurements and Disclosures*, discussed in detail in Chapter 6.

Bargain purchases. If the computation above results in negative goodwill, this constitutes a "bargain purchase." Under ASC 805, a bargain purchase is recognized in net income as an acquisition-date gain. Unlike the predecessor standard, the gain is not characterized as an extraordinary gain. Rather, it is considered part of income from continuing operations.

Given the complexity of the computations involved, FASB prescribed a verification protocol for management to follow if the computation preliminarily results in a bargain purchase. If the computation initially yields a bargain purchase, management of the acquirer is to perform the following procedures before recognizing a gain on the bargain purchase:

1. Perform a completeness review of the identifiable tangible and intangible assets acquired and liabilities assumed to reassess whether all such items have been correctly identified. If any omissions are found, recognize the assets and liabilities that had been omitted.
2. Perform a review of the procedures used to measure all of the following items. The objective of the review is to ensure that the acquisition-date measurements appropriately considered all available information available at the acquisition date:
   a. Identifiable assets acquired
   b. Liabilities assumed
   c. Consideration transferred
   d. Noncontrolling interest in the acquiree, if applicable
   e. Acquirer's previously held equity interest in the acquiree for a business combination achieved in stages

Measurement period. More frequently than not, management of the acquirer does not obtain all of the relevant information needed to complete the acquisition-date measurements in time for the issuance of the first set of interim or annual financial statements subsequent to the business combination. If the initial accounting for the business combination has not been completed by that time, the acquirer is to report provisional amounts in the consolidated fi-

nancial statements for any items for which the accounting is incomplete. ASC 805 provides for a "measurement period" during which any adjustments to the provisional amounts recognized at the acquisition date are to be retrospectively adjusted to reflect new information that management obtains regarding facts and circumstances existing as of the acquisition date. Information that has a bearing on this determination must not relate to postacquisition events or circumstances. The information is to be analyzed to determine whether, if it had been known at the acquisition date, it would have affected the measurement of the amounts recognized as of that date.

In evaluating whether new information obtained is suitable for the purpose of adjusting provisional amounts, management of the acquirer is to consider all relevant factors. Critical in this evaluation is the determination of whether the information relates to facts and circumstances as they existed at the acquisition date or instead, the information results from events occurring after the acquisition date. Relevant factors include

1. The timing of the receipt of the additional information, *and*
2. Whether management of the acquirer can identify a reason that a change is warranted to the provisional amounts.

Obviously, information received shortly after the acquisition date has a higher likelihood of relevance to acquisition-date circumstances than information received months later.

Example of consideration of new information obtained during the measurement period

Krupp Industries, Inc. (KI) acquired Miller Motor Works Corp. (MMW) on January 2, 2009. In the first quarter 2009 consolidated financial statements of Krupp Industries and Subsidiary, it assigned a provisional fair value of $40 million to an asset group consisting of a factory and related machinery that manufactures engines used in large trucks and sport utility vehicles (SUVs).

As of the acquisition date, the average cost of gasoline in the markets served by the customers of MMW was $4.30 per gallon. For the first four months subsequent to the acquisition, the per-gallon price of gasoline was relatively stable and only fluctuated slightly up or down on any given day. Upon further analysis, management was able to determine that, during that four-month period, the production levels of the asset group and related order backlog did not vary substantially from the acquisition date.

In May, 2009, however, due to an accident on May 3, 2009, at a large US refinery, the average cost per gallon skyrocketed to more than $6.00 a gallon. As a result of this huge spike in the price of fuel, MMW's largest customers either canceled orders or sharply curtailed the number of engines they had previously ordered.

Scenario 1: On April 15, 2009, management of KI signed a sales agreement with Joshua International (JI) to sell the asset group for $30 million. Given the fact that management was unable to identify any changes that occurred during the measurement period that would have accounted for a change in the acquisition-date fair value of the asset group, management determines that it will retrospectively reduce the provisional fair value assigned to the asset group to $30 million.

Scenario 2: On May 15, 2009, management of KI signed a sales agreement with Joshua International (JI) to sell the asset group for $30 million. Given the intervening events that affected the price of fuel and the demand for MMW's products, management determines that the $10 million decline in the fair value of the asset group from the provisional fair value it was originally assigned resulted from those intervening changes and, consequently does not adjust the provisional fair value assigned to the asset group at the acquisition date.

In addition to adjustments to provisional amounts recognized, the acquirer may determine during the measurement period that it omitted recognition of additional assets or liabilities that existed at the acquisition date. During the measurement period, any such assets or liabilities identified are also to be recognized and measured on a retrospective basis.

In determining adjustments to the provisional amounts assigned to assets and liabilities, management should be alert for interrelationships between recognized assets and liabilities.

For example, new information that management obtains that results in an adjustment to the provisional amount assigned to a liability for which the acquiree carries insurance could also result in an adjustment, in whole or in part, to a provisional amount recognized as an asset representing the claim receivable from the insurance carrier. In addition, as discussed in this chapter and Chapter 17, changes in provisional amounts assigned to assets and liabilities frequently will also affect temporary differences between the items' income tax basis and GAAP carrying amount, which in turn will affect the computation of deferred income assets and liabilities.

Adjustments to the provisional amounts that are made during the measurement period are recognized retrospectively as if the accounting for the business combination had actually been completed as of the acquisition date. This will result in the revision of comparative information included in the financial statements for prior periods including any necessary adjustments to depreciation, amortization, or other effects on net income or other comprehensive income related to the adjustments.

The measurement period ends on the earlier of

1. The date management of the acquirer receives the information it seeks regarding facts and circumstances as they existed at the acquisition date or learns that it will be unable to obtain any additional information, *or*
2. One year after the acquisition date.

After the end of the measurement period, the only revisions that are permitted to be made to the initial acquisition date accounting for the business combination are restatements for corrections of prior period errors in accordance with ASC 250, *Accounting Changes and Error Corrections,* discussed in detail in Chapter 5.

Additional guidance in applying the acquisition method. Due to the complexity of many business combinations and the varying structures used to effect them, FASB provided supplemental guidance to aid practitioners in applying the standard.

Business combinations achieved in stages (step acquisitions). A step acquisition is a business combination in which the acquirer held an equity interest in the acquiree prior to the acquisition date on which it obtained control.

ASC 805 requires the acquirer to remeasure its previous holdings of the acquiree's equity at acquisition date fair value. Any gain or loss on remeasurement is recognized in earnings on that date.

If the acquirer had previously recognized changes in the carrying amount of the acquiree's equity in other comprehensive income (e.g., because the investment was classified as available for sale), that amount is to be reclassified and included in the computation of the acquisition date gain or loss from remeasurement.

Example of a step acquisition.

On 12/31/2008, Finestone Corporation (FC) owns 5% of the 30,000 outstanding voting common shares of Kitzes Industries (KI). On FC's 12/31/2008 balance sheet, it classified its investment in KI as available for sale. On 3/31/2009, FC acquired additional equity shares in KI sufficient to provide FC with a controlling interest in KI and, thus, become KI's parent company.

The following table summarizes FC's initial holdings in KI, the subsequent increase in those holdings, and the computation of the gain on remeasurement at the acquisition date of 3/31/2009:

Date	*# of Shares*	*Percent interest*	*Per share Cost*	*Per share Fair value*	*Aggregate investment Cost*	*Aggregate investment Fair value*	*Unrealized appreciation included in accumulated other comprehensive income*
12/31/2008	1,500	5%	$10	$16	$ 15,000	$ 24,000	$9,000
3/31/2009	21,000	70%	20	20	420,000	420,000	
	22,500	75%					

Computation of gain (loss) on remeasurement at acquisition date:

Fair value per share on 4/1/2009	$ 20
Number of preacquisition shares	× 1,500
Aggregate fair value of preacquisition shares on 4/1/2009	30,000
Carrying amount of preacquisition shares on 4/1/2009	24,000
Appreciation attributable to the 1st quarter of 2009	6,000
Pre-2009 appreciation reclassified from accumulated OCI	9,000
Gain on remeasurement of KI stock on 3/31/2009	$ 15,000

Business combinations achieved without the transfer of consideration. The reason that ASC 805 discontinued use of the term "purchase method" and coined the new term "acquisition method" was to emphasize that a purchase is not the only means by which one entity can obtain control over another entity. Examples of acquisitions that are *not* the result of a purchase transaction include

1. Repurchase by the acquiree of a sufficient amount of its own outstanding shares to enable an existing investor to obtain control and, in effect, become an acquirer.
2. The expiration of minority veto rights where those rights had previously prevented an investor holding the majority of the voting equity from controlling the investee.
3. Execution of a contract between acquirer and acquiree in which the parties agree to combine their businesses without the transfer of consideration and without the acquirer holding any equity interests in the acquiree, either precombination or thereafter. Two variations of this type of business combination are
   a. A stapling arrangement in which two entities agree contractually that each of their respective equity securities be traded or transferred together. The combined securities are referred to as stapled securities because they cannot be traded or transferred independently and market quotations are only available at a single, stapled price.
   b. A dual-listing company structure (DLC) in which two companies, pursuant to provisions included in their bylaws, articles of incorporation, or articles of association agree to operate as if they were a single economic entity while each retains its separate legal identity. Under a DLC structure, unlike a stapling arrangement, the two companies' shares are traded and quoted separately.

In a business combination achieved solely by contract, the acquirer, in its postcombination financial statements, is to account for the equity interests in the acquiree that it does not hold as a noncontrolling interest in the acquiree. This treatment is required even when it results in 100% of the equity interests in the acquiree being attributed to the noncontrolling interest holders.

Changes in the parent's ownership interest in a subsidiary. Subsequent to a business combination, the parent may increase or decrease its ownership percentage in the acquiree/subsidiary.

Changes not affecting control. The parent company may purchase or sell shares of the subsidiary after the acquisition date without affecting the determination that it controls the subsidiary. In addition, the subsidiary may issue new shares or repurchase some of its own shares as treasury stock or for retirement.

Changes in the parent's ownership interest that do not affect the determination that the parent retains a controlling financial interest in the subsidiary are accounted for as equity transactions with no gain or loss recognized in consolidated net income or in other comprehensive income. The carrying amount of the noncontrolling interest in the subsidiary is to be adjusted to reflect the change in ownership interest. Any difference between the fair value of the consideration received or paid in the transaction and the amount by which the noncontrolling interest is adjusted is to be recognized in equity attributable to the parent.

In the case of a subsidiary that has accumulated other comprehensive income (AOCI), if there is a change in the parent's ownership interest, the carrying amount of AOCI is to be adjusted through a corresponding charge or credit to equity attributable to the parent.

Changes resulting in loss of control. If a parent company ceases to have a controlling financial interest in a subsidiary, the parent is required to deconsolidate the subsidiary as of the date on which its control ceased. Examples of situations that can result in a parent being required to deconsolidate a subsidiary include

1. Sale by the parent of all or a portion of its ownership interest in the subsidiary resulting in the parent no longer holding a controlling financial interest,
2. Expiration of a contract that granted control of the subsidiary to the parent,
3. Issuance by the subsidiary of stock that reduces the ownership interest of the parent to a level not representing a controlling financial interest,
4. Loss of control of the subsidiary by the parent because the subsidiary becomes subject to control by a governmental body, court, administrator, or regulator.

If a parent effects a deconsolidation of a subsidiary through a nonreciprocal transfer to owners such as through a spinoff transaction, the transaction is accounted for under ASC 845, *Nonmonetary Transactions*. Otherwise, the parent is to account for the deconsolidation by recognizing, in net income, a gain or loss attributable to the parent. The gain or loss is measured as follows:

FVCR = Fair value of consideration received, if any

FVNIR = Fair value of any noncontrolling investment retained by the former parent at the deconsolidation date

CVNI = Carrying value of the noncontrolling interest in the former subsidiary on the deconsolidation date, including any accumulated other comprehensive income attributable to the noncontrolling interest

CVAL = Carrying value of the former subsidiaries assets and liabilities at the deconsolidation date.

(FVCR + FVNIR + CVNI) – CVAL = Deconsolidation Gain (Loss)

Should the parent's loss of controlling financial interest occur through two or more transactions, management of the former parent is to consider whether the transactions should be accounted for as a single transaction. In evaluating whether to combine the transactions, management of the former parent is to consider all of the terms and conditions of the transactions as well as their economic impact. The presence of one or more of the following indicators may lead to management concluding that it should account for multiple transactions as a single transaction:

1. The transactions are entered into simultaneously or in contemplation of one another,
2. The transactions, when considered in tandem, are in substance a single transaction designed to achieve an overall commercial objective,
3. The occurrence of one transaction depends on the occurrence of at least one other transaction,
4. One transaction, when considered on its own merits, does not make economic sense, but when considered together with the other transaction or transactions would be considered economically justifiable.

Obviously, this determination requires the exercise of sound judgment and attention to economic substance over legal form.

Allocation of net income and other comprehensive income to the parent and noncontrolling interest. In preparing consolidated financial statements, the parent is to eliminate 100% of the intercompany income or loss. This elimination is not affected by the existence of a noncontrolling interest since the consolidated financial statements purport to present the financial position and economic performance of a single economic entity. The elimination of the intercompany income or loss may be allocated between the parent and noncontrolling interests.

Revenues, expenses, gains, losses, net income or loss, and other comprehensive income are to be reported in the consolidated financial statements at the consolidated amounts that include amounts attributable to the owners of the parent company and the noncontrolling interest. Net income or loss, and other comprehensive income or loss, are to be allocated to the parent and the noncontrolling interest.

Losses allocated to the parent and to the noncontrolling interest may exceed their respective interests in the equity of the subsidiary. When this occurs, and if it continues to occur in subsequent periods, the excess as well as any further losses are to continue to be allocated to the parent and noncontrolling interest even if this allocation results in a deficit balance in noncontrolling interest.

Disclosures

The disclosure requirements of the new standards are quite extensive and, for the reader's convenience, are presented in detail in the disclosure checklist in Appendix A to this publication.

Other Changes Made by ASC 805 and ASC 810

Variable interest entities (VIEs). Several important changes have been made that affect VIEs. Additional changes are expected to be forthcoming shortly. FASB has been pursuing a "fast-track" project to reexamine VIE accounting along with accounting for securitized assets and qualified special-purpose entities (QSPE). FASB is under extreme pressure to act quickly with respect to these matters due to perceptions by regulators and some marketplace participants that these standards may have played a contributory role in the deterioration of credit markets currently being experienced in the US and other parts of the world.

Terminology. The new standards amend the definitions of parent and subsidiary to encompass variable interest entities. Thus, the primary beneficiary of a variable interest entity will henceforth be referred to as the parent, and the VIE itself will be referred to as a subsidiary.

Definition of a business. The revised definition of a business provided by ASC 805 will provide limited simplification in performing the qualitative analysis required by ASC 810. More entities are expected to qualify as businesses under the revised definition, but it is still

unclear as to the effect, if any, this might have, for example, in decreasing the number of entities that might be required to be consolidated as VIEs.

Definition of noncontrolling interests. The Master Glossary defines a noncontrolling interest as the portion of equity (or net assets) in a subsidiary (VIE) that is not directly or indirectly attributable to the parent (primary beneficiary). Thus parent companies of subsidiaries that are variable interest entities will be required, as described earlier in this chapter, to fully record the noncontrolling interest's share of VIE losses even if recording these losses results in a deficit in noncontrolling interest. Further, the consolidated financial statements are to reflect noncontrolling interests as part of the equity section of the balance sheet rather than in liabilities or mezzanine.

Initial measurement provisions. The initial measurement provisions of ASC 810 provide that

1. When the primary beneficiary of the VIE and the VIE are under common control, the primary beneficiary is to initially measure the assets, liabilities and noncontrolling interests of the VIE at their carrying amounts in the accounting records of the entity that controls the VIE or the amounts at which they would be carried by the controlling entity if that entity issued GAAP financial statements.
2. When the primary beneficiary of the VIE and the VIE are not under common control
   a. The initial consolidation of a VIE that is a business, discussed above, is a business combination transaction and, accordingly, is to be accounted for in accordance with the provisions of ASC 805.
   b. If an entity becomes the primary beneficiary of a VIE that is *not* a business
      (1) The primary beneficiary is to initially measure and recognize the assets and liabilities of the VIE, except for goodwill, in accordance with ASC 805. However, any assets and liabilities transferred to the VIE by the primary beneficiary at, after, or shortly before the date the entity became the primary beneficiary are to be initially measured at the same amounts at which the assets and liabilities would have been measured if they had not been transferred. No gain or loss is to be recognized as a result of such transfers.
      (2) The primary beneficiary is to recognize a gain or loss for the difference between (a) the fair value of any consideration paid, the fair value of any noncontrolling interests, and the reported amount of any previously held interests and (b) the net amount of the VIE's identifiable assets and liabilities recognized and measured under the provisions of ASC 805. *Goodwill is not to be recognized if the VIE is not a business.*

Disclosures. The primary beneficiary (parent) of a VIE (subsidiary) that is a business is required to make all of the applicable informative disclosures required by ASC 805. The primary beneficiary of a VIE that is not a business is to disclose (in addition to the other extensive disclosures required by ASC 810) the amount of gain or loss recognized on the initial consolidation of the VIE/subsidiary.

DEFINITIONS OF TERMS

Accounting consolidation. The process of combining the financial statements of a parent company and one or more legally separate and distinct subsidiaries.

Acquisition. One enterprise pays cash, or issues stock or debt, for all or part of the voting stock of another enterprise. The acquired enterprise remains intact as a separate legal entity. The parent-subsidiary relationship is accounted for as a purchase, and it is referred to as an acquisition.

Combination. Any transaction whereby one enterprise obtains control over the assets and properties of another enterprise, regardless of the resulting form of the enterprise emerging from the combination transaction.

Combined financial statements. Financial statements presenting the financial position and/or results of operations of legally separate entities, related by common ownership, as if they were a single entity.

Consolidated financial statements. Consolidated statements presenting, primarily for the benefit of the shareholders and creditors of the parent company, the results of operations and the financial position of a parent company and its subsidiaries essentially as if the group were a single enterprise with one or more branches or divisions.

Consolidation. A new enterprise is formed to acquire two or more other enterprises through an exchange of voting stock. The acquired enterprises then cease to exist as separate legal entities.

Control. Generally, the ability of one entity to direct the activities of another, so as to accomplish the former entity's objectives. Control may be present even absent majority ownership.

Controlling financial interest. The at-risk equity investors hold a controlling financial interest in an entity if they collectively

1. Have voting or similar rights (such as the rights of a common stockholder, general partner, or LLC member) to make decisions, directly or indirectly, about the entity's activities that significantly affect the entity's success.

   NOTE: If none of the investors hold these rights, this criterion is not satisfied. In addition, if some investors' voting rights are not proportional to their obligations to absorb the entity's expected losses, or to receive the entity's expected residual rewards, or both ***and*** *substantially all of the entity's activities involve or are conducted on behalf of an investor that has disproportionately few voting rights, this criterion is not satisfied.*

2. Are obligated to absorb the entity's expected losses. If the investors are directly or indirectly protected from these losses or guaranteed a return by the entity (or by other parties involved with the entity), this criterion is not satisfied.
3. Are entitled to receive the entity's expected residual returns. If the investors' return is limited by (a) the entity's governing documents, (b) arrangements with other variable interest holders (e.g., holders of debt, beneficial interests, etc.) or (c) the entity itself, this criterion is not satisfied.

If any one of these three criteria is absent, the at-risk equity investors collectively lack a controlling financial interest and, therefore, only have a controlling voting interest.

Entity concept. A method of preparing consolidated financial statements of a parent and majority-owned subsidiary that involves restatement of net assets of the subsidiary to fair value at the date of acquisition for *both* majority and noncontrolling interests.

Equity investment. An interest in an entity that, under GAAP, is reportable as equity on the entity's balance sheet. The practical application of this definition to certain types of instruments (e.g., mandatorily redeemable preferred stock) was affected by the issuance of ASC 480, *Distinguishing Liabilities from Equity*.

Goodwill. The excess of the cost of an acquisition price over the fair value of acquired net assets which is recorded as an asset and written down only when, and if, impairment is identified and measured, based on future events and conditions.

Merger. One enterprise acquires all of the net assets of one or more other enterprises through an exchange of stock, payment of cash or other property, or the issuance of debt instruments.

Negative goodwill. Properly known as the "excess of fair value over cost of acquired net assets." This amount represents the *net* excess of fair value of the net assets of a business acquisition, after allocation as a pro rata reduction of the amounts that otherwise would be assigned to all of the acquired assets other than cash and cash equivalents, trade receivables, inventory, financial instruments that are required to be carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred tax assets. This excess is generally reported as an extraordinary gain in the period in which the business combination is initially recognized, unless the purchase price involves contingent consideration, in which case it is reported as a deferred credit until the contingency is resolved.

Noncontrolling interest. Sometimes referred to as minority interest, any remaining outstanding voting stock of a subsidiary not purchased by the acquiring enterprise.

Parent company concept. A method of preparing consolidated financial statements of a parent and majority-owned subsidiary that involves restatement of net assets of the subsidiary to fair value at the date of acquisition for *only* the majority interest.

Preacquisition contingencies. Uncertainties existing at the date of an acquisition accounted for by the purchase method that, if resolved within one year of the acquisition, result in a reallocation of the purchase price.

Purchase method. The accounting method used for a business combination that recognizes that one combining entity was acquired by another. It establishes a new basis of accountability for the acquiree.

Purchased preacquisition earnings. An account used to report the earnings of a subsidiary attributable to percentage ownership acquired at the interim date in the current reporting period.

Related parties and de facto principals and agents. In determining whether a holder of an interest in a variable interest entity (VIE) is the VIE's primary beneficiary, the holder and its related parties are treated collectively as a single party. For this purpose, ASC 810

expands the definition of related parties to include additional parties that act as "de facto agents or principals" of the variable interest holder including

1. A party unable to finance its operations without receiving subordinated financial support from the VIE interest holder such as another VIE of which the holder is the primary beneficiary.
2. A party the received its interests in the VIE as a contribution or loan from the holder.
3. An officer, employee, or member of the governing board of the holder.
4. A party that has agreed not to sell, transfer, or encumber its interest in the entity without prior approval of the holder when that agreement could constrain that party's ability to manage the economic risks or realize the economic rewards with respect to its interests in the VIE to which it would otherwise be entitled.
5. A party with a close business relationship to the holder such as the relationship between a professional service provider (e.g., an attorney, accountant, banker, consultant, etc.) and one of its significant clients.

Upon the application of this related-party attribution rule, if two or more related parties (including de facto agents or principals) hold variable interests in the same VIE for which the parties collectively would be the primary beneficiary, a determination is required of which party will individually be considered the primary beneficiary (i.e., will consolidate the VIE in its financial statements). The party whose activities are most closely associated with the VIE is deemed to be the primary beneficiary. Among the factors that are to be considered when making this determination are

1. The existence of principal/agency relationships between members of the related-party group.
2. The significance of the VIE's activities to the members of the related-party group.
3. The relationship of the members of the related-party group to the VIE's activities.
4. The exposure of a member of the related-party group to the VIE's expected losses.
5. The design (structure) of the VIE.

Subsidiary. An enterprise that is controlled, directly or indirectly, by another enterprise.

CONCEPTS, RULES, AND EXAMPLES

Purchase Accounting under FAS 141

Business combinations (of whatever legal form) involving unrelated entities (i.e., those not under common control), are required to be accounted for using the purchase method of accounting. The only current exceptions to this rule are not-for-profit entities or mutual enterprises, whose consolidation accounting is currently being deliberated by FASB. The long-standing option in US GAAP to treat certain transactions, meeting a series of restrictive criteria, as "poolings of interests" no longer exists for newly transacted business combinations. Purchase accounting is an application of the cost principle, whereby assets obtained are accounted for at the price that was paid (which, in an arm's-length transaction, represents fair value). A purchase transaction gives rise to a new basis of accounting for the purchased assets and liabilities.

Pooling has been banned outright, effective for transactions initiated after June 30, 2001. The use of grossly disparate methods of accounting for what could be almost identical economic transactions was no longer seen as being conceptually defensible, despite widespread use not only in the US but in many other nations as well (although, in recent years, the use of pooling had been sharply curtailed by many nations' accounting standards). Though de-

fended by some (principally publicly held entities that generally were able to structure stock-swap acquisitions and which were often very driven by the desire to avert future goodwill amortization charges that would reduce reported earnings) all transactions must now be accounted for as purchases.

FAS 141, *Business Combinations*, continues the definition of "initiated" originally found in APB 16: it is the earlier of (1) the date that the major terms of a plan, including the ratio of exchange of stock, are announced publicly or otherwise formally made known to the stockholders of any one of the combining companies, or (2) the date that stockholders of a combining company are notified in writing of an exchange offer. Purchase accounting must be used for acquisitions initiated after June 30, 2001. The other provisions of FAS 141 (e.g., strengthened rules for identification and separate recognition of intangibles other than goodwill, discussed later in this chapter) are effective for acquisitions completed after June 30, 2001; thus these requirements are applicable to transactions that may have been initiated earlier.

FAS 141 replaced APB 16, while largely retaining the guidance in that standard pertaining to purchase business combinations. ASC 350, *Intangibles—Goodwill and Other,* superseded APB 17 and arguably mitigates to a great extent the perceived negative impact of banning pooling by dropping the requirement to amortize goodwill arising from business acquisitions accounted for as purchases. (Goodwill is addressed later in this chapter and also in Chapter 11.)

Cost allocation, goodwill, and negative goodwill. The major purchase business combinations accounting issue is how to allocate the purchase cost to the various assets and liabilities acquired. Where the legal form of combination is a merger or consolidation, the acquirer records all the acquired assets and assumed liabilities at their fair values (not the acquired entity's book values). If the actual cost exceeds the fair values of the tangible and identifiable intangible net assets acquired, this excess is recorded as an intangible asset (goodwill). Under ASC 350, goodwill is no longer subject to periodic amortization, but rather, is subject to periodic evaluation for impairment. It is expected that many, if not most, purchase business combinations will involve the recognition of goodwill.

Requirements for goodwill accounting now differ markedly from what was mandated under the prior rules (APB 17). They also differ from what appeared to be the goal of the FASB's original proposal, under which pooling accounting was to have been eliminated and goodwill arising from purchases was to have been amortized over twenty years or less. At that time, FASB rejected the notion of not subjecting goodwill to periodic amortization, and it noted that the conceptual alternative, conducting periodic assessments of goodwill impairment, would be hindered by the absence of cash flows directly identifiable with goodwill. Nonetheless, faced with strident opposition to the proposed elimination of pooling of interests accounting, FASB first proposed a compromise that would have retained goodwill amortization and reported it "below the line" (i.e., as a nonoperating expense). Ultimately FASB reached an accommodation which eliminated the longstanding requirement to amortize goodwill, substituting impairment testing, which it had earlier said would be unworkable.

Far less common than transactions giving rise to goodwill are "bargain purchases," where the cost of the acquisition is actually less than the fair value of the net assets acquired. Under ASC 350, this deficiency of cost under fair value is first allocated as a pro rata reduction of the amounts that otherwise would be assigned to the acquired assets other than cash and cash equivalents, trade receivables, inventory, financial instruments that are required to be carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred income tax assets.

If the initially recorded amounts of these acquired assets are entirely eliminated, the excess, commonly, if somewhat misleadingly, called "negative goodwill," is generally recognized immediately as an extraordinary gain. In cases in which there are contingent consideration issues (discussed below), however, the negative goodwill will be carried as a deferred credit on the balance sheet, until the contingency is resolved. To the extent that some or all of the contingency has to be settled by the acquirer (i.e., via payment of cash or distribution of other assets), it is charged against this deferred credit, with any ultimate remaining balance being reported as a gain.

NOTE: Under prior GAAP, the offset was against all noncurrent assets, other than marketable securities, with any residual being deferred and amortized in the manner of positive goodwill. In practical terms, the new requirement is very close to the superseded one.

The logical foundation for gain recognition in bargain purchases is the belief that the very act of consummating the acquisition gives rise to income. This contradicts the principle that income results only from the use of assets, not their mere purchase. However, if care is given to accurate measurement of fair values, and the bargain is of such a great magnitude (unlikely to occur, in reality) that the allocated fair values of most noncurrent assets is entirely offset by the negative goodwill, with an excess yet remaining, then a gain has probably indeed been achieved by the acquirer. By giving this residual gain prominence in the income statement by requiring that it be categorized as extraordinary, rather than included in operations or in other income, the risk of misleading users of the financial statements is reduced.

Accounting for mergers. If the acquisition form of combination is used, the acquired entity maintains a separate legal and accounting existence and all assets and liabilities remain, in the records of the acquiree, at their premerger book values. However, when an accounting consolidation is performed (i.e., when consolidated financial statements are prepared), exactly the same results are obtained as those outlined above (i.e., assets and liabilities are adjusted to fair values, and goodwill is recorded). In terms of how the parent-level (i.e., consolidated) financial statements are presented, there is absolutely no difference between acquisition combinations and outright mergers.

When less than 100% of the stock of the acquired entity is owned by the acquirer, a complication arises in the preparation of consolidated statements, and a noncontrolling interest (discussed below) must be computed.

When one entity is acquired by another, whether by outright merger or via a stock holding, a distinguishing characteristic of the purchase accounting method is that none of the equity accounts of the acquired entity (including its retained earnings) will appear on the acquirer's accounting records or on the consolidated financial statements. In other words, ownership interests of the acquired entity's shareholders are not continued after the merger, consolidation, or combination (acquisition) takes place.

In some transactions there is a continuity of ownership, as when, for example, shareholders in one entity exchange their shares for stock of the other (acquiring) entity. Previously, if a number of restrictive conditions were met, these transactions would be accounted for as poolings of interests, and (with some limitations) the equity of both combining enterprises would be carried forward to the postcombination balance sheets. Despite the appearance of being "mergers of equals," however, the vast preponderance of these transactions were acquisitions of one entity by the other. Under current GAAP, pooling accounting has been eliminated, and the acquiree's equity accounts cannot be carried forward under any circumstances.

In determining which entity is the acquirer in transactions involving two or more enterprises, the new standard stresses that consideration be given to all pertinent facts, with emphasis on the relative voting rights in the combined enterprise and the composition of the

board of directors and the senior management of the combined enterprise. In determining which of the shareholder groups retained or received the larger portion of the voting rights in the combined enterprise, the existence of any major voting blocks, unusual or special voting arrangements, and options, warrants, or convertible securities needs to be considered. Even if a new enterprise is formed to issue stock to effect a business combination (sometimes referred to as a consolidation), one of the existing combining enterprises must, on the basis of the evidence available, be deemed the acquirer.

Determining fair values. The purchase method requires that a determination be made of the fair value of each of the acquired company's identifiable tangible and intangible assets and of each of its liabilities, as of the date of combination. The determination of these fair values is crucial for proper application of the purchase method. FAS 141 carried forward the guidance previously found in APB 16, with some elaboration. The list below indicates how this is to be accomplished for various assets and liabilities.

1. Marketable securities—Fair values, which, for trading and available for sale securities, are already reflected in the acquiree's balance sheet
2. Receivables—Present values of amounts to be received determined by using current interest rates, less allowances for uncollectible accounts and collection costs, if applicable
3. Inventories
   a. Finished goods and merchandise inventories—Estimated selling prices less the sum of the costs of disposal and a normal profit
   b. Work in process inventories—Estimated selling prices less the sum of the costs of completion, costs of disposal, and a normal profit
   c. Raw material inventories—Current replacement cost
4. Property, plant, and equipment
   a. If expected to be used in operations—Current replacement costs for similar capacity unless the expected future use of the assets indicates a lower value to the acquirer
   b. If expected to be sold—Fair value less cost to sell
5. Identifiable intangible assets and other assets (such as land, natural resources, and nonmarketable securities)—Appraised (fair) value
6. Liabilities (such as notes and accounts payable, long-term debt, warranties, claims payable)—Present value of amounts to be paid determined at appropriate current interest rates
7. Single-employer defined benefit pension plans—Liabilities for a projected benefit obligation (PBO) in excess of the fair value of plan assets (or, conversely, assets representing the fair value of plant assets in excess of PBO) are to be determined pursuant to ASC 715-30, *Compensation—Retirement Benefits—Defined Benefit Plans—Pensions*
8. Single-employer defined benefit postretirement plans—Liabilities for accumulated postretirement benefit obligations (APBO) in excess of the fair value of plan assets (or, conversely, assets representing the fair value of plan assets in excess of APBO) are to be determined pursuant to ASC 715-60, *Compensation—Retirement Benefits—Defined Benefit Plans—Other Post-Retirement*

ASC 820, *Fair Value Measurements and Disclosures,* offers detailed guidance on the criteria to be employed in determining fair values in a variety of applications, including purchase business combinations. A key provision of the standard is the elimination of any

entity-specific valuations (e.g., unique value in use to the acquiring entity), in favor of objectively determinable valuations (e.g., relying upon market-based values). This standard is discussed in detail in Chapter 6.

In-process research and development. One of the more controversial items, from an accounting perspective, that might be acquired in business combinations is "in-process research and development." As business acquisitions increasingly are consummated in order to obtain intangible assets possessed by acquirees, this matter has been more commonly encountered, and the apparent inconsistency between GAAP requirements and the motivations for such transactions has been the subject of much debate. Currently, FASB is considering changes to extant requirements that would have a significant impact, as described below.

Under longstanding GAAP, research and development costs (R&D) must be expensed as incurred. This requirement, which dates to the mid-1970's, was imposed in recognition of the great difficulty in assessing the value retained after R&D expenditures are made. Before these rules, many entities capitalized a wide range of intangibles resulting from R&D, only to periodically have to acknowledge the impairment or utter worthlessness of accumulated costs via a large, and unwelcome, charge against earnings. Under US GAAP, therefore, both research and development costs must be fully expensed as incurred; no deferral is permitted.

As an alternative to engaging in its own research and/or development, an acquirer can purchase another entity that has previously incurred and expensed substantial sums for research and development. These transactions are increasingly encountered; in some instances, much or most of the price paid for the acquisition is for the value of the acquiree's previous R&D efforts. To preclude capitalization of these indirect R&D expenditures, FIN 4 clearly states that the acquirer must expense that portion of the purchase price since, were this to be recorded as an acquired asset, it would create a "back door" for R&D capitalization which is prohibited by FAS 2.

While the traditional concern had been that acquiring entities would attempt to capitalize in-process research and development, in more recent years the opposite situation has more frequently arisen; that is, excessive portions of purchase premiums were attributed to in-process research and development and then immediately expensed, thereby reducing the allocation to goodwill and averting future amortization charges. With the new "no amortization" requirement, the expectation is that the motivation for exaggerated allocations to in-process research and development will abate. However, the new standard emphasizes again that appropriate allocation of the purchase cost to in-process research and development is required, and that this must be immediately expensed by the acquiring entity.

While in-process research and development costs must be expensed immediately upon acquisition, under current GAAP (but see below for discussion of possible changes), the value of this R&D continues to play an important financial reporting role due to the new requirement that goodwill be regularly tested for impairment. Specifically, under the provisions of ASC 350, a determination must be made of the implied fair value of goodwill, which is compared to the recorded amount of goodwill for purposes of ascertaining whether, and by how much, goodwill has been impaired. The process, which is identical to the purchase price allocation procedure used in a purchase business combination, involves the allocation of the overall fair value of a reporting unit to all assets and liabilities and unrecognized intangibles (including in-process R&D) as if the unit had been acquired as of the date of the impairment test.

Thus, the value of in-process R&D remains of vital concern to those responsible for accurate financial reporting as long as goodwill remains a recognized asset. Only to the extent that there is an excess of the aggregate fair value over amounts assigned to individual assets/liabilities will there be an implied fair value of goodwill. Were the analysis not done in this

manner, the entire (and overstated) residual amount would be allocated to goodwill, which logically would not be truly comparable to the recorded amount of the goodwill, thereby impeding the impairment testing of goodwill.

Example

Purchaser Corp. acquired Attractive Co. in 2007 for $3.4 million. The purchase price was properly allocated to assets acquired and liabilities assumed, including an allocation of $240,000 to in-process R&D, which was properly expensed as of the acquisition date. A residual value of $500,000 was assigned to goodwill. The operations of the former Attractive Co. became a separate reporting unit within the consolidated company.

In 2008, to test for possible impairment, Purchaser management assessed the fair value of the former Attractive Co. operations—using information about comparable operations and economic characteristics, including market multiples of earnings—at $2.75 million. As of that date, the recorded (book) value of the reporting unit's net assets, excluding goodwill, was $2,400,000, and goodwill continued at its original $500,000 recorded value. Because the estimated fair value of the reporting unit is less than its book value, ASC 350 requires the computation of the fair values of the individual assets and liabilities of the reporting unit to determine if its goodwill is impaired.

Management assigns an aggregate fair value of $2.4 million to the net identifiable tangible and intangible assets excluding goodwill, and also estimates that the in-process R&D has an economic (fair) value of $210,000. Since the residual fair value, [$2.75 million less ($2.4 million + $210,000) = $140,000], is less than the recorded amount of goodwill ($500,000), an impairment of ($500,000 – $140,000 =) $360,000 must be recognized by Purchaser Corp. as an operating expense in 2008.

Note that had the fair value of acquired in-process R&D, $210,000, been excluded from the foregoing analysis, the residual fair value would have been computed as $2.75 million – $2.4 million = $350,000; in that case, since recorded goodwill was $500,000, the impairment of goodwill would have only been $150,000. This result would have been erroneous because it would have ignored a real, albeit unrecognized, asset of the reporting unit (i.e., the in-process R&D). This would result in overstating goodwill by the $210,000 of in-process R&D, recognizing and erroneously captioning an asset for which such recognition is prohibited by GAAP.

Identifying all intangibles. Prior to undertaking the purchase price allocation, the acquiring enterprise must review the purchase consideration, if other than cash, to ensure that it has been appropriately valued. It must also carefully identify all of the assets acquired and liabilities assumed, including intangible assets. As the move to a "knowledge-based economy" accelerates, an increasing share of the purchase cost for business acquisitions will pertain to intangible assets, adding to valuation challenges as time goes on.

Intangibles cannot expediently be classified as part of goodwill, as was often done under prior standards, since the newly prescribed treatment for goodwill is not mirrored in the accounting for other intangibles. An identifiable intangible asset will be recognized separately from goodwill if it meets the asset recognition criteria in CON 5, and if either (1) control over the future economic benefits of the asset results from contractual or other legal rights (referred to as the "legal/contractual" criterion) or (2) the intangible asset is capable of being separated or divided and sold, transferred, licensed, rented, or exchanged (referred to as the "separability" criterion). Furthermore, even if the intangible asset cannot be sold, transferred, licensed, rented, or exchanged individually, it would still meet the separability criterion if it could be sold, transferred, licensed, rented, or exchanged along with a related contract, asset, or liability.

FAS 141 lists the intangibles to be separately recognized, along with the terms over which amortization is generally to be applied, with certain exceptions for those intangibles having indefinite lives, such as perpetually renewable broadcast licenses, which are maintained at cost (subject to potential impairment write-downs) until a finite life can be ascertained, if ever. These intangibles generally fall into one of a set of categories, such as

customer- or market-based assets (e.g., customer lists, newspaper mastheads, and trademarked brand names); contract-based assets (e.g., covenants not to compete, broadcast rights); artistic-based assets (e.g., plays, other literary works, musical compositions); and technology-based assets (e.g., title plant, databases, computer software). Except for indefinite life intangibles, identifiable intangibles are to be amortized over their estimated useful lives, defined as the period over which the intangible asset is expected to directly or indirectly generate cash flows for the entity. (See Chapter 11 for a complete discussion.)

The standards demand that all identifiable assets acquired and liabilities assumed in a business combination, whether or not recorded separately in the financial statements of the acquired enterprise, are to be assigned a portion of the total cost of the acquisition, based on their respective fair values as of the date of acquisition. Fair value—the amount a seller would receive on the open market (as per ASC 860) for the asset—will not necessarily correspond to the perceived value to the acquirer, based on the acquirer's planned use of the asset, which was the implicit cost allocation basis under the now-superseded APB 16. A hierarchy of methods available for the determination of fair value is outlined in ASC 820, *Fair Value Measurements and Disclosures*, but interestingly, the income tax basis of an asset or liability is not to be considered in determining its fair value. Given that the residual asset, goodwill, will not be amortized and thus might (unless impaired) remain on the balance sheet indefinitely, the emphasis on accurate and complete valuation of all other identifiable intangibles, which are subject to amortization, is necessary to prevent goodwill's overstatement.

Duplicate assets and assets to be disposed of. While all assets are to be carefully evaluated, it is equally important to note that assets having no value are to be assigned no allocated cost. A typical example arises when facilities of the acquired entity duplicate those of the acquirer and accordingly are to be disposed of. The cost allocated to these facilities is equal to the estimated net salvage value, zero if no salvage value is expected, or a negative amount equal to the estimated costs of disposal, if warranted. The EITF has approved the allocation of "holding costs" to assets to be disposed of when debt from the business acquisition is to be paid down from the proceeds of such asset sales. In effect, the value assigned to such assets to be sold is the present value of the estimated selling price; interest incurred on debt used to finance these assets is then charged to the asset rather than to interest expense until the disposition actually occurs. On the other hand, if facilities of the acquired entity duplicate and are superior to facilities of the purchaser, with the intention that the latter will be disposed of, fair value must be allocated to the former. Eventual disposition of the redundant facilities of the acquirer may later result in a recognized gain or loss. This would fall into the general category of indirect costs of acquisition, which are not capitalizable or allocable to assets acquired in the purchase business combination.

The EITF has reached a similar conclusion with regard to entire subsidiaries of acquired entities (EITF 87-11 and 90-6). In such situations, the expected cash flows from the subsidiary's operations, through the expected date of disposition (but not longer than one year from the acquisition date), are considered in the purchase price allocation process. Ideally, operations of the subsidiary, including the cost of borrowed funds, if relevant, will not impact the acquirer's income statement, absent changes in estimates or altered plans for its disposition. Failure to achieve the planned disposition within one year, however, will result in all further operating results, including borrowing costs, being reported in the consolidated statement of income for future periods. Any difference between the subsidiary's carrying value at the disposition date and the proceeds of the disposition is treated as a reallocation of the original purchase price of the business combination. If, however, the difference arises from identifiable events that occur after the merger date, gain or loss is reported at the disposition date.

Income tax accounting implications of purchase business combinations. Accounting for the income tax implications of purchase business combinations changed substantially with the issuance of FAS 109. Prior to that, any existing deferred income tax benefits or liabilities of the acquired entity, or any deferred income tax effects created by the purchase transaction itself (e.g., due to different income tax and financial reporting bases of the acquired assets or liabilities), were not recognized as such in the postacquisition consolidated balance sheet of the acquirer. Instead, these income tax effects were deemed to be components of the valuation process whereby the total purchase cost was allocated to the acquired identifiable assets and liabilities and, when necessary, to goodwill or negative goodwill. Accordingly, purchased assets and liabilities were recorded on a net-of-tax basis under APB 16.

Under FAS 109, the net-of-tax method was eliminated. Instead, asset and liability fair values are assigned "gross," and income tax effects, if any, are recorded as deferred income tax assets and/or liabilities. Under the FAS 109 "asset and liability" approach to deferred income tax accounting (detailed in Chapter 17), deferred income tax assets and liabilities are computed and adjusted at the date of each balance sheet. Therefore, any deferred income taxes of an acquired entity, or any deferred income taxes generated by the acquisition transaction itself, are recognized in recording the purchase business combination.

Other costs of business combinations. Direct costs of a business acquisition (e.g., finders' fees) were, under FAS 141, part of the cost to be allocated to tangible and intangible assets, including goodwill. However, stock registration and related expenses are offset against the proceeds (credits) of the stock issuance. Indirect costs are simply expensed in the period when the combination is effected. (Note that revisions to acquisition accounting made by ASC 805 require that acquisition costs be expensed immediately, and prohibit adding these to capitalized costs, since these costs add no value to the combined entity and thus fail to meet the criteria for asset recognition.)

In some instances, there are alternative ways to handle certain costs, influencing their treatment as either direct or indirect costs of a business acquisition. For example, if a prospective acquiree company has employee stock options outstanding that were being accounted for under now-superseded APB 25, and it pays the employees to settle the options prior to the acquisition, then (per APB 25, as later interpreted by the EITF in 84-13 and 85-45) compensation expense must be recognized. On the other hand, if the employees exercise their options and then have their shares purchased by the acquirer (or exchanged for stock in the acquirer), there is no compensation expense, but instead this is reported as an additional cost of the purchase.

Costs related to a takeover defense by a prospective acquiree company are not capitalized, but are expenses of the period incurred. However, the EITF has suggested that if the costs are related to a "going private" transaction, these expenses may be classified as an extraordinary item in the statement of income.

In some takeover defense strategies, a target company will repurchase some of its own shares, generally at a price higher than that being offered by the prospective acquirer. Although generally the cost of repurchased stock is simply charged to treasury stock, there is the recognition that excessive repurchase costs are not always related to the "fair value" of the stock. When the price paid explicitly contains consideration for the seller's agreement not to purchase any further shares (a "standstill agreement"), this excess cost must be expensed (per FTB 85-6), with only the fair value of the shares themselves being charged to the treasury stock account. The EITF did not reach a consensus about the treatment of excessive costs of treasury shares absent explicit payment for other services. However, the SEC favors expensing any excess costs. As a general rule, judgment should be applied in evaluating each circumstance.

Example of purchase transaction—goodwill

Jorie Corp. acquired all of the common stock of Balkin Boiler Manufacturing Co. on January 2, 2007, at a cost of $32 million, consisting of $15 million in cash and the balance represented by a long-term note to former Balkin stockholders. As of January 2, 2007, immediately prior to the transaction, Balkin's balance sheet is as follows, with both book and fair values indicated ($000 omitted):

	Book value	*Fair value*		*Book value*	*Fair value*
Cash	$ 1,000	$ 1,000	Current liabilities	$26,200	$26,200
Accounts receivable, net	12,200	12,000	Long-term debt	46,000	41,500
Inventory	8,500	9,750	Guarantee of debt	--	75
Other current assets	500	500			
Property, plant, and equipment, net	38,500	52,400			
Customer list	--	1,400			
Patents	2,400	3,900			
In-process research and development	--	8,600	Stockholders' equity (deficit)	(9,100)	21,775
Totals	$63,100	$89,550		$63,100	$89,550

The fair value of inventory exceeded the corresponding book value because Balkin had been using LIFO for many years to cost its inventory, and actual replacement cost was therefore somewhat higher than carrying value at the date of the acquisition. The long-term debt's fair value was slightly lower than carrying value (cost) because the debt carries a fixed interest rate and the market rates have risen since the debt was incurred. Consequently, Balkin benefits economically by having future debt service requirements that are less than they would be if it were to borrow at current rates. Conversely, of course, the fair value of the lender's note receivable has declined since it now represents a loan payable at less than market rates. Finally, the fair value of Balkin's receivables have also declined from their carrying amount, due to both the higher market rates of interest and to the greater risk of uncollectibility because of the change in ownership. The higher interest rates impact the valuation in two ways: (1) when computing the discounted present value of the amounts to be received, the higher interest rate reduces the computed present value, and (2) the higher interest rates may serve as an incentive for customers to delay payments to Balkin rather than borrow the money to repay the receivables, with that delay resulting in cash flows being received later than anticipated thus causing the present value to decline.

Balkin's customer list has been appraised at $1.4 million and is a major reason for the company's acquisition by Jorie. Having been internally developed over many years, the customer list is not recorded as an asset by Balkin, however. The patents have been amortized down to $2.4 million in Balkin's accounting records, consistent with GAAP, but an appraisal finds that on a fair value basis the value is somewhat higher.

Similarly, property, plant, and equipment has been depreciated down to a book value of $38.5 million, but has been appraised at a sound value (that is, replacement cost new adjusted for the fraction of the useful life already elapsed) of $52.4 million.

A key asset being acquired by Jorie, albeit one not formally recognized by Balkin, is the in-process research and development (IPR&D), which pertains to activities undertaken over a period of several years aimed at making significant process and product improvements which would enhance Balkin's market position and will be captured by the new combined operations. It has been determined that duplicating the benefits of this ongoing R&D work would cost Jorie $8.6 million. The strong motivation to make this acquisition, and to pay a substantial premium over book value, is based on Balkin's customer list and its IPR&D. Balkin has previously expensed all R&D costs incurred, as required under ASC 730-10.

Balkin had guaranteed a $1.5 million bank debt of a former affiliated entity, but this was an "off the books" event since, under FIN 45, guarantees issued between corporations under common control are exempt from recognition. The actual contingent obligation has been appraised as having a fair value (considering both the amount and likelihood of having to honor the commitment) of $75,000.

Thus, although Balkin's balance sheet reflects a stockholders' deficit (including the par value of common stock issued and outstanding, additional paid-in capital, and accumulated deficit) of $9.1 million, the value of the acquisition, including the IPR&D, is much higher. The preliminary computation of goodwill is as follows:

Purchase price		$32,000,000
Net working capital	$(2,950,000)	
Property, plant, and equipment	52,400,000	
Customer list	1,400,000	
Patents	3,900,000	
In-process research and development	8,600,000	
Guarantee of indebtedness of others	(75,000)	
Long-term debt	(41,500,000)	21,775,000
Goodwill (excess of cost over fair value)		$10,225,000

Under FIN 4, the fair value allocated to the in-process research and development must be immediately expensed. All other assets and liabilities are recorded by Jorie at the allocated fair values, with the excess cost being assigned to goodwill. The entry to record the purchase (for preparation of consolidated financial statements, for example) is as follows:

Cash	1,000,000	
Accounts receivable, net	12,000,000	
Inventory	9,750,000	
Other current assets	500,000	
Property, plant, and equipment	52,400,000	
Customer list	1,400,000	
Patents	3,900,000	
Goodwill	10,225,000	
Research and development expense	8,600,000	
Current liabilities		26,200,000
Guarantee of indebtedness of others		75,000
Long-term debt		41,500,000
Notes payable to former stockholders		17,000,000
Cash		15,000,000

Note that, while the foregoing example is for a stock acquisition, an asset and liability acquisition would be accounted for in the exact same manner. Also, since the debt is recorded at fair value, which will often differ from face (maturity) value, the resulting differential (premium or discount) must be amortized using the effective yield method from acquisition date to the maturity date of the debt, and thus there will be differences between actual payments of interest and the amounts recognized in the income statements as interest expense. Finally, note that property, plant, and equipment is recorded "net"—that is, the allocated fair value becomes the "cost" of these assets; accumulated depreciation previously recorded in the accounting records of the acquired entity does not carry forward to the postacquisition financial statements of the consolidated entity.

Example of purchase transaction—negative goodwill

Haglund Corp. acquires, on March 4, 2008, all the capital stock of Foster Co. for $800,000 in cash. A formerly successful enterprise, Foster had recently suffered from declining sales and demands for repayment of its outstanding bank debt, which were threatening its continued existence. Haglund management perceived an opportunity to make a favorable purchase of a company operating in a related line of business, and accordingly made this modest offer, which was accepted by the stockholders of Foster, the acquiree. Foster's balance sheet at the date of acquisition is as follows, with both book and fair values indicated ($000 omitted):

	Book value	*Fair value*		*Book value*	*Fair value*
Cash	$ 800	$ 800	Current liabilities	$ 2,875	$ 2,875
Accounts receivable, net	3,600	3,400	Long-term debt	11,155	11,155
Inventory	1,850	1,800			
Property, plant, and equipment	6,800	7,200	Stockholders' equity		
Net operating loss carryforwards	--	2,400	(deficit)	(980)	1,570
Totals	$13,050	$15,600		$13,050	$15,600

Foster had provided a valuation allowance for the deferred income tax asset attributable to the net operating loss carryforward benefit, since recurring and increasing losses made it more likely than not that these benefits would not be realized, consistent with GAAP (FAS 109). Haglund Corp., which is highly profitable, is in the same line of business, and intends to continue Foster's operations, expects to be able to realize these benefits, and therefore will have no valuation allowance against this asset.

Thus, although Foster's balance sheet reflects a stockholders' deficit (including outstanding common stock, additional paid-in capital and accumulated deficit) of $980,000, the value of the acquisition is much higher, and furthermore the acquirer is able to negotiate a bargain purchase. The preliminary computation of negative goodwill is as follows:

Net working capital	$ 3,125,000	
Property, plant, and equipment	7,200,000	
Net operating loss carryforward	2,400,000	
Long-term debt	(11,155,000)	1,570,000
Purchase price		800,000
Negative goodwill (excess of fair value over cost)		$ 770,000

Under FAS 141, the negative goodwill is first used to offset all acquired assets other than cash and cash equivalents, trade receivables, inventory, financial instruments that are required to be carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred income tax assets, on a pro rata basis. In the present instance, only the property, plant, and equipment are available for this offsetting (the NOL benefits are equivalent to deferred income tax assets under FAS 109; see further discussion in Chapter 17). The entry to record the purchase before allocating negative goodwill is therefore as follows:

Cash	800,000	
Accounts receivable, net	3,400,000	
Inventory	1,800,000	
Property, plant, and equipment	7,200,000	
Deferred income tax asset	2,400,000	
Current liabilities		2,875,000
Long-term debt		11,155,000
Cash		800,000
Negative goodwill		770,000

The entry to record the offsetting of the negative goodwill is as follows:

Negative goodwill	770,000	
Property, plant, and equipment, net		770,000

Since the negative goodwill is fully absorbed by the property, plant, and equipment, there will be no residual to recognize in earnings.

Example of purchase transaction—excess negative goodwill

The facts are similar to the immediately preceding example, except that Foster Co.'s long-term debt amounts to only $3,155,000 (book and fair values) as of the date of the acquisition transaction. This results in such a large amount of negative goodwill that an excess remains after property, plant, and equipment are reduced to zero. This excess negative goodwill is reported in the period in which the acquisition occurs as an extraordinary gain.

Foster's balance sheet at the date of acquisition is as follows, with both book and fair values indicated ($000 omitted):

	Book Value	Fair Value		Book Value	Fair Value
Cash	$ 800	$ 800	Current liabilities	$ 2,875	$ 2,875
Accounts receivable, net	3,600	3,400	Long-term debt	3,155	3,155
Inventory	1,850	1,800			
Property, plant, and equipment, net	6,800	7,200			
Net operating loss carryforwards	--	2,400	Stockholders' equity	7,020	9,570
Totals	$13,050	$15,600		$13,050	$15,600

The preliminary computation of negative goodwill is as follows:

Net working capital	$3,125,000	
Property, plant, and equipment	7,200,000	
Net operating loss carryforward	2,400,000	
Long-term debt	(3,155,000)	9,570,000
Purchase price		800,000
Negative goodwill (excess of fair value over cost)		$8,770,000

The entry to record the purchase before allocating negative goodwill is therefore as follows:

Cash	800,000	
Accounts receivable, net	3,400,000	
Inventory	1,800,000	
Property, plant, and equipment	7,200,000	
Deferred income tax asset	2,400,000	
Current liabilities		2,875,000
Long-term debt		3,155,000
Cash		800,000
Negative goodwill		8,770,000

The entry to record the offsetting of the negative goodwill is as follows:

Negative goodwill	8,770,000	
Property, plant, and equipment, net		7,200,000
Extraordinary item—gain on purchase		1,570,000

Since the negative goodwill is not fully absorbed by the property, plant, and equipment, there will be a residual to recognize in earnings. Under GAAP, this is presented as an extraordinary item (net of the related income tax effects, not computed here) in the income statement.

However, if the transaction provided for a contingent purchase price (e.g., based on meeting earnings targets over the next several years), the excess negative goodwill ($1,570,000 in this example) would be recorded on the balance sheet as a deferred credit, not subject to amortization, until the contingency was resolved. To the extent an increase in the purchase price resulted, that would reduce (or, at the extreme, fully eliminate) the negative goodwill. Any remaining negative goodwill after the contingent purchase price has been resolved will be reported in the period of final resolution as an extraordinary gain.

Determining if an Acquisition Is a Business Combination

Before applying FAS 141 it is necessary to conclude that the acquisition constitutes a business, as opposed to being a group of productive assets. EITF 98-3 addresses this particular issue and offers a set of criteria, all of which must be met in order for the acquiree to meet the definition of a business. A business is defined as

> *…a self-sustaining integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. A business consists of (a) inputs, (b) processes applied to those inputs, and (c) resulting outputs that are used to generate revenues. For a transferred set of activities and assets to be deemed a business, it must contain all of the inputs and processes necessary for it to continue to conduct normal operations after the transferred set is separated from the transferor, which includes the ability to sustain a revenue stream by providing its outputs to customers.*

According to EITF 98-3, the necessary inputs include (1) long-lived assets, including intangible assets, or right to the use of long-lived assets; (2) intellectual property; (3) the abil-

ity to obtain access to necessary materials or rights; and (4) employees. Note that the presence of intellectual property does not necessarily imply that intangible assets had been recognized for financial reporting purposes by the acquiree, and in many cases intangibles might not even be assigned values by the acquirer applying FAS 141.

Processes represent the existence of systems, standards, protocols, conventions, and rules that act to define the processes necessary for normal, self-sustaining operations, such as (1) strategic management processes, (2) operational processes, and (3) resource management processes.

Outputs are the ability to obtain access to the customers that purchase the outputs of the transferred set.

According to EITF 98-3, a transferred set of activities and assets fails the definition of a business if it excludes one or more of the above items such that it is not possible for the set to continue normal operations and sustain a revenue stream by providing its products and/or services to customers. Exclusion of minor items that does not prevent the transferred set from continuing normal operations does not prevent classification of the acquired assets and activities as a business. The assessment of whether excluded items are only minor should be made without regard to the attributes of the transferee and should consider such factors as the uniqueness or scarcity of the missing element, the time frame, the level of effort, and the cost required to obtain the missing element. If goodwill is present in a transferred set of activities and assets, it should be presumed that the excluded items are minor and that the transferred set is a business, since goodwill is associated with an ongoing business and not with individual productive assets.

Importantly, the assessment of whether a transferred set of assets and operations constitutes a business should be made without regard to how the acquirer intends to use the transferred set. It is not relevant whether the transferee will actually operate the transferred set of assets and operations on a stand-alone basis or intends to continue using the transferred set in the same manner as did the transferor. The acquired operations can be restructured, integrated with the acquirer's operations, and reengineered in various ways without interfering with the determination that it was a business combination, if all criteria are satisfied.

There is also no threshold for numbers of individual assets to be obtained to qualify as a business. However, EITF 98-3 notes that if essentially all but a *de minimis* amount of the fair value of the transferred set of activities and assets is represented by a single tangible or identifiable intangible asset, the concentration of value is an indicator that an asset rather than a business is being received. It cites 3% as being a working definition of *de minimis*.

As described by EITF 98-3, the actual determination of whether a transferred set of assets and activities is or is not a business is a three-step process. These are

1. Identify the elements included in the transferred set of assets and activities.
2. Compare the identified elements in the transferred set to the complete set of elements necessary for the transferred set to conduct normal operations, to identify any missing elements.
3. If there are missing elements, make an assessment as to whether the missing elements lead to a conclusion that the transferred set is not a business. That assessment is based on the degree of difficulty or the level of investment (relative to the fair value of the transferred set) necessary to obtain access to or to acquire the missing elements.

If the degree of difficulty and level of investment necessary to obtain access to or to acquire the missing elements are not significant, the missing elements may be deemed minor, thus not impeding classification as a business acquisition. The determination requires the exercise of judgment and is dependent on the particular facts and circumstances. EITF 98-3

offers a series of illustrative examples to suggest how to apply the three-step test to determine if an acquisition is a business combination or merely the purchase of assets.

The provisions in EITF 98-3 as they relate to nonmonetary exchanges of similar productive assets under APB 29 have been nullified by FAS 153, *Exchanges of Nonmonetary Assets,* which became effective for exchanges of nonmonetary assets occurring in fiscal periods beginning after June 15, 2005.

Goodwill

Identifiable and unidentifiable intangible assets. Ending the acceptability of pooling of interests accounting was accompanied by an even more fundamental change in the accounting for goodwill. FASB first prepared to demand accelerating amortization of goodwill over a period shorter than the previously permitted forty years while precluding impairment testing, but then changed its mind and decided to prohibit any form of amortization in favor of the formerly rejected intermittent testing for impairment—and thus an entirely new methodology was introduced.

The asset commonly known as goodwill is a subset of the broader subject, intangible asset accounting. ASC 350 addresses the accounting for all intangibles and raises the bar for delineating among different types of intangibles (i.e., distinguishing those separately identifiable intangibles having finite lives, those arguably having indefinite lives, and goodwill, which is unique in being "unidentifiable" and having an indeterminate life which makes periodic amortization impossible, in the FASB's current view). Chapter 11 discusses intangibles other than goodwill in great detail. Accordingly, this subject will only be addressed in the present chapter to the extent that the recognition and measurement of identifiable intangibles acquired in a purchase business combination impacts upon the measurement of goodwill, which is normally understood as being the residual asset after the assignment of purchase cost to all other assets and liabilities.

CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*, states that an asset is recognized if it meets the definition of an asset (found in CON 6, *Elements of Financial Statements*), has a relevant attribute measurable with sufficient reliability, and the information about it is representationally faithful, verifiable, neutral (i.e., it is reliable), and capable of making a difference in user decisions (i.e., it is relevant). In a business acquisition, any acquired identifiable intangible asset (e.g., patents, customer lists, etc.) must be recognized separately from goodwill when it meets these CON 5 asset recognition criteria, and additionally meets either of the following two criteria:

1. ***Legal/contractual***—Control over the future economic benefits of the asset results from contractual or other legal rights (regardless of whether those rights are transferable or separable from other rights and obligations), or
2. ***Separability***—The asset is capable of being separated or divided and sold, transferred, licensed, rented, or exchanged (regardless of whether there is an intent to do so or whether a market currently exists for that asset)—or, if it cannot be individually sold, etc., it is capable of being sold, transferred, licensed, rented or exchanged along with a related contract, asset, or liability.

All intangible assets acquired from other enterprises or individuals, whether singly, in groups, or as part of a business combination, are recognized initially and are measured based on their respective fair values. (Note that the initially determined fair value may be reduced in the case of business combinations with which negative goodwill is associated, as illustrated above.) Under the provisions of ASC 350, serious effort must be directed to identifying the various intangibles acquired.

Useful economic life. Reliably measurable identifiable intangible assets, with the exception of those meeting the criteria for nonamortization (explained below), must be amortized over their respective useful economic lives. Useful economic life is the period over which the asset is expected to contribute (whether directly or indirectly) to cash flows of the entity. Factors to be considered in estimating the useful economic life of an intangible asset to an enterprise include

1. Legal, regulatory, or contractual provisions that may limit the maximum useful life;
2. Legal, regulatory, or contractual provisions that may enable renewal or extension of the asset's legal or contractual life (provided there is evidence to support renewal or extension without substantial cost and without materially modifying the original terms);
3. The effects of obsolescence, demand, competition, and other economic factors (such as the stability of the industry, the rate of technological change, expected changes in distribution channels, and the existence of uncertainty over future legal and/or regulatory changes);
4. The expected useful life of assets or groups of assets of the enterprise to which the useful life of the asset may parallel (such as mineral rights to depleting assets);
5. The expected use of the intangible asset by the enterprise; and
6. The level of maintenance expenditure required to obtain the expected future economic benefits from the asset.

In those instances where an intangible asset is determined to have an indefinite useful economic life, it will not be amortized until its life is determined to be finite at a later date. An example of such an asset would be a broadcast license, expiring in five years, but which may be renewed indefinitely at little cost. If the acquirer intends to renew the license indefinitely, and there is evidence to support its ability to do so, and the cash flows related to that license are expected to continue indefinitely, then no amortization would be recognized until such time as these criteria are no longer met.

Residual value. Typically, the entire fair value assigned to an intangible asset will be subject to amortization, although in some instances a residual value may be determined, which reduces the amortizable basis. The residual value of an amortizable intangible is assumed to be zero unless the useful life to the acquiring enterprise is shorter than the intangible asset's useful economic life, and either (1) the acquiring enterprise has a commitment from a third party to purchase the asset at the end of its useful life, or (2) the residual value can be determined by reference to an observable market for that asset and that market is expected to exist at the end of the asset's useful life. The method of amortization is to reflect the pattern in which the economic benefits of the intangible asset are to be consumed; absent the ability to ascertain this, straight-line amortization is applied. However, if impairment (determined by application of the ASC 360 criteria) is later determined, the carrying amount will be written down to the impaired amount.

Allocation to goodwill. After completing the purchase price allocation, any residual of cost over fair value of the net identifiable assets and liabilities is assigned to the unidentifiable asset, goodwill. Formerly subject to mandatory amortization, this now is not permitted to be amortized at all, by any allocation scheme and over any useful life. Impairment testing, using a methodology at variance with that set forth in ASC 360 (which, however, continues in effect for all other types of long-lived assets and intangibles other than goodwill), must be applied periodically, and any computed impairment will be presented as a separate line item in that period's income statement, as a component of income from continuing operations (unless associated with discontinued operations, in which case, the impairment would, net of income tax effects, be combined with the remaining effects of the discontinued operations).

If all other acquired assets have been identified (including, at the moment the transactions occurs, in-process research and development, which is then immediately expensed) and properly valued, by process of elimination. The remaining excess purchase price can be assigned to no asset other than goodwill.

The decision to eliminate the requirement for amortization was based on the recognition that any assigned useful life would be entirely arbitrary. The FASB recognized that not all goodwill declines in value and that any decline in value would rarely occur on a straight-line basis. Furthermore, FASB found during its field testing of the revised proposal that the estimation (albeit, indirectly) of future cash flows associated with goodwill (which is critical to implementation of an impairment testing approach) was feasible, contrary to earlier doubts. Finally, elimination of periodic amortization charges against earnings was a political price the FASB was willing to pay in order to secure its primary goal, elimination of the pooling-of-interests method of accounting for business combinations.

Impairment of goodwill. Given the decision to end the practice of amortization of goodwill, it became necessary to develop a mechanism for ensuring that the amount presented in the financial statements would not exceed the goodwill's estimated fair value at any point in time. This goal is generally consistent with the rules underlying those governing the balance sheet presentation of other long-lived assets.

For example, unlike tangible fixed assets, goodwill is impossible to separately identify and, if the ongoing business is successful, will tend to regenerate itself or be replaced by new internally generated goodwill. Historically, of course, goodwill could only achieve financial statement recognition in the limited situation of being purchased (i.e., internally generated goodwill was not recognizable for financial reporting purposes). However, any strategy for testing for impairment will inevitably be confounded by the existence, along with the purchased goodwill, of internally generated goodwill created subsequent to the date of the business combination. FASB concluded that it would be impossible to track "acquisition-specific" goodwill for impairment testing purposes and accordingly endorsed a major departure from the traditional prohibition against recognition of internally generated intangibles. This approach still results in an inconsistency, however, since only entities that have purchased goodwill in the past will be permitted to recognize the internally generated replacement goodwill to avoid impairment write-downs. Entities that internally generate goodwill but that have not entered into prior purchase business combinations are still prohibited from capitalizing that new goodwill and from presenting it as an asset on their balance sheets.

The impairment testing approach endorsed by ASC 350 reasons that "anomalies that result from the differences in how acquired goodwill and internally generated goodwill are accounted for…justify a departure from the current model of accounting." Thus, it concluded, as long as the total goodwill identifiable with the "reporting unit" to which acquisition-based goodwill was assigned can be shown to have a fair value exceeding the book value of the goodwill arising from the acquisition (which means apples are to be compared with oranges), no impairment will be found. This represents a major departure from prior accounting practice.

A reporting unit is defined in ASC 350 as an operating segment or a component of an operating segment that is one level below the operating segment as a whole. In order for a component to be considered a reporting unit it must

1. Constitute a business as defined in EITF 98-3, *Determining Whether a Nonmonetary Transaction Involves Receipt of Productive Assets or of a Business*, and
2. Have available discrete financial information regarding its operating results that is regularly reviewed by segment management.

A reporting unit is defined by reference to an operating segment, which is a term used in ASC 280. This definition applies equally to publicly held and privately held companies, even though nonpublic entities are exempted from reporting segment information.

Chapter 2, in the section entitled, "Alternative Balance Sheet Segmentation," provides a diagram of how an organizational structure could be analyzed to determine its reporting units and provides definitional guidance regarding terminology used in the authoritative GAAP literature.

Measurement procedures for impairment. FASB recognized that goodwill impairment testing could not be effected by the same mechanical approach as ASC 360 sets forth for other long-lived assets. The reason is that the potentially very long-enduring cash flows emanating from goodwill would obviate the usefulness of ASC 360's "undiscounted cash flows" threshold test for impairment. In other words, it is computationally impossible to forecast undiscounted cash flows from the use and eventual disposition of an asset that has an indefinite life. In essence, the cash flows would continue into perpetuity and, thus, goodwill would never be deemed to be impaired.

Accordingly, FASB devised a unique impairment testing protocol for goodwill. Since direct measurement of the fair value of goodwill is clearly impossible, FASB concluded that a method similar to the method of allocating the purchase price to the net assets acquired in a business combination would be used to indirectly measure the value of goodwill subsequent to its acquisition date. Thus, it decided that the fair value of the net assets of a reporting unit be subtracted from the fair value of that reporting unit to determine the implied fair value of goodwill.

The fair value of the net assets of the reporting unit can be measured in a variety of ways. Direct market observation, as outlined in ASC 820, *Fair Value Measurements and Disclosures,* is certainly the most objective method, but in the absence of that information, other techniques can be substituted. CON 7 sets forth an "expected present value technique" which uses the sum of probability-weighted present values in a range of estimated cash flows adjusted for risk, all discounted using the same interest rate convention. FASB has indicated that such a technique is a more effective measurement tool than was the traditional present value approach, especially in situations in which the timing or the amount of estimated cash flows is uncertain, as is the case in measuring nonfinancial assets and liabilities.

In order to operationalize an approach that incorporates the values of the recognized assets and liabilities, the FASB concluded that all of the assets and liabilities of an acquired entity (including goodwill) that will be used in the operations of a reporting unit would be allocated to that reporting unit as of the acquisition date. For many business entities, this required changes to internal management accounting: for example, many of them had not previously allocated liabilities such as pension and environmental obligations below the corporate or entity level. To the extent these liabilities relate to one or more reporting unit or units, they are now included in the determination of the fair value of the recognized net assets of that unit or units.

Under ASC 280, the standard that sets forth the segment reporting required of publicly held corporations, "corporate" assets and liabilities are not assigned to any operating segment. Goodwill had often been included in these unallocated corporate assets. The impairment testing process, however, could not proceed if a similar approach were adhered to, and accordingly under ASC 350 goodwill and all other related assets and liabilities are assigned to reporting units for purposes of testing goodwill for impairment. The amount of goodwill allocated to each segment is required to be disclosed in the notes to the financial statements of publicly held enterprises.

Goodwill impairment testing is a two-step process (as is impairment testing under ASC 360, although these two standards differ fundamentally in their respective approaches). In the first step, the possibility of impairment is assessed by comparing the fair value of the "reporting unit" taken as a whole to its carrying (book) value. If the fair value of the reporting unit exceeds its book value, there is no need for further analysis, since no impairment will be found to have occurred.

If, however, the carrying value exceeds fair value, a second step must be performed to indicate whether goodwill is impaired and, it if is impaired, by how much. In the second step, the recorded goodwill is compared to its implied fair value, computed in the same manner as when completing a business combination's "purchase price allocation." Thus, the fair value of the reporting unit is allocated to all the unit's assets and liabilities (including any unrecognized intangibles, according to the standard, even though this raises a question of noncomparability with book value), including, as a residual, goodwill. If the amount thus assigned to goodwill (its implied fair value) is less than its carrying value, the excess book value must be written off as an impairment expense. No other adjustments are to be made to the carrying values of any of the reporting unit's other assets or liabilities.

Unlike ASC 360's impairment measurement requirements, which use net (i.e., discounted) present values (or, when there is uncertainty regarding amounts or timing of future cash flows, probability-weighted expected present values) to actually measure the magnitude of any indicated impairment, the goodwill impairment approach uses a pseudo–purchase price allocation methodology. Implicitly, of course, the present value of future cash flow estimation techniques described above are incorporated in the impairment model, since the overall fair value of the reporting unit, and the fair values of some or all of the individual assets and liabilities, may be measured using these techniques.

Initial assessment of goodwill's fair value. In order to facilitate periodic assessments of possible impairment, it is necessary that a "benchmark assessment" be made. This benchmark assessment is performed in conjunction with most significant acquisitions, regardless of how much goodwill arises from that acquisition. Similarly, a benchmark assessment is performed in conjunction with a reorganization of an entity's reporting structure.

The benchmark assessment involves identifying the valuation model to be used, documenting key assumptions, and measuring the fair value of the reporting unit. In determining how goodwill is to be assigned to "reporting units," a reasonable and supportable approach must be adopted. In general, goodwill is assigned consistent with previous recognition of goodwill and with the reporting units to which the acquired assets and liabilities had been assigned. Goodwill assigned to a reporting unit is measured by the difference between the fair value of the entire reporting unit and the collective sum of the fair values of the reporting unit's assets, net of its liabilities.

In practice, consideration of the "synergistic" effects of business acquisitions may also be necessary (i.e., if other reporting units are expected to benefit from an acquired reporting unit, some or all of the acquired goodwill might be assignable to the other units). For example, a purchase may give a division of the acquirer access to a market niche benefiting one of its existing operating units, even if all the tangible and other intangible assets are assigned to other parts of the enterprise. If the goodwill allocation is based on the existence of such synergies, a "with and without" calculation is then used (i.e., it will be necessary to compare the fair value of the reporting unit before the acquisition to that after it).

Goodwill may also be split among two or more reporting units of the acquirer. Any allocation method used is to be consistently applied and the logic for doing so documented.

While it may be costly to accomplish, this benchmark assessment is necessary to ensure that the entity has identified and documented all key assumptions and tested the outputs of

the selected valuation model for reasonableness prior to actually testing goodwill for impairment. Furthermore, measuring the fair value of the reporting unit as part of the benchmark assessment will provide management with a "reality check" on whether the amount of goodwill assigned to the reporting unit is reasonable, by comparing the fair value of the reporting unit with its carrying (book) value. If the fair value of the reporting unit is found to be less than its carrying amount, the goodwill allocation methodology should be reassessed, and the selected valuation model and the assumptions underpinning the initial valuation critically reexamined. In those cases where the indicated fair value of the reporting unit is still less than its carrying amount, goodwill would be tested for impairment.

Under ASC 350, a two-step testing protocol is prescribed. The first step is to compare the reporting unit's carrying amount (book value) to the unit's fair value. If fair value exceeds carrying value, there is no impairment and no need for further analysis. On the other hand, if carrying value exceeds estimated fair value, it becomes necessary to formally test for impairment; that is, to apply the second step as described in the following section.

Ongoing testing for impairment of goodwill. FASB's original intent was to mandate goodwill impairment testing on an "events and circumstances" basis, similar to the approach used in ASC 360 for depreciable or amortizable long-lived assets. This approach was discarded in favor of a requirement for annual impairment testing, although interim testing also remains necessary when an event or circumstance occurs between annual tests that suggests that the fair value of a reporting unit might have declined below its carrying value. Examples of such occurrences include an adverse change in the business climate or market, a legal factor, an action by regulators, the introduction of new competition, or a loss of key personnel. Goodwill is also required to be tested for impairment on an interim basis when it is deemed "more likely than not" that a reporting unit or a significant portion of a reporting unit will be sold or otherwise disposed of, and furthermore, when a significant asset group within a reporting unit is required to be reviewed for recoverability because of the events and circumstances triggers included in ASC 360. Annual testing, however, is not triggered by such circumstances, but rather, is required in all cases.

The SEC has indicated that it will likely raise concerns if a registrant is found to have frequently changed the date of its annual goodwill impairment test, especially if it appears that the change in testing dates has been made with the intent of accelerating or delaying an impairment charge.

Assuming the step-one analysis (comparing fair value to carrying value for any reporting unit which includes goodwill) reveals the possibility of impairment, the step-two exercise, impairment testing, must be performed. Because of the nature of goodwill, FASB rejected the use of the impairment testing technique of FAS 121 (which was later superseded by the similar ASC 360) and instead crafted a unique methodology.

The two-step testing regime requires as the first step that a threshold test be applied: is the fair value of the reporting unit greater than, or less than, its carrying value? If the fair value is lower than the carrying value, impairment is suggested. The impairment, however, is not validly measured by the shortfall computed in step one, because to do so would effectively be to adjust the carrying value of the entire reporting unit to the lower of cost or market.

Under ASC 350, impairment is the condition that exists when the carrying amount of goodwill exceeds its implied fair value. Implied fair value, in turn, is the excess of the fair value of a reporting unit as a whole over the individual fair values assigned to its assets and liabilities. Once the fair value of a reporting unit is determined, the fair value of the goodwill component of that unit's net assets must be computed; this is then compared to the carrying value of that goodwill, to ascertain if any impairment loss is to be recognized. For the pur-

pose of making this determination, fair value of a reporting unit is the amount at which the unit as a whole could be bought or sold in a current transaction between willing parties.

The second step of the process is as follows:

1. It is necessary to allocate the fair value of the reporting unit to all assets and liabilities, and to any unrecognized intangibles (including in-process R&D), as if the unit had been acquired at the measurement date. Any excess of fair value over amounts assigned to net assets (including the unrecognized assets such as in-process research and development) is the implied fair value of goodwill.
2. The implied fair value of goodwill is compared to its carrying amount (book value). If the carrying amount of the goodwill is greater than its implied fair value, a write-down of the carrying amount is required. Once written down, goodwill cannot later be written back up, even if later tests show that the fair value has recovered and exceeds carrying value.

Example of goodwill impairment testing

Armand Heavy Industries is a holding company that has two reporting units that were acquired as wholly owned subsidiaries consequent to purchase business combinations after the effective date of ASC 350. Armand's relevant reporting units are Bardige Diesel Engines and Ciarcia Transmissions. Upon acquisition of the two businesses (which are operated as subsidiaries), Armand recorded the assets and liabilities at fair values and recognized the excess of the purchase prices over these assigned fair values as goodwill.

At December 31, 2008, the carrying values of the assets and liabilities are as follows:

	(Amounts in millions)	
	Bardige Diesel	*Ciarcia Transmissions*
Cash	$ 20	$ 10
Accounts receivable	100	20
Inventories	10	700
Land, buildings, and equipment	1,400	1,800
Identifiable intangibles	300	0
Goodwill	400	200
Accounts payable	(80)	(300)
Long-term debt	(300)	(400)
Totals	$1,850	$2,030

Summary income statement information for the two companies for the year ended December 31, 2008, is as follows:

	(Amounts in millions)	
	Bardige Diesel	*Ciarcia Transmissions*
Revenues	$1,000	$800
Pre-tax income	$ 200	$120
Net income	$ 120	$ 30

It is Armand's policy to perform its annual goodwill impairment testing for both reporting units as of December 31.

The following data is available, at reasonable cost, to management of Armand:

Bardige Diesel

There are no comparable publicly held companies that have similar economic characteristics to this operation. However, management is able to develop reasonably supportable estimates of expected future cash flows associated with the group of assets. That computation yielded a fair value for Bardige Diesel of $1,700.

Ciarcia Transmissions

A competitor of Ciarcia Transmissions, the Gaffen Gearbox Company, is publicly held and traded on the NASDAQ. Its stock has consistently sold at a multiple of 3 times revenues. Management of Armand Heavy Industries believes that the stock price is fairly representative of the

fair value of Gaffen Gearbox, and accordingly that using the multiple in assessing the value of Ciarcia will result in a fair estimate.

	(Amounts in millions)	
	Bardige Diesel	*Ciarcia Transmissions*
Fair value of reporting unit	$1,700	$2,400
Carrying amount of reporting unit including goodwill	1,850	2,030
Fair value over (under) carrying value	$ (150)	$ 370

Step 1—Test for potential impairment. Compare fair value of the reporting unit to its carrying amount, including goodwill.

a. In the case of Bardige Diesel, the carrying amount exceeds the fair value of the reporting unit, and thus the goodwill of this reporting unit must be tested further to determine whether it is impaired.
b. In the case of Ciarcia Transmissions, the fair value of the reporting unit exceeds the carrying value, and thus the goodwill of this reporting unit is not impaired and no further testing is required.

Step 2—Measure the amount of the impairment loss. For Bardige Diesel, management used the guidance in FAS 141 on business combinations and computed the implied value of goodwill and resulting impairment loss as follows:

	(Amounts in millions)	
	Carrying value	*Fair value*
Cash	$ 20	$ 20
Accounts receivable	100	90
Inventories	10	8
Land, buildings, and equipment	1,400	1,200
In-process research and development	--	100
Identifiable intangibles	300	350
Customer lists	--	100
Goodwill	400	NA
Accounts payable	(80)	(80)
Long-term debt	(300)	(280)
Total (net) carrying value	$1,850	
Total (net) fair value assigned to assets and liabilities		1,508
Fair value of reporting unit		1,700
Implied fair value of goodwill		192
Carrying value of goodwill		400
Impairment loss		$ 208

As indicated above, Ciarcia Transmissions does not have to proceed to Step 2 because its goodwill was found in Step 1 not to be impaired.

Circumstances under which detailed annual testing may be waived. Obviously, annual assessments of impairment can become very extended, and possibly expensive, exercises. In recognition of this fact, the FASB prescribed limited circumstances in which the risk of impairment would be quite low, and therefore the fair value of each reporting unit would not have to be recomputed in a year when they apply. To qualify for this exception, there must not have been changes to the components of the reporting unit since the previous fair value computation; when last measured, the fair value amount must have exceeded the carrying amount of the reporting unit by a substantial margin; and there must be no evidence to suggest that the current fair value of the reporting unit may be less than its current carrying amount.

Timing of annual testing. The annual impairment tests need not be performed at fiscal year-ends. Instead, the fair value measurement for each reporting unit could be performed any time during the fiscal year, as long as that measurement date is used consistently from year to year. Different measurement dates can be used for different reporting units. Once

elected, however, a reporting unit's annual impairment measurement date is not permitted to be changed.

Other impairment testing considerations.

Impairment of identifiable long-lived assets. Testing for impairment of goodwill in accordance with ASC 350 may intersect with evaluating long-lived assets for impairment, as prescribed by ASC 360. GAAP requires that assets other than goodwill be evaluated for impairment first, and any adjustments necessitated by this evaluation made before testing for goodwill impairment. In some cases, possible impairment of long-lived assets may only be discovered as the goodwill impairment testing is progressing; in such instances, the goodwill impairment testing is ceased and other impairment issues fully addressed before returning to the goodwill impairment testing procedures.

Example—Evaluation of other assets necessitated by goodwill impairment testing

Using the same facts as given above for Armand Heavy Industries, the step two comparison of fair values to carrying values yielded a fair value of land, buildings, and equipment of $1,200 which is less than the carrying value of those assets. ASC 360 (as discussed in detail in Chapter 11) requires management to evaluate whether the carrying values of long-lived assets are recoverable when events or changes in circumstances indicate that this may be in doubt. One of the triggering events given as an example in ASC 360 is a significant decrease in the market price of a long-lived asset or asset group. Therefore, since this factor is present, management is required to evaluate the recoverability of those assets.

Management ceased its goodwill impairment testing and estimated the future cash flows (without discounting) from using and disposing of its long-lived assets (which consisted of a single asset group) and determined that these future cash flows aggregated $1,500,000 for the remaining estimated useful lives of the assets. The following comparison was made to the assets' carrying values:

Future cash flows over remaining estimated lives from use and disposition	$1,500,000
Carrying value	1,400,000
Excess (deficiency) of cash flows over carrying value	$ 100,000

Note the following anomalies that arise from this set of facts:

1. Because the gross, undiscounted cash flows from use and disposition of the asset group exceed the carrying value of the asset group, the group is not considered to be impaired even though its fair value has declined below its carrying value.
2. If the amount of the estimated future cash flows had been even slightly below the carrying value, say $1,390,000, the assets would be considered impaired.
3. If the assets were determined to be impaired, the carrying value would be required to be written down to fair value, which in this example is $1,200,000, and this write-down would be recognized prior to the resumption of goodwill impairment testing.

Tiered structures. Another possibly complicating factor is the existence of "tiered" structures, with goodwill reflected in the financial statements of a subsidiary entity. In such a circumstance, it is necessary to test for goodwill impairment at the subsidiary reporting unit level in the same manner as goodwill is tested by the parent entity. This subsidiary level test must to be made prior to making the test at the parent company level. If an impairment loss is recognized at the subsidiary level, consideration must be given to the question of whether it is "more likely than not" that the event that gave rise to the impairment loss at the subsidiary level would also reduce the fair value of the consolidated reporting unit or units in which the subsidiary's reporting unit with impaired goodwill resides, to an amount below its carrying amounts. If this is deemed not "more likely than not" to have occurred, then there is no need to test further. On the other hand, if it is deemed to be "more likely than not" that a fair value deficit might also impact the consolidated reporting unit(s), then there is a need to test for impairment at the consolidated reporting unit level. It is possible for the subsidiary to

recognize an impairment loss but for the consolidated reporting unit not to recognize a further loss—if the excess fair value of the other operations included in the consolidated reporting unit effectively offsets the deficit value flowing from the subsidiary's portion of that unit.

Display of goodwill and of goodwill impairment. The aggregate amount of goodwill is to be presented as a separate line item in the statement of financial position (balance sheet). Traditionally, in classified balance sheets, goodwill is an "other" noncurrent asset, distinguished from property, plant, and equipment.

The aggregate amount of goodwill impairment losses is generally to be presented as a separate line item in the operating section of the income statement. The exception to this rule is when the goodwill impairment loss is associated with a discontinued operation, in which case the impairment loss will be included, on a net-of-tax basis, within the results of discontinued operations. The portion of goodwill associated with net assets to be disposed of is recognized as part of the gain or loss on disposal and is not included in the calculation of impairment loss.

Disclosures about business combinations are to include the primary reason for the acquisition, including a description of the factors that contributed to a purchase price that reflects a premium that results in recognition of goodwill or a discount that results in recognition of an extraordinary gain (negative goodwill). If goodwill is material in relation to the total cost of a business acquisition, disclosure is required of the amount of acquired goodwill. The amount of acquired goodwill related to each segment (only for those entities that are required to report segment information) and the amount of acquired goodwill that is deductible for income tax purposes must also be disclosed.

For each period for which a balance sheet is presented, the notes to the financial statements must disclose the changes in the carrying amount of goodwill during the period. This must include the amount of goodwill acquired, the amount of impairment loss recognized, and the amount of goodwill included in the gain or loss on disposal of all or a portion of a reporting unit. For publicly held entities, this information is to be provided for each segment, and disclosure is to be made of any significant changes in the allocation of goodwill by segment.

For each goodwill impairment loss recognized, disclosure must be made of the following information: a description of the facts and circumstances leading to the impairment; a description of the reporting unit for which the impairment loss is recognized, the adjusted carrying amount of goodwill of that reporting unit, and the amount of the impairment loss; if applicable, the fact that the impairment loss is an estimate that has not yet been finalized, with the reasons therefore and, in subsequent periods, the nature and amount of any significant adjustments made to the initial estimate of the impairment loss; and, when salient, the segment to which the impaired goodwill pertains.

In the period in which an excess over cost related to an acquisition (i.e., negative goodwill) is recognized as an extraordinary gain, it will be shown net of income tax, as set forth by APB 30.

Special requirements for disposal of segments or other operations containing goodwill. When a significant portion of a reporting unit is disposed of, goodwill is allocated based on the relative fair values of the portion of the reporting unit being disposed of and the portion of the reporting unit remaining. An impairment test of the goodwill in the remaining (i.e., not disposed of) portion of the reporting unit would be required after the allocation of goodwill to ensure that the reporting unit can support the remaining goodwill.

Goodwill is allocated to a portion of a reporting unit being disposed of only when that portion constitutes a business. However, the allocation approach is not to be used when the

business being disposed of is not classified as held-for-sale and was never integrated into the reporting unit. In that scenario, since the operating unit's identity and the original goodwill are still intact, all of the goodwill associated with that business would be included in the determination of the gain or loss on disposal.

The relative fair value allocation approach is also used to determine how goodwill is to be allocated when an entity reorganizes its reporting structure.

Other impairment considerations. In some instances a reporting unit may consist of multiple asset groups, and an event might occur that would necessitate an evaluation to determine if the carrying values of some, but not all, long-lived assets of that reporting unit are fully recoverable, per ASC 360. In between required annual goodwill impairment tests, that same event that triggered the recoverability review of an asset group under ASC 360, might or might not require an interim impairment test of reporting unit goodwill, since the criteria differ between the two pertinent standards. Under ASC 350, should a recoverability review be required for a significant asset group within the reporting unit, management must assess whether the triggering event would, more likely than not, also result in a reduction of the fair value of that reporting unit.

Under ASC 350, the reporting unit is the unit of measurement for goodwill, and thus the reporting unit is the lowest level of assets with which goodwill can be associated. Therefore, goodwill cannot be associated with lower-level asset groups, and there is no need to allocate or otherwise associate reporting unit goodwill with asset groups when those assets are tested for impairment.

Example of the interrelationship between ASC 350 and ASC 360

By reference to the Chapter 2 diagram, "Alternative Balance Sheet Segmentation," the Parent Holding Company's (PHC) Subsidiaries 5 and 6 include two asset groups. PHC's last annual goodwill impairment testing date for Subsidiaries 5 and 6 was November 30, 2007. At March 31, 2008, an evaluation for recoverability is required for Asset Group (j) due to the incurrence of an operating loss for business ix that contains those assets coupled with the forecasted continuation of such losses for the foreseeable future. When PHC initially made the benchmark assessment of its goodwill and allocated the portion of goodwill that relates to reporting unit (5), all of that goodwill was related to Business viii, which is a self-contained asset group whose assets are not required to be reviewed for recoverability at March 31, 2008, and which has significantly outperformed the expectations that PHC originally had for it upon its initial acquisition. Consequently, management believes it unlikely that the poor financial results of business ix which contains Asset Group (j) would result in a reduction in the fair value of the reporting unit as a whole to an amount below its carrying value. Consequently, it is not necessary for PHC to perform a goodwill impairment test at March 31, 2008.

Goodwill may be an asset of a consolidated subsidiary, and the subsidiary may also prepare and present financial statements on a stand-alone basis (for example, to provide to creditors of, and noncontrolling stockholders in, that subsidiary). The subsidiary might constitute part of a reporting unit at the parent company level (by reference to the Chapter 2 diagram captioned "Alternative Balance Sheet Segmentation," for example, this is the case with Subsidiary 5). Per ASC 350, impairment must be tested annually at the subsidiary level when stand-alone financial statements of the subsidiary are produced, whether the subsidiary is publicly held or private. As discussed earlier, for consolidated financial reporting purposes, an impairment loss at the subsidiary level would not automatically be "pushed up," but testing for impairment at the level of the parent's reporting unit that contains that subsidiary would require consideration due to the indicator of possible impairment. If management considers it more likely than not that the goodwill impairment loss recognized by the subsidiary that is a component of a reporting unit would reduce the fair value of that reporting unit to an amount less than its carrying amount, then the goodwill of that reporting unit is

to be tested for impairment at the date the subsidiary recognizes its goodwill impairment loss. Upon testing, however, it might be the case that impairment would be found not to exist; this would be the result of the reporting unit's fair value exceeding its carrying value, probably because other component parts of that reporting unit had appreciated in value, thereby offsetting the reduction in value of the subsidiary.

Noncontrolling Interests

When a company acquires some, but not all, of the voting stock of another entity, the shares held by third parties represent a minority or noncontrolling interest in the acquired company. This occurs when the acquisition form of business combination is employed. A legal merger or consolidation would give the acquirer a 100% interest in whatever assets it obtained from the selling entity. Under GAAP, if a parent company owns more than half of another entity (majority ownership creating presumptive control), the two are generally to be consolidated for financial statement purposes. The only remaining exception to this rule occurs when the parent company does not have control over the subsidiary, such as in situations where the subsidiary is in bankruptcy or reorganization, or subject to severe restrictions imposed by a domestic or foreign government. The noncontrolling interest in the assets and earnings of the consolidated entity must also be accounted for, however.

When consolidated statements are prepared, the full amount of assets and liabilities (in the balance sheet) and income and expenses (in the income statement) of the subsidiary are generally presented. Accordingly, offsetting amounts must be shown for the portion of these items that does not belong to the parent company. In the balance sheet this offset is normally a credit shown as a separate caption in stockholders' equity, representing the noncontrolling interest in consolidated net assets equal to the noncontrolling percentage ownership in the net assets of the subsidiary, based on preacquisition book values. (Note that a likely forthcoming FASB pronouncement, *Business Combinations*, will require that all net assets be restated to fair value upon a business combination, including the noncontrolling interest's portion, in a departure from current practice.)

Some entities choose to present minority (noncontrolling) interest between liabilities and stockholders' equity; however CON 6, *Elements of Financial Statements*, points out that such noncontrolling interests do not meet the definition of a liability and that they represent residual interests in components of the consolidated entity. (Likely future pronouncements from FASB will require that noncontrolling interests be reported only in the equity section.)

Although less likely, a debit balance in noncontrolling interest could result when the subsidiary has a deficit in its stockholders' equity and when there is reason to believe that the noncontrolling owners will make additional capital contributions to erase that deficit. This situation sometimes occurs where the entities are closely held and the noncontrolling owners are related parties having other business relationships with the parent company and/or its stockholders. In most other circumstances, a debit in noncontrolling interest would be charged against parent company retained earnings under the concept that the loss will be borne by that company. Although some believe that this debit should be added to goodwill on the consolidated balance sheet instead, it might be difficult to demonstrate that this would not result in an overstatement of total assets.

In the income statement, the noncontrolling interest in the income (or loss) of a consolidated subsidiary is shown as a deduction from (or an addition to) consolidated net income. As above, if the noncontrolling interest in the net assets of the subsidiary has already been reduced to zero, and if a net debit noncontrolling interest will not be recorded (the usual case), then the noncontrolling interest in any further losses is also not recorded. (However, this must be explained in the notes to the financial statements.) Furthermore, if past noncon-

trolling losses have not been recorded, the noncontrolling interest in current profits will not be recognized until the aggregate of such profits equals the aggregate unrecognized losses. This closely parallels the rule for equity method accounting recognition of profits and losses.

Under current GAAP (FAS 141) goodwill arising from a purchase of less than 100% of the acquiree is valued at the difference between the purchase price paid by the acquirer and the acquirer's proportionate share of the fair values of the identifiable net assets acquired. The computational approach used to implement the parent company theory is called the partial goodwill method. Under this method, the noncontrolling interest is reported based on the book value of the subsidiary. (Note that under provisions of the forthcoming *Business Combinations* standard for the application of purchase accounting, this accounting will be superseded by a complete adoption of fair value accounting for partial business combinations, under which the acquired entity will be fully revalued at fair value, including recognition of the noncontrolling interest's share of identifiable net assets and implied goodwill.)

An example of currently applicable accounting procedures follows:

On January 1, 2008, Andes Company acquires a 90% interest in Baker Company in exchange for 5,400 shares of its $10 par value stock having a total market value of $120,600.

Details regarding the book values and fair values of the net assets acquired are as follows:

Item	*Book value (BV)*	*Fair value (FV)*	*Difference between BV and FV*
Cash	$ 37,400	$ 37,400	$ --
Accounts receivable (net)	9,100	9,100	--
Inventories	16,100	17,100	1,000
Equipment	50,000	60,000	10,000
Accumulated depreciation	(10,000)	(12,000)	(2,000)
Patents	10,000	13,000	3,000
Accounts payable	(6,600)	(6,600)	--
Total	$106,000	$118,000	$12,000

Note that the book value of the net assets of Baker Company may be computed by one of the following two methods:

1. Subtract the book value of the liability from the book values of the assets.

$112,600 – $6,600 = $106,000

2. Add the book values of the components of Baker Company stockholders' equity.

$50,000 + $15,000 + $41,000 = $106,000

The balance sheets of Andes and Baker are presented below as of January 1, 2008, immediately preceding the purchase.

Andes Company and Baker Company
Balance Sheets at 1/1/08
(Immediately before combination)

	Andes Company	*Baker Company*
Assets		
Cash	$ 30,900	$ 37,400
Accounts receivable (net)	34,200	9,100
Inventories	22,900	16,100
Equipment	200,000	50,000
Less accumulated depreciation	(21,000)	(10,000)
Patents	--	10,000
Total assets	$267,000	$112,600

	Andes Company	Baker Company
Liabilities and stockholders' equity		
Accounts payable	$ 4,000	$ 6,600
Bonds payable, 10%	100,000	--
Common stock, $10 par value	100,000	50,000
Additional paid-in capital	15,000	15,000
Retained earnings	48,000	41,000
Total liabilities and stockholders' equity	$267,000	$112,600

The working paper for preparing a consolidated balance sheet at the date of acquisition is presented below. The first two columns are the trial balances of Andes Company and Baker Company immediately following the acquisition.

Andes Company and Baker Company Consolidated Working Papers
For Date of Combination—1/1/08

90% interest

	[1]	*[2]*	*[3]*	*[4]*	*[5]*	*[6]*
	Andes Company	*Baker Company (book value)*	*Adjustments and eliminations Debit*	*Credit*	*Noncontrolling interest*	*Consolidated balances*
Balance sheet, 1/1/08						
Cash	$ 30,900	$ 37,400				$ 68,300
Accounts receivable, net	34,200	9,100				43,300
Inventories	22,900	16,100	$ 900b			39,900
Equipment	200,000	50,000	9,000b			259,000
Accumulated depreciation	(21,000)	(10,000)		$ 1,800b		(32,800)
Investment in stock of Baker Company	120,600			120,600a		
Difference between cost and book value			25,200b	25,200b		
Excess of cost over fair value (goodwill)			14,400b			14,400
Patents		10,000	2,700b			12,700
Total assets	$387,600	$112,600				$404,800
Accounts payable	$ 4,000	$ 6,600				$ 10,600
Bonds payable	100,000					100,000
Common stock	154,000	50,000	45,000a		$ 5,000	154,000
Additional paid-in capital	81,600	15,000	13,500a		1,500	81,600
Retained earnings	48,000	41,000	36,900a		4,100	48,000
Noncontrolling interest					$10,600	10,600
Total liabilities and equity	$387,600	$112,600	$147,600	$147,600		$404,800

1. Record investment in Andes Company's accounting records (entry already reflected in column [1] above).

   The entry by Andes Company to record the 90% purchase-acquisition was

Investment in stock of Baker Company	120,600	
Common stock		54,000
Additional paid-in capital		66,600

   To record the issuance of 5,400 shares of $10 par value stock to acquire a 90% interest in Baker Company

   Although common stock is used for the consideration in our example, Andes Company could have used debentures, cash, or any other form of consideration acceptable to Baker Company's stockholders to make the purchase. This entry is identical to the first entry in the preceding example using the entity theory/full goodwill method.

2. Difference between investment cost and book value

   The difference between the investment cost and the parent company's equity in the net assets of the subsidiary is computed as follows:

Investment—FV of 5,400 shares of Andes issued		$120,600
Common stock	$50,000 × 90% =	45,000
Additional paid-in capital	15,000 × 90% =	13,500
Retained earnings	41,000 × 90% =	36,900
Andes' share—Baker net assets/stockholders' equity		95,400
Differential		$25,200

This difference is due to several undervalued assets and to unrecorded goodwill. The allocation procedure is similar to that for a 100% purchase; however, in this case, the parent company obtained a 90% interest, and thus, will only recognize 90% of the difference between the fair values and book values of the subsidiary's assets, not 100%. The allocation is presented as follows:

Allocation of the Differential

Item	Book value (BV)	Fair value (FV)	Difference between BV and FV	Ownership percentage	Percentage share of difference between BV and FV
Cash	$ 37,400	$ 37,400	$ --		
Accounts receivable (net)	9,100	9,100	--		
Inventories	16,100	17,100	1,000	90%	$ 900
Equipment	50,000	60,000	10,000	90%	9,000
Accumulated depreciation	(10,000)	(12,000)	(2,000)	90%	(1,800)
Patents	10,000	13,000	3,000	90%	2,700
Accounts payable	(6,600)	(6,600)	--		
Total	$106,000	$118,000	$12,000		

Amount of difference between purchase price and share of book value allocated to revaluation of net assets	10,800
Total differential per above	25,200
Remainder allocated to goodwill	$14,400

The equipment has a book value of $40,000 ($50,000 less 20% depreciation of $10,000). An appraisal concluded that the equipment's replacement cost new was $60,000 less 20% accumulated depreciation of $12,000 resulting in a net fair value of $48,000.

Goodwill is proven by the following computation:

Purchase price paid by Andes		$120,600
Fair value of net assets acquired	$118,000	
Percentage interest acquired	× 90%	106,200
Excess of purchase price over fair value of net assets acquired		$ 14,400

Noncontrolling interest is proven by the following computation:

Fair value of net assets acquired	$118,000
Percentage interest retained by former controlling stockholders	× 10%
Noncontrolling interest	$ 11,800

3. Consolidating entries on working paper

The basic reciprocal accounts are the investment in subsidiary account on the parent's books and the subsidiary's stockholders' equity accounts. Only the parent's share of the subsidiary's accounts may be eliminated as reciprocal accounts. The remaining 10% portion is allocated to the noncontrolling interest. The working paper entry to eliminate the basic reciprocal accounts is as follows:

Entry a:

Capital stock—Baker Co.	45,000	
Additional paid-in capital—Baker Co.	13,500	
Retained earnings—Baker Co.	36,900*	
Differential	25,200	
Investment in stock of Baker Co.—Andes Co.		120,600

* *($41,000 × 90% = $36,900)*

Note that only 90% of Baker Company's stockholders' equity accounts are eliminated. Also, an account called "differential" is debited in the working paper entry. The differential account is a temporary account to record the difference between the cost of the investment in Baker Company in the parent's accounting records and the book value of the parent's interest (90% in this case) from the subsidiary's accounting records.

The next step is to allocate the differential to the specific assets by making the following workpaper entry:

Entry b:

Inventory	900	
Equipment	9,000	
Patents	2,700	
Goodwill	14,400	
Accumulated depreciation		1,800
Differential		25,200

This entry reflects the allocations prepared in step 2. and recognizes the parent's share of the asset revaluations. The noncontrolling interest column is the 10% interest of Baker Company's net assets owned by third parties. Under current GAAP, there is no step-up for the noncontrolling interest's share of the excess of the fair value of net assets over book value.

The foregoing examples do not include any other intercompany balances as of the date of consolidation. If any such balances existed, they would be eliminated to fairly present the financial position of the consolidated entity. Several examples of the elimination of other reciprocal amounts will be shown later in the illustration of the preparation of consolidated financial statements subsequent to the date of acquisition.

Consolidated Statements in Subsequent Periods

The same concepts employed to prepare a consolidated balance sheet at the date of acquisition are applicable to later consolidated statements. Where a noncontrolling interest exists, income in subsequent periods must be allocated to it. The exact nature of the worksheet entries depends on whether the parent is maintaining its accounting records of the investment in a subsidiary using the cost method or equity method (which are acceptable alternatives since the consolidated financial statements will be identical under either method). The equity method is often used when a separate, parent-only column is included in consolidating financial statements.

In addition to the eliminating entries for the parent's recorded investment and subsidiary stockholders' equity, other eliminations will be needed when there are intercompany balances or transactions resulting from parent-subsidiary loans (advances), sales of inventory items (whether or not these occurred at a profit to the seller), sales of fixed assets at other than net book value, and bond transactions or transactions in stock other than voting common shares. The selected items in the following example will demonstrate the accounting issues applicable to all such intercompany items and the proper handling of these items in the consolidation working papers.

Example of a consolidation in subsequent periods

The basic facts of the Andes Company-Baker Company case have already been presented. Additional information is as follows:

1. Andes Company uses the equity method to record changes in the value of its investment in Baker.
2. During 2008, Andes Company sold merchandise to Baker Company for $20,000 that originally cost Andes Company $15,000. This is referred to as a downstream sale. On December 31, 2008, Baker Company's inventory included merchandise purchased from Andes Company at a cost to Baker Company of $12,000.

3. Also during 2008, Andes Company purchased $18,000 of merchandise from Baker Company. This is referred to as an upstream sale. Baker Company uses a normal markup of 25% above its cost. Andes Company's ending inventory includes $10,000 of the merchandise acquired from Baker Company.
4. Baker Company reduced its intercompany account payable to Andes Company to a balance of $4,000 as of December 31, 2008, by making a payment of $1,000 on December 30. This $1,000 payment was still in transit on December 31, 2008, and thus, had not yet been received by Andes.
5. On January 2, 2008, Baker Company acquired equipment from Andes Company for $7,000. The equipment was originally purchased by Andes Company for $5,000 and had a book value of $4,000 at the date of sale to Baker Company. The equipment had an estimated remaining life of four years as of January 2, 2008, and is being depreciated using the straight-line method, with no estimated salvage value.
6. On December 31, 2008, Baker Company purchased for $44,000, 50% of the outstanding bonds issued by Andes Company. The bonds mature on December 31, 2013, and were originally issued at par. The bonds pay interest annually on December 31 of each year, and the interest was paid to the prior investor immediately before Baker Company's purchase of the bonds.

The worksheet for the preparation of consolidated financial statements as of December 31, 2008, is presented below.

The balance shown in the parent's accounting records as "investment in subsidiary" at the financial statement date should be reconciled to ensure the parent company made the proper entries under the method of accounting used to account for its investment.

An analysis of the investment in Baker at December 31, 2008, is as follows:

	Investment in Stock of Baker Company		
Original cost, 1/1/08	120,600		
% of Baker Co.'s 2008 income ($9,400 × 90%)	8,460	3,600	% of Baker Co.'s 2008 dividends paid ($4,000 × 90%)
Balance, 12/31/08	125,460		

Any errors would require correcting entries before the consolidation process is continued. Correcting entries are posted by the appropriate company; eliminating entries are not recorded by either company.

The difference between the cost of the investment and the book value of the net assets acquired was determined and allocated in the preparation of the date of acquisition consolidated balance sheet presented earlier. The same computations are used in preparing financial statements for as long as the investment is owned. Since FASB has currently expressed its preference for the entity theory/full goodwill method, the illustration of that method is carried forward for the purpose of this example.

The following adjusting and eliminating entries are required to prepare consolidated financial statements as of December 31, 2008, and for the year then ended. The number or letter in parentheses to the left of the entry corresponds to the key used on the worksheet.

Step 1 —Complete the transaction for any intercompany items in transit at the end of the year.

		Debit	Credit
(a)	Cash	1,000	
	Accounts receivable—subsidiary		1,000

This adjusting entry will now properly present the financial positions of both companies by eliminating the timing difference.

Step 2 —Prepare the eliminating entries.

		Debit	Credit
(a)	Sales	38,000	
	Cost of sales		38,000

Total intercompany sales of $38,000 include $20,000 in a downstream transaction sold from Andes Company to Baker Company and $18,000 in an upstream transaction sold from Baker Company to Andes Company.

(b)	Cost of sales	5,000	
	Inventory		5,000

The ending inventories are overstated because of the unrealized gross profit from the intercompany sales. The debit to cost of goods sold is required because a decrease in ending inventory will increase cost of goods sold to be deducted on the income statement. Supporting computations for the entry are as follows:

	In ending inventory of	
	Andes Company	*Baker Company*
Intercompany sales not resold, at selling price	$10,000	$12,000
Cost basis of remaining intercompany merchandise		
From Baker to Andes (÷ 125%)	(8,000)	
From Andes to Baker (÷ 133 1/3%)		(9,000)
Unrealized gross profit	$ 2,000	$ 3,000

NOTE: When preparing consolidated working papers for 2009 (the next fiscal period), an additional eliminating entry will be required if the goods in 2008's ending inventory are sold to outsiders during 2009. The additional entry will recognize the profit for 2009 that was eliminated as unrealized in 2008. This entry is necessary since the entry at the end of 2008 was made only on the worksheet and not recorded in the accounting records of either Andes or Baker. The 2009 entry would be as follows:

Retained earnings—Baker Co., 1/1/09	2,000	
Retained earnings—Andes Co., 1/1/09	3,000	
Cost of goods sold, 2009		5,000

(c)	Accounts payable—Parent	4,000	
	Accounts receivable—Subsidiary		4,000

This entry eliminates the remaining intercompany receivable/ payable owed by Baker Company to Andes Company. This eliminating entry is necessary to avoid overstating the consolidated entity's balance sheet. The receivable/payable is not extinguished, and Baker Company must still transfer $4,000 to Andes Company in the future.

(d)	Gain on sale of equipment	3,000	
	Equipment		2,000
	Accumulated depreciation		250
	Depreciation expense		750

This entry eliminates the gain on the intercompany sale of the equipment, eliminates the overstatement of equipment, and removes the excess depreciation taken on the gain. Supporting computations for the entry are as follows:

	Cost	*At date of intercompany sale accum. depr.*	*2008 depr. ex.*	*End-of-period accum. depr.*
Original basis (to seller, Andes Co.)	$5,000	$(1,000)	$ 1,000	$(2,000)
New basis (to buyer, Baker Co.)	7,000	--	1,750	(1,750)
Difference	$(2,000)		$(750)	$ 250

If the intercompany sale had not occurred, Andes Company would have depreciated the remaining book value of $4,000 over the estimated remaining life of four years. However, since Baker Company's acquisition price ($7,000) was more than Andes Company's undepreciated basis in the asset

($4,000), the depreciation recorded by Baker Company will include part of the unrealized intercompany profit. The equipment must be reflected on the consolidated balance sheet at its original cost to the consolidated entity. Therefore, the write-up of $2,000 in the equipment, the excess depreciation of $750, and the gain of $3,000 all must be eliminated in consolidation. The ending balance of accumulated depreciation must be shown at what it would have been if the intercompany equipment transaction had not occurred. In future periods, a retained earnings adjustment will be used instead of adjusting the gain since the gain is a 2008 transaction; however, concepts with respect to adjusting accumulated depreciation and the related expense will be extended to include the additional periods.

(e)	Bonds payable	50,000	
	Investment in bonds of Andes Company		44,000
	Gain on debt extinguishment		6,000

This entry eliminates the book value (the par value of the bonds) of Andes Company's debt against the bond investment account of Baker Company. To the consolidated entity, this transaction is shown as a retirement of debt even though Andes Company still owes the outstanding intercompany debt to Baker Company. For the purpose of this example, it is assumed that Baker Company is accounting for its investment in the bonds as being held-to-maturity under ASC 320 and, therefore, accounting for the investment at amortized cost. In future periods, Baker Company will amortize the discount, ultimately, upon maturity, bringing the recorded investment up to its par (maturity) value. Retained earnings will be used in future eliminating entries instead of the gain since the gain is a 2008 event.

(f)	Equity in subsidiary's net income—Andes Co.	8,460	
	Dividends paid—Baker Co.		3,600
	Investment in stock of Baker Co.		4,860

This eliminating entry adjusts the carrying value of the investment in Baker back to its balance at the beginning of the period and also eliminates the subsidiary's net income. The elimination is computed as follows:

Baker's net income of $9,400 × 90% attributable to Andes	=	$ 8,460
Baker's dividends paid of $4,000 × Andes' 90% share	=	$ 3,600
Andes' investment in Baker at 12/31/08		$125,460
Andes' original recorded investment in Baker		120,600
Effects of Andes' 2008 equity method accounting		$ 4,860

(g)	Goodwill	16,000	
	Inventories	1,000	
	Equipment	10,000	
	Patents	3,000	
	Common stock—Baker Company	50,000	
	Additional paid-in capital—Baker Company	15,000	
	Retained earnings—Baker Company	41,000	
	Accumulated depreciation		2,000
	Noncontrolling interest		13,400
	Investment in Baker		120,600

This entry eliminates Baker Company's stockholders' equity at the beginning of the year, 1/1/08, reflects 100% of the imputed goodwill associated with Baker, revalues the acquired assets at their acquisition date fair values, reflects the noncontrolling interests of the formerly controlling stockholders of Baker, and eliminates Andes' 1/1/08 investment in Baker. Note that the changes in these amounts during the year were eliminated in entry (f) above. Also note that this entry is identical with the 1/1/08 revaluation and

elimination entry 2. in the example of recording the acquisition at 1/1/08 using the entity theory/full goodwill method.

(h)			
	Cost of sales	1,000	
	Depreciation expense	2,000	
	Other operating expenses—patent amortization	300	
	Inventory		1,000
	Accumulated depreciation		2,000
	Patents (or contra asset, accumulated amortization)		300

The elimination entry amortizes the revaluations to fair value made in entry (g). The inventory has been sold and, therefore, becomes part of cost of goods sold. Goodwill is not amortized, but will be tested annually for possible impairment. The remaining revaluations will be amortized as follows:

	Revaluation	*Amortization period*	*Annual amortization*
Equipment (net)	$8,000	4 years	$2,000
Patents	3,000	10 years	300

Amortization will continue to be made on future worksheets. For example, at the end of the next year (2009), the amortization entry (h) would be as follows:

Retained earnings	3,300	
Depreciation expense	2,000	
Other operating expenses—patent amortization	300	
Inventory		1,000
Accumulated depreciation		4,000
Patents (or contra asset, accumulated amortization)		600

The $3,300 debit to retained earnings is an aggregation of the prior period's charges affecting the income statement ($1,000 + $2,000 + $300). During subsequent years, some accountants prefer reducing the allocated amounts in entry (g) for prior periods' charges. In this case, the amortization entry in future periods would reflect just that period's amortization.

In adjusting for the noncontrolling interest in the consolidated entity's equity and earnings, the following guidelines are to be observed:

1. The entire subsidiary's stockholders' equity section is eliminated in the basic eliminating entry. The noncontrolling interest's share of the subsidiary's stockholders' equity is presented separately.
2. The entire amounts of intercompany transactions and balances are eliminated. For example, all receivables/payables and sales/cost of sales with a 90% subsidiary are eliminated.
3. For intercompany transactions in inventory and fixed assets, the possible effect on noncontrolling interest depends on whether the original transaction affected the subsidiary's income statement. Noncontrolling interest is adjusted only if the subsidiary is the selling entity (upstream sales). In this case, the noncontrolling interest is adjusted for its percentage ownership of the common stock of the subsidiary. The noncontrolling interest is not adjusted for unrealized profits on downstream sales. The effects of downstream transactions are confined solely to the parent's (i.e., controlling) ownership interests.

The noncontrolling interest's share of the subsidiary's net income is shown as a deduction on the consolidated income statement since 100% of the subsidiary's revenues and expenses are consolidated, even though the parent company owns less than a 100% interest. For this example, the noncontrolling interest deduction on the income statement is computed as follows:

Baker Company's reported income	$9,400
Less unrealized profit on an upstream inventory sale	(2,000)
Baker Company's income for consolidated financial statement purposes	7,400
Noncontrolling interest share	× 10%
Noncontrolling interest share of Baker net income	$ 740

Common stock	154,000	50,000	50,000[g]			154,000
Additional paid-in capital	81,600	15,000	15,000[g]			81,600
Retained earnings (from above)	68,060	46,400	98,760	48,350	$340	63,710
Noncontrolling interest				13,400[g]	$340	13,740
Total stockholders' equity	303,660	111,400				313,050
Total liabilities and stockholders' equity	$412,560	$130,350	$48,760	$48,760	$0	$386,900

Other Accounting Issues in Business Combinations

Contingent consideration. Many business acquisitions include contingent consideration features, which require, if specified conditions are later met, that additions to the purchase price be paid either in cash, or in shares of the acquiring entity. The presence of contingent consideration provisions in an acquisition arrangement must be addressed, both at the time of the acquisition and later, if and when contingent consideration is earned and paid.

Under FAS 141, contingent consideration was not deemed part of the cost of the acquisition until the contingency (e.g., future earnings) was later resolved. (But see exception in following paragraph.) However, under ASC 805, as described in this chapter, the estimated fair value of such contingent payments is to be incorporated into the purchase price determination. The following comments apply to requirements under FAS 141.

At the date of the acquisition, under FAS 141, contingent consideration is important to the extent that it precludes immediate recognition of an extraordinary gain arising from the excess of "negative goodwill" over the amounts allocable to reduce the carrying values of various assets (all assets other than cash, receivables, inventory, financial instruments carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred income tax assets). Under GAAP, if such an excess exists, it is to be classified as a deferred credit, not taken into earnings, until the contingency regarding the purchase price has been resolved.

In truth, only a small fraction of business combinations are true "bargain purchases," and of these, it is expected that only a minute portion will result in such a large amount of negative goodwill that an excess will remain after offsetting against the qualified assets. Of those, an even smaller proportion will relate to transactions in which contingent consideration is to be paid, and thus for which the deferral of what otherwise would be immediately recognized as extraordinary gain would be prescribed.

The accounting for the subsequent payment of the added (i.e., contingent) consideration depends upon whether the contingency was related to the earnings of the acquired entity or to the fair value of the original consideration package given by the acquirer.

In the former instance, commonly referred to as an "earn-out" provision, a subsequent payment of added cash, stock, or any other valuable consideration will require a revaluation of the purchase price. This revaluation possibly could alter the amounts allocable to certain (mostly noncurrent) assets (where cost in the original purchase transaction was less than fair value acquired (i.e., a "bargain purchase") and the difference was offset against those assets), or could result in an increased amount of goodwill being recognized. The effects of a revaluation are handled prospectively (i.e., the additional depreciation of fixed assets is allo-

cated to the remaining economic lives of those items) without making any adjustment to postacquisition periods' results already reported.

In the latter case, the event triggering the issuance of additional shares is a decline in fair value of the original purchase package. Additional shares of the acquirer's stock are issued in order to restore the value of the consideration to the amount intended by the parties at the date of the transaction. According to FAS 141, this does not alter the total cost of the transaction for accounting recognition purposes, even though further consideration is later transferred to the former owners of the acquiree. The total value of the purchase would not be changed and, thus, no alteration of amounts allocated to the various assets and liabilities acquired would be needed. However, the issuance of extra shares of common stock will typically require that the allocation between the common stock and the additional paid-in capital accounts be adjusted, if the shares carry par or stated values.

In rare instances, contingent consideration based on the value of the securities used to effect the acquisition may involve transactions in which common stock was not used. If part of the original purchase price had been paid in bonds or other debt instruments, the reallocation might affect the premium or discount recognized on the debt, which would have an impact on future earnings as these accounts are subsequently amortized.

Net operating loss carryforwards of an acquired entity. An entity acquired in a purchase business combination may have a net operating loss carryforward (NOL) that will be available for use by the acquiring entity. While prior GAAP generally prohibited recognition of the income tax benefit of NOL, under ASC 740, deferred income tax assets including NOL are given recognition. Under this standard, benefits related to acquired NOL are reported in the acquirer's balance sheet (as are deferred income tax assets arising from any other future deductible temporary differences). A valuation allowance is also recorded if realization of the NOL is not considered "more likely than not."

As discussed more fully in Chapter 17, recognition "for the first time" of the benefits of NOL (acquired in a purchase business combination at a date subsequent to the purchase) is accomplished by reducing recorded goodwill to zero. Next, if further acquired NOL are realized, other identifiable intangible assets acquired in the same transaction are reduced to zero. Any excess over this amount is reflected as an adjustment to current period deferred income tax expense or benefit. "For the first time" means that a valuation allowance has been reduced or eliminated, either because the probability of realization has been reassessed or because the income tax benefits have, in fact, been realized in the current period.

Preacquisition contingencies. At the time a business combination is consummated, the purchase price must be allocated to acquired assets and assumed liabilities in accordance with their respective fair values, with any excess purchase price being assigned to goodwill (if fair value exceeds cost, the cost deficiency is allocated primarily against noncurrent assets, with any remainder treated as "negative goodwill" and, in general, recognized as an extraordinary gain at the date of the acquisition). In some cases, however, the fair values of certain assets (e.g., those to be disposed of) may not be known with precision, and the amounts of certain estimated or contingent liabilities (such as outstanding warranty or litigation claims) may also be subject to a high degree of uncertainty. FAS 141 provides for a "look back" to reallocate the purchase price when these contingencies are ultimately resolved. However, under FAS 141 there is a limited allocation period, usually deemed to be one year, during which a reallocation can be effected; thereafter, resolutions of preacquisition contingencies are treated as current period events and reported in net income of that period.

An exception to this rule exists in the case of income tax uncertainties existing at the date of the business combination. Resolution of these must be accounted for in accordance with ASC 740, which stipulates that such adjustments are to be applied to increase or de-

crease the remaining balance of goodwill attributable to that business combination; if goodwill is reduced to zero, the remaining amount is first used to reduce other noncurrent intangible assets from the same acquisition to zero, and any excess beyond that amount is recorded as an adjustment to the deferred income tax expense or benefit for the period of resolution. Thus, the resolution of these specific income tax uncertainties cannot result in a general reallocation of the purchase price, as are other resolutions of preacquisition contingencies.

Changes in controlling interest. The parent's ownership interest can change as a result of purchases or sales of the subsidiary's common shares by the parent, or as a consequence of capital transactions consummated by the subsidiary itself. The latter circumstance is generally handled precisely as demonstrated in the equity method discussion in Chapter 12, (see pages 545-547). If the parent's relative book value interest in the subsidiary changes, gains or losses are treated as incurred in an entity's own treasury stock transactions. Gains are credited to additional paid-in capital; losses are charged to any previously created additional paid-in capital or, absent that, to retained earnings. However, in financial statements of its registrants, the SEC requires that the parent company recognize a gain on a transaction when a subsidiary sells shares to outside interests at a price greater than the parent's carrying amount.

When the parent's share of ownership increases through the purchase of additional stock in the subsidiary, the cost of the newly acquired stock is debited to the asset, "investment in subsidiary," with a corresponding credit to cash. An issue arises in the preparation of consolidated income statements when the change in ownership takes place midperiod. Consolidated statements are to be prepared based on the ending ownership level.

Example of a consolidation with a change in the majority interest

Assume that Andes Company increased its ownership of Baker Company from 90% to 95% on October 1, 2008. The investment was acquired at book value of $5,452.50 determined as follows:

Baker Company common stock outstanding at 10/1/08		$50,000
Additional paid-in capital, 10/1/08		15,000
Retained earnings at 10/1/08		
Balance, 1/1/08	$41,000	
Net income for nine months ($9,400 × .75)	7,050*	
Preacquisition dividends paid	(4,000)	44,050
		109,050
		× 5%
Book value acquired		$5,452.50

* *Assumes income was earned evenly over the year.*

The consolidated net income attributable to Andes' interests for 2008 would reflect a net of

90%	×	$9,400	×	12/12	=	$8,460.00
5%	×	$9,400	×	3/12	=	117.50
95%						$8,577.50

The preacquisition dividends ($4,000 × 90%) would have been recorded by Andes as follows:

Cash	3,600.00	
Investment in Baker company		3,600.00

Andes would apply the equity method to record its share of the consolidated net income as follows:

Investment in Baker company	8,577.50	
Equity in subsidiary's income		8,577.50

The interim stock purchase results in a new caption, **purchased preacquisition earnings**, being presented on the consolidated income statement. This caption represents the percentage of the subsidiary's income earned, in this case, on the 5% stock interest from January 1, 2008, to October 1, 2008. The basic eliminating entries would be based on the 95% ownership as follows:

Equity in subsidiary's income—Andes Co.	8,577.50	
Dividends paid—Baker Co.		3,600.00
Investment in Baker Co.		4,977.50
Goodwill	16,000.00	
Inventories	1,000.00	
Equipment	10,000.00	
Patents	3,000.00	
Common stock—Baker Co.	50,000.00	
Additional paid-in capital—Baker Co.	15,000.00	
Retained earnings—Baker Co.**	40,800.00	
Purchased preacquisition earnings***	352.50	
Accumulated depreciation		2,000.00
Investment in stock of Baker Co.—Andes Co. ****		120,600.00
Noncontrolling interest*****		13,552.50

** *$41,000 beginning 2008 balance*	*$41,000*
Less preacquisition dividend of 5% x $4,000	*(200)*
Retained earnings available, as adjusted	*$40,800*
*** *5% × $9,400 × 9/12 = $352.50*	
**** *Original cost, 1/1/08, for 90% interest*	*$120,600*
***** *Noncontrolling interest consists of:*	
Originally recognized amount	*$13,400.00*
Allocated share of earnings 1/1/08 – 10/1/08 ($9,400 × 75% × 10% = $705)	*705.00*
Share of preacquisition dividends through 10/1/08 ($4,000 × 10% = $400)	*(400.00)*
Sale of 50% preacquisition retained net income to Andes [($705 – $400) × 50% = $152.50]	*(152.50)*
	$13,552.50

Purchased preacquisition earnings are shown as a deduction, along with noncontrolling interest, to arrive at consolidated net income. Purchased preacquisition earnings are used only with interim acquisitions when applying the purchase accounting method.

Requirement that all majority-owned subsidiaries be consolidated. It has been a general assumption under GAAP that when one entity is owned outright or a majority of its voting interests are controlled by another entity (the parent company), the most meaningful representation of the parent company's real financial position and economic performance will be through the presentation of consolidated financial statements. This presumption dates from the issuance in 1959 of ARB 51, *Consolidated Financial Statements*, which stopped short of absolutely requiring that consolidated financial reporting be employed. Over the ensuing years, a number of excuses for not fully consolidating certain subsidiaries arose, leading to substantial diversity of reporting practices. This in turn resulted in FASB issuance of FAS 94, *Consolidation of All Majority-Owned Subsidiaries*.

The practice of excluding some or all subsidiaries from the parent company's financial statements was variously justified due to the parent's lack of absolute control over the affairs of the subsidiary, whether because of legal restrictions or due to the relationship with non-controlling owners, as well as when control was present but expected to be only temporary. More controversial, if less widely understood, were situations where "off-balance-sheet financing" was accomplished through the use of majority or wholly owned leasing, factoring, or other financing subsidiaries that were then excluded from the parent's financial statements. The actual justification given for excluding these entities from the consolidated financial statements, particularly in the cases of highly leveraged financing subsidiaries, was that consolidation of such "nonhomogeneous" operations would distort the parent's key financial and operating statistics, such as the working capital ratio and gross profit margin.

FAS 94 significantly narrowed, but did not totally eliminate, the ability of entities to exclude majority-owned subsidiaries from parent company financial statements. Most impor-

tantly, the "nonhomogeneity" argument could no longer be used to exclude leasing, real estate, financing, insurance, or other subsidiary operations. Under FAS 94, all majority-owned subsidiaries were to be consolidated, unless (1) control over the subsidiary was expected to be temporary in nature, or (2) control could be shown to not reside with the majority owner.

FAS 144 further restricted decisions to not consolidate majority-owned subsidiaries by eliminating the "temporary control" exception. Thus, currently, only demonstrable lack of ability to control the majority-owned subsidiary can justify excluding it from the parent company's consolidated financial statements.

Separate financial statements of entities that are majority owned by other companies (i.e., its subsidiaries) are still permitted to be issued. In fact, noncontrolling stockholders and other interested parties (creditors, vendors, or customers, as well as regulatory authorities) might, in many instances, receive little useful disaggregated information from the parent company's consolidated financial statements. However, if the reporting subsidiary itself had one or more majority-owned subsidiaries of its own, these would be consolidated in the financial statements of the first-tier subsidiary.

Majority-owned subsidiaries that are not consolidated due to the absence of control by a parent company will generally be accounted for using the equity method (discussed in detail in Chapter 11). Analysis of the specific facts and circumstances (e.g., whether the parent has significant influence, even if not actual control) will determine whether the equity method is appropriate.

Combined Financial Statements

When a group of entities is under common ownership, control, or management, it is often useful to present combined (or combining—showing the separate as well as the combined entities) financial statements. In this situation, the economic substance of the nominally independent entities' combined operations may be more important to financial statement users than is the legal form of those enterprises. When consolidated statements are not presented, combined statements may be used to show the financial position, or operating results, of a group of companies that are each subsidiaries of a common parent.

According to ARB 51, the process of preparing combined statements is virtually the same as consolidations employing the previously permitted pooling-of-interests method. The major exception is that the equity section of the combined balance sheet will incorporate the equity sections of both of the combining entities. However, only a single combined retained earnings amount need be presented.

Example of the stockholders' equity section of a combined financial statement

Lanushka Ltd. and Scully Enterprises, Inc.
Combined Balance Sheet
December 31, 2008

Stockholders' equity	
Capital stock:	
Preferred, $100 par, authorized 90,000 shares, issued 5,000 shares	$ 500,000
Common, $50 par, authorized 100,000 shares, issued 60,000 shares	3,000,000
Common, $10 par, authorized 250,000 shares, issued 100,000 shares	1,000,000
Additional paid-in capital	650,000
Retained earnings	3,825,000
	$8,975,000

Combinations of Entities under Common Control

FAS 141 explicitly does not apply to combinations of entities under common control (parent and subsidiary, brother-sister corporations, etc.). Mergers among such affiliated en-

tities must be accounted for "as if" poolings. This treatment is consistent with the concept of poolings as combinations of common stockholder interests. Notwithstanding the banning of pooling of interests accounting under current GAAP, this prescription still remains in effect.

A question arises, however, when a parent (Company P) transfers ownership in one of its subsidiaries (Company B) to another of its subsidiaries (Company A) in exchange for additional shares of Company A. If P's carrying value of its investment in B differs from B's book value, there appears to be a requirement for A to reflect its new investment in B at B's book value, rather than at P's cost (or equity) basis.

EITF 90-5 resolved this apparent conflict by stating that A's carrying value for the investment in B is to be P's basis, not B's book value. Furthermore, if A subsequently retires the interests of noncontrolling owners of B, the transaction is to be accounted for as a purchase, whether it is effected through a stock issuance by A or by a cash payment to the selling shareholders.

The EITF further concluded (in Issue 90-13) that when a purchase transaction is closely followed by a "sale" of the parent's subsidiary to the newly acquired (target) entity, these two transactions are to be viewed as a single transaction. Accordingly, the parent recognizes gain or loss on the sale of its subsidiary to the target company, to the extent of noncontrolling interest in the target entity. As a result, there will be a new basis (step-up) not only for the target company's assets and liabilities, but also for the subsidiary company's net assets. Basis is stepped up to the extent of noncontrolling participation in the target entity to which the subsidiary company was transferred.

Combinations of Mutual Enterprises and Not-for-Profit Organizations

Mutual enterprises. Acquisitions of an investor-owned entity by a mutual enterprise and acquisitions of a mutual enterprise by an investor-owned entity are fully subject to the requirements of FAS 141. Historically, combinations of mutual enterprises (of which mutually owned savings and loan associations had been the most prominent) had been accounted for as poolings of interests, since there was normally no exchange of cash or other assets as consideration for the transaction. Also, the identity of the "acquirer" was difficult to ascertain in such transactions. Under the provisions of FAS 141, pooling accounting has been eliminated, and in every business combination one party must be identified as the acquirer.

APB 16 and 17 continue to be applicable to combinations of two or more mutual enterprises until such time as FASB is able to provide guidance on how it will meet its stated objective of including mutual enterprises in the scope of FAS 141.

Not-for-profit organizations. As with mutual enterprise mergers, many not-for-profit organization combinations are characterized by an absence of cash or other consideration being paid by the presumptive acquirer. Also, many of these combinations have traditionally been accounted for as poolings, which is banned under FAS 141. The acquisition of a not-for-profit organization by a business enterprise is already within the scope of FAS 141. The FASB is currently pursuing a project designed to provide guidance regarding combinations of not-for-profit organizations and the treatment of goodwill and other intangible assets acquired in a merger or acquisition. In the interim, such combinations are subject to the requirements of SOP 94-3, *Reporting of Related Entities by Not-for-Profit Organizations.*

Accounting for Leveraged Buyouts

One of the most complex accounting issues to have arisen over the past several decades has been the appropriate accounting for a leveraged buyout (LBO). At the center of this issue is the question of whether a new basis of accountability has been created by the LBO transaction. If so, then a step-up in the reported value of assets and/or liabilities is warranted.

If not, the carryforward bases of the predecessor entity continues to be reported in the company's financial statements.

The EITF has addressed leveraged buyouts, first in 86-16, then in 88-16 and 90-12. The EITF's conclusion was that partial or complete new basis accounting is appropriate only when the transaction is characterized by a change in control of voting interest. EITF 88-16 established a series of mechanical tests by which this change in interest is to be measured. Three groups of interests were identified: shareholders in the newly created company, management, and shareholders in the old company (who may or may not also have an interest in the new company). Depending upon the relative interests of these groups in the old entity (OLDCO) and in the new enterprise (NEWCO), there will be either, (1) a finding that the transaction was a purchase (new basis accounting applies) or (2) that it was a recapitalization or a restructuring (carryforward basis accounting applies).

Among the tests that the EITF decreed to determine proper accounting for any given LBO transaction is the "monetary test." This test requires that at least 80% of the net consideration paid to acquire OLDCO interests must be monetary. In this context, monetary means cash, debt, and the fair value of any equity by securities given by NEWCO to selling shareholders of OLDCO. Loan proceeds provided OLDCO to assist in the acquisition of NEWCO shares by NEWCO shareholders are excluded from this definition. If the portion of the purchase that is effected through monetary consideration is less than 80%, but other criteria of EITF 88-16 are satisfied, there will be a step up. This step up will be limited to the percentage of the transaction represented by monetary consideration.

EITF 88-16 presents an extensive series of examples illustrating the circumstances that would and would not meet the purchase accounting criteria to be employed in LBO. These examples should be consulted as needed when addressing an actual LBO transaction accounting issue.

Reverse Acquisitions

Reverse acquisitions are stock transactions that occur when one entity (the nominal acquirer) issues so many of its shares to the former owners of another entity (the nominal acquiree) that they become the majority owners of the resultant combined enterprise. The consequence of such a transaction is that the legal and accounting treatments will diverge, with the nominal acquiree being the acquirer for financial reporting purposes. While often the nominal acquirer will adopt the acquiree's name, thus alerting users of the statements to the nature of the organizational change, this does not necessarily occur, and, in any event, it will be critical that the financial statements contain sufficient disclosure so that users are not misled. This will be important particularly in the periods immediately following the transaction, and especially when comparative financial statements are presented which include some periods prior to the acquisition, since comparability will be affected.

A typical reverse acquisition would occur when a "shell" enterprise, which often is a publicly held but dormant company, merges with an operating company, which often will be nonpublic. The objective is for the operating entity to "go public" without the usual time consuming and expensive registration process. However, reverse acquisitions are not limited to such situations, and there have been many such transactions involving two public or two nonpublic companies. The nominal acquirer may have substantial operations of its own, although of lesser scope or with lower growth prospects than those of the nominal acquiree.

A number of difficult questions arise in reverse acquisitions, and GAAP does not provide definitive guidance on these important issues. The SEC has provided some direction that, under the hierarchy of GAAP, are viewed as definitive absent higher level "official" indicators from other standard setters. Among the matters to be considered, and which will be discussed in the following paragraphs, are these:

1. What circumstances signal a reverse acquisition?
2. How should the consolidated financial statements be presented in the subsequent periods?
3. How should the purchase cost be computed and allocated in a reverse acquisition?
4. What would the shareholders' equity section of the balance sheet be immediately following the reverse acquisition?
5. What would be the impact on computation of earnings per share?
6. How will noncontrolling interest be presented in the financial statements?

Reverse acquisitions occur when the former shareholders of the nominal acquiree become the majority owners of the postacquisition consolidated enterprise, and most commonly this will result when a stock-for-stock swap occurs. Under prior rules, if all of the twelve restrictive conditions set forth in the now-superseded APB 16 were met, the transaction would be accounted for as a pooling, thus obviating the concerns noted above. Under FAS 141, however, poolings are prohibited and all business combinations will be accounted for as purchases. Unless the combining entities were under common control prior to the transaction (in which case the transaction is accounted for in the manner of a pooling, continuing the exception first established by Interpretation 39 under APB 16), purchase accounting is required for all reverse acquisitions.

If the former owners of the nominal acquiree in a purchase business combination become the majority owners of the consolidated enterprise following the transactions, it will be deemed to have been a reverse acquisition. Following a reverse acquisition, consolidated financial statements will be presented. Although the financial statements will be identified as being those of the nominal acquirer (which will be the legal owner of the nominal acquiree), in substance these will be the financial statements of the acquiree company, with the assets and liabilities, and revenues and expenses, of the nominal acquirer being included effective with the date of the transaction. Put another way, the legal parent company will be deemed to be a continuation of the business of the legal subsidiary, notwithstanding the formal structure of the transaction or the name of the successor enterprise. For this reason, if the legal parent (nominally the acquirer) does not change its name to that of the acquiree, it would be appropriate for the financial statement titles to be captioned in a way that most clearly communicates the substance of the transaction to the readers. For example, the statements may be headed "ABC Company, Inc.—successor to XYZ Corporation."

Given the foregoing, it is clear that the stockholders' equity section of the posttransaction consolidated balance sheet is to be that of the acquiree, not the acquirer, with appropriate modification for the new shares issued in the transaction and ancillary adjustments, if any. Comparative financial statements for earlier periods, if presented, are to be consistent, meaning that these would be the financial statements of the nominal acquiree. Since in some instances the acquiree's name is different than that shown in the heading, care must be taken to fully communicate with the readers. The fact that the prior period's financial information identified as being that of the legal parent is really that of the nominal acquiree obviously is extremely pertinent to a reader's understanding of these statements.

Consistent with the accounting imposed on other purchase business combinations, the cost of reverse acquisitions is measured at the fair value of the net assets acquired, or the value of the consideration paid, if more apparent. A special rule is that, if fair value cannot be determined for the issuer's stock, and the transaction is valued at the fair value of the issuer's net assets, no goodwill is recognized in the transaction. In addition, in the special case of a publicly held shell company and a privately held acquiree, the SEC has ruled that no goodwill can be recognized in any event. Clearly, in such instances there is substantial doubt

about the true existence of goodwill and unusual difficulty in valuing the transaction, and this prohibition is prudent under the circumstances.

If the fair value of the shares of the nominal acquiree (which becomes the legal subsidiary after the transaction is completed) is used to determine the cost of the purchase, it is suggested that a calculation be made to determine the number of shares that the acquiree would have issued in order to provide the same level of ownership in the combined entity to the shareholders of the nominal acquirer as they have as a consequence of the reverse acquisition. The fair value of the number of shares thus determined is used to value the transaction, as illustrated later in this section.

In some instances, the market price of acquiree shares may not be fairly indicative of the value of the transaction. In such cases, the most feasible alternative would be to use the fair value of all the outstanding shares of the ostensible acquirer, prior to the transaction, to value the purchase transaction. In some instances, adjustments would have to be made for trading volume, price fluctuations, etc., to most accurately reflect the substance of the acquisition.

In other cases, particularly where the acquirer is a dormant shell entity, market price of its shares may not be meaningful. If it is possible to determine, utilizing the fair value of the net assets of the acquirer may be a more meaningful technique.

Whatever technique is employed under the circumstances, the total purchase cost is to be allocated to the net assets of the acquirer (not the acquiree) following the principles set forth in FAS 141. If the purchase cost exceeds the fair value of net identifiable assets, the excess is allocated to goodwill, which will be tested for impairment as explained elsewhere in this chapter, and written down or eliminated when and if impairment is detected. The financial statements of the consolidated enterprise following the reverse acquisition would reflect the assets and liabilities of the nominal acquirer at fair value, and those of the nominal acquiree at historical cost.

Since for financial reporting purposes the nominal acquiree is the parent company, the retained earnings or deficit of the acquiree will be carried forward in the equity section of the successor entity's balance sheet. The retained earnings or deficit of the nominal acquirer will not be presented. The amount shown for paid-in capital would be valued in terms of the issued capital of the nominal acquiree (the new subsidiary), plus the cost of the acquisition as described above and illustrated below. However, in the actual financial statement, which must reflect the legal structure of the transaction, paid-in capital would be expressed in terms of the legal parent company, which was the nominal acquirer. An example of accounting for a reverse acquisition follows.

Assume that Agoura Corp., which is the nominal acquirer that becomes the legal parent company, issues shares in exchange for the outstanding common stock of Belmar Co., Inc., which is the nominal acquiree which becomes the legal subsidiary of Agoura. For accounting purposes, this will be a reverse acquisition such that Belmar is the actual acquirer.

The balance sheets of the two entities at the end of 2008 and as of September 30, 2009, the date of the transaction, are given as follows:

	Agoura Corporation	
	December 31, 2008	*September 30, 2009*
Current assets	$ 800,000	$1,000,000
Plant, property, and equipment, net	2,400,000	2,600,000
	$3,200,000	$3,600,000
Current liabilities	$ 400,000	$ 600,000
Long-term debt	600,000	400,000
Deferred tax liabilities	200,000	200,000
	1,200,000	1,200,000

	Agoura Corporation	
	December 31, 2008	September 30, 2009
Stockholders' equity		
8% redeemable preferred stock, 2,000 shs.	200,000	200,000
Common stock, 100,000 shs.	600,000	600,000
Retained earnings	1,200,000	1,600,000
	$3,200,000	$3,600,000

	Belmar Company, Inc	
	December 31, 2008	September 30, 2009
Current assets	$2,500,000	$1,750,000
Plant, property and equipment, net	5,000,000	7,500,000
	$7,500,000	$9,250,000
Current liabilities	$1,250,000	$1,500,000
Long-term debt	1,750,000	2,000,000
Deferred tax liabilities	500,000	750,000
	3,500,000	4,250,000
Stockholders' equity		
Common stock, 60,000 shs.	1,500,000	1,500,000
Retained earnings	2,500,000	3,500,000
	$7,500,000	$9,250,000

Agoura had net income of $400,000 for the nine months ended September 30, 2008, while Belmar Co. enjoyed earnings of $1,000,000 for that period. Neither company paid any dividends during this period.

The fair value of each share of Belmar common stock was $100 at the date of the acquisition. Agoura shares were quoted at $24 on the date.

Agoura's identifiable net assets had fair values equal to their respective book values, with the exception of the plant, property and equipment, which were appraised at $3,000,000 at September 30, 2008.

In effecting the acquisition, Agoura issues 150,000 new shares of its common stock to the owners of Belmar in exchange for all outstanding Belmar shares. Thus, former Belmar owners become the owners of a majority of the common stock of Agoura after this transaction.

To compute the cost of the reverse acquisition, the number of shares of the nominal acquiree entity, Belmar, which would have had to have been issued to acquire the nominal acquirer, Agoura, must be computed. This is done as follows:

Actual Agoura shares issued to former Belmar owners	150,000
Agoura shares outstanding prior to transaction	100,000
Total Agoura shares outstanding after transaction	250,000
Fraction held by former Belmar owners (150,000/250,000)	60%
Number of Belmar shares outstanding before transaction	60,000
Number of Belmar shares that could have been issued in transaction if 60% of total would have remained with original Belmar shareholders	40,000

If Belmar had issued 40,000 of its shares to effect the acquisition of Agoura, the cost would have been (given the fair value of Belmar shares at September 30, 2008) $100 × 40,000 = $4,000,000. This purchase cost would have been allocated to Agoura's assets and liabilities as follows:

Current assets		$1,000,000
Plant, property and equipment		3,000,000
		$4,000,000
Current liabilities	$600,000	
Long-term debt	400,000	
Deferred tax liabilities	200,000	1,200,000
		2,800,000
8% redeemable preferred stock, 2,000 shares		200,000
		2,600,000
Cost of purchase (from above)		4,000,000
Goodwill to be recognized		$1,400,000

From the foregoing, the information needed to construct a consolidated balance sheet as of the date of the transaction, September 30, 2008, can be determined.

Agoura Corporation
Consolidated Balance Sheet
September 30, 2008

Current assets	$ 2,750,000
Plant, property and equipment, net	10,500,000
Goodwill	1,400,000
	$14,650,000
Current liabilities	$ 2,100,000
Long-term debt	2,400,000
Deferred tax liabilities	950,000
	5,450,000
Stockholders' equity	
8% redeemable preferred stock, 2,000 shares	200,000
Common stock, 100,000 shares	5,500,000
Retained earnings	3,500,000
	9,200,000
	$14,650,000

Computing earnings per share after a reverse acquisition poses special problems, particularly so in the year in which the transaction occurs and in any subsequent years when comparative financial statements are presented that include those of pretransaction periods. For this purpose, the number of shares outstanding for the period from the beginning of the current reporting year until the date of the reverse acquisition is the number of shares issued by the nominal acquirer (the legal parent company) to the shareholders of the nominal acquiree. For the period after the transaction, the number of shares considered to be outstanding is the actual number of shares of the legal parent company outstanding during that period. The average number of shares outstanding for the full year being reported upon would be computed by averaging these two amounts. Other appropriate adjustments would be made to deal with changes in numbers of shares issued during the period, as is done under other circumstances (as described in Chapter 20), if necessary. Under the current standard for computing earnings per share (ASC 260), the calculation of basic earnings per share (replacing the former measure, primary earnings per share) is simplified for all entities.

Earnings per share for any earlier periods presented for comparative purposes is likewise complicated by the occurrence of a reverse acquisition. The number of shares issued by the legal parent (i.e., the nominal acquirer) in the reverse acquisition transaction would be used to make this calculation.

Continuing with the Agoura-Belmar acquisition example above, earnings per share can be computed. Assume that consolidated net income for the year ended December 31, 2008, after deducting preferred dividends, equals $1,600,000. This includes Belmar Co., Inc. earnings for the full year 2008, plus Agoura Corp. earnings from the date of acquisition, September 30, 2008, until year-end. Remember that, notwithstanding that the new entity is called Agoura, from an accounting perspective this is Belmar Company.

Earnings per share would thus be computed as follows:

Number of shares outstanding from September 30, 2008	250,000
Number of shares deemed outstanding before September 30—the number of Agoura shares issued to Belmar	150,000

Average number of shares

$[(150,000 \times 9) + (250,000 \times 3)] \div 12 = 175,000$

Earnings per share for 2007

$\$1,600,000 \div 175,000 = \$9.14$ per share

For 2008, assuming Belmar alone had earnings of $1,400,000 for the year, earnings per share would be

$1,400,000 ÷ 150,000 = $9.33 per share

Finally, there is the question of noncontrolling interest. In a reverse acquisition situation, the noncontrolling interest is comprised of the former shareholders of the legal subsidiary who do not exchange their shares for those of the new parent company, but continue on as stockholders in the legal subsidiary entity. Note that this holds even though from the accounting perspective they are shareholders in an entity that acquired another company. In other words, the identity of the noncontrolling interest is determined by the legal structure of the transaction, not the accounting substance. Since the net assets of the legal subsidiary (but substantive parent) are included in the consolidated financial statements at the old book values, noncontrolling interest is likewise computed based on the book value of the legal subsidiary's net assets.

For example, in the present case all shareholders of Belmar might not agree to tender their shares in exchange for Agoura stock, and if so they will continue on as noncontrolling owners of the legal subsidiary, Belmar, after it is nominally acquired by Agoura Corp. To illustrate, consider these assumed facts.

Agoura offered 2.5 shares for each share of Belmar common stock. In the example above, 150,000 shares of Agoura were exchanged for 60,000 Belmar shares. Now, however, assume that owners of 4,000 Belmar shares decline to participate in this transaction, so Agoura issues only 140,000 shares in exchange for 56,000 Belmar shares. After the exchange, former Belmar owners hold 140,000 of a total of 240,000 Agoura Corp. shares, or 58.33% of the total outstanding; still a majority and thus enough to define this as a reverse acquisition.

The cost of the purchase is computed similar to what was illustrated above. Since the owners of 56,000 Belmar shares participated and the transaction resulted in these owners obtaining a 58.33% interest in the successor entity, the calculation of the number of Belmar shares hypothetically required to be issued in a "straight" acquisition of Agoura is as follows:

56,000 shares outstanding ÷ .5833 = 96,000 total shares after transaction

96,000 total shares – 56,000 shares outstanding = 40,000 new shares to be issued

Thus, it can be seen that the cost of the purchase, determined in the manner that is necessary when a reverse acquisition takes place, remains 40,000 × $100 = $4,000,000 even given the existence of the noncontrolling interest.

The noncontrolling interest is 4,000 shares ÷ 60,000 shares = 6.6667%. It consists, as of the acquisition date, of 6.6667% of the book value of Belmar common stock and retained earnings, as follows:

6.6667% × $1,500,000	=	$100,000
6.6667% × $3,500,000	=	233,310
Total noncontrolling interest		$333,310

The consolidated balance sheet at the acquisition date would differ from that shown above only as follows: a noncontrolling interest of $333,310 would be presented (under current GAAP, as a liability, as equity, or in a semiequity account); common stock would be only $5,400,000, comprised of 93.33% (1 – 6.66667%) of Belmar's $1,500,000, plus the $4 million purchase cost); and retained earnings would be only 93.33% or Belmar's pretransaction balance of $3.5 million, or $3,266,655. All other asset and liability account balances would be identical to the presentation above.

Spin-Offs

Occasionally an entity disposes of a wholly or partially owned subsidiary or of an investee by transferring it unilaterally to the entity's shareholders. The proper accounting for such a transaction, generally known as a spin-off, depends upon the percentage of the company that is owned.

If the ownership percentage is relatively minor, 25% for example, the transfer to stockholders would be viewed as a "dividend in kind" and would be accounted for at the fair value of the property (i.e., shares in the investee) transferred.

However, when the entity whose shares are distributed is majority or wholly owned, the effect is not merely to transfer a passive investment, but to remove the operations from the former parent and to vest them with the parent's shareholders. This transaction is a true spin-off transaction, not merely a property dividend. APB 29 requires that spin-offs and other similar nonreciprocal transfers to owners be accounted for at the recorded book values of the assets and liabilities transferred.

If the operations (or subsidiary) being spun off are distributed during a fiscal period, it may be necessary to estimate the results of operations for the elapsed period prior to spin-off in order to ascertain the net book value as of the date of the transfer. Stated another way, the operating results of the subsidiary to be disposed of are included in the reported results of the parent through the actual date of the spin-off.

In most instances, the subsidiary being spun off will have a positive net book value. This net worth represents the cost of the nonreciprocal transfer to the owners, and, like a dividend, will be reflected as a charge against the parent's retained earnings at the date of spin-off. In other situations, the operations (or subsidiary) will have a net deficit (negative net book value). Since it is unacceptable to recognize a credit to the parent's retained earnings for other than a culmination of an earnings process, the spin-off is recorded as a credit to the parent's paid-in capital. In effect, the stockholders (the recipients of the spun-off subsidiary) have made a capital contribution to the parent company by accepting the operations having a negative book value. As with other capital transactions, this would not be presented in the income statement, but only in the statement of changes in stockholders' equity (and in the statement of cash flows).

Reverse Spin-Offs

The preceding section has discussed the normal spin-off situation, where an entity (now being referred to as the spinnor) transfers assets into a new legal spun-off entity (the spinnee) and distributes the shares of the spinnee to its shareholders, without the surrender by the shareholders of any stock of the spinnor. As noted, this transaction is accounted for at book value under APB 29.

In other situations, the spinnee will be the continuing entity. The issue is whether to account for a spin-off as a reverse spin-off based on the substance instead of the legal form of the transaction. In a reverse spin-off, the legal spinnee is treated as though it were the spinnor for accounting purposes (accounting spinnor). This parallels the considerations applicable to reverse acquisitions, discussed earlier in this chapter. It is further complicated, however, by the fact that the determination of the accounting spinnor and spinnee may have significant implications with regard to the reporting of discontinued operations in accordance with ASC 360. The accounting spinnee is reported as a discontinued operation by the accounting spinnor if the spinnee is a component of an entity and meets the conditions for such reporting contained in ASC 360.

In ASC 505-60, a consensus was expressed that reverse spin-off accounting (whereby the legal spinnee is treated as the accounting spinnor, etc.) is appropriate when it results in the most accurate depiction of the substance of the transaction for shareholders and other users of the financial statements. Whether this is appropriate however, is a matter of judgment and must be based on all the facts and circumstances. Absent convincing evidence of the existence of a reverse spin-off, the presumption will be that normal spin-off accounting (whereby the legal spinnee is treated as the accounting spinnee, etc.) is to be applied.

Factors that suggest that reverse spin-off accounting is warranted would include factors such as these.

Relative size. Generally, in a reverse spin-off, the accounting spinnor (legal spinnee) is larger than the accounting spinnee (legal spinnor). This determination will be based on a comparison of the assets, revenues, and earnings of the two entities. There are no established "bright lines" that are used to determine which entity is the larger of the two, however.

Relative fair values. Generally, in a reverse spin-off, the fair value of the accounting spinnor (legal spinnee) is greater than that of the accounting spinnee (legal spinnor).

Senior management. Typically, in a reverse spin-off, the accounting spinnor (legal spinnee) retains the senior management of the formerly combined entity, defined to include the chairman of the board, chief executive officer, chief operating officer, chief financial officer, and those divisional heads reporting directly to them, or the executive committee if one exists.

Length of time to be held. Normally, in a reverse spin-off, the accounting spinnor (legal spinnee) is held for a longer period than the accounting spinnee (legal spinnor). A proposed or approved plan of sale for one of the separate entities concurrent with the spin-off may, therefore, identify that entity as the accounting spinnee.

The determination of which entities are the accounting spinnor and spinnee, respectively, has significant implications. In a spin-off, the net book value of the spinnee is treated, in effect, as a dividend distribution to the shareholders of the spinnor. Since the net book value of these entities will differ from each other, the amount of the reduction to retained earnings of the surviving reporting entity (the accounting spinnor) will be affected by this determination. ASC 505-60 offers several examples of fact patterns which support spin-off or reverse spin-off determinations.

Push-Down Accounting

For a number of years, the matter of what is commonly called "push down" accounting (but which is also known as "new basis accounting") had been on the FASB's technical agenda. It received scant attention notwithstanding the SEC's long-held position that, under narrowly defined circumstances, push-down accounting is to be applied. Since 2000 this matter has received renewed attention and may be jointly dealt with by the FASB and the International Accounting Standards Board.

Under new basis accounting, the amounts allocated to various assets and liabilities can be adjusted to reflect the arm's-length valuation reflected in a significant transaction, such as the sale of a majority interest in the entity. For example, the sale of 90% of the shares of a company by one shareholder to a new investor—which under the entity concept would not alter the accounting by the company itself—would, under new basis accounting, be "pushed down" to the entity. The logic is that, as under purchase method accounting for business combinations, the most objective gauge of "cost" is that arising from a recent arm's-length transaction.

Traditionally, GAAP has not permitted new basis accounting, in part because of the practical difficulty of demonstrating that the reference transaction was indeed arm's-length in nature. (Obviously, the risk is that a series of sham transactions could be used to grossly distort the "cost" and hence carrying values of the entity's assets, resulting in fraudulent financial reporting.) Also heavily debated has been where the threshold should be set (a 50% change in ownership, an 80% change, etc.) to denote when a significant event had occurred that would provide valid information on the valuation of the entity's assets and liabilities for financial reporting purposes.

In its deliberations on this subject, the FASB has agreed that a transfer of control over assets from one entity to a joint venture is an event which should result in gain recognition (where warranted) in the financial statements of the transferor, and that a new basis of accountability would be established for those assets. This is a marked departure from past practice, under which a transfer of appreciated assets to a joint venture or partnership (e.g., a transfer of land to a building partnership) was to be accounted for at book value.

Many of the more general issues of push-down accounting (those applicable to traditional business acquisitions) have yet to be dealt with. For example, proponents of push-down accounting point out that in a purchase business combination a new basis of accounting is established, and that this new basis should be pushed down to the acquired entity and should be used when presenting that entity's own, separate financial statements. However, practical problems remain: for example, while push-down makes some sense in the case where a major block of the investee's shares is acquired in a single free-market transaction, if new basis accounting were to be used in the context of a series of step transactions, continual adjustment of the investee's carrying values for assets and liabilities would be necessary. Furthermore, the price paid for a fractional share of ownership of an investee may not always be meaningfully extrapolated to a value for the investee company as a whole.

The SEC's position has been that push-down accounting would be required if 95% or more of the shares of the company have been acquired (unless the company has outstanding public debt or preferred stock that may impact the acquirer's ability to control the form of ownership of the company); that it would be permitted, but not mandated, if 80% to 95% has been acquired; and it would be prohibited if less than 80% of the company is acquired.

While there is no requirement under GAAP to apply the push-down concept, the SEC position is substantial authoritative support and can be referenced even for nonpublic company financial reporting. It would be defensible in any instance where there is a change in control and/or a change in ownership of a majority of the common shares, when separate financial statements of the subsidiary are to be presented. Full disclosure is to be made of the circumstances whenever push-down accounting is applied.

Example of push-down accounting

Assume that Pullup Corp. acquires, in an open market arm's-length transaction, 90% of the common stock of Pushdown Co. for $464.61 million. At that time, Pushdown Co.'s net book value was $274.78 million (for the entire company). Book and fair values of selected assets and liabilities of Pushdown Co. as of the transaction date are summarized as follows ($000,000 omitted):

	Book value		*Fair value of*	*Excess of*
	100% of entity	*90% interest*	*90% interest*	*FV over book*
Assets				
Receivables	$ 24.6	$ 22.14	$ 29.75	$ 7.61
Inventory	21.9	19.71	24.80	5.09
Property, plant & equipment, net	434.2	390.78	488.20	97.42
All others	223.4	201.06	201.06	0.00
Additional goodwill			120.00	120.00
Total assets	$704.1	$633.69	$863.81	$230.12
Liabilities				
Bonds payable	104.9	94.41	88.65	5.76
All other liabilities	325.0	292.50	310.55	18.05
Total liabilities	429.9	386.91	399.20	12.29

	Book value		Fair value of	Excess of
	100% of entity	*90% interest*	*90% interest*	*FV over book*
Equity				
Preferred stock	40.0	36.00	36.00	0.00
Common stock	87.4	78.66	78.66	0.00
Revaluation surplus*			217.83	217.83
Retained earnings	146.8	132.12	132.12	0.00
Total equity	274.2	246.88	464.61	217.83
Liabilities + Equity	$704.1	$633.69	$863.81	$230.12

* *Net premium paid over book value by arm's-length of "almost all" common stock*

Assuming that "new basis" accounting is deemed to be acceptable and meaningful, since Pushdown Co. must continue to issue separate financial statements to its creditors and holders of its preferred stock, and also assuming that a revaluation of the share of ownership that did not change hands (i.e., the 10% noncontrolling interest in this example) should not be revalued based on the majority transaction, the entries by the subsidiary (Pushdown Co.) for purposes only of preparing stand-alone financial statements would be as follows:

Accounts receivable	7,610,000	
Inventory	5,090,000	
Plant, property and equipment (net)	97,420,000	
Goodwill	120,000,000	
Discount on bonds payable	5,760,000	
Other liabilities		18,050,000
Paid-in capital from revaluation		217,830,000

The foregoing entry would only be made for purposes of preparing separate financial statements of Pushdown Co. If consolidated financial statements of Pullup Corp. are also presented, essentially the same result will be obtained. The additional paid-in capital account would be eliminated against the parent's investment account, however, since in the context of the consolidated financial statements this would be a cash transaction rather than a mere accounting revaluation.

There is also a body of opinion holding that the separate financial statements of Pushdown Co. in this example should be "grossed up" for the imputed premium that would have been achieved on the transfer of the remaining 10% ownership interest. This is less appealing, however, given the absence of a "real" transaction involving that last 10% ownership stake, making the price at which it would have traded somewhat speculative.

The foregoing example obviously also ignored the tax effects of the transaction. Since the step-ups in carrying value would not, in all likelihood, alter the corresponding tax bases of the assets and liabilities, deferred tax effects would also require recognition. This would be done following the procedures set forth at ASC 740, as described fully in Chapter 17.

Non-Sub Subsidiaries

Another issue that has concerned accountants and the SEC is the popularity of what have been called "non-sub subsidiaries." This situation arises when an entity plays a major role in the creation and financing of what is often a start-up or experimental operation, but does not take an equity position at the outset. For example, the sponsor might finance the entity by means of convertible debt or debt with warrants entitling it to the later purchase of common shares. The original equity in such arrangements is often provided by the creative or managerial talent engaged in the new entity's operations, who generally exchange their talents for an equity interest. If the operation prospers, the sponsor will exercise its rights and obtain a majority voting stock position; if the operation fails, the sponsor presumably avoids reflecting the losses in its financial statements.

While this strategy may seem to avoid the requirements of equity method accounting or consolidation based on majority voting ownership, the economic substance of the arrange-

ment clearly suggests that the operating results of the sponsored entity be reflected as a subsidiary in the consolidated financial statements of the sponsor who, in substance, is fulfilling the customary role of a parent, even absent ownership of voting stock.

The entities described above are often similar in structure and purpose to what were formerly called "special-purpose entities" or "special-purpose vehicles" and which have now been identified as "variable interest entities." These VIE have been widely discussed in recent years, as their use has grown exponentially for such valid purposes as securitizations, but also for less worthy objectives, including concealing the existence of debt which might represent the moral, if not necessarily the legal, obligations of the reporting entity. These matters are described in the next section.

Variable Interest Entities

Introduction and background information. As previously discussed, ARB 51, *Consolidated Financial Statements*, issued over 40 years ago, provides the primary authority for determining when presentation of consolidated financial statements is required. The rationale underlying ARB 51 is that consolidated financial statements are more informative to users when one enterprise directly or indirectly holds a "controlling financial interest" in one or more other enterprises. ARB 51 went on to stipulate that the usual condition that best evidenced which party held a controlling financial interest was the party that held a majority voting interest.

This general rule requiring consolidation by a party holding a majority of the voting interests is still operational today and the foregoing discussion of consolidations and business combinations provided extensive guidance regarding parent/subsidiary relationships in the context of the parent holding a majority voting interest in the subsidiary. The subsidiary in this relationship is sometimes referred to as a voting interest entity.

Since the issuance of ARB 51, however, managers and their advisors have devised many new and creative types of ownership structures, financing arrangements, financial instruments, and business relationships. Many, if not most of these arrangements were originated to accomplish legitimate business objectives. Some of the arrangements were designed with the express intent of establishing financial control over assets or operations while the sponsoring entity avoided the establishment of voting control that served as the determinant of consolidation.

Examples of such arrangements abound and have been discussed in previous sections of this chapter. Perhaps no such type of financial arrangement or structure, however, has received the level of negative publicity as the special-purpose entity (SPE). The primary authoritative pronouncement that addressed SPE is FAS 140, *Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities*, which is discussed in detail in Chapter 7. In the context of FAS 140 (and the predecessor standard, FAS 125, where the definition originated) an SPE is narrowly defined as a trust or other legal vehicle to which a transferor transfers a portfolio of financial assets (such as mortgage loans, commercial loans, credit card debt, automobile loans, and other groups of homogenous borrowings).

Commonly SPE have been organized as trusts or partnerships (flow-through entities, in order to avoid double incidence of corporate income taxation), and the outside equity participant was ultimately defined as having as little as 3% of the total assets of the SPE at risk (this was not established by GAAP, but rather evolved somewhat by default and has been subject to varying interpretation under different sets of conditions).

In a process called a securitization, the SPE typically issues and sells securities that represent beneficial interests in the cash flows from the portfolio. The proceeds the SPE receives from the sale of the securities are used to purchase the portfolio from the transferor. The cash flows received by the SPE from the dividends, interest, redemptions, principal re-

payments, and/or realized gains on the financial assets are used to pay a return to the investors in the SPE's securities. By transferring packages of such loans to an SPE, these assets can be legally isolated and made "bankruptcy proof" (and thus made more valuable as collateral for other borrowings); various types of debt instruments can thus be used, providing the sponsor with fresh resources to fund future lending activities. SPE within the scope of FAS 140 are limited to entities that hold financial assets. SPE are sometimes used, however, to hold nonfinancial assets such as real estate, machinery, or energy contracts.

Use of special-purpose entities under prior GAAP. SPE had their origin in the rules for consolidation, which historically were based on the existence of majority ownership of one enterprise by another. While the substitution of control for ownership had been contemplated as a means of limiting the use of SPE to evade consolidation requirements, practical difficulties in defining control had kept this project from fruition for many years.

As discussed previously, SPE achieved "level A GAAP" status by virtue of being somewhat obliquely addressed in FAS 125, which dealt with transfers of financial assets (and later was superseded by the very similar FAS 140). The concept of a "qualified" SPE (QSPE) also arose from this standard, denoting that SPE can participate in "true sales" of financial assets under FAS 125/140, to be accounted for as sales rather than as secured borrowings.

Importantly, in order for the sponsor to avoid consolidating the SPE, the outside equity participant was required to have *control,* which—although customarily not invoked under GAAP as the criterion for consolidation—was established as the key determinant for sponsor nonconsolidation of an SPE. Where an SPE was controlled by parties other than the sponsor, and there was significant risk capital invested by them, consolidation of the SPE in the sponsor's financial statements could be avoided.

Problems in past practice. With benefit of hindsight, it is clear that the rules for SPE evolved in a way that left too much to chance and to the influence of highly interested parties. As a result, notwithstanding the arguably important role that SPE may have played in the financial marketplace, SPE came to be widely used to accomplish financial reporting manipulations. Thus, the "outside" equity participants often funded their "independent capital contributions" with debt obtained from lenders to the sponsor, or via debt indirectly guaranteed by the sponsor, some of whom evaded disclosure of their positions as guarantors by means of imaginative interpretations of GAAP, particularly of FAS 5.

Furthermore, sponsors engaged in transactions with SPE that often resulted in the sponsors recognizing large amounts of income. In some instances, complex sets of guarantees and option arrangements had the effect of causing these gains to be reversible. In the most egregious transactions, sponsors were able to recoup reportable gains from economic events and transactions that could never have supported income recognition if engaged in directly by the entity, even extending to recognizing fair value changes in the sponsor's own capital stock.

It is clear that SPE do serve various tax, legal, and strategic corporate objectives, but whether the exclusion of SPE from their sponsor's consolidated financial statements had, under prior rules, any accounting legitimacy, remains an open question. In other words, in setting forth a representation of an entity's economic position and the results of its operations, the validity of excluding events or transactions that are in fact integral to the entity's current position and future prospects, merely because these have been "walled off" by a legal structure, was doubtful. Simply put, the issue is whether economic substance is to be presented, regardless of legal form.

FASB's response. After the public revelations regarding Enron and its use of SPE to hide its true financial condition, FASB recognized the need to augment the existing consoli-

dations model to take into account financial arrangements where parties other than the holders of a majority of the voting interests exercise financial control over another entity. Thus, it undertook a project to issue an interpretation of ARB 51 to broaden its scope.

In its deliberations on these issues, FASB decided not to refer to entities within the scope of the eventual interpretation as SPE. This decision underscores the fact that the type of entity to which the interpretation applies is more broadly defined than entities that qualify as SPE involved in securitization transactions or even SPE that hold nonfinancial assets. Thus, an entity within the scope of the interpretation may or may not have formerly been referred to as an SPE.

FASB coined the term variable interest entity (VIE) to designate an entity that is financially controlled by one or more parties that do not hold a majority voting interest. A party that possesses the majority of this financial control, if there is one, is referred to as the VIE's primary beneficiary.

Scope exceptions. The following are excluded from the scope of FIN 46(R):

1. Not-for-profit organizations as defined in FAS 117, para 168, (including not-for-profit health care organizations subject to the AICPA AAG, *Health Care Organizations*) unless the organization was organized to avoid VIE status
2. Employer/sponsors of employee benefit plans including ESOP, pension, profit sharing, 401(k), postretirement, and postemployment plans
3. Enterprises subject to SEC Regulation S-X Rule 6-03(c)(1) (investment companies, mutual funds) may only consolidate an entity subject to the same regulation.
4. Separate accounts of life insurance entities
5. A "qualifying special-purpose entity" (QSPE) or a "formerly qualifying SPE" (FQSPE) under the provisions of FAS 140, *Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities*, are not to be consolidated by entities and their affiliates who transfer financial assets to them
6. Enterprises holding variable interests in a QSPE or FQSPE are not to consolidate that entity unless the holder has the unilateral ability to cause the entity's liquidation or change the entity so that it ceases to meet the conditions of FAS 140 to be considered a QSPE or FQSPE
7. A governmental organization
8. A nongovernmental financing entity established by a governmental organization unless the financing entity is being used to circumvent FIN 46(R) to avoid consolidation
9. An entity created prior to December 31, 2003, for which, after expending "exhaustive efforts," management of the variable interest holder is unable to obtain information needed to determine whether the entity is a VIE, determine whether the holder is the primary beneficiary, or make the required consolidating/eliminating entries required by FIN 46(R)

   NOTE: With respect to this exception, however, management of the variable interest holder is required to continue to make these efforts after initial adoption of FIN 46(R). If the variable interest holder significantly participated in the design/redesign of the entity, it would be unusual for it to be able to contend that it was unable to obtain the necessary information.

10. An entity that qualifies to be treated as a business, as defined below (the definition included in FIN 46(R) was adapted from EITF 98-3, *Determining Whether a Nonmonetary Transaction Involves Receipt of Productive Assets or a Business*). However, this scope exception does not apply and the entity would be required to be evaluated as to whether it is a VIE by the holders of its variable interests if any one or more of the following conditions exists:

a. The variable interest holder and/or its related parties/de facto agents[6] (de facto agents are discussed later in this chapter) participated significantly in the design or redesign of the entity. This factor is not considered when the entity is an operating joint venture jointly controlled by the variable interest holder, and either an independent party or a franchisee.
b. The design of the entity results in substantially all of its activities either involving or being conducted on behalf of the variable interest holder and its related parties.
c. Based on the relative fair values of interests in the entity, the variable interest holder and its related parties provide more than half of its total equity, subordinated debt, and other forms of subordinated financial support.
d. The entity's activities relate primarily to one or both of the following:

   (1) Single-lessee leases

11. Securitizations or other forms of asset-backed financings

Definition of a business. A business is defined, in the context of FIN 46(R) as

> *…a self-sustaining integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. A business consists of (a) inputs, (b) processes applied to those inputs, and (c) resulting outputs that are used to generate revenues. For a set of activities and assets to be a business, it must contain all of the inputs and processes necessary for it to conduct normal operations, which include the ability to sustain a revenue stream by providing its outputs to customers.*

In evaluating whether an entity is a business, consideration must be given to unique factors relating to the industry and the activities being performed including

Inputs

1. Fixed assets either owned or leased
2. Intangibles either owned or licensed
3. Access to materials or rights needed to perform its activities
4. Employees

Processes

1. Strategic management
2. Operations
3. Resource management

Outputs

1. Access to customers (clients)

A three-step process is provided in order to assess whether a set of activities ("set") qualifies as a business.

1. Identify elements included in the "set" (i.e., determine the existing inputs, processes, and outputs).
2. Compare the elements identified in 1. with the elements necessary for the set of activities to be conducted as a normal business operation.
3. If any elements are missing, assess the degree of effort or investment relative to the fair value of the set of activities needed to acquire or gain access to the missing

[6] *Only for the purposes of applying factor a. above, de facto agents exclude parties that require the variable interest holder's prior approval to sell, transfer, or encumber their interest in the entity.*

elements. If a significant effort or investment would be required, it can be concluded that the set of activities is not a business; conversely, a de minimis amount of effort or investment to supply the missing elements would lead to the conclusion that the set of activities is a business.

Interpretation 46(R): accounting for variable interest entities (VIE). FIN 46(R) substantially alters the consolidations model to which accountants had long been accustomed. Under FIN 46(R), variable interest entities that have a primary beneficiary, as defined, must be consolidated in the general-purpose financial statements of that primary beneficiary, regardless of the extent of ownership (or lack of it) by that entity. FIN 46(R) introduces a number of new terms and concepts in the attempt to explain and operationalize the accounting for VIE.

Expected variability. When estimating an entity's expected future cash flows in accordance with CON 7, *Using Cash Flow Information and Present Value in Accounting Measurements* (discussed more fully in Chapter 1), a range of probability-weighted expected outcomes is used. Mathematically, this is simply a weighted-average calculation. The following example illustrates the mathematical concept of expected variability:

Example of expected variability of cash flows

Mided Mining Company is computing the probability-weighted expected future cash flows from operating and disposing of a tunnel boring machine that has a remaining estimated useful life of three years. This estimate was necessitated by ASC 360 which requires an evaluation, when certain events or circumstances occur, of whether the future cash flows associated with the use and disposal of long-lives assets are sufficient to recover their carrying value over their estimated remaining depreciable lives. Because of uncertainty regarding the amounts and timing of the cash flows, Mided's management used the CON 7 probability-weighted expected cash flow model with the following results:

	2008	*2009*	*2010*	*3-year outcome*	*Probability of occurrence*	*Probability-weighted expected outcome*
Expected outcome 1	$3,500	$3,200	$2,700	$9,400	20%	$1,880
Expected outcome 2	4,000	3,900	3,700	11,600	45%	5,220
Expected outcome 3	4,300	4,100	4,000	12,400	30%	3,720
Expected outcome 4	4,400	4,700	--	9,100	5%	455
					100%	
Probability-weighted expected cash flows (weighted-average)						$11,275

The $11,275 weighted-average, undiscounted, is compared to the carrying value of the tunnel boring machine to determine whether or not the carrying value is fully recoverable. The weighted-average consists of four different outcomes, each with its own estimated probability of occurrence. Since these amounts represent management's best estimates, management deems it possible that, at the end of the three-year period, any one of these outcomes could actually occur. When management considers the individual probability of occurrence for each of the four outcomes estimated above, the analysis yields the following results:

	[1]	[2]	[3]	[4]	[5]		
	3-year outcome	*Probability-weighted expected outcome*	*[1] – [2] Variation*	*Probability of occurrence*	*[3] × [4] Probability-weighted variation*	*Positive variation*	*Negative variation*
Expected outcome 1	$9,400	$11,275	$(1,875)	20%	$(375)	$ --	$(375)
Expected outcome 2	11,600	11,275	325	45%	146	146	--

	[1]	[2]	[3]	[4]	[5]		
	3-year outcome	*Probability-weighted expected outcome*	*[1] – [2] Variation*	*Probability of occurrence*	*[3] × [4] Probability-weighted variation*	*Positive variation*	*Negative variation*
Expected outcome 3	12,400	11,275	1,125	30%	338	338	--
Expected outcome 4	9,100	11,275	(2,175)	5%	(109)	--	(109)
				100%		$484	$(484)

Careful examination of the above analysis yields the following conclusions:

1. Variations naturally occur between expected outcomes and actual outcomes.
2. Because the expected outcome is calculated as an average, some of the amounts used to compute it will be higher than the average and some will be lower than the average.
3. When the individual variations are computed and each is multiplied by its probability of occurrence, the absolute value of the sum of the positive variations will exactly equal the absolute value of the sum of the negative variations.
4. When these two absolute values are summed ($484 + $484 = $968 in the example above), the result, the total variability in both directions is called the expected variability of the cash flows.
5. The higher the expected variability of a set of cash flow estimates, the higher the level of risk and uncertainty associated with the estimate.

Further interpretation of this concept is provided in FSP FIN 46(R)-6, where the analysis of expected variability is based on the following two-step approach: (1) Determine the nature of an entity's risks, which shall at least include the areas of credit, interest rates, foreign currency exchange, commodity prices, equity prices, and operations, and then (2) determine the extent of the variability the entity was designed to pass through to its interest holders by reviewing its activities, contract terms, terms of issued interests, how those interests were negotiated, and the parties participating in the entity's design.

Variable interests. Ownership, contractual, or other monetary interests in an entity that are either entitled to receive expected positive variability (referred to as expected residual returns) or obligated to absorb expected negative variability (referred to as expected losses). Variable interests are identified by thoroughly analyzing the assets, liabilities, and contractual arrangements of an entity to determine whether each item being analyzed creates variability or absorbs/receives variability. Favorable changes in the fair value of the entity's net assets and contractual arrangements that create variability comprise expected residual returns which result from estimated outcomes in which the entity outperforms the probability-weighted expected results. Unfavorable changes in the fair value of the entity's net assets and contractual arrangements that create variability comprise expected losses which result from estimated outcomes in which the entity underperforms the probability-weighted expected results.

Appendix B of FIN 46(R) provides examples of potential variable interests. Each of the items below is potentially an explicit or implicit variable interest in an entity or in specified assets of an entity. Upon analysis of the specific facts, circumstances, and contract terms, the financial statement preparer is charged with determining whether a particular item either absorbs expected losses or receives expected residual returns (collectively referred to as expected variability) or both. The absorbing/receiving of variability is the sole determinant of whether an interest is a variable interest and, in analyzing specific situations, the degree of variability can differ widely for each item.

1. At-risk equity investments in a VIE
2. Investments in subordinated debt instruments issued by a VIE
3. Investments in subordinated beneficial interests issued by a VIE
4. Guarantees of the value of VIE assets or liabilities
5. Written put options on the assets of a VIE or similar obligations that protect senior interests from suffering losses
6. Forward contracts to sell assets owned by the entity at a fixed price
7. Stand-alone or embedded derivative instruments including total return swaps and similar arrangements
8. Contracts or agreements for fees to be paid to a decision maker (These are generally deemed to absorb variability unless the relationship between the entity and the decision maker meets specified criteria to be considered an employee/employer relationship or a "hired service provider" relationship, in which case the arrangement would not be deemed to create a variable interest. In this case, the fees would be included in computations of expected variability.)
9. Other service contracts with nondecision makers
10. Operating leases that include residual value guarantees and/or lessee option to purchase the leased property at a specified price
11. Variable interests of one VIE in another VIE
12. Interests retained by a transferor of financial assets to a VIE

As previously stated, although all of these examples potentially qualify as variable interests, they differ widely in terms of the extent of their variability which has a direct effect on the likelihood of their causing their holders to be considered the primary beneficiary of the VIE. Note that an interest can qualify as a variable interest but the entity in which the interest is held may not qualify as a variable interest entity. Careful analysis of the facts and circumstances is necessary to determine the economics of a particular situation.

Implicit variable interests. One of the most misunderstood provisions of FIN 46(R) is referred to as an implicit variable interest. The FASB Staff attempted to clarify this matter in FSP FIN 46(R)-5.

As discussed in Chapter 16, a party which did not explicitly issue a direct guarantee of another party's obligation can, nevertheless, be held to be an implicit guarantor of that obligation and thus, under FIN 46(R), hold a variable interest in the party whose debt is implicitly guaranteed.

Consider the situation where the principal shareholder of a company personally guarantees a mortgage on the premises that the company occupies and leases from a related LLC whose sole member is the lessee's principal shareholder. Normally, the rent payments due under the related-party lease are structured to provide sufficient cash flow to the lessor to enable it to meet its debt service under the mortgage. If the lessee were to become delinquent under its rent obligations to the lessor, the lessor would not have sufficient cash flow to enable it to make the payments due under its mortgage which would cause a loan delinquency or default.

Should this occur, the following scenarios could occur:

1. The lender could repossess the property and sell it to pay off the loan
2. The lender could enforce the guarantee and compel the shareholder to pay off the loan on behalf of the lessor or, at least to make the delinquent payments on behalf of the lessor to cure the default, or
3. The lessee could sell off assets or borrow money from its stockholder or a third party to enable it to pay its delinquent rent, thereby enabling the lessor to make its delinquent mortgage payments.

Scenario 1. would not be a desirable outcome, as the lessor would lose title to its property and the lessee, in default on its rent, could end up without the premises in which it operates its business since, upon sale of the property, the successor owner would potentially terminate the lease for nonpayment.

Under scenario 2. if the shareholder were to pay the delinquent mortgage payment on behalf of the lessor, the transactions would be recorded as follows:

Lessor Accounting Records

	Debit	*Credit*
Rent receivable	xxx	
Rental income		xxx
To record delinquent rent due from lessee		
Mortgage payable	xxx	
Loan payable—Member		xxx
To record mortgage payment made on behalf of LLC by its member as a loan payable to the member		

Lessee Accounting Records

Rent expense	xxx	
Rent payable		xxx
To record delinquent rent due to lessor		

Scenario 3. would be recorded as follows (assuming that the lessee obtains additional funds from its principal shareholder):

Lessee Accounting Records

	Debit	*Credit*
Cash	xxx	
Loan payable—shareholder		xxx
To record loan from shareholder		
Rent payable	xxx	
Cash		xxx
To record rent payment		

Lessor Accounting Records

	Debit	*Credit*
Cash	xxx	
Rental income		xxx
To record rent received from lessee		
Mortgage interest	xxx	
Mortgage payable	xxx	
Cash		xxx
To record mortgage payment		

The outcomes of scenarios 2. and 3. are very similar. Under scenario 2., the shareholder/member will have a loan receivable from the thinly capitalized LLC that depends solely on the delinquent corporation for its cash flow. In scenario 2., the lessee will have to raise cash in an amount sufficient to fund the LLC's repayment of its loan to the shareholder/member and keep the mortgage current. Since the LLC is dependent upon the lessee for its cash flow, the lessee has implicitly incurred an obligation to fund the LLC's loan repayment to the shareholder/member. It is, of course, in the best interest of the lessee to fund this since it entitles the lessee to continue to benefit from the use of the leased property and, contractually, the lessee is already obligated to pay the delinquent rent.

Under scenario 3., the shareholder/member will have a loan receivable from a lessee that is experiencing difficulty in meeting its rent obligations. The lessee will have substituted a presumably interest-bearing loan payable to its shareholder for a noninterest-bearing rent payable obligation to the LLC and will, as in scenario 2., be obligated to raise cash sufficient

to repay its shareholder and fund its rent obligations under the lease. In effect, the lessee will have used its available credit that it could have used for other operating purposes to help provide financial support to the LLC that would otherwise have insufficient capital to be self-sustaining. Again, implicitly, the lessee is functioning as a guarantor of the LLC's mortgage indebtedness by its willingness to provide the cash flow necessary for the LLC to meet its obligations.

Based on the foregoing analysis, in substance the lessee is the holder of an implicit variable interest in the lessor in the form of an implicit guarantee of the lessor's mortgage debt. Due to the fact that the implicit guarantee exposes the lessee/variable interest holder to the expected losses of the lessor, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

Expected losses and expected residual returns. Expected losses represent the expected negative variability in the fair value of an enterprise's net assets exclusive of variable interests. Expected residual returns represent the expected positive variability in the fair value of an enterprise's net assets exclusive of variable interests. The expected variability in an enterprise's net income or loss is included in the determination of its expected losses and expected residual returns.

VIE defined. Variable interest entities include, under FIN 46(R), any entity which, by design, satisfies one of the following characteristics:

1. The total equity investment at risk is not sufficient to permit the entity to finance its activities without additional subordinated financial support from either the existing equity holders or other parties. That is, the equity investment at risk is not sufficient to absorb all of the expected losses of the entity. For this purpose, the total equity investment at risk
   a. Includes only equity investments in the entity that participate significantly in profits and losses even if those investments do not carry voting rights.
   b. Does not include equity interests that the entity issued in exchange for subordinated interests in other variable interest entities.
   c. Does not include amounts provided to the equity investor directly or indirectly by the entity or by other parties involved with the entity (for example, by fees, charitable contributions, or other payments), unless the provider is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.
   d. Does not include amounts financed for the equity investor (for example, by loans or guarantees of loans) directly by the entity or by other parties involved with the entity, unless that party is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.

or

2. As a group the holders of the equity investment at risk lack any one of the following three characteristics of a controlling financial interest:
   a. The direct or indirect ability through voting or similar rights to make decisions about an entity's activities that affect the entity's success. The investors do not have that ability through voting rights or similar rights if no owners hold voting rights or similar rights (such as those of a common stockholder in a corporation or a general partner in a partnership).
   b. The obligation to absorb the expected losses of the entity. The investor or investors do not have that obligation if they are directly or indirectly protected

from absorbing the expected losses or are guaranteed a return by the entity itself or by other parties with whom the entity is involved.

c. The right to receive the expected residual returns of the entity. The investors do not have that right if their return is limited to a specified maximum amount by the entity's governing documents or arrangements with other variable interest holders or with the entity.

The equity investors as a group also are considered to lack characteristic 2.a. if, upon consideration of those investors' at-risk equity investments and all other interests in the entity (1) the voting rights of some investors are not proportional to their obligations to absorb the entity's expected losses, to receive the entity's expected residual returns, or both, and (2) substantially all of the entity's activities (for example, lending activities, or asset acquisitions) either involve or are conducted on behalf of an investor that has disproportionately few voting rights.

In other words, VIE are generally thinly capitalized entities that carry risks of economic losses or possibilities of economic gains beyond what the nominal owner (the "equity participant") could absorb or will be able to benefit from, respectively. If a party provides "subordinated financial support" to the entity that exposes it to absorbing the majority of the VIE's expected losses, or entitles it to receive the majority of the VIE's expected residual returns, or both, it is generally deemed to be the primary beneficiary of that VIE and will be required to consolidate the VIE as its subsidiary, irrespective of how much, if any equity investment it has in the VIE.

Initial determination of VIE status. Whether or not an entity qualifies as a VIE is initially determined when an entity obtains its variable interest in that entity. This determination is based on the circumstances existing at that date, taking into account future changes that are required in existing governing documents and contractual arrangements. It is not necessary, however, for an interest holder to make this determination if both of the following conditions exist:

1. It is apparent that the holder's interest would not be a significant variable interest, and
2. The holder, its related parties, and its de facto agents (as specified below) were not significant participants in the design or redesign of the entity.

Related-party considerations in determining the primary beneficiary. Many SPE structures made use of related-party relationships, which did not, however, automatically necessitate consolidation (although disclosures were required under GAAP). For the purpose of a variable interest holder determining whether it is the primary beneficiary of a VIE, FIN 46(R) expands the definition of related parties that is set forth in ASC 850, *Related-Party Disclosures*, to include additional parties that act as "de facto agents" or "de facto principals" of the variable interest holder. The following table sets forth the related parties as prescribed by ASC 850 as well as additional related parties designated by FIN 46(R) for this purpose:

Related parties ASC 850	De facto principals/agents FIN 46(R)
• Affiliates—Parties that directly or indirectly, through one or more intermediaries control, are controlled by, or are under common control with the variable interest holder	• Parties that cannot finance their operations without subordinated financial support from the variable interest holder (e.g., another VIE of which the variable interest holder is the primary beneficiary)
• Equity method investees of the variable interest holder	• Parties that received their interest in the VIE as a contribution or loan from the variable interest holder

- Employee benefit trusts (e.g., pension and profit-sharing trusts) when the variable interest holder/plan sponsor or members of its management manage the plan or serve as the plan trustee
- Principal owners of the variable interest holder (owners of record or beneficial owners of > 10% of the variable interest holder's voting interests) and members of their immediate families
- Management of the variable interest holder and members of their immediate families
- Transacting parties where one party controls or significantly influences the management or operating policies of the other to the extent that it might be prevented from fully pursuing its own separate interests
- Other parties that have an ownership interest in one of the transacting parties; or control, or significantly influence the management or operating policies of the transacting parties to the extent that one or more of the transacting parties might be prevented from fully pursuing its own separate interests
- Officers and employees of the variable interest holder
- Members of the governing board of the variable interest holder
- Parties that have agreements not to sell, transfer, or pledge their interests in the VIE as collateral without the prior approval of the variable interest holder where that prior approval right constrains that party's ability to manage the economic risks or realize the economic rewards from its interests
- Parties with a close business relationship to the variable interest holder such as the relationship of a professional service provider to one of its significant clients.

These related-party attribution rules under FIN 46(R) will require consolidation of many of the currently popular SPE structures, unless the VIE is well capitalized and such subordinated support vehicles as loan guarantees are dispensed with.

If two or more related parties (including de facto principals/agents specified above) hold variable interests in the same VIE, and the aggregate variable interests held by those parties would, if held by a single party, identify that party as the primary beneficiary, then the member of the related-party group that is most closely associated with the VIE is the primary beneficiary that is required to consolidate the VIE as a subsidiary in its financial statements. In determining which party is most closely associated with the VIE, all relevant facts and circumstances are to be considered including

1. Whether there is a principal/agent relationship between parties within the related-party group
2. The relationship of the activities of the VIE to each of the parties in the related-party group
3. The significance of the VIE's activities to each of the parties in the related-party group
4. The extent of a party's exposure to the expected losses of the VIE
5. The structure of the VIE

Reconsideration of VIE status. Once an initial determination is made as to whether an entity is a variable interest entity (as opposed to a voting interest entity), that initial determination need not be reconsidered unless one or more of the following circumstances occurs:

1. A change is made to the VIE's governing documents or contractual arrangements that results in changes in either the characteristics or sufficiency of the at-risk equity investment in the VIE.
2. As a result of a return of some or all of the equity investment to the equity investors, other interests become exposed to the VIE's expected losses.
3. There is an increase in the VIE's expected losses that results from the entity engaging in activities or acquiring assets that were not anticipated at either the inception of the entity or a later reconsideration date.
4. There is a decrease in the VIE's expected losses due to the entity modifying or curtailing its activities.
5. Additional at-risk equity is invested in the VIE.

FIN 46(R) specifically excludes a troubled debt restructuring (as defined and discussed in Chapter 15) from being an event requiring reconsideration of VIE status.

Determination and redetermination of whether an interest holder is the primary beneficiary. A holder of a variable interest initially determines whether it is the primary beneficiary of a VIE in conjunction with the initial determination that the entity is a VIE, that is, when the holder initially obtains its interest in the entity. This initial determination of whether an interest holder is the primary beneficiary (irrespective of whether the holder is or is not considered to be the primary beneficiary) needs to be reconsidered when the changes are made to the entity's governing documents or contractual arrangements that result in a reallocation of the obligation to absorb expected losses or the right to receive expected residual returns of the VIE between the existing primary beneficiary and other unrelated parties. A variable interest holder that had previously determined that it was the VIE's primary beneficiary is required to reconsider its initial decision to consolidate that VIE if (1) it sells or otherwise disposes of all or part of its variable interest to unrelated parties, or (2) if the VIE issues new variable interests to parties other than the primary beneficiary or the primary beneficiary's related parties.

If a variable interest holder had, upon obtaining its interest, determined that it was not the primary beneficiary of a VIE, it is to reconsider this determination it if obtains additional variable interests in the VIE.

As is the case with the determination of whether an entity is a VIE, the initial or subsequent determination of its primary beneficiary is not affected by a troubled debt restructuring.

Variable interests in "silos." A party may hold a variable interest in specific assets of a VIE (e.g., a guarantee or a subordinated residual interest). In computing expected losses and expected residual returns, a holder of a variable interest in specified assets of a VIE must determine if the interest it holds qualifies as an interest in the VIE itself. The variable interest is considered an interest in the VIE itself if either (1) the fair value of the specific assets is more than half of the total fair value of the VIE's assets or (2) the interest holder has another significant variable interest in the entity as a whole.

If the interests are deemed to be interests in the VIE itself, the expected losses and expected residual returns associated with the variable interest in the specified assets are treated as being associated with the VIE.

If the interests are not deemed to be interests in the VIE itself, the interests in the specified assets are treated as a separate VIE (referred to as a "silo") if the expected cash flows from the specified assets (and any associated credit enhancements, if applicable) are essentially the sole source of payment for specified liabilities or specified other interests. Under this scenario, expected losses and expected residual returns associated with the silo assets are accounted for separately to the extent that the interest holder either absorbs the VIE's ex-

pected losses or is entitled to receive its expected residual returns. Any excess of expected losses or expected residual returns not borne by (received by) the variable interest holder is considered attributable to the entity as a whole.

If one interest holder is required to consolidate a silo of a VIE, other VIE interest holders are to exclude the silo from the remaining VIE.

Consolidation requirements. An entity must consolidate a VIE of which it is the primary beneficiary. The variable interest holder that is the primary beneficiary of a VIE holds a variable interest (or combination of variable interests) that will absorb a majority of the entity's expected losses, receive a majority of the entity's expected residual returns, or both. The rights and obligations conveyed by the reporting entity's variable interests and the relationship of its variable interests with variable interests held by other parties must be weighed to determine whether its variable interests will absorb a majority of a VIE's expected losses, receive a majority of the entity's expected residual returns, or both. Note that absorbing losses is more important than receiving residual returns: thus, if one entity will absorb a majority of a VIE's expected losses and another (unrelated) entity will receive a majority of the VIE's expected residual returns, the entity absorbing a majority of the losses must consolidate the VIE.

If there are other (noncontrolling) interests, which are analogous to minority interests, these are shown in the consolidated balance sheet just as minority interests are under GAAP, and likewise a share of the operating results of the VIE are allocated to the noncontrolling interests in the consolidated statements of income (operations).

FIN 46(R) provides a 10% equity threshold test which in practice is confusing and unworkable. The interpretation indicates that an at-risk equity investment of less than 10% of the entity's total assets is presumptively not considered sufficient to permit the entity to finance its activities without obtaining additional subordinated financial support but then goes on to provide that the presumption of insufficiency can be overcome by either quantitative analysis, qualitative analysis, or both. Consequently, financial statement preparers could mistakenly rely on the 10% presumption to conclude that an entity with less than 10% at-risk equity is a VIE, when in fact, further analysis would contradict that conclusion. Conversely, the interpretation indicates that it is also possible that an entity can require at-risk equity of more than 10% in order to sufficiently finance its activities. Consequently, the financial statement preparer also cannot rely on meeting or exceeding the 10% threshold as conclusive proof that the entity is sufficiently capitalized to avoid being characterized as a VIE.

FIN 46(R) greatly changes past practice. Currently, enterprises generally have been consolidated in financial statements because one enterprise controls the other through a majority of voting interests. FIN 46(R) requires existing unconsolidated variable interest entities to be consolidated by their primary beneficiaries if the entities do not effectively disperse risks among parties involved. Variable interest entities that effectively disperse risks will not be consolidated unless a single party holds an interest or combination of interests that effectively recombines risks that were previously dispersed.

Example of application of FIN 46(R). To explain the approach required by FIN 46(R), consider one of the more common SPE situations under prior GAAP, that of a synthetic lease. A synthetic lease is a financing transaction whereby an independent third-party lessor (i.e., unrelated to the lessee) constructs or acquires an existing single-tenant property and leases it to a lessee. The synthetic lease transaction is generally structured with a short lease term so that the lessee accounts for it as an operating lease under GAAP notwithstanding the fact that, for federal income tax purposes, it is treated as a "financing" which results in the lessee/taxpayer capitalizing the leased asset and deducting depreciation and interest. This arrangement achieves the lessee's objective by removing the related debt obligation from its

balance sheet. The lessee commits to a fixed schedule of rental payments, say for five years, so over that time there will be only a single amount for annual cash flows paid each year. The lease calls for the lessor to pay the lessee any excess of the fair value of the asset at lease termination date over its book value, plus a fixed rate of return to the lessor's owners. However, if the fair value of the asset is less than the book value plus the fixed rate of return, the lessee agrees to pay the lessor for any shortfall. Thus, there is cash flow variability created by this residual value guarantee by the lessee, making the lease structure potentially a VIE.

Assume the rental will be $50,000 per year for this example. Thus, the average (expected) cash flow each of those years will be the contractual amount. The fair value of the annual cash flow in any year will be the amount defined under CON 7, which is essentially the discounted present value of the lease payment. Assume 6% is the relevant discount rate, and rents are paid annually in arrears. The fair value of year one rent is then $50,000 ÷ 1.06 = $47,170; the corresponding amount for year two rent is $50,000 ÷ 1.06^2 = $44,500; etc. Since this amount is fixed, there are no expected residual rewards or expected losses from the rental stream in each of the years one through five.

NOTE: See Chapter 16 for more complex lease examples involving VIE and decision diagrams useful in analyzing VIE.

However, it is estimated that at the lease termination date there may be a range of fair values for the asset. Also, the lessor is entitled to a cumulative return on investment. It is now necessary to compute, separately, the expected (i.e., probability-weighted) fair values of the shortfall amount and the excess value amount. For simplicity, assume only three discrete outcomes are estimated to be possible.

1. The asset is sold for an amount that falls short of the book value plus the promised rate of return, for a net shortfall of $20,000;
2. The asset is sold for a net gain, after guaranteed return to the lessor, of $10,000; or
3. The asset is sold for a net gain of $40,000.

The relative probabilities of the three outcomes have been assessed at 40%, 35%, and 25%, respectively.

The expected residual cash flow to (or from) the lessee is given as $-20,000(.40) + $10,000(.35) + $40,000(.25) = $5,500.

Using these amounts, the expected loss (the single negative outcome) and the expected residual return (the sum of the two positive outcomes) can be computed. These are the foregoing individual cash flow amounts less the expected cash flows, weighted by the respective probabilities.

Expected loss = $-20,000 – $5,500 = $-25,500(.40) = $-10,200

Expected residual return = [$10,000 – $5,500 = $4,500(.35) = $1,575] + [$40,000 – $5,500 = $34,500(.25) = $8,625] = $10,200

Note that the expected loss equals the expected residual returns, as it must, since the arithmetic average (mean) was used to compute the deviations of each projected outcome. Since the expected loss based on expected cash flow will be borne by the lessee if it occurs, and the expected residual based on expected cash flows will be paid to the lessee if one or the other occurs, the lessee is the primary beneficiary.

The actual computation would be based on the fair value of the expected cash flows. In this case, the expected fair value of the loss is given as $-10,200 ÷ $(1.06)^5$ = $-7,622. The expected fair value of the expected residual rewards is $7,622.

The total expected variability of the lease arrangement is therefore $15,244 (all earlier years' rental streams had zero variability), and the lessee absorbs all of this.

Note that in real-life situations there may be many other complications, such as rentals based on variables such as sales of product, etc. In an actual situation, with a wide range of possible cash flows each period, the computations will be more challenging. However, it might be possible in many cases to immediately conclude qualitatively, based on analysis of the risks, rewards, and relationships that the VIE is indeed to be consolidated, in which case these calculations will be unnecessary. Also, in some situations the VIE will have a range of assets and multiple parties with whom it is in contractual arrangements, which is a complication addressed somewhat by the standard, but which requires more analysis.

Initial measurement. Assets, liabilities, and noncontrolling interests of newly consolidated VIE generally will be initially measured at their fair values. However, there is a (logical) exception for assets and liabilities transferred to a VIE by its primary beneficiary; these will continue to be measured as if they had not been transferred (i.e., at book value in the transferor/primary beneficiary's hands). Were this rule not imposed, a reporting entity could create gains merely by transfer of assets to a VIE, violating a basic principle of revenue recognition.

In general, FIN 46(R) applies the concepts regarding initial measurement and recognition of goodwill or negative goodwill that are found in FAS 141, *Business Combinations*, summarized as follows:

	Measurement or recognition issue	*Applicable requirement per FIN 46(R) to be followed by primary beneficiary (PB)*
1.	Measurement date	Date that holder of variable interest(s) first becomes the primary beneficiary
2.	Measurement amount for assets, liabilities and noncontrolling interests	Fair value (FV) on measurement date
3.	Measurement amount exception for enterprises under common control and assets and liabilities consolidated shortly after transfer from primary beneficiary to the VIE	Carrying value (net book value or NBV) in the accounting records of the enterprise that controls the VIE with no gain or loss recognized on account of transfer to a VIE
4.	Excess of FV of VIE assets + NBV of assets transferred by the PB to the VIE *Over* FV of consideration paid + NBV of previously held interests + FV of VIE liabilities and noncontrolling interests	Pro rata adjustment to newly consolidated VIE nonmonetary assets, as required by FAS 141 when negative goodwill results from a business combination. Any remaining amount, after the pro rata adjustment, is an extraordinary gain in the period of initial consolidation
5.	Excess of FV of consideration paid + NBV of previously held interests + FV of VIE liabilities and noncontrolling interests *Over* FV of VIE identifiable assets + NBV of identifiable assets transferred by the PB to the VIE	If the VIE is a business, as defined, recognized as goodwill If the VIE is not a business, recognized as an extraordinary loss in the period of initial consolidation

The following examples clarify application of the rules described in the preceding paragraphs:

Case One

First, assume that Client Corporation enters into an operating lease with an unrelated VIE, Non-Affiliate Corp., and that Non-Affiliate Corporation has a building with book value of

$12,000,000, fair value of $10,500,000 and an outstanding mortgage balance of $11,000,000 (assumed to be the mortgage's fair value). Assume that, due to the terms of the lease arrangement, the criteria for consolidation under FIN 46(R) are met, and that Client Corporation has no equity interest (even using the FIN 46[R] related-party criteria) in Non-Affiliate Corp. Client Corporation would consolidate the building on its balance sheet at its fair value of $10.5 million, reflect debt of $11 million, and because Non-Affiliate Corp. qualifies as a business under the definition provided by FIN 46(R), record goodwill of $500,000. Noncontrolling interest would be recorded at zero, since at this date there is no value to its interest.

Case Two

If, instead, the fair value of the building were $12.5 million, then the consolidation entry would reflect the building at $12.5 million, the debt at $11 million, and the noncontrolling interest (which happens to also be the 100% equity holder in the VIE) at $1.5 million, since all residual interest will go to those parties.

Case Three

Same facts as above, but now assume Client Corporation has a 25% interest in Non-Affiliate Corporation, and again the fair value of the building is $12.5 million. Recordation as follows would initially seem appropriate: debit building $12.5 million, credit mortgage payable $11 million, credit noncontrolling interest ($1.5 million × .75 =) $1.125 million, credit Client Corporation's equity (paid-in capital, representing the investment made in the building corporation) for ($1.5 million × .25 =) $375,000. However, this is wrong, since it effectively recognizes a gain on the increase in value of the building ($12.5 million fair value less $12 million book value). Under FIN 46(R) the primary beneficiary cannot recognize this gain, and therefore the primary beneficiary's percentage share of the excess fair value over its carrying value ($500,000 × .25 =) $125,000, must be used to reduce the recorded value of the building. The proper entry is: debit building $12,375,000 ($12,500,000 fair value – primary beneficiary's share of appreciation of $125,000 = $12,375,000), credit mortgage payable $11 million, credit noncontrolling interest ($1.5 million × .75 =) $1.125 million, and credit Client Corporation's equity ($375,000 – $125,000 =) $250,000.

After initial measurement, the assets, liabilities, and noncontrolling interests of a consolidated variable interest entity will be accounted for as if the entity were consolidated based on majority voting interests. In some circumstances, earnings of the variable interest entity attributed to the primary beneficiary arise from sources other than investments in equity of the entity.

Disclosures. The primary beneficiary of a VIE is required to disclose (1) the nature, purpose, size, and activities of the VIE, (2) the carrying amount and classification of consolidated assets that are collateral for the VIE's obligations, and (3) any lack of recourse by creditors (or beneficial interest holders) of a consolidated VIE to the general credit of the primary beneficiary. If an enterprise holds a significant variable interest in a VIE of which it is not the primary beneficiary, it is required to disclose (1) the nature of its involvement with the VIE and when that involvement began, (2) the nature, purpose, size, and activities of the VIE, and (3) the reporting enterprise's maximum exposure to loss as a result of its involvement with the VIE.

If a reporting enterprise does not consolidate a VIE because it is unable, after exhaustive efforts, to obtain the necessary information, it is required to make the following disclosures:

1. The number of entities to which FIN 46(R) is not being applied and the reason why the required information is unavailable,
2. The nature, purpose, size (if available), and activities of the entity or entities excluded and the nature of the reporting enterprise's involvement with them,
3. The reporting enterprise's maximum exposure to loss due to its involvement with the entity or entities, and

4. The amounts of income, expense, purchases, sales, or other measures of activity between the reporting enterprise and the VIE for all periods presented. If, in the first set of financial statements to which FIN 46(R) applies, it is not practicable to provide the information for prior periods that are presented for comparative purposes, then that information may be omitted.

If the reporting enterprise consolidates multiple, similarly structured VIE, the informative disclosures may be aggregated for these similar VIE as long as separate information would not be deemed to provide material information to a financial statement user.

If the VIE engages in activities covered by FAS 140, *Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities*, the disclosures required by FAS 140 regarding the VIE are required to be in the same note to the financial statements as the disclosures enumerated above.

Exceptions to VIE consolidation requirements. While FIN 46(R) is expected to require the consolidation of VIE engaged in leasing, and in a wide range of other transactions, including financial transactions, such as securitizations, it specifically permits off-balance-sheet financial vehicles known as qualified special purpose entities (QSPE) to continue to be nonconsolidated entities. These are widely used by corporations and financial institutions and consolidation of QSPE would have been enormously disruptive to the capital markets.

Prior to the issuance of FAS 125, the accounting for financial SPE was guided by analogizing from EITF 90-15, although that standard specifically stated that it applied only to leasing transactions. In fact, SPE were not even formally defined in the accounting literature. In practice, it was generally observed that SPE were designated as any entity that does not qualify as a "business" as that term is defined in EITF 98-3 (and has been adapted in FIN 46(R), as described earlier in this chapter). Generally, if an entity meets the definition of a business, the special nonconsolidation rules for SPE did not apply. However, this was not universally agreed, and an entity that qualified as a business under Issue 98-3 could also have been an SPE, at least in the opinion of some of those involved in standard setting.

The SEC has decreed that for an SPE to remain unconsolidated by the sponsor, and for sale recognition (where relevant) by the sponsor/transferor to be appropriate, "the majority owner of the SPE must be an independent third party who has made a substantive capital investment in the SPE, has control of the SPE, and has substantive risks and rewards of ownership of the assets of the SPE (including residuals). This became known as the "risks and rewards" analysis approach, which became the de facto standard until the issuance of FAS 125.

Rules regarding SPE changed again with the issuance of a comprehensive standard, FAS 125, which was replaced by yet another comprehensive standard, FAS 140. These deal with financial assets only, and establish the new concept of a qualifying SPE.

FAS 125 replaced the "risks and rewards" approach with a focus on "control over financial assets." Note that FAS 125 addressed transfers of financial assets, and was therefore not germane to transfers of other operating assets (plant and equipment, patents and copyrights, etc.). It introduced the concept of the qualifying SPE (QSPE), which was an SPE which

1. *Is a trust, corporation, or other legal vehicle whose activities are permanently limited by the legal documents establishing the SPE to*

   -Holding title to transferred financial assets
   -Issuing beneficial interests
   -Collecting cash proceeds from and otherwise servicing the assets held
   -Distributing proceeds to the holders of its beneficial interests

2. *Has standing at law distinct from the transferor*

Thus, one could say that QSPE were intended as a subset of SPE. In order for transfers of financial assets to SPE to be accounted for as sales (true sales), and thus for gain recognition to be appropriate (when otherwise warranted by the facts), the SPE transferee must be a QSPE. The consolidation requirements under EITF 90-15 and EITF Topic D-14 remained in effect for all transactions other than those involving QSPE or subject to FAS 125 (e.g., for nonfinancial assets, for transfers to related parties, etc.). FAS 125 did not explicitly address the need for sponsors to consolidate QSPE, but clearly if gain recognition would be appropriate consolidation could not be mandated, since that would obviate gain recognition (because upon consolidation, intercompany transactions, gains, etc., are all eliminated).

FAS 140 entirely replaced FAS 125, although most of the guidance remained identical. One reason for issuing the new standard was dissatisfaction with FAS 125's treatment of SPE. FAS 140 added new guidance with regard to defining the circumstances in which an SPE can be considered qualifying; circumstances in which the assets held by a qualifying SPE are to appear in the consolidated financial statements of the transferor; circumstances in which sale accounting is precluded if transferred financial assets can be removed from an SPE by the transferor; and other matters.

QSPE under FAS 140 were more narrowly defined. To be deemed a QSPE

A qualifying SPE is a trust or other legal vehicle that meets all of the following conditions:

a. It is demonstrably distinct from the transferor,

b. Its permitted activities (1) are significantly limited, (2) were entirely specified in the legal documents that established the SPE or created the beneficial interests in the transferred assets that it holds, and (3) may be significantly changed only with the approval of the holders of at least a majority of the beneficial interests held by entities other than any transferor, its affiliates, and its agents,

c. It may hold only

i) Financial assets transferred to it that are passive in nature;

ii) Passive derivative financial instruments that pertain to beneficial interests (other than another derivative financial instrument) issued or sold to parties other than the transferor, its affiliate, or its agents;

iii) Financial assets (for example, guarantees or rights to collateral) that would reimburse it if others were to fail to adequately service financial assets transferred to it or to timely pay obligations due to it and that it entered into when it was established, when assets were transferred to it, or when beneficial interests (other than derivative financial instruments) were issued by the SPE;

iv) Servicing rights related to financial assets that it holds;

v) Temporarily, nonfinancial assets obtained in connection with the collection of financial assets that it holds; and

vi) Cash collected from assets that it holds and investments purchased with that cash pending distribution to holders of beneficial interests that are appropriate for that purpose (that is, money-market or other relatively risk-free instruments without options and with maturities no later than the expected distribution date).

d. If it can sell or otherwise dispose of noncash financial assets, it can do so only in automatic response to one of the following conditions:

i) Occurrence of an event or circumstance that (a) is specified in the legal documents that established the SPE or created the beneficial interests in the transferred assets that it holds; (b) is outside the control of the transferor, its affiliates, or its agents; and (c) causes, or is expected at the date of transfer to cause, the fair value of those financial assets to decline by a specified degree below the fair value of those assets when the SPE obtained them;

ii) Exercise by a beneficial interest holder (other than the transferor, its affiliates, or its agents) of a right to put that holder's beneficial interest back to the SPE;

iii) Exercise by the transferor of a call or "replacement of accounts provision" specified in the legal documents that established the SPE, transferred assets to the SPE, or created the beneficial interests in the transferred assets that it holds; or

iv) Termination of the SPE or maturity of the beneficial interests in those financial assets on a fixed or determinable date that is specified at inception.

FAS 140 provided detailed guidance addressing the matters of the QSPE's need to be demonstrably distinct from the transferor; the necessary limitation on its permitted activities; limitations on what assets the QSPE can hold; and the limitations on sales or other dispositions of the assets by the QSPE. When all conditions are met, the QSPE is not consolidated in the financial statements of the sponsor.

Of interest is that the threshold level of an outside equity under FAS 140 was set at 10%. As the FASB stated, "if at least 10% of the interests in the transferred assets (or 10% of the interests in a series in the master trust) were currently held by third parties and if the transferor could not unilaterally dissolve the SPE, that is sufficient evidence to demonstrate that the SPE is demonstrably distinct from the transferor, its affiliates, or its agents." FASB settled on the 10% level "not because it was grounded in any particular literature, but because it appeared sufficient to demonstrate that the transferee is distinct from the transferor."

The accounting for VIE meeting the QSPE rules of FAS 140 continue to be governed by that standard and are not impacted by the imposition of FIN 46(R). However, FASB may further revise VIE accounting, and this area is ripe for ongoing evolution.

Example of consolidation under FIN 46(R)

In practice, the most common situations requiring consolidation under FIN 46(R) will involve related-party leases as discussed in detail in Chapter 16. Consequently, this example uses a structured related-party lease to illustrate application of the consolidation provisions of FIN 46(R).

Arielle Aromatics Ltd. (AAL) is a manufacturer of aromatherapy products that is 100% owned by Arielle Stone. AAL's headquarters and manufacturing plant are leased pursuant to an operating lease with an S Corporation, Myles' Management, Inc (MMI) owned by Arielle's brother, Myles.

AAL's headquarters building and the land on which it is built are the only assets owned by MMI. They have been pledged as collateral for a mortgage loan which is guaranteed by a corporate guarantee of AAL and a personal guarantee of Arielle.

MMI has been determined to be a variable interest entity (VIE) and AAL its primary beneficiary.

The following is the consolidating worksheet at December 31, 2008:

Arielle Aromatics Ltd. and Subsidiary
Consolidated Worksheet
Year Ending December 31, 2008

(000 omitted)			**Adjustments and Eliminations**			
	AAL	*MMI*	*Debit*	*Credit*	*Noncontrolling interest*	*Consolidated*
Statement of income:						
Revenues						
Sales	$ 6,400					$ 6,400
Rental income		$1,200[a]	$1,200			--
Cost of sales	3,800					3,800
Gross profit	2,600	1,200	1,200			2,600
Depreciation	100	230				330
Rent expense	1,200			$1,200[a]		--
Interest expense	200	400				600
Other expenses	300	--				300

(000 omitted)			Adjustments and Eliminations			
	AAL	*MMI*	*Debit*	*Credit*	*Noncontrolling interest*	*Consolidated*
Total operating expenses and interest	1,800	630		1,200		1,230
Income before noncontrolling interest share	800	570	1,200	1,200		1,370
Noncontrolling interest share of income					$570	(570)
Net income	$ 800	$ 570	$1,200	$1,200	$570	$ 800
Statement of retained earnings:						
Retained earnings, beginning						
AAL	$ 1,200					$1,200
MMI		$ --				--
Add net income (from above)	800	570	$1,200	$1,200	$570	800
Deduct dividends paid	(100)	(500)			(500)	(100)
Retained earnings, ending	$ 1,900	$ 70	$1,200	$1,200	$ 70	$ 1,900
Balance sheet:						
Cash	$ 2,100					$ 2,100
Accounts receivable, trade (net)	7,500					7,500
Rentals receivable		$100	b	$100		--
Inventories	1,100					1,100
Land		1,000				1,000
Depreciable property and equipment	1,200	7,000				8,200
Accumulated depreciation	(300)	(230)				(530)
Total assets	$11,600	$7,870		100		$19,370
Notes and mortgages payable	$5,000	$6,900				$11,900
Accounts payable, trade	4,400					4,400
Rent payable	100	b	$100			--
Total liabilities	9,500	6,900	100		--	16,300
Common stock	200	900			900	200
Retained earnings (from above)	1,900	70	1,200	1,200	$970	1,900
Noncontrolling interest					970	970
Total stockholder's equity	2,100	970	1,200	1,200		3,070
Total liabilities and stockholders' equity	$11,600	$7,870	$1,300	$1,200		$19,370

The consolidating entries posted to the December 31, 2008 worksheet are as follows:

a.	*Debit*	*Credit*
Rental income	1,200	
Rental expense		1,200

To eliminate intercompany rental income and rental expense at December 31, 2008

b.	*Debit*	*Credit*
Rental payable	100	
Rentals receivable		100

To eliminate intercompany rent receivable and rent payable at December 31, 2008

The consolidation process is relatively straightforward. The effects of the related-party lease, the rental income and expense and intercompany receivable and payable are eliminated so that, on a consolidated basis, the financial statements reflect the building, mortgage debt, depreciation, and interest expense.

The only difference between this consolidation under FIN 46(R) and a conventional consolidation of a voting interest entity in accordance with ARB 51, is the noncontrolling interest allocation. ARB 51, para. 14 specifies that the elimination of intercompany profit or loss is allocable proportionately to the majority and minority (controlling and noncontrolling) interests. In this ex-

ample, however, the controlling interest holder, AAL, has no legal claim on the profit of MMI since MMI's profit or loss is legally allocable to its equity owner. If this example had been a conventional consolidation of a voting interest entity, the effect of eliminating the rental income from MMI would be a remaining MMI loss of $630 computed as follows:

MMI net income	$ 570
Effect of elimination of rental income	(1,200)
MMI net loss after elimination of intercompany rental income	$ (630)

FIN 46(R) provides a special rule that the effect of eliminating fees or other sources of income or expense between the primary beneficiary and the consolidated VIE is to be allocated to the primary beneficiary and not to the noncontrolling interest computed as follows and illustrated above:

Net loss of VIE	$ (630)
FIN 46(R) adjustment to allocate rental expense to primary beneficiary	1,200
Adjusted VIE net income allocable to noncontrolling interest	$ 570

The net income allocation to the noncontrolling interest shown above is reduced by the dividends paid to the noncontrolling interest as follows:

Adjusted VIE net income allocable to noncontrolling interest	$570
Dividend paid to noncontrolling interest	(500)
Noncontrolling interest retained earnings	70
Noncontrolling interest common stock	900
Total noncontrolling interest	$970

The results of the consolidation can be summarized as

Primary beneficiary rent expense	$1,200
VIE	
Depreciation	230
Interest	400
	630
Net effect, allocable to noncontrolling interest	$ 570

Consolidated net income of $800 is the same as the primary beneficiary's net income since the entire $570 of VIE net income is allocated to the noncontrolling interest. The results, however, can have a profound effect on the way that the financial statements portray the leverage of the primary beneficiary to users, which might be the difference between AAL meeting or violating its loan covenants.

Debt to equity ratio	
Primary beneficiary	4.5:1
Consolidated	5.3:1

Certain practical matters require consideration in the case of consolidating VIEs.

1. *VIE without GAAP financial statements.* Many VIEs structured as shown in this example had not previously prepared financial statements. Prior to consolidating the VIE with the primary beneficiary, the VIE's accounting records must be adjusted to eliminate any differences between GAAP and the basis on which the VIE reports for income tax purposes.
2. *Lack of prior independent CPA involvement with VIE.* VIEs that had not been subject to financial reporting in the past obviously had not needed to engage an independent CPA to perform a compilation, review, or audit engagement. Upon consolidation, the consolidated financial statements including the VIE's financial position and results of operations will be subject to the same level of service as the financial statements of the primary beneficiary.
3. *Interaction with ASC 460-10.* ASC 460-10, *Guarantor's Accounting and Disclosure Requirements for Guarantees, Including Indirect Guarantees of Indebtedness of Others,* requires guarantors to recognize a liability at inception for the obligations embodied in the guarantee. In the example above, the guarantee of the VIE's mortgage by the primary beneficiary would be exempt from the initial recognition and measurement provi-

sion of ASC 460-10 because the guarantee is analogous to a parent guarantee of its subsidiary's debt to a third party, which is specifically exempted from the recognition and measurement provisions of ASC 460-10. However, the guarantee is not exempt from the disclosure requirements of ASC 460-10 and ASC 450-10.

4. *General-purpose financial statements.* In the example, AAL is the "parent" company. It would be precluded by ARB 51 from issuing separate, general purpose financial statements that exclude MMI since this would be a GAAP departure; however, nothing precludes MMI from issuing separate subsidiary-only financial statements.

Disclosure Requirements

In the period in which a material business combination is completed, the notes to the acquirer's financial statements must disclose the following information:

1. The name and a brief description of the acquiree, together with the percentage of voting shares acquired
2. The period for which the results of the acquiree's operations are included in the income statement of the acquirer
3. The cost of the transaction and, if applicable, the number of shares of stock issued or issuable, the value assigned to those shares, and the basis for determining that value
4. Contingent payments, options, or commitments specified in the acquisition agreement and the accounting treatment that will be followed should any such contingency occur
5. A condensed balance sheet disclosing the following for each major asset and liability caption of the acquiree:
    a. The book value as reflected in the acquiree's financial records at the date of acquisition before fair value adjustments
    b. The fair values assigned at the date of acquisition (including, if pertinent, how negative goodwill was allocated to preliminarily determined asset fair values)
6. For any purchase price allocation that has not been finalized, that fact and the reasons therefore and, in subsequent periods, the nature and amount of any material adjustments made to the initial allocation of the purchase price; and
7. If the amount assigned to goodwill or to other intangible assets acquired is significant in relation to the total cost of the acquired enterprise
    a. The amount of acquired goodwill
    b. The amount of acquired goodwill related to each segment (for entities that are required to report segment information in accordance with ASC 280-10)
    c. The amount of acquired goodwill that is deductible for income tax purposes

The notes to the financial statements of the acquirer also must disclose the following information in the period in which individually immaterial business combinations have been completed, if material in the aggregate:

1. The number of entities acquired and a brief description of the acquirees;
2. The aggregate cost of the acquisitions, the number of shares of stock issued or issuable, and the value assigned to those shares;
3. The aggregate amount of any contingent payments, options, or commitments and the accounting treatment that will be followed should any such contingency occur (if potentially significant in relation to the aggregate cost of the acquirees); and

4. Information pertaining to recorded goodwill, if the aggregate amount assigned to goodwill or to other intangible assets acquired is significant in relation to the aggregate cost of the acquirees.

Notes to the financial statements also must disclose, for any material business combination completed after the balance sheet date but before the financial statements are issued, information similar to that for completed transactions, above.

For each period for which a statement of financial position is presented, the notes to the financial statements also are to disclose the changes in the carrying amount of goodwill during the period. That would include the amount of goodwill acquired, the amount of impairment loss recognized, and the amount of goodwill included in the gain or loss on disposal of all or a portion of a reporting unit. Entities that report segment information in accordance with ASC 280-10 are to provide that information for each segment, disclosing any significant changes in the allocation of goodwill by segment.

When goodwill impairment losses are recognized, disclosure is required of

1. The facts and circumstances leading to the impairment;
2. The reporting unit for which the impairment loss is recognized, the adjusted carrying amount of goodwill of that reporting unit, and the amount of the impairment loss;
3. If relevant, the fact that the impairment loss estimate has yet to be finalized, the reasons therefore and, in subsequent periods, the nature and amount of any significant adjustments made to the initial estimate of the impairment loss; and
4. The segment to which the impaired goodwill relates (for entities that are required to report segment information in accordance with ASC 280-10).

In the period in which an excess over cost related to an acquisition is recognized as an extraordinary gain, it will be presented net of tax, as required under the provisions of ASC 225-20, with appropriate disclosure in the notes to the financial statements.

INTERPRETIVE GUIDANCE

The complexity of business combinations and the related accounting has necessitated the issuance of numerous interpretive pronouncements. To assist in conducting research and finding the relevant guidance, these pronouncements are categorized as follows:

Common Control

Definition of "common control" in applying FAS 141. FAS 141 does not provide a definition of the term "common control." Nevertheless, this did not prevent FASB from excluding combinations of entities under common control from being subject to fair value purchase accounting requirements. In EITF 02-5, the Task Force was unable to reach a consensus regarding this definition. The discussion of this matter included in the EITF Abstract of that issue, however, indicates the SEC Staff position that common control only exists between or among separate entities in the following situations:

1. An individual or entity holds more than 50% of the voting ownership interests of each entity,
2. Immediate family members (defined below) hold more than 50% of the voting ownership interests of each entity with no evidence present that those family members will not vote their shares identically, and
3. A group of shareholders holds more than 50% of the voting ownership interests of each entity, and there is an agreement documented contemporaneously in writing to vote the majority of the entities' shares identically.

For the purpose of this determination, immediate family members include a married couple and their children, but not their grandchildren. Entities that are owned in varying combinations by living siblings and their children are to be carefully considered regarding the substance of the ownership and voting relationships.

Exchanges of ownership between commonly controlled entities. EITF 90-5 stipulates that there is no step up in a transfer of a subsidiary from a parent company to another of its subsidiaries, and that the recipient subsidiary's basis in the new subsidiary will be the same as was the parent company's. However, a buyout of noncontrolling interests by the subsidiary is to be accounted for as a purchase transaction, whether effected by cash or by a stock transaction.

Change in accounting basis in master limited partnership transactions. ASC 805-50, as modified by FAS 141, addresses the following types of transactions used to create master limited partnerships (MLP):

1. Roll-up—The combination of two or more separate limited partnerships into one MLP.
2. Drop-down—A sponsor (usually a corporation) transfers specified assets to a limited partnership, units of which are then sold to the public.
3. Roll-out—Same as a drop-down except that instead of selling units to the public, the units are distributed to the stockholders of the sponsor.
4. Reorganization—An entity transfers all of its assets into an MLP and then the transferor terminates its existence.

The key consideration in analyzing the facts and circumstances of the transaction is whether the transaction is covered by the scope of FAS 141. Generally, transactions in which entities transfer net assets or the entities' owners transfer their equity interests to a newly formed entity (referred to as roll-up or put-together transactions) are included in the scope of FAS 141 and would be subject to the prescribed accounting for purchase business combinations. However if the transaction is considered to be a transfer of net assets or exchange of equity interests between entities under common control, it is excluded from the scope of FAS 141 and is recorded in a manner similar to the formerly permitted poolings-of-interest.

The consensuses reached in ASC 805-50, as modified for the issuance of FAS 141, were

1. A new basis of accounting is not appropriate in a roll-up where no cash is involved in the transaction and where the general partner was also the general partner in any of the former limited partnerships involved in the roll-up. The Task Force also specified that, in recording a roll-up, the related transaction costs are to be charged to expense in a manner similar to the accounting for poolings-of-interest under APB 16.
2. A new basis of accounting is not appropriate in a drop-down in which
    a. The sponsor receives 1% of the units in the MLP as the general partner and 24% of the units as a limited partner,
    b. The other 75% of the units are being sold to the public, and
    c. The partnership agreement requires a two-thirds votes of the limited partners to replace the general partner.
3. A new basis of accounting is not appropriate in any roll-out, and
4. A new basis of accounting is not appropriate in a reorganization.

The SEC Observer to the Task Force proceedings specified that the SEC staff would not object to a new basis being recognized in a drop-down to the extent of the percentage change in ownership as long as

1. The MLP sells 80% or more of the partnership units to the public, and
2. The limited partners have the ability to replace the general partner through a "reasonable vote."

Simultaneous common control mergers. EITF 90-13 addresses situations in which a parent company obtains control of a target company, then spins one of its previously owned subsidiaries off to the target in exchange for more shares in the target (i.e., the old subsidiary becomes a "grandchild" after the series of transactions). The consensuses reached were as follows, as updated for the issuance of FAS 141:

1. When the transfer of the subsidiary to the target was negotiated in tandem with the parent's obtaining its controlling interest in the target, the two transactions are to be considered as one transaction and, therefore, the transfer is not considered to be between entities under common control.
2. The transaction is to be accounted for by the parent under the provisions of EITF 01-2 as a partial sale of the subsidiary to the noncontrolling interest holders of the target with a resulting gain or loss recognized as well as a partial acquisition of the target.
3. A step-up in basis is permitted to the extent of a change in control, both with respect to the acquisition of the target and the sale of the subsidiary to the target.
4. The accounting for a spin-off of the old subsidiary to the target company is to be accounted for as "reverse acquisition" of the target by the subsidiary. Under reverse acquisition accounting, the subsidiary is substantively considered to have acquired an interest in the target. This results in the subsidiary's assets and liabilities being carried at fair value in the target's financial statements to the extent acquired by the target. The subsidiary, however, does not, in its separate financial statements, revalue its own assets and liabilities since no gain or loss is recognized at the target-subsidiary level.

Contingent Consideration

Contingent consideration paid to the acquiree's shareholders. Whether contingent consideration based on earnings is to be accounted for as an adjustment of the purchase price or as compensation for services, for the use of property, or for profit sharing depends on the facts and circumstances of each case. EITF 95-8 provides factors that can assist in making this determination relate to the terms of continuing employment, components of shareholder group, reasons for the contingent payment provisions, the formula used for determining contingent consideration, and other agreements and issues. For example, if compensation other than contingent payments is set at a reasonable level, this supports treatment of the contingent payments as an additional purchase price.

Indirect contingent consideration. EITF 97-8 deals with indirect contingent consideration arrangements in which the contingency is based either on earnings or a guaranteed value of the securities issued to effect the combination. The reason this consideration is considered indirect is because the consideration is not included in the combination agreement but, rather, is embedded in a security or in the form of a separate, freestanding financial instrument.

EITF 97-8, as modified by subsequently issued pronouncements, holds that if the security or separate financial instrument is publicly traded or indexed to a publicly traded secu-

rity, it is to be recorded by the acquirer/issuer at fair value on the acquisition date. If not publicly traded or indexed to a publicly traded security, the acquirer/issuer is to record the contingent consideration in accordance with FAS 141; that is, when the contingency is resolved. If the security or financial instrument is considered a guarantee under FIN 45, the acquirer/issuer is also subject to the guarantor disclosure requirements of that pronouncement.

ASC 480 specifies that the acquirer/issuer recognize post-acquisition-date changes in the fair value of publicly traded freestanding financial instruments issued as consideration in a business combination. This accounting is followed irrespective of whether the financial instruments are contingent or noncontingent.

Contingencies based on security prices. The terms of a business combination may include a stipulation that the acquirer will pay cash or other consideration to the seller if the securities issued by acquirer to effect the business combination are not worth an agreed-upon amount at a specified future date.

Depending on the specifics of the contract, the guaranteed minimum value of the securities could be less than the issuance-date value of the securities which is referred to as a "below-market guarantee." The consensus specifies that for a below-market guarantee, there is no adjustment to the cost of the acquisition, as cost is computed as the fair value of unconditional securities issued on the date of combination. In order to determine the proper accounting for the contingent consideration, the issuer for the securities must analyze the character of the instruments to determine whether they are within the scope of ASC 480. ASC 480 applies to certain freestanding financial instruments that are settleable by the issuance of a variable number of the issuer's equity shares. If the instruments are hybrid instruments containing an embedded derivative, ASC 480 does not apply because the instruments are not a derivative in their entirety. Irrespective of whether the issuer records the securities as liabilities or equity, the contingent consideration arrangement will be subject to the additional disclosures required for guarantors by ASC 460-10.

EITF 97-15 provides several examples of target value contingent arrangements. One such example is as follows:

- Acquirer, Inc. purchases Seller Co. by issuing 100,000 shares of stock
- The fair value of the stock is $10 per share on the acquisition date, making the aggregate fair value of the stock on the acquisition date $10 × 100,000 = $1,000,000
- As part of the acquisition agreement, Acquirer agrees to issue additional shares three years after the acquisition date if, at that later date, the aggregate fair value of the stock has not appreciated to a target value of at least $2,000,000 ($20 per share) on the following sliding scale:

Per share price of acquirer shares 3 years after acquisition	*Number of additional shares to be issued*
$16	25,000
$17	18,750
$18	12,500
$19	6,250
$20	--

Note that this example does not result in Seller receiving a guaranteed minimum price since no matter how much the price of Acquirer's shares declines below $16 per share, the number of shares that Seller would be entitled to receive does not increase.

EITF 97-15 sets forth the following formula for computing the acquisition cost when the contingency arrangement does not result in a guaranteed minimum amount of total consideration, which is the lesser of the target value or

(Maximum # of shares potentially issuable) × (Acquisition date fair value per share)

In the example given, the target value is $2,000,000 and the computation of the maximum number of shares × acquisition date fair value per share is computed as

125,000 shares × $10 per share = $1,250,000

Since $1,250,000 is less than the target amount, the cost of the acquisition would be recorded at an aggregate amount of $1,250,000 on the acquisition date.

Valuation of assumed debt. FAS 141 requires cost allocation to be based on the fair values of assets and liabilities, with the fair value of liabilities being computed using present value. An issue arises because present value ≠ fair value in some cases, such as when a prepayment option affects fair value but present value would often ignore this contingent change in future cash flows. EITF 98-1 holds that fair value is to be used, even if ≠ present value of cash flows. Since market values may not be available, some use of a present value method may be required, but the value of option features, etc., must be included in the calculation.

Exit and Disposal Activities

Recognition of termination benefits or changing benefit plan assumptions in anticipation of a business combination. Termination costs to be incurred from an anticipated business combination are not to be accrued even if the business combination is deemed probable. EITF 96-5 provides that these costs may only be recognized when the business combination is actually consummated.

Exiting activities and integrating operations. EITF 95-3 sets forth the consensuses regarding the accounting for certain costs incurred when an acquirer, Company A, in connection with its acquisition of Company B plans to incur certain costs of exiting activities and integrating operations.

EITF specified that a plan to exit an activity of an acquired company exists if it meets all of the following conditions:

1. On the date that the acquisition is consummated, management with the appropriate level of authority has begun to assess and formulate a plan to exit the activity.
2. The assessment of which of the acquiree company's activities to exit is completed and the exit plan finalized, approved, and committed to by the combined company on the earlier of the soonest possible date after consummation, or one year after the consummation date.
3. The exit plan specifically identifies
   a. The activities of the acquired company that will not be continued
   b. The locations of those activities
   c. The method of disposition
   d. All significant actions needed to complete the plan
   e. The expected date of completion of the plan
4. Actions required by the plan commence as soon as possible after the plan is finalized, and
5. The period of time necessary to complete the plan makes it unlikely that the plan will undergo significant changes

The Task Force reached a consensus that a cost resulting from a plan to exit an activity of an acquired company is to be recognized as a liability on the date the acquisition is consummated only if the cost is not associated with or incurred to generate revenues to the combined entity after the consummation date and it meets either of the following criteria:

1. The cost represents an amount to be incurred by the combined company under a contractual obligation of the acquiree that predated the consummation date and either will
   a. Continue after completion of the plan with no economic benefit to the combined company, or
   b. Result in the combined company incurring a cancellation penalty to terminate the obligation.
2. The cost
   a. Has no future economic benefit to the combined company,
   b. Is incremental to other costs incurred either by the acquirer or the acquiree in the conduct of preconsummation date activities, and
   c. Will be incurred as a direct result of the plan to exit an activity of the acquired company.

Costs associated with a plan to involuntarily terminate or relocate employees of the acquiree are recognized as a liability assumed on the date the business combination was consummated and included in the allocation of acquisition cost if all of the following conditions are met:

1. On the date that the acquisition is consummated, management with the appropriate level of authority has begun to assess and formulate a plan to involuntarily terminate or relocate employees of the acquiree.
2. The assessment of which of the acquiree company's employees will be involuntarily terminated or relocated is completed and the plan of termination or relocation is finalized, approved, and committed to by the combined company on the earlier of the soonest possible date after consummation, or one year after the consummation date.
3. On or before the time specified in 2., above, the termination or relocation arrangement has been communicated to the employees of the acquiree in sufficient detail to enable them to determine the type and amount of benefits that they would be entitled to receive if terminated or relocated.
4. The exit plan specifically identifies with respect to the acquiree employees to be terminated or relocated
   a. The number of employees affected,
   b. Their job classification or function, and
   c. Their locations.
5. Actions required by the plan will commence as soon as possible after the plan is finalized, and
6. The period of time necessary to complete the plan makes it unlikely that the plan will undergo significant changes.

These adjustments are not considered preacquisition contingencies under FAS 141.

If later settled for less than the amount initially accrued, the savings are accounted for as a reduction in the purchase price of the acquiree, which usually means goodwill recorded on the acquisition is reduced. If settled for greater than the amount initially accrued, and determined within one year of the acquisition date, the excess is accounted for as an increase in the purchase price of the acquiree, which usually means goodwill recorded on the acquisition is increased. If an excess settlement is not determined within one year of acquisition, it is to be recorded as an expense of the period in which it is determined.

Any costs relating to activities or employees of the acquiree not meeting the specified conditions are considered indirect and general acquisition expenses under FAS 141. Per FTB

85-5, costs related to assets or employees of the acquirer are not costs of the acquisition and thus are prohibited from being included as part of the purchase price allocation process; instead, these costs are required to be reflected in the income statement when incurred. The consensus also identified certain disclosures to be made under these circumstances, including a description of plans to exit activities, possible reallocation of purchase transactions, etc.

Impairment

Determination of reporting units. Whether a component of an operating segment is a reporting unit for purposes of applying ASC 350, for purposes of applying the requirement to determine goodwill impairment depends on whether the component functions as a business, whether discrete financial information is available about that component, whether it is accountable to and in regular contact with segment managers, and whether it is qualitatively distinct from other components of the operating segment. It is possible that components aggregated for purposes of reporting under FAS 131 could be separate for purposes of applying ASC 350 (EITF D-101).

Income Tax Considerations

Income tax uncertainties. EITF 93-7 holds that all income tax uncertainties (such as uncertainties about the allocation of purchase price to individual assets and liabilities for tax purposes in a taxable business combination, uncertainties about carryforwards in a nontaxable combination, and uncertainties about preacquisition tax returns of the acquired entity) existing at the time of a purchase business combination are to be accounted for under the provisions of ASC 740, not under the provisions of FAS 38 (preacquisition contingencies). Any such adjustments are to be applied to increase or decrease the remaining balance of goodwill attributable to that business combination; if goodwill is reduced to zero, the remaining amount is used to reduce other noncurrent intangible assets from the same acquisition to zero, with any excess taken to income.

Deferred income taxes on acquired in-process R&D. Per FIN 4, the purchase price allocated in a purchase business combination to research and development costs must be expensed immediately. At issue is whether, under ASC 740, a deferred tax liability must be allocated to the initial (pre-write-off) basis difference between tax and book bases. EITF 96-7 held that since the write-off occurs prior to the measurement of deferred taxes, no deferred taxes are to be assigned.

Decrease in valuation allowances as a result of a change in income tax regulations. Consolidated income tax return regulations issued in 1999 changed the rules for utilizing certain net operating loss carryovers and carrybacks (NOLC). These regulations eliminated the requirement to apply the limitations on the separate return limitation year losses to situations in which a change in ownership as defined in IRC §382 has occurred within six months of a target company becoming a member of a consolidated group.

This change in income tax regulations required an entity to reevaluate the need for an existing valuation allowance for deferred income tax assets relating to NOLC acquired in a prior purchase business combination. The specific question was whether the effect of the adjustment should be (1) included in operations or (2) applied first to reduce to zero any goodwill related to the acquisition, second to reduce to zero other noncurrent intangible assets related to the acquisition, and third to reduce income tax expense.

EITF 99-15 requires the effect of a change in income tax law or regulation that results in a decrease in a valuation allowance that initially was recorded in the allocation of the purchase price in a purchase business combination to be included in income from continuing operations. The consensus applies to any reduction in the valuation allowance that otherwise

would not have been recognized except for the change in income tax law or regulation, regardless of whether the valuation allowance is reduced in the period of the income tax law change or in a subsequent period.

Leveraged Buyouts (LBO)

Cost basis. One of the most complex accounting areas, EITF 88-16 stipulates how to compute the new cost basis after an LBO transaction. A consensus was reached that a new basis is to be recognized only when there is a change in the voting control from the former entity to the post-LBO entity; that a "substance over form" rule applies when seeking to determine if there had in fact been a change in control; and that a "monetary test" is established whereby fair value can only be used if at least 80% of the fair value of consideration paid to make the acquisition is monetary in nature.

EITF 90-12 prescribes the use of the partial purchase (step acquisition accounting) method, even if retained earnings are eliminated as a consequence.

Measurement and Allocation

Measurement date for the market price of acquirer securities issued. EITF 99-12 provides that the measurement of the fair value of the marketable equity securities issued by the acquirer to effect a business combination is to be made based on the market price of those securities for a very short period of time, such as a few days before and after the terms of the acquisition are agreed to and announced. The determination of this period should not be influenced by the need to obtain approvals of the combination from regulators and/or shareholders.

If the transaction involves a hostile tender offer, the measurement date is established upon the announcement of the proposed transaction and the tender of a sufficient number of shares to make the offer binding, or when the proposed acquisition becomes nonhostile as a result of an agreement by the target company to the purchase price.

If, as a result of further negotiations or the execution of a revised acquisition agreement, the purchase price is substantively changed (either the number of shares to be issued or the amount of other consideration), a new measurement date is to be established on the date of the change.

In some cases, the initial acquisition agreement includes a formula that potentially changes the number of acquirer's shares to be issued or other consideration to be paid. Under these circumstances, the measurement date is the first date on which the number of the acquirer's shares and the amount of other consideration become fixed without being subject to further revision in accordance with the formula. The Task Force noted, however, that the measurement period should not include any dates after the date the business combination is consummated.

Recognition of customer relationship intangible assets. EITF 02-17 addresses the propriety of separate recognition of customer relationship intangibles in a business combination. EITF concluded that the contractual-legal and the separability criteria do not restrict the use of certain assumptions that would be used in estimating the fair value of an intangible asset. Thus, if the parties to the business combination believe that an existing contractual relationship with a customer will be renewed, this is considered in making the purchase price allocation to that asset, once the threshold for recognition (i.e., the contractual right) has been identified. It furthermore concluded that the guidance in FAS 141 that states "if an entity establishes relationships with its customers through contracts, those customer relationships would arise from contractual rights," applies if an entity has a practice of establishing contracts with customers, regardless of whether a contract is in existence at the date of acquisi-

tion. However, in assigning fair value to the relationship, the lack of a current contract would likely be considered, even if recognition is warranted. Finally, consensus was reached that an order or a production backlog arising from contracts such as purchase or sales orders (even if the purchase or sales orders are cancelable) would be considered a contract.

Separating goodwill and other intangibles. Under FAS 141, intangible assets other than goodwill resulting from business combinations are to be separately accounted for, but under prior GAAP (APB 17) it was not uncommon for intangibles thus obtained to be aggregated as goodwill, since the accounting was identical. The transition provisions for ASC 350 permit disaggregating intangibles, but only to the extent that separate accounting records (even if aggregated for financial reporting purposes) had been maintained. The amount of purchase cost allocated to goodwill and other intangible assets cannot be redetermined as part of this process, however. A failure to properly separate formerly aggregated intangibles would potentially distort subsequent determinations of goodwill impairment, since under FAS 141 this determination is based on the value of goodwill after fully assigning purchase cost to all intangibles, including those not formally recognized (EITF D-100).

Deferred revenue of the acquiree. EITF 01-3 addresses recognition by an acquirer of deferred revenue previously accounted for by an acquired entity as a liability under GAAP, noting that the fair value requirement for liability recognition under FAS 141 does not correspond to the customary revenue recognition rules for ongoing businesses.

In the case of revenue deferred because the acquiree entity had a performance obligation, the conclusion was that in the context of a purchase business combination, recognition of a performance obligation liability would only be appropriate when the acquirer has a legal obligation (either contractually or by operation of consumer rights laws in the applicable legal jurisdiction) to provide goods, services, the right to use assets, or some other consideration to customers of the acquiree. Other types of obligations that are recognizable by the acquirer might be general rights of return under FAS 48 or contractual price protection provisions.

Absent this legal obligation, the deferred revenue is not recognized as a liability of the acquirer. Revenue arrangements in business combinations might also result in the recognition of an asset (for the customer relationship) and a liability (deferred revenue); these are not permitted to be netted.

Preexisting relationships between the parties. EITF 04-1 resolves a number of issues regarding how to account for business combinations involving parties that had preexisting relationships. When two parties with preexisting relationships enter into a business combination, it is to be considered a multiple-element transaction with the business combination being one element and the settlement of the preexisting relationship being the other element.

Executory contracts. The effective settlement of a preexisting executory contract between the parties to a business combination is measured at the lesser of

1. The amount by which the contract is either favorable or unfavorable to the acquirer when compared to the terms of current market transactions for the same or similar items, or
2. Any contractually stated settlement provisions available to the counterparty to which the contract is unfavorable.

To the extent that the settlement amount in 2. is less than the "off-market component" in 1., the difference is to be included as part of the business combination.

Rights to use intangible assets. An acquirer may have previously granted to the acquiree the right to use its intangible assets, whether recognized or unrecognized. For example, the acquiree may have been granted the right to use the acquirer's logo or service mark under a franchise agreement. As a result of the acquisition the acquirer is, in effect, reac-

quiring that right. If the contract containing the reacquired right is either favorable or unfavorable when compared to the current market for the same or similar rights, the acquirer is to record a settlement gain or loss measured at the lesser of

1. The amount by which the contract is either favorable or unfavorable to market terms from the acquirer's perspective, or
2. Any contractually stated settlement provisions available to the counterparty to which the contract is unfavorable.

To the extent that the settlement amount in 2. is less than the "off-market component" in 1., the difference is to be included as part of the business combination.

The reacquired right, exclusive of any settlement gain or loss computed in accordance with the method described in the previous paragraph, is to be recognized as an intangible separate from goodwill.

Lawsuits. In connection with a business combination, the effective settlement of either a lawsuit or threatened litigation is to be measured at fair value with a gain or loss recognized in the acquirer's consolidated statement of income, except where the accounting is specified in a different manner in other authoritative GAAP literature.

Disclosures. In a business combination between parties that had a preexisting relationship, the following disclosures are required:

1. The nature of the preexisting relationship
2. The amounts related to the settlement of the preexisting relationship, if any, and the valuation methods used to measure those amounts
3. The amount of settlement gain or loss recognized and how it is classified in the consolidated income statement

Noncontrolling (Minority) Interest

Accounting by majority owner for a derivative indexed to the noncontrolling interest in that subsidiary. After the issuance of FAS 150, the scope of EITF 00-4 has been narrowed considerably. The still-effective provisions of EITF 00-4 address only a single scenario where the parent company holds 80% of its subsidiary's equity shares with the remaining 20% owned by an unrelated noncontrolling interest holder. The noncontrolling interest holder sells its interest to a new party that simultaneously enters into a put option to sell the 20% interest to the parent at a stated future price and date with the parent having a call option to buy the 20% interest under those same terms (i.e., the fixed price of the call option and the fixed price of the put option are the same). Finally, the put and call options are not covered by the scope of FAS 150 because they are embedded in the noncontrolling interest shares and those shares are not mandatorily redeemable.

Under EITF 00-4, the put and call options are viewed on a combined basis with the noncontrolling interest and accounted for as a financing of the parent's purchase of the noncontrolling interest. The parent consolidates 100% of the subsidiary and attributes the stated yield that it earns under the combined derivative and noncontrolling interest position as interest expense (i.e., it accretes the financing to the strike price of the options over the period from their issuance until settlement). This accounting is to be followed even if the exercise prices of the put and call are not equal, as long as they do not differ significantly.

Nonmonetary Transactions

Exchanges of similar productive assets.

NOTE: The guidance from EITF 98-3 described in this section with respect to similar productive assets was partially nullified by the issuance of FAS 153, discussed fully in Chapter 10. FAS 153 elimi-

nated the exception to fair value for exchanges of similar productive assets and substituted a new exception for exchange transactions lacking commercial substance. This discussion is retained in its original form as it applies to nonmonetary exchanges predating the effective date of FAS 153, which was for nonmonetary asset exchanges occurring in fiscal periods beginning after June 15, 2005.

APB 29 states that nonmonetary exchanges are generally to be reported at fair value, but the exchange of productive assets are to be recorded at the carrying value of the assets relinquished. FAS 141, however, uses a fair value approach, to account for business combinations. Some exchanges (e.g., of radio stations or other groups of operating assets) may be viewed as being either nonmonetary exchanges or business combinations. EITF 98-3 defines a business as a self-sustaining integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. It consists of (1) inputs, (2) processes applied to those inputs, and (3) resulting outputs that are used to generate revenues. Each of these criteria is further defined by EITF 98-3. For a transferred set of activities and assets to be deemed a business, it must contain all of the inputs and processes necessary for it to continue to conduct normal operations after the transferred set is separated from the transferor, which includes the ability to sustain a revenue stream by providing its outputs to customers. If these criteria are not satisfied, the assets do not comprise a business and FAS 141 would not apply to an acquisition.

Exchanges of investments accounted for under the cost method or under ASC 320. EITF 91-5 addresses three issues regarding a transaction structured as follows:

1. Company A and Company B enter into a purchase business combination.
2. Company A, the acquirer as defined in FAS 141, exchanges its equity shares with the investors holding 100% of Company B's outstanding shares.
3. After the exchange, Company A's shareholders hold the majority of the shares of the combined entity.
4. Shares of the combined entity continue to be publicly traded after the business combination.

The first consensus was that a former investor in Company B who had accounted for the investment in Company B using the cost method or under ASC 320 would record the transaction at fair value.

The second consensus was that an investor in Company A who had accounted for the investment in Company A using the cost method or under ASC 320 would continue to carry the investment in the same manner as it had prior to the business combination (i.e., at historical cost if accounted for under the cost method and at fair value if subject to ASC 320). The third consensus was that the results in the first and second consensuses would not be different if an investor in Company B has also held an investment in Company A prior to the business combination.

Specialized Accounting Principles

Specialized accounting principles that are appropriately applied at a subsidiary company level are also to be used in the consolidated financial statements (EITF 85-12).

Subsidiary Accounting and Transactions

Early extinguishment of subsidiary's mandatorily redeemable preferred stock. A wholly owned subsidiary issues mandatorily redeemable preferred stock (MRPS) that is subsequently purchased by the parent company prior to the mandatory redemption date (i.e., as an early extinguishment). The EITF considered this scenario and reached a consensus in EITF 86-32, though its guidance was partially nullified by ASC 480.

If the MRPS qualifies as a "mandatorily redeemable financial instrument" under ASC 480, the stock is accounted for as a liability of the subsidiary. Amounts paid or to be paid by the parent company to the former holders of the MRPS in excess of the initial measurement amount are to be accounted for as interest cost.

If the MRPS contains a redemption feature but does not qualify as a mandatorily redeemable financial instrument under ASC 480, FAS 140 provides criteria for determining whether the liability has been extinguished and APB 26 requires the parent company to account for any difference between the redemption price and the carrying amount as a gain or loss on extinguishment of the subsidiary's liability (EITF 86-32).

Variable Interest Entities and Other Exceptions to Consolidation by Majority Voting Interests

Variable interests in specified assets of VIE. Certain variable interests in specified assets of a variable interest entity (VIE) are required to be treated by their holder as separate variable interest entities, sometimes referred to as "silos," "virtual VIEs," or "deemed entities." FSP FIN 46(R)-1 specifies that if any parties other than the variable interest holder and the secured lender have rights or obligations with respect to the specified assets or the cash flows from those assets, the specified assets and related liabilities are not to be treated as a silo for accounting purposes.

Calculating expected losses. FSP FIN 46(R)-2 clarifies and illustrates the fact that all entities have "expected losses" as that term is defined in FIN 46(R); even when the entity has never experienced a net loss and does not expect to ever experience one. The term "expected losses" is based on the variability in the fair value of the entity's net assets exclusive of variable interests and not on the anticipated amount or variability of the net income or loss.

Evaluation of decision making through voting or similar rights. The holders of the equity investment at risk (the equity group) have the ability to make decisions about an entity's activities if they hold all voting or similar rights. Conversely, the equity group would lack the ability to make decisions if it holds no voting or similar rights.

In situations in which the equity group and another party (or parties) outside the equity group have the ability to make or participate in making decisions about the entity, FSP FIN 46(R)-3 specifies that emphasis should be placed on

1. The ability of the equity group to make decisions that have a significant impact on the success of the entity, and
2. The extent to which the equity group absorbs expected losses and receives expected residual returns of the entity.

If the equity group has the ability to make decisions that have a significant impact on the success of the entity and the equity group has an obligation to absorb expected losses and the right to receive expected residual returns, the equity group likely has the "direct or indirect ability to make decisions about an entity's activities through voting rights or similar rights."

The greater the equity as compared to the expected losses of the entity, the less likely that the equity group would surrender the direct or indirect ability to make decisions about an entity's activities to another party outside the equity group. Further, if the amount of at-risk equity is sufficient to absorb expected losses, the risks of another party outside the equity group may be significantly mitigated by the amount of the equity group's investment.

FSP 46(R)-3 also clarifies that it was not the intent of FASB that all franchisor/franchisee relationships qualify as VIE. A distinction is drawn between the decision-making authority that a franchisee typically holds with respect to the success of the business and the decision-making authority that a franchisor typically retains with respect to the protection of its brand image. The latter authority does not generally limit the franchisee's authority over

the normal operations of its business and thus would not preclude the franchisee's investors from being judged to hold decision-making authority through voting or other rights.

Leasing transactions involving special-purpose entities. FSP FIN 46(R)-4 clarifies the applicability of the accounting guidance provided in EITF 96-21 with respect to the accounting for contingent loss accruals by a lessee who has guaranteed the lessor's residual under an operating lease. The guidance in the EITF continues to be applicable when the lessee is not the primary beneficiary of a VIE lessor. If the lessee is the primary beneficiary, the EITF guidance does not apply since any such loss accrual would eliminate in consolidation.

Majority investor's accounting when the minority shareholder(s) have certain approval or veto rights. EITF 96-16 deals with situations in which the majority owner of an entity does not exercise control and thus, under FAS 94, potentially should not consolidate the investee. The situation arises when the minority owners have rights such as approval of management compensation, selection or termination of management, or the establishment of operating and capital policies and procedures. Collectively, these approval or veto powers are referred to as "substantive participating rights," and are contrasted to "protective rights" such as those relating to entering bankruptcy proceedings, or to major acquisitions or dispositions of assets. The EITF concluded that a finding that the majority owner lacks control depends on the facts and circumstances, and that its lack of control is generally related to the minority owner's ability to effectively participate in decisions in the "ordinary course of business." In the view of the EITF, a minority owner's protective rights would not be sufficient to overcome the presumption of majority control, while substantive participating rights would overcome that presumption.

The Task Force further concluded that a number of other factors must be considered in reaching a conclusion on the matter of a possible negating of majority owner control. Among these are the relative size of majority and minority interests (the greater the disparity, the more likely the minority's rights are only protective in nature); the mechanisms of governance (which decisions are reserved to stockholders as opposed to being made by the directors); other possible relationships between the majority and minority owners; and the likelihood of occurrence of decision-making situations in which the minority would have the right to significantly participate.

The consensuses in this issue were reached prior to the issuance of FIN 46(R), which sets forth criteria to determine when financial control does not reside in the majority voting owners of an entity because the entity (referred to as a variable interest entity or VIE) does not have sufficient subordinated financial support to enable it to be self-supporting. If an entity is considered a VIE under FIN 46(R), it is not subject to this consensus. If, however, the shareholders of an entity are considered to exercise financial control under FIN 46(R), the entity would not be considered a VIE even if the entity is not controlled by the majority voting interest holders because of minority veto rights as described in this issue.

Physician practice management entities and certain other entities with contractual management arrangements.

Scope. EITF 97-2 applies to contractual management relationships (CMR) between entities operating in the health care industry including the practices of medicine, dentistry, veterinary science, and chiropractic medicine (collectively referred to as physician practices) and entities engaged in managing the operations of physician practices (physician practice management entities or PPMs) where

1. The physician practice is not a variable interest entity (VIE) subject to the requirements of FIN 46(R) and

2. In which the PPM does not own a majority of the outstanding voting equity shares of the physician practice either because the PPM does not elect to do so or because the PPM is precluded by law from that ownership

Both the EITF and its SEC Observer observed that there may be analogous contractual arrangements in other industries to which the consensuses in this issue may be applicable.

Controlling financial interest. A PPM is considered to have a controlling financial interest in a non-VIE physician practice via a contractual management agreement, and thus trigger required consolidation under FAS 94 if six criteria set forth in EITF 97-2 are met.

1. The term of the CMR is either the entire remaining legal life of the physician practice or a period of ten years or more.
2. The CMR may only be terminated by the physician practice because of the PPM's gross negligence, fraud, other illegal acts, or bankruptcy.
3. The PPM has exclusive decision-making authority with respect to
   a. Ongoing, major, or central operations of the physician practice (except the dispensing of medical services). This exclusive decision-making authority is required to encompass
      (1) Scope of services,
      (2) Patient acceptance policies and procedures,
      (3) Contract negotiation and execution,
      (4) Establishment and approval of operating and capital budgets, and
      (5) Issuance of debt if debt financing is an ongoing, major, or central source of financing used by the physician practice.
4. Total compensation of the licensed medical professionals and the ability to establish and implement guidelines for their selection, hiring, and termination.
5. The PPM has a significant financial interest in the physician practice that both can be unilaterally sold or transferred by the PPM, and
6. Provides the PPM with the right to receive income from both ongoing fees and proceeds from the sale of its interest in the physician practice in amounts that fluctuate due to the physician practice's operating performance and changes in fair value.

Disclosure requirements 737
Offsetting of Assets and Liabilities 738

PERSPECTIVE AND ISSUES

The balance sheet bifurcation of assets and liabilities into current and noncurrent segments allows net working capital (defined as current assets minus current liabilities) to be readily perceived. Working capital, which is the relatively liquid portion of total entity capital, can be used to determine the ability of an entity to repay obligations as they become due in the ordinary course of business. Working capital assumes a going-concern concept. If the entity is to be liquidated in the near future, this mode of balance sheet classification of assets and liabilities is generally inappropriate.

ASC 210-10-20 defines current liabilities as those obligations whose liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets or the creation of other current liabilities. This definition excludes from the current liability classification any currently maturing obligations that will be satisfied by using long-term assets and currently maturing obligations expected to be refinanced.

The offsetting of assets and liabilities is almost entirely prohibited under GAAP. However, under certain narrowly defined circumstances, where a right of setoff actually exists, netting for financial reporting purposes is acceptable, as described in this chapter.

FASB has declared, as a long-term goal, that all financial liabilities are to be recognized in the balance sheet at fair values, rather than at amounts based on their historical cost. The proper calculation of fair value, as presented in ASC 820, is described in detail in Chapter 6. Under ASC 825, an entity has the option to record its current liabilities at fair value. This option is addressed in detail in Chapters 8 and 12. Under ASC 805, acquirers are required to record contract-related contingencies at their fair values. However, most entities continue to measure their current liabilities at their settlement value, which is the amount of cash (or its equivalent amount of other assets) that will be paid to the creditor to liquidate the obligation during the current operating cycle. Accounts payable, dividends payable, salaries payable, and other current obligations are measured at settlement value because they require the entity to pay a determinable amount of cash. If a current liability is near its payment date, there

will be only an insignificant risk of changes in fair value because of changes in market conditions or the entity's credit standing, and settlement value and fair value will be essentially the same.

Other current liabilities are measured at the proceeds received when the obligation arose. Liabilities that are measured this way generally require the entity to discharge the obligation by providing goods or services rather than by paying cash. Liabilities that require the entity to provide goods or services, rather than cash, are not financial instruments and thus are not a target of the fair value measurement option presented in ASC 825. Subscriptions payable, deposits payable, and deferred revenues are examples of current liabilities measured by reference to proceeds received. (However, significant changes could result from the FASB's ongoing revenue recognition project, which appears likely to adopt a "balance sheet" orientation to the definition of revenue and the timing of its recognition. As part of this project, some revisions to the definition of liabilities are being contemplated. A complete discussion of this project is found in Chapter 10).

Although measurement of current liabilities is generally straightforward, some liabilities are difficult to measure because of uncertainties. Uncertainties regarding whether an obligation exists, how much of an entity's assets will be needed to settle the obligation, and when the settlement will take place can impact whether, when, and for how much an obligation will be recognized in the financial statements. ASC 450 is the primary standard that describes accounting for potential liabilities in circumstances involving uncertainties. It requires a liability to be recognized if it is (1) probable that an obligation has been incurred because of a transaction or event happening on or before the date of the financial statements and (2) the amount of the obligation can be reasonably estimated. Thus, uncertainties about the existence of an obligation need not be resolved before the liability is recorded. For example, estimated settlement amounts for ongoing lawsuits are recognized prior to a court's decision if it is probable that the outcome will be unfavorable. Further, difficulty in measuring an obligation is not, by itself, a reason for not recording a liability if the amount can be estimated. For example, warranty obligations are commonly recognized as liabilities even though the number of claims and the amount of each claim are unknown at the time of the sale of the item under warranty. Although future events will eventually resolve the uncertainties (the warranty claims will be paid and the lawsuit will be settled), the liabilities are required to be recognized before all of the uncertainties are resolved so that relevant information is provided on a timely basis.

There had been a longstanding requirement in GAAP for specific disclosures to be provided about direct and indirect guarantees of the indebtedness of others. ASC 460 now requires that certain obligations arising from guarantees be recorded as liabilities. ASC 460 is discussed in detail in this chapter.

DEFINITIONS OF TERMS

Accumulated benefits. Employee benefits that can be carried over into the next year but that expire upon termination of employment.

Contingency. An existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss that will ultimately be resolved when one or more future events occur or fail to occur.

Current liabilities. Obligations whose liquidation is reasonably expected to require the use of existing resources properly classified as current assets or the creation of other current liabilities. Obligations that are due on demand or will be due on demand within one year or the operating cycle, if longer, are current liabilities. Long-term obligations callable because of the debtor's violation of a provision of the debt agreement are current liabilities unless specific conditions set forth in ASC 470-10-45 are met.

FICA. Social security taxes levied upon both employees and employers.

FUTA. Social security tax levied upon employers to finance the administration of federal unemployment benefit programs.

Indirect guarantee of indebtedness of others. A guarantee under an agreement that obligates one entity to transfer funds to a second entity upon the occurrence of specified events under conditions whereby (1) the funds are legally available to the creditors of the second entity, and (2) those creditors may enforce the second entity's claims against the first entity.

Operating cycle. The average length of time necessary for an enterprise to convert inventory to receivables to cash.

CONCEPTS, RULES, AND EXAMPLES

ASC 210-10-45 contains several examples of current liabilities. It also contains broad general descriptions of the types of items to be shown as current liabilities. These obligations can be divided into those where

1. Both the amount and the payee are known;
2. The payee is known but the amount may have to be estimated;
3. The payee is unknown and the amount may have to be estimated; and
4. The liability has been incurred due to a loss contingency.

Examples of each of the foregoing types of current liabilities are discussed in the following sections.

Amount and Payee Known

Accounts payable arise primarily from the acquisition of materials and supplies to be used in the production of goods or in conjunction with the providing of services. ASC 835-30 states that payables that arise from transactions with suppliers in the normal course of business and that are due in customary trade terms not to exceed one year may be stated at their face amount rather than at the present value of the required future cash flows.

Notes payable are more formalized obligations that may arise from the acquisition of materials and supplies used in operations or from the use of short-term credit to purchase capital assets (ASC 835-30 also applies to short-term notes payable).

Dividends payable become a liability of the enterprise when the board of directors declares a cash dividend. Since declared dividends are usually paid within a short period of time after the declaration date, they are classified as current liabilities.

Unearned revenues or advances result from customer prepayments for either performance of services or delivery of product. They may be required by the selling enterprise as a condition of the sale or may be made by the buyer as a means of guaranteeing that the seller will perform the desired service or deliver the product. Unearned revenues and advances should be classified as current liabilities at the balance sheet date if the services are to be performed or the products are to be delivered within one year or the operating cycle, whichever is longer.

Refundable deposits may be received to cover possible future damage to property. Many utility companies require security deposits. A deposit may be required for the use of a reusable container. Refundable deposits are classified as current liabilities if the firm expects to refund them during the current operating cycle or within one year, whichever is longer.

Accrued liabilities have their origin in the end-of-period adjustment process required by accrual accounting. Commonly accrued liabilities include wages and salaries payable, benefits payable, interest payable, and taxes payable. In addition an employer may have a current obligation for the employer portion of FICA tax and FUTA (unemployment) tax. Payroll taxes are not legal liabilities until the associated payroll is actually paid.

Agency liabilities result from the legal obligation of the enterprise to act as the collection agent for customer or employee taxes owed to various federal, state, or local government units. Examples of agency liabilities include sales taxes, income taxes withheld from employee paychecks, and employee FICA contributions.

Product financing liabilities originate when an entity sells and agrees to repurchase its inventory with the repurchase price equal to the original sales price plus the carrying and financing costs. The purpose of this transaction is to allow the seller to arrange financing on the original purchase of the inventory. The transaction is accounted for as a borrowing rather than as a sale. Chapter 9 provides more information about product financing arrangements.

Current maturing portion of long-term debt is shown as a current liability if the obligation is to be liquidated by using assets classified as current. However, if the currently maturing debt is to be liquidated by using other than current assets (i.e., by using a sinking fund that is properly classified as a noncurrent investment), then these obligations should be classified as long-term liabilities.

Obligations that, by their terms, are due on demand (ASC 470-10-45-10) or will be due on demand within one year (or operating cycle, if longer) from the balance sheet date, even if liquidation is not expected to occur within that period, are classified as current liabilities.

Noncurrent debt may be due on demand under certain circumstances. Long-term obligations that contain call provisions be classified as current liabilities, if as of the balance sheet date one of the following occurs:

1. The debtor is in violation of the agreement and that violation makes the obligation callable.
2. The debtor is in violation of the agreement and that violation, unless cured within the grace period specified in the agreement, makes the obligation callable.

However, if circumstances arise that effectively negate the creditor's right to call the obligation, the obligation may be classified as long-term. Examples are

1. The creditor has waived the right to call the obligation caused by the debtor's violation or the creditor has subsequently lost the right to demand repayment for more than one year (or operating cycle, if longer) from the balance sheet date.
2. Obligations contain a grace period for remedying the violation, and it is probable that the violation will be cured within the grace period. In these situations, the circumstances must be disclosed.

Demand notes having scheduled repayment terms. In some instances, a loan will call for scheduled payments and, in the alternative, state that it is due on demand or may be affected by a subjective acceleration clause. According to ASC 470, an obligation is considered due on demand even if a debt agreement specifies repayment terms, if the creditor can demand payment at any time. This situation is distinguished from a subjective acceleration clause, which is addressed separately.

Increasing-rate debt. Arrangements commonly referred to as "increasing-rate notes" are debt instruments that mature at a defined, near-term date, but which can be continually extended (renewed) for a defined longer period at the option of the debtor, with predefined increases in the interest rate as extensions are elected. The effective outstanding term of the debt is to be estimated after considering plans, ability and intent to service the debt. Based upon this term, the borrower's periodic interest rate is determined by the use of the interest method. Thus, a constant yield will be computed and additional interest will be accrued during the earlier portions of the final term.

Debt interest costs should be amortized over the estimated outstanding term of the debt. Any excess accrued interest resulting from paying the debt before the estimated maturity date is an adjustment of interest expense. It may not be treated as an extraordinary item.

The classification of the debt as current or noncurrent should be based on the source of repayment. Thus, this classification need not be consistent with the period used to determine the periodic interest cost. For example, the time frame used for the estimated outstanding term of the debt could be a year or less, but because of a planned long-term refinancing agreement the noncurrent classification could be used.

Furthermore, the term-extending provisions of the debt instrument should be evaluated to ascertain whether they constitute a derivative financial instrument under ASC 815. If so, the derivative element is in all likelihood not "clearly and closely related" to the host instrument (the debt), and thus would have to be reported separately and carried at fair value.

Long-term obligations that contain subjective acceleration clauses are classified as current liabilities if circumstances (such as recurring losses or liquidity problems) indicate that the clause will be exercised and payment will be due within one year (or one operating cycle). If, instead, the likelihood of the acceleration of the due date were remote, the obligation would be reported as long-term debt. Situations between the two extremes require disclosure (ASC 470-10-45).

Classification of long-term obligations when there are violations of covenants. Most commercial debt agreements contain a range of financial covenants. The failure to meet these often provides the lender with the contractual right to accelerate the due date, commonly to make the full amount due and payable on demand. Unless a waiver is obtained in such a situation, the balance sheet would have to reflect the nominally long-term debt as a current liability, which in turn might create going concern issues for management and the outside auditors to address and report on.

While a complete waiver, effectively a promise by the lender to not exercise its rights under the financial covenants for at least one year from the balance sheet date, makes it possible to continue presenting the debt as noncurrent, great care must be exercised in interpreting the substance of such an agreement. In practice, many waivers are not effective and can-

not form the basis for continued accounting for the debt as noncurrent. For example, a waiver "as of" the current balance sheet date provides no real comfort, since the lender is entitled to assert its rights as soon as the very next day. Likewise, a waiver pending the next scheduled submission of a borrower's covenant compliance letter (generally quarterly, possibly monthly) offers no assurance that the borrower will successfully meet its obligations, and hence affords no basis for presentation of the debt as noncurrent.

According to ASC 470-10, the lender waives that right for a period greater than one year (but retains the requirements to meet the covenant in the future), the reporting entity (i.e., the debtor) should classify the debt as noncurrent unless both (1) a covenant violation has occurred at the balance sheet date or would have occurred absent a loan modification and (2) it is probable that the borrower will be unable to comply with the covenant at measurement dates within the next twelve months.

Classification of borrowings outstanding under certain revolving credit agreements. Borrowings outstanding under a revolving credit agreement sometimes include both a subjective acceleration clause and a requirement to maintain a lockbox into which the borrower's customers send remittances that are then used to reduce the debt outstanding. These borrowings are short-term obligations and are classified as current liabilities unless the entity has the intent and ability to refinance the revolving credit agreement on a long-term basis (i.e., the conditions in ASC 470-10-45 are met). However, if the lockbox is a "springing" lockbox, which is a lockbox agreement in which remittances from the borrower's customers are forwarded to its general bank account and do not reduce the debt outstanding until and unless the lender exercises the subjective acceleration clause, the obligations are long-term since the remittances do not automatically reduce the debt outstanding if the acceleration clause has not been exercised.

Short-term obligations expected to be refinanced may be classified as noncurrent liabilities if the conditions specified in ASC 470-10-45-11 all are met. An entity may reclassify currently maturing debt (other than obligations arising from transactions in the normal course of business that are due in customary terms) as long-term, provided that the entity intends to refinance the obligation on a long-term basis and its intent is supported by either of the following:

1. Post-balance-sheet-date issuance of a long-term obligation or equity securities. After the date of the entity's balance sheet but before that balance sheet is issued, long-term obligations or equity securities have been issued for the purpose of refinancing the short-term obligations on a long-term basis.
2. Refinancing agreement. Before the balance sheet is issued, the entity has entered into a financing agreement that clearly permits the entity to refinance the short-term obligation on a long-term basis on terms that are readily determinable.

If reclassification of the maturing debt is based upon the existence of a refinancing agreement, then the following requirements must be met:

1. The refinancing agreement is noncancelable and will not expire within one year or operating cycle of the balance sheet date.
2. The replacement debt will not be callable except for violation of a provision of the refinancing agreement with which compliance is objectively determinable or measurable.
3. The entity is not in violation of the terms of the refinancing agreement.
4. The lender or investor is financially capable of honoring the refinancing agreement.

The amount of currently maturing debt to be reclassified cannot exceed the amount raised by the replacement debt or equity issuance, nor can it exceed the amount specified in

the refinancing agreement. If the amount specified in the refinancing agreement can fluctuate, then the maximum amount of debt that can be reclassified is equal to a reasonable estimate of the minimum amount expected to be available on any date from the due date of the maturing obligation to the end of the fiscal year. If no estimate can be made of the minimum amount available under the financing agreement, then none of the maturing debt can be reclassified as long-term. If debt or other agreements limit the ability of the organization to fully utilize the proceeds of the refinancing agreement (for example, a clause in another debt agreement sets a maximum debt-to-equity ratio), then only the amount that can be drawn without violating the limitations expressed in those other agreements can be reclassified to long-term. ASC 470-10-55 states that if an entity uses current assets after the balance sheet date to liquidate a current obligation, and then replaces those current assets by issuing either equity securities or long-term debt before the issuance of the balance sheet, the currently maturing debt must still be classified as a current liability.

Example of short-term obligations to be refinanced

The Madison Warehousing Company has obtained a $3,500,000 bridge loan to assist it in completing a new public warehouse. All construction is completed by the balance sheet date, after which Madison has the following three choices for refinancing the bridge loan:

- Enter into a 30-year fixed-rate mortgage for $3,400,000 at 7% interest, leaving Madison with a $100,000 obligation to fulfill from short-term funds. Under this scenario, Madison reports as current debt the $100,000, as well as the $50,000 portion of the mortgage due within one year, with the remainder of the mortgage itemized as long-term debt. The presentation follows:

Current liabilities:	
Short-term notes	100,000
Current portion of long-term debt	50,000
Noncurrent liabilities:	
7% mortgage note due in 20XX	3,350,000

- Pay off the bridge loan with Madison's existing variable-rate line of credit (LOC), which expires in two years. The maximum amount of the LOC is 80% of Madison's accounts receivable. Over the two-year remaining term of the LOC, the lowest level of qualifying accounts receivable is expected to be $2,700,000. Thus, only $2,700,000 of the debt can be classified as long-term, while $800,000 is classified as a short-term obligation. The presentation follows:

Current liabilities:	
Short-term note—variable rate line of credit	800,000
Noncurrent liabilities:	
Variable rate line of credit due in 20XX	2,700,000

- Obtain a 10% loan from Madison's owner, with a balloon payment due in five years. Under the terms of this arrangement, the owner can withdraw up to $1,500,000 of funding at any time, even though $3,500,000 is currently available to Madison. Under this approach, $1,500,000 is callable, and therefore must be classified as a short-term obligation. The remainder is classified as long-term debt. The presentation follows:

Current liabilities:	
Short-term note—majority stockholder	1,500,000
Noncurrent liabilities:	
10% balloon note payable to majority stockholder, due in 20XX	2,000,000

Payee Known but Amount May Have to Be Estimated

Taxes payable includes federal, state, and local income taxes. The amount of income taxes payable is an estimate because the tax laws and rates in effect when the accrual is determined may differ from the tax laws and rates in effect when the taxes ultimately are paid. Temporary differences in recognition and measurement between accounting standards and tax laws create deferred tax liabilities (and deferred tax assets). The portion deemed currently payable must be classified as a current liability. The remaining amount is classified as a long-term liability.

Property taxes payable represents the unpaid portion of an entity's obligation to a state or other taxing authority that arises from ownership of real property. ASC 720-30 indicates that the most acceptable method of accounting for property taxes is a monthly accrual of property tax expense during the fiscal period of the taxing authority for which the taxes are levied. The fiscal period of the taxing authority is the fiscal period that includes the assessment or lien date.

A liability for property taxes payable arises when the fiscal year of the taxing authority and the fiscal year of the entity do not coincide or when the assessment or lien date and the actual payment date do not fall within the same fiscal year. For example, XYZ Corporation is a calendar-year corporation that owns real estate in a state that operates on a June 30 fiscal year. In this state, property taxes are assessed and become a lien against property on July 1, although they are not payable until April 1 and August 1 of the next calendar year. XYZ Corporation would accrue an expense and a liability on a monthly basis beginning on July 1. At year-end (December 31), the firm would have an expense for six months' property tax on their income statement and a current liability for the same amount.

Bonus payments may require estimation since the amount of the bonus may be affected by the entity's net income for the year, by the income taxes currently payable, or by other factors. Additional estimation is necessary if bonus payments are accrued on a monthly basis for purposes of interim financial reporting but are determinable only annually by using a formula whose values are uncertain until shortly before payment.

Compensated absences refer to paid vacation, paid holidays, paid sick leave, and other paid leaves of absence. ASC 710-10-25 states that an employer must accrue a liability for employee's compensation of future absences if all of the following conditions are met:

1. The employee's right to receive compensation for future absences is attributable to employee services already rendered.
2. The right vests or accumulates.
3. Payment of the compensation is probable.
4. The amount of the payment can be reasonably estimated.

If an employer is required to compensate an employee for unused vacation, holidays, or sick days even if employment is terminated, then the employee's right to this compensation is said to vest. Accrual of a liability for nonvesting rights depends on whether the unused rights expire at the end of the year in which earned or accumulate and are carried forward to succeeding years. If the rights expire, a liability for future absences should not be accrued at year-end because the benefits to be paid in subsequent years would not be attributable to employee services rendered in prior years. If unused rights accumulate and increase the benefits otherwise available in subsequent years, a liability should be accrued at year-end to the extent that it is probable that employees will be paid in subsequent years for the increased benefits attributable to the accumulated rights and the amount can be reasonably estimated.

ASC 710-10-25-7 allows an exception for employee paid sick days that accumulate but do not vest. No accrued liability is required for sick days that only accumulate. However, an

accrual may be made. The Board stated that these amounts are rarely material and the low reliability of estimates of future illness coupled with the high cost of developing these estimates indicates that accrual is not necessary. The required accounting should be determined by the employer's actual administration of sick pay benefits. If the employer routinely lets employees take time off when they are not ill and allows that time to be charged as sick pay, then an accrual should be made.

Pay for other employee leaves of absence that represent time off for past services (jury duty, personal days) should be considered compensation subject to accrual. Pay for employee leaves of absence that will provide future benefits and that are not attributable to past services rendered would not be subject to accrual. ASC 710-10-25 does not provide guidance as to whether accruals should be based on current pay rates or expected future rates of pay and does not provide guidance regarding discounting of the accrual amounts.

ASC 710-10-25-4 et seq. contains the accounting requirements regarding sabbatical leaves or other similar benefit arrangements that require the completion of a minimum service period, and for which the benefit does not increase with additional years of service. Under these arrangements, the individual continues to be a compensated employee and is not required to perform duties for the entity during his/her absence. Assuming the conditions set forth above are met, the compensation cost associated with a sabbatical or other similar arrangement must be ratably accrued over the presabbatical periods of service.

ASC 712 specifies the use of the four conditions of ASC 710-10-25 to identify the need to accrue an obligation for postemployment benefits other than pensions. Postemployment benefits other than pensions are benefits paid after termination of employment but before retirement to or on behalf of former or inactive employees, their beneficiaries, and covered dependents. Examples of those benefits are salary continuation agreements, supplemental unemployment compensation, severance benefits, workers' compensation and other disability-related payments, job training or job placement services and continuation of health care or life insurance benefits after employment. If the four conditions are met, a liability is accrued. If one or more of the conditions are not met, the employer should assess whether a liability should be accrued under ASC 450. If neither ASC 710-10-25 nor ASC 450 is applicable because the amount cannot be reasonably estimated, this fact must be disclosed.

Payee Unknown and the Amount May Have to Be Estimated

Sales incentives are usually offered by an enterprise to increase product sales. They may require the purchaser to accumulate a specified number of miles, points, box tops, wrappers, or other proofs of purchase. They may or may not require the payment of a cash amount. If the incentive offer terminates at the end of the current period but has not been completely accounted for, or if it extends into the next accounting period, a current liability for the estimated number of redemptions that are expected in the future period would be recorded. If the incentive offer extends for more than one accounting period, the estimated liability must be divided into a current portion and a long-term portion. See Chapter 10 for a discussion of ASC 605-50 for additional information about accounting for and disclosure of sales incentives.

Example of an accrued sales incentive

Sonoma Airlines, a specialty airline offering flights to California's wine producing regions, offers frequent flier miles to its passengers. Anyone remitting 15,000 mileage points earns a free flight on Sonoma, which costs the airline $120 per flight granted, or approximately $0.008 per mileage point remitted. In April, the airline granted 23,000,000 mileage points, having a total value of $184,000 (23,000,000 miles flown × 0.008). Sonoma's history of mileage claims remitted over the past 12 months has been that 40% of all mileage points are eventually remitted. Thus,

Sonoma records the following liability in April, based on recognition of 40% of the total value of mileage points granted:

Passenger transportation expense	73,600	
Unremitted mileage points liability		73,600

Also in April, 8,475,000 mileage points are remitted by Sonoma passengers for free flights. The cost of these remittances is as follows:

Mileage points remitted		8,475,000
Cost per mileage point	×	$ 0.008
Total liability reduction	=	$67,800

Sonoma records the liability reduction with the following entry:

Unremitted mileage points liability	67,800	
Passenger transportation expense		67,800

The actual cost of transportation of passengers paid or accrued by Sonoma at the time the flights occur is thus reduced by the amount accrued at the time the points currently being redeemed were awarded.

A year later, Sonoma finds that the mileage points remittance rate has risen from 40% to 42%. At this time, there are 163,000,000 mileage points outstanding. Sonoma records a liability for the incremental increase of 2% in the remittance level with the following entry:

Passenger transportation expense	26,080	
Unremitted mileage points liability		26,080

The entry is based on the following calculation:

Mileage points outstanding		163,000,000
Net increase in percentage	×	2%
Cost per mileage point	×	$ 0.008
Total liability	=	$26,080

Sonoma receives an offer to sell 20,000,000 mileage points to the Wine Connoisseur branded credit card, which in turn sells the points to its card holders in exchange for purchases made with its credit card. The sale price is $0.005 per mile sold, resulting in the following entry:

Cash	100,000	
Revenue		100,000

Sonoma must also record the related cost of this transaction. Based on its estimated 42% mileage points remittance rate and $0.008 cost per mileage point, Sonoma arrives at the following estimated cost of the transaction:

Mileage points sold		20,000,000
Mileage remittance percentage	×	42%
Cost per mileage point	×	$ 0.008
Total estimated cost	=	$67,200

Sonoma records the following entry to record the expense associated with the mileage point sale:

Passenger transportation expense	67,200	
Unremitted mileage points liability		67,200

Product warranties providing for repair or replacement of defective products may be sold separately or may be included in the sale price of the product. If the warranty extends into the next accounting period, a current liability for the estimated amount of warranty expense expected in the next period must be recorded. If the warranty spans more than the next period, the estimated liability must be partitioned into a current and long-term portion. ASC 460, discussed more fully later in this chapter, requires disclosure of product warranties in the notes to financial statements. Entities are required to disclose the following information:

1. The nature of the product warranty, including how the warranty arose and the events or circumstances in which the entity must perform under the warranty.

2. The entity's accounting policy and methodology used to determine its liability for the product warranty, including any liability (such as deferred revenue) associated with an extended warranty.
3. A reconciliation of the changes in the aggregate product warranty liability for the reporting period. The reconciliation must include five components: (1) the beginning aggregate balance of the liability, (2) the reductions in the liability caused by payments under the warranty, (3) the increase in the liability for new warranties issued during the period, (4) the change in the liability for adjustments to estimated amounts to be paid under preexisting warranties, and (5) the ending aggregate balance of the liability.
4. The nature and extent of any recourse provisions or available collateral that would enable the entity to recover the amounts paid under the warranties, and an indication (if estimable) of the approximate extent to which the proceeds from recovery or liquidation would be expected to cover the maximum potential amount of future payments under the warranty.
5. The disclosures required by ASC 850 if the warranties are granted to benefit related parties. (See Chapter 2 for a discussion of related-party disclosures.)

A proposed FASB staff position would also require the above disclosures for an indemnification clause included by a software vendor-licensor in a software licensing agreement that indemnifies the licensee against liability and damages (including legal defense costs) arising from any claims of patent, copyright, trademark or trade secret infringement by the software vendor's software.

Example of product warranty expense

The Churnaway Corporation manufactures clothes washers. It sells $900,000 of washing machines during its most recent month of operations. Based on its historical warranty claims experience, it reserves an estimated warranty expense of 2% of revenues with the following entry:

Warranty expense	18,000	
Reserve for warranty claims		18,000

During the following month, Churnaway incurs $10,000 of actual labor and $4,500 of actual materials expenses to repair warranty claims, which it charges to the warranty claims reserve with the following entry:

Reserve for warranty claims	14,500	
Labor expense		10,000
Materials expense		4,500

Churnaway also sells three-year extended warranties on its washing machines that begin once the initial one-year manufacturer's warranty is completed. During one month, it sells $54,000 of extended warranties, which it records with the following entry:

Cash	54,000	
Unearned warranty revenue		54,000

This liability is unaltered for one year from the purchase date, after which the extended warranty servicing period begins. Churnaway recognizes the warranty revenue on a straight-line basis over the 36 months of the warranty period, using the following entry each month:

Unearned warranty revenue	1,500	
Warranty revenue		1,500

Future product returns are accrued if a buyer has a right to return the product purchased and the sale is recognized currently. An accrual for returns must reduce both revenue and the associated cost of sales (ASC 605-15). In the relatively unlikely situation where the reporting entity is unable to make a reasonable estimate of the amount of future returns, the sale cannot be recognized until the return privilege has expired or conditions permit the loss

to be estimated, at which point it would become reportable. Examples of factors that might impair the ability to reasonably estimate a loss are

1. Susceptibility of the product to technological or other obsolescence
2. A lengthy period over which returns are permitted
3. Absence of experience with returns on similar products sold to similar markets
4. Sales are few, significant, and have unique terms (rather than a large number of relatively homogeneous sales of small dollar amounts).

Example of future product returns

The SnoJet Company manufactures high-powered snowmobiles, for which it issues a six-month return policy to its distributors. It recently developed the XTR Pro model, which is an incremental enhancement of earlier models, with more horsepower and a tighter suspension. Given its similarity to earlier models, SnoJet's management is comfortable in extending the historical product return rate of 10% to sales of the XTR Pro model. In February, SnoJet sold $840,000 of XTR Pro snowmobiles which have an associated cost of $504,000 (a 60% cost of goods sold). At the same time, the company records $84,000 (10% of gross sales) in an allowance for sales returns, resulting in the following income statement presentation:

Sales	$840,000
Less: sales returns	(84,000)
Net sales	$756,000

Note that, to fully comply with the requirements of ASC 605-15, a reserve for the cost of the estimated product should also be provided, with a corresponding reduction of cost of sales, as follows:

Cost of sales	$504,000
Less: cost of sales on estimated returns	(50,400)
Net cost of sales	$453,600

In the following month, ten XTR Pro models are returned to SnoJet. The revenue originally recorded on their sale was $24,000, with associated cost of goods sold of $14,400. However, there is some damage to the models, which will require $3,000 to repair. SnoJet records the transaction with the following entry:

Allowance for sales returns	24,000	
Inventory—rework	11,400	
Loss—returned inventory damage	3,000	
Accounts receivable		24,000
Allowance for cost of sales on product returns		14,400

SnoJet develops an entirely new, jet-powered snowmobile, called the JetPro, which requires the substantial redesign of its basic snowmobile platform. Also, it is to be sold strictly to professional snowmobile racers with whom the company has minimal sales experience, with sale terms allowing returns only within the first two months. In the first month, SnoJet has $150,000 of JetPro sales, for which the related cost of goods sold is $100,000. Given the sales return uncertainty associated with this model, SnoJet records no revenue during the first month, waiting until the second month for the product return policy to expire before recording any revenue. In the first month, its entry to record JetPro sales is

Accounts receivable	150,000	
Unearned revenue		150,000
Inventory—customer location	100,000	
Finished goods inventory		100,000

At the end of the second month, after the right of return has expired, SnoJet uses the following entry to record the sale and its related profit:

Unearned revenue	150,000	
Revenue		150,000
Cost of goods sold	100,000	
Inventory—customer location		100,000

Note that the decision not to record revenues until after the risk of product returns has lapsed is relatively unusual in practice, and will be dependent on careful consideration of all the facts and circumstances.

Environmental remediation liabilities. Obligations arising from pollution of the environment have become a major cost for businesses. ASC 410-30 sets forth a very detailed description of relevant laws, remediation provisions and other pertinent information, which is useful to auditors as well as to reporting entities. In terms of accounting guidance, ASC 450 contains the principal standard to be interpreted in the context of environmental obligations (e.g., determining the threshold for accrual of a liability, etc.) and its sets "benchmarks" for liability recognition. The benchmarks for the accrual and evaluation of the estimated liability (i.e., the stages which are deemed to be important to ascertaining the existence and amount of the liability) are

1. The identification and verification of an entity as a potentially responsible party (PRP), since ASC 410-30 stipulates that accrual should be based on the premise that expected costs will be borne by only the "participating potentially responsible parties" and that the "recalcitrant, unproven and unidentified" PRP will not contribute to costs of remediation
2. The receipt of a "unilateral administrative order"
3. Participation, as a PRP, in the remedial investigation/feasibility study (RI/FS)
4. Completion of the feasibility study
5. Issuance of the Record of Decision (RoD)
6. The remedial design through operation and maintenance, including postremediation monitoring

The amount of the liability that is to be accrued is affected by the entity's allocable share of liability for a specific site, and by its share of the amounts related to the site that will not be paid by the other PRP or the government. The categories of costs to be included in the accrued liability include incremental direct costs of the remediation effort itself, as well as the costs of compensation and benefits for employees directly involved in the remediation effort. The SOP indicates that costs are to be estimated based on existing laws and technologies, and are not to be discounted to estimated present values unless timing of cash payments is fixed or reliably determinable.

Incremental direct costs will include such items as fees paid to outside law firms for work related to the remediation effort, costs relating to completing the RI/FS, fees to outside consulting and engineering firms for site investigations and development of remedial action plans and remedial actions, costs of contractors performing remedial actions, government oversight costs and past costs, the cost of machinery and equipment dedicated to the remedial actions that do not have an alternative use, assessments by a PRP group covering costs incurred by the group in dealing with a site, and the costs of operation and maintenance of the remedial action, including costs of postremediation monitoring required by remedial action plan.

ASC 410-30 states that potential recoveries cannot be offset against the estimated liability, and further notes that any recovery recognized as an asset should be reflected at fair value, which implies that only the present value of future recoveries can be recorded. It also stipulates that environmental clean up costs are not unusual in nature, and thus cannot be shown as extraordinary items in the income statement. Furthermore, it is presumed that the costs are operating in nature, and thus cannot normally be included in "other income and expense" category of the income statement, either. Disclosure of accounting policies regarding recognition of the liability and of any related asset (for recoveries from third parties) are also needed, where pertinent.

Contingencies

ASC 450 defines a contingency as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss. The uncertainty will ultimately be resolved when one or more future events occur or fail to occur. ASC 450 defines the different levels of probability as to whether or not future events will confirm the existence of a loss as follows:

1. **Probable**—The future event or events are likely to occur.
2. **Reasonably possible**—The chance of the future event or events occurring is more than remote but less than likely.
3. **Remote**—The chance of the future event or events occurring is slight.

Professional judgment is required to classify the likelihood of the future events occurring. All relevant information that can be acquired concerning the uncertain set of circumstances needs to be obtained and used to determine the classification.

ASC 450 states that a loss must be accrued if *both* of the following conditions are met:

1. It is probable that an asset has been impaired or a liability has been incurred at the date of the financial statements.
2. The amount of loss can be reasonably estimated.

Loss contingency. Loss contingencies are recognized only if there is an impairment of an asset or the incurrence of a liability as of the balance sheet date. Examples of possible loss contingencies include

1. Collectibility of receivables
2. Warranty liabilities and product defects
3. Loss due to fire, explosion, or other hazards
4. Expropriation of assets
5. Litigation, claims, and assessments
6. Incurred but not reported (IBNR) claims if the entity insures its risk of loss with a claims-made policy
7. Exposures under multiple-year retrospectively rated insurance contacts
8. Catastrophic losses by insurance and reinsurance entities
9. The contingent obligations under guarantees
10. Obligations under standby letters of credit
11. Repurchase agreements
12. Withdrawal from a multiemployer plan
13. Consideration for a failed registration statement

Events that give rise to loss contingencies that occur after the balance sheet date (i.e., bankruptcy or expropriation) but before issuance of the financial statements may require disclosure so that statement users are not misled. Note disclosures or pro forma financial statements may be prepared as supplemental information to show the effect of the loss.

It is not necessary that a single amount be identified. A range of amounts is sufficient to indicate that some amount of loss has been incurred and should be accrued. The amount accrued is the amount within the range that appears to be the best estimate. If there is no best estimate, the minimum amount in the range should be accrued since it is probable that the loss will be at least this amount (ASC 450-20). The maximum amount of loss should be disclosed. If future events indicate that the minimum loss originally accrued is inadequate, an additional loss should be accrued in the period when this fact becomes known. This accrual is a change in estimate, not a prior period adjustment.

When a loss is probable and no estimate is possible, these facts should be disclosed in the current period. The accrual of the loss should be made in the earliest period in which the amount of the loss can be estimated. Accrual of that loss in future periods is a change in estimate. It is not a prior period adjustment.

If the occurrence of the loss is reasonably possible, the facts and circumstances of the possible loss and an estimate of the amount, if determinable, should be disclosed. (See also Chapter 2.) If the occurrence of the loss is remote, no accrual or disclosure is usually required.

When a public company cannot estimate the reasonably likely impact of a contingent liability, but a range of amounts are determinable, the SEC requires disclosure of those amounts. Disclosure of contingencies for public companies should also include quantification of the related accruals and adjustments, costs of legal defense, and reasonably likely exposure to additional loss, as well as the assumptions that management has made about those amounts, and the extent to which the resulting estimates of loss are sensitive to changes in those assumptions.

Acquisition-related contingencies. ASC 450 does not generally apply when determining which contingent assets or liabilities are to be recognized as of the date of an acquisition. Instead, under provisions of ASC 805, the acquirer recognizes at their acquisition date fair values the assets acquired and liabilities assumed that arise from contract related contingencies. For noncontractual contingencies, the acquirer shall assess as of the acquisition date whether it is more likely than not that a contingency shall result in an asset or liability; if so, the acquirer recognizes the acquisition-date asset or liability at its fair value. A noncontractual contingency that does not meet the more-likely-than-not criterion is to be treated as previously described under ASC 450.

If the acquirer later obtains new information about the expected outcome of an acquisition-related contingency, it should then measure each liability at the higher of its acquisition-date fair value or the amount that would be recognized under ASC 450. Each acquisition-related contingent asset should be reported at the lower of its acquisition-date fair value or the best estimate of its future settlement amount.

Unasserted claims or assessments. It is not necessary to disclose loss contingencies for an unasserted claim or assessment where there has been no manifestation of an awareness of possible claim or assessment by a potential claimant unless it is deemed probable that a claim will be asserted and a reasonable possibility of an unfavorable outcome exists. Under the provisions of ASC 450, general or unspecified business risks are not loss contingencies and, therefore, no accrual is necessary. Appropriations of retained earnings may be used for these risks as long as no charge to income is made to establish the appropriation. Disclosure of these business risks may be required under ASC 275 (see Chapter 2).

Estimate vs. contingency. Distinguishing between an estimate and a contingency can be difficult because both involve an uncertainty that will be resolved by future events. However, an estimate exists because of uncertainty about the amount of a loss resulting from an event requiring an acknowledged accounting recognition. The event has occurred and the effect is known, but the amount itself is uncertain. For example, depreciation is an estimate, but not a contingency because the actual fact of physical depreciation is acknowledged, although the amount is obtained by an assumed accounting method.

In a contingency, the amount is also usually uncertain, although that is not an essential characteristic. Instead, the uncertainty lies in whether the event has occurred (or will) and what the effect, if any, on the enterprise would be. Collectibility of receivables is a contingency because it is uncertain whether a customer will not pay at a future date, although it is probable that some customers will not pay. Similar logic would hold for obligations related

to product warranties. That is, it is uncertain whether a product will fail, but it is probable that some will fail within the warranty period.

Other contingencies are rarely recognized until specific events confirming their existence occur. Every business risks loss by fire, explosion, government expropriation or casualties in the ordinary course of business. To the extent those losses are not (or cannot be) insured, the risks are contingencies. Because those events are often random in their occurrence, uncertainty surrounds whether the future event confirming the loss will or will not take place. The passage of time usually resolves the uncertainty. Until the event confirming the loss occurs (or is probable of occurrence) and the amount of the loss can be reasonably estimated, the potential loss is not recognized in financial statements.

The most difficult area of contingencies is litigation. Accountants must rely on attorneys' assessments concerning the likelihood of such events. Unless the attorney indicates that the risk of loss is remote or slight, or that the loss if it occurs would be immaterial to the company, disclosure in financial statements is necessary and an accrual may also be necessary. In practice, attorneys are loathe to state that the risk of loss is remote, as that term is defined by ASC 450, although the likelihood of obtaining a definitive response to lawyers' letters under SAS 12 is improved if the auditors explicitly cite a materiality threshold. In cases where judgments have been entered against the reporting entity, or where the attorney gives a range of expected losses or other amounts and indicates that an unfavorable outcome is probable, accruals of loss contingencies for at least the minimum point of the range must be made. In most cases, however, an estimate of the contingency is unknown and the contingency is reflected only in footnotes.

Accruals for contingencies, including those arising in connection with litigation, are limited under GAAP to expected losses resulting from events occurring prior to the balance sheet date. One unresolved issue is whether expected legal costs to be incurred in connection with a loss contingency (that is being accrued) should be accrued as well. Apparently, GAAP would permit such an accrual, but practice is varied. With respect to SEC registrants, the SEC Staff expects the decision to do so to be disclosed in the financial statements and applied consistently (ASC 450-20-S99).

Guarantees

While disclosures of at least some guarantees had been common under GAAP, the economic significance of such arrangements had rarely been measured or disclosed in the past. ASC 460 significantly altered past practice by requiring that the fair value of guarantees be recognized as a liability.

ASC 460 applies to guarantee contracts that contingently require the guarantor to make payments (either in cash, financial instruments, shares of its stock, other assets, or in services) to the guaranteed party based on any of the following circumstances:

1. Changes in a specified interest rate, security price, commodity price, foreign exchange rate, index of prices or rates, or any other variable, including the occurrence or nonoccurrence of a specified event that is related to an asset or liability of the guaranteed party. For example, the provisions apply to the following, as cited by ASC 460:
    a. A financial standby letter of credit
    b. A market value guarantee on either securities (including the common stock of the guaranteed party) or a nonfinancial asset owned by the guaranteed party
    c. A guarantee of the market price of the common stock of the guaranteed party
    d. A guarantee of the collection of the scheduled contractual cash flows from individual financial assets held by a variable interest entity (VIE)

e. A guarantee granted to a business or its owners that the revenue received by the business will equal or exceed some stated amount

One common example of this type of situation is where a hospital lures a doctor to open a practice in an under-served community with a guarantee of fee income for an initial period. ASC 460 explicitly states that these types of assurances are guarantees and must be given accounting recognition.

2. Another entity's failure to perform under an obligating agreement. For example, the provisions apply to a performance standby letter of credit, which obligates the guarantor to make a payment if the specified entity fails to perform its nonfinancial obligation.
3. The occurrence of a specified event or circumstance (an indemnification agreement), such as an adverse judgment in a lawsuit or the imposition of additional taxes due to either a change in the tax law or an adverse interpretation of the tax law, provided that the guarantor is an entity other than an insurance or reinsurance company.
4. The occurrence of specified events under conditions whereby payments are legally available to creditors of the guaranteed party and those creditors may enforce the guaranteed party's claims against the guarantor under the agreement (an indirect guarantee of the indebtedness of others).

ASC 460 does *not* apply to

1. Commercial letters of credit and other loan commitments
2. Subordination on arrangements in securitization transactions
3. A lessee's guarantee of the residual value of leased property
4. A guarantee contract or an indemnification agreement that is issued by either an insurance or a reinsurance company
5. Contingent rents
6. Vendor rebates (by the guarantor) based on either the sales revenues of or the number of units sold by the guaranteed party
7. Guarantees that prevent the guarantor from recognizing either the sale of the asset underlying the guarantee or the profits from that sale
8. Guarantees arising from pension plans, vacation pay arrangement, deferred compensation contracts, and stock issued to employees

ASC 460's requirement to recognize an initial liability does not apply to the following types of guarantees (i.e., these guarantees are subject only to ASC 460's disclosure requirements):

1. A guarantee that is accounted for as a derivative instrument at fair value
2. A contract that guarantees the functionality of nonfinancial assets that are owned by the guaranteed party (product warranties)
3. Contingent consideration in a business combination
4. A guarantee that requires the guarantor to issue its own equity shares
5. A guarantee by an original lessee that has become secondarily liable under a new lease that relieved the original lessee of the primary obligation under the original lease
6. A guarantee issued between parents and their subsidiaries or between corporations under common control
7. A parent's guarantee of a subsidiary's debt to a third party
8. A subsidiary's guarantee of a parent's debt to a third party or the debt of another subsidiary of the parent

9. Software licenses which contain an "indemnification clause" protecting the licensee from liabilities and damages that might arise if the licensor's software is subject to a claim of patent, copyright, or trade secret infringement

ASC 460 establishes the notion that a guarantee actually consists of two distinct components. These two obligations have quite different accounting implications. The first of these is a noncontingent obligation, namely, the obligation to stand ready to perform over the term of the guarantee in the event that the specified triggering events or conditions occur. The second element, which is a contingent obligation, is the obligation to make future payments if those triggering events or conditions occur. At the inception of a guarantee, the guarantor would recognize a liability for both the noncontingent and contingent obligations at their fair values. However, in the unusual circumstance that a liability is recognized under ASC 450 for the contingent obligation (i.e., because it is deemed probable of occurrence and reasonable of estimation that the guarantor will pay), the liability to be initially recognized for the noncontingent obligation would only be the portion, if any, of the guarantee's fair value not already recognized to comply with ASC 450.

It is important to stress that this does not mean that the guarantor records the entire face amount of the guarantee; rather, it is the fair value that would be recognized. When a guarantee is issued in a stand-alone, arm's-length transaction with an unrelated party, the fair value of the guarantee (and thus the amount to be recognized as a liability) is the premium received by the guarantor. When a guarantee is issued as part of another transaction (such as the sale or lease of an asset) or as a contribution to an unrelated party, the fair value of the liability is measured by the premium that would be required by the guarantor to issue the same guarantee in a stand-alone, arm's-length transaction with an unrelated party.

In practice, if the likelihood that the guarantor will have to perform is judged to be only "possible" or "remote," the only amount to be reported will be the fair value of the noncontingent obligation to stand ready to perform. If, however, the contingency is probable of occurrence and can be reasonably estimated under ASC 450, that amount must be reported and the liability to be reported, in total, under the guarantee arrangement will be the greater of (1) the fair value computed as explained above, or (2) the amount computed in accordance with ASC 450's provisions.

In 2006, FASB deleted language from its standard that had previously referenced the application of the CON 7 present value methodology. In the authors' view, this is because, in the context of guarantees given (e.g., by sellers of merchandise) the probability-weighted cash flow estimates would be difficult to develop, unless the guarantor engages in a large volume of such arrangements. However, present value of cash flows is one acceptable means of estimating fair value, although is might involve so-called "level 3" (i.e., unobservable) inputs, and thus would rank at the bottom of the ASC 820 fair value hierarchy.

Since, in the authors' opinion, in the absence of other, better input data, such as the pricing of insurance to assume the risk of performing on the guarantee, the probability-weighted present value of possible future cash flows could serve as useful input to determining the fair value of guarantees made, the following example is presented.

Example of estimating the fair value of a guarantee using CON 7 when recognition under ASC 450 would not be otherwise required

Big Red Company guarantees a $1,000,000 debt of Little Blue Company for the next three years in conjunction with selling equipment to Little Blue. Big Red evaluates its risk of payment as follows:

(1) There is no possibility that Big Red will pay during year 1.
(2) There is a 15% chance that Big Red will pay during year 2. If it has to pay, there is a 30% chance that it will have to pay \$500,000 and a 70% chance that it will have to pay \$250,000.
(3) There is a 20% chance that Big Red will pay during year 3. If it has to pay, there is a 25% chance that it will have to pay \$600,000 and a 75% chance that it will have to pay \$300,000.

The expected cash flows are computed as follows:

Year 1	100% chance of paying \$0 = \$0
Year 2	85% chance of paying \$0 and a 15% chance of paying (.30 × \$500,000 + .70 × \$250,000 =) \$325,000 = \$48,750
Year 3	80% chance of paying \$0 and a 20% chance of paying (.25 × \$600,000 + .75 × \$300,000 =) \$375,000 = \$75,000

The present value of the expected cash flows is computed as the sum of the years' probability-weighted cash flows, here assuming an appropriate discount rate of 8%.

Year 1	$\$0 \times 1/1.08 =$	\$ 0
Year 2	$\$48,750 \times 1/(1.08)^2 =$	41,795
Year 3	$\$75,000 \times 1/(1.08)^3 =$	59,537
Fair value of the guarantee		\$101,332

Based on the foregoing, a liability of \$101,332 would be recognized at inception. This would reduce the net selling price of the equipment sold to Little Blue, thereby reducing the profit to be reported on the sale transaction.

Example of estimating the fair value of a guarantee using CON 7 when recognition under ASC 450 is also required

Assume the same basic facts as in the foregoing example, but now also assume that it has been determined that there is a 60% likelihood that the buyer will eventually default and, after legal process, Big Red will have to repay debt amounting to \$400,000 at the end of the fifth year. Assume also that a likelihood of 60% is deemed to make this contingent obligation "probable" under ASC 450. The present value of that payment is \$272,233, but ASC 450 does not address or seemingly anticipate the application of present value methods. Thus, it would appear that accrual of the full \$400,000 expected loss is required, unaffected by expected timing or by the probability (60%, in this example) that it will occur. Since this amount exceeds the amount computed under ASC 460, no additional amount would be recognized in connection with the noncontingent obligation to stand ready to perform.

If, instead of the immediate foregoing facts, the probable repayments were estimated to be \$75,000, then the liabilities to be recognized would total \$101,322, of which \$75,000 would be required to satisfy the provisions of ASC 450, and the incremental amount, \$26,332, would be attributed to the noncontingent obligation.

The entry to record the liability depends upon the circumstances under which the guarantee arose. If the guarantee was issued in a stand-alone transaction for a premium, the offset would be to the asset accepted for the premium's payment (most likely, cash or a receivable). If the guarantee was issued in conjunction with the sale of assets, the proceeds would be allocated between the sale of the asset and the guarantee obligation, so that the profit (loss) on the sale of the asset would be reduced (increased). If the guarantee was issued in conjunction with the formation of a business accounted for under the equity method, the offset would be an increase in the carrying amount of the investment. If the guarantee was issued to an unrelated party for no consideration, an immediate expense would be recognized. If a residual value guarantee was provided by a lessee-guarantor, the offset would be reported as prepaid rent and then amortized over the term of the lease to rent expense. The residual value of equipment by the manufacturer is recognized by the manufacturer as an asset (included in the seller/lessor's net investment in lease).

After initial recognition, the liability is adjusted as the guarantor either is released from risk or is subject to increased risk. ASC 460 does not specify the accounting for guarantees subsequent to initial recognition, and there is no requirement to reassess the fair value of the guarantee after inception. In fact, ASC 460 only addresses measurement of a guarantor's liability at the inception of the guarantee and fair value should only be used in subsequent accounting for the guarantee if the use of that method can be justified under other authoritative guidance. ASC 460 cannot be cited to support adjustments to fair value subsequent to initial recognition.

However, if the guarantor is subsequently released from risk, that logically could be recognized in one of three ways, in the authors' opinion, although no guidance is provided by ASC 460. First, the liability could simply be written off at its expiration or settlement. Second, the liability could be amortized systematically over the guarantee period. Third, the liability might be adjusted to reflect changing fair value, which presumably declines over time as the risk of having to perform decreases. Furthermore, changes dictated by the provisions of ASC 450 (e.g., as a previously "remote" contingency becomes a "probable" one) must be accounted for under that requirement, apart from the requirements of ASC 460.

Fees for guaranteeing a loan. According to ASC 605-20-25-9, fees received for guaranteeing another entity's obligation should be recognized as income over the guarantee period, rather than at the time of receipt, consistent with other standards governing service fee income recognition. The guarantor is to perform ongoing assessments of the probability of loss related to the guarantee and recognize a liability if the conditions in ASC 450 are met. Upon entering into a guarantee arrangement, the guarantor is required to recognize the stand-ready obligation under the guarantee. The contingent aspect of the guarantee would only be recognized if the conditions defined by ASC 450 are met.

Impact of ASC 460 on revenue recognition on sales with a guaranteed minimum resale value. ASC 840-10-55 holds that manufacturers are precluded from recognizing sales of equipment when they provide purchasers with guarantees of resale value, unless the criteria for sales-type lease accounting are met. It states that minimum lease payments, used to ascertain whether a given lease would be an operating or sales-type (capital) lease, are to include the difference between the initial proceeds and the guaranteed amount. Under these circumstances, the fair value of the resale value guarantee is not recognized by the manufacturer, because ASC 460 does not apply to an asset of the guarantor. Given that the manufacturer would report the residual value as an asset, the guarantee does not fall within the domain of ASC 460.

Disclosure requirements. A guarantor is now required to disclose the following information about each guarantee, or each group of similar guarantees, even if the likelihood of the guarantor's having to make any payments under the guarantee were deemed remote:

1. The nature of the guarantee, including how the guarantee arose and the events or circumstances that would require the guarantor to perform under the guarantee
2. The maximum potential amount of future payments (undiscounted) under the guarantee
3. The carrying amount of the liability, if any, for the guarantor's obligations under the guarantee, including any amount recognized under ASC 450
4. The nature and extent of any recourse provisions or available collateral that would enable the guarantor to recover the amounts paid under the guarantee, and an indication of the approximate extent to which the proceeds from recoveries or liquidation would be expected to cover the maximum potential amount of future payments under the guarantee

5. The fair value of financial guarantees issued, if the entity is required to disclose the fair value of financial instruments under the provisions of ASC 825. (See Chapter 8 for a discussion of which entities are required to disclose the fair value of financial instruments.)
6. The disclosures required by ASC 850 if the guarantees are made to benefit related parties. (See Chapter 2 for a discussion of related-party disclosures.)

Offsetting of Assets and Liabilities

ASC 210-20 states that offsetting of assets and liabilities is improper except where a right of setoff exists. A right of setoff is a debtor's legal right to discharge debt owed to another party by applying against the debt an amount the other party owes to the debtor. Certain conditions, if met, allow but do not require an entity to offset the amounts recognized. The entity's choice to offset or not must be applied consistently. (ASC 210-20 is discussed further in Chapter 2.)

PERSPECTIVE AND ISSUES

Long-term (or noncurrent) liabilities are liabilities that will be paid or otherwise settled over a period of more than one year, or if longer, greater than one operating cycle. This chapter discusses accounting for bonds, long-term notes payable, mandatorily redeemable shares, and obligations to issue or repurchase the entity's own shares. Other common types of long-term liabilities are lease obligations (Chapter 16), deferred income taxes (Chapter 17), pension and deferred compensation plan obligations (Chapter 18), and contingencies (Chapter 14).

The appropriate valuation of long-term debt at the date of issuance is the present value of the future payments, using an interest rate commensurate with the risks involved. In many situations this is the rate stated in the agreement between the borrower and the creditor. However, in other situations the debt may be noninterest-bearing, or the rate stated in the agreement may not be indicative of the rate applicable to a borrower having similar creditworthiness and debt having similar terms. In other words, the rate stated in the agreement is

not commensurate with the risks involved. To reflect the liability at the appropriate value, interest must be imputed at the market rate, and the resulting premium or discount is amortized as interest over the life of the agreement (per ASC 835-30).

Debt remains on the books of the debtor until it is extinguished. In most cases, a debt is extinguished at maturity, when the required principal and interest payments have been made and the debtor has no further obligation to the creditor. In other cases, the debtor may desire to extinguish the debt before its maturity. For example, if market interest rates are falling, a debtor may choose to issue debt at the new lower rate and use the proceeds to retire older higher-interest-rate debt. ASC 405-20-40-1 states that a debt is extinguished if either of two conditions is met.

1. The debtor pays the creditor and is relieved of its obligation for the liability.
2. The debtor is legally released from being the primary obligor under the liability, either judicially or by the creditor.

FASB continues to pursue a project, *Accounting for Transfers of Financial Assets*, which addresses several liability extinguishment issues. Among these is the possible clarification or replacement of the criterion above, that directs extinguishment accounting when the debtor is "legally released from being the primary obligor," since this expression is not legally defined. The project will also consider whether the criteria should be applied to liabilities which are not within the scope of that standard. The most recent Exposure Draft was issued in 2005.

If a debtor experiences financial difficulties before the debt is repaid, a creditor may need to recognize an impairment of the debt. Under ASC 310-10-35-16, an impairment of the debt is recognized when the present value of the expected future cash flows discounted at the debt's original effective interest rate is less than the recorded investment in the debt. If for economic or legal reasons related to the debtor's financial difficulties, the creditor grants the debtor concessions that would not otherwise have been granted, the debtor must determine how to recognize the effects of the troubled debt restructuring (ASC 470-60).

Some debt is issued with terms that allow it to be converted to an equity instrument (common or, less often, preferred stock) at a future date. When issued, under current GAAP, no value is attributed to the conversion feature. When the debt is converted, the stock issued is generally valued at the carrying value of the debt (ASC 470). In certain situations, a debtor will modify the conversion privileges after issuance of the debt in order to induce prompt conversion of the debt into equity, in which case the debtor must recognize an expense for this consideration (ASC 470-20-40-16).

Debt can also be issued with stock warrants, which allow the holder to purchase a stated number of common shares at a certain price within a defined time period. If debt is issued with detachable warrants, the proceeds of issuance are allocated between the two financial instruments (ASC 470-20-05).

ASC 470-60 requires an issuer to report (1) mandatorily redeemable shares, (2) financial instruments that obligate the issuer to repurchase its shares, and (3) financial instruments that obligate the issuer to issue a variable number of shares as liabilities. This can have a major impact on the entity's balance sheet and on key financial ratios by which it is judged as to its solvency and financial stability.

Other proposed standards would require that the proceeds from the issuance of a compound instrument, such as convertible debt or debt issued with warrants, be allocated to liability and equity components, to be separately presented in the balance sheet. FASB believes that such a presentation provides a more faithful representation of the rights and obligations embedded in compound instruments than does the current practice of presenting the instruments entirely as liabilities or entirely as equity. A discussion of the proposed standard is found later in this chapter.

Through-put contracts, take-or-pay contracts, and other unconditional purchase obligations are sometimes used instead of debt to finance a capital project or a joint venture. These agreements may or may not be recognized on the balance sheet. Entities are required to disclose information about those types of obligations in the notes to the financial statements (ASC 440).

Short-term obligations that are expected to be refinanced and therefore classified as long-term debt per ASC 470 are discussed in Chapter 14.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
310-40	Receivables—Troubled Debt Restructurings by Creditors
Liabilities	
405-20	Liabilities—Extinguishments of Liabilities
450	Contingencies
470	Debt
470-20	Debt—Debt with Conversion and Other Options
470-30	Debt—Participating Mortgage Loans
470-50	Debt—Modifications and Extinguishments
470-60	Debt—Troubled Debt Restructurings by Debtors
480	Distinguishing Liabilities from Equity
Equity	
505-50	Equity—Equity-Based Payments to Nonemployees
Broad Transactions	
815	Derivatives and Hedging
830-20	Foreign Currency Matters—Foreign Currency Transactions
835-30	Interest—Imputation of Interest

DEFINITIONS OF TERMS

Amortization. The process of allocating an amount to expense over the periods benefited.

Bond. A written agreement whereby a borrower agrees to pay a sum of money at a designated future date plus periodic interest payments at the stated rate.

Bond issue costs. Costs related to issuing a bond (i.e., legal, accounting, underwriting fees, printing, and registration costs).

Book value approach. Recording the stock issued from a bond conversion at the carrying value of the bonds converted.

Callable bond. A bond in which the issuer reserves the right to call and retire the bond prior to its maturity.

Carrying value. The face amount of a debt issue increased or decreased by the applicable unamortized premium or discount plus unamortized issue costs.

Collateral. Asset(s) pledged to settle the obligation to repay a loan.

Contingently convertible. Convertible securities where either the exercisability of the conversion feature or the conversion price are dependent upon the occurrence or nonoccurrence of some defined event (e.g., an IPO or change in control).

Convertible debt. Debt that may be converted into common or preferred stock at the holder's option after specific criteria are met.

Covenant. A clause in a debt contract written for the protection of the lender that outlines the rights and actions of the parties involved when certain conditions occur (e.g., when the debtor's current ratio declines beyond a specified level).

Debenture. Long-term debt not secured by collateral.

Discount. Created when a debt instrument is issued for less than face value and occurs when the stated rate on the instrument is less than the market rate at the time of issue.

Effective interest method. Amortizing the discount or premium to interest expense so as to result in a constant rate of interest when applied to the amount of debt outstanding at the beginning of any given period.

Effective rate. See **market rate**.

Face value. The stated amount or principal due on the maturity date.

Freestanding financial instrument. A financial instrument that is entered into separately and apart from any of the entity's other financial instruments or equity transactions, or that is entered into in conjunction with some other transaction and is legally detachable and separately exercisable.

Imputation. The process of interest rate approximation that is accomplished by examining the circumstances under which the note was issued.

Issuer. The entity that issued a financial instrument or may be required under the terms of a financial instrument to issue its equity shares.

Long-term debt. Probable future sacrifices of economic benefits arising from present obligations that are not currently payable within one year or the operating cycle of the business, whichever is longer.

Mandatorily redeemable shares. Any of various financial instruments issued in the form of shares that embody an unconditional obligation requiring the issuer to redeem the instrument by transferring its assets at a specified or determinable date (or dates) or upon an event that is certain to occur.

Market rate. The current rate of interest available for obligations issued under the same terms and conditions by an issuer of similar credit standing.

Market value approach. Recording the stock issued from a bond conversion at the current market price of the bonds converted or the stock issued.

Maturity date. The date on which the face value (principal) of the bond or note becomes due.

Maturity value. See **face value**.

Monetary value. What the fair value of the cash, shares, or other instruments that a financial instrument obligates the issuer to convey to the holder would be at the settlement date under specified market conditions.

Net settlement. A form of settling a financial instrument under which the party with a loss delivers to the party with a gain cash (net cash settlement) or shares of stock (net share settlement) with a current fair value equal to the gain.

Physical settlement. A form of settling a financial instrument under which (1) the party designated in the contract as the buyer delivers the full stated amount of cash or other financial instruments to the seller and (2) the seller delivers the full stated number of shares of stock or other financial instruments or nonfinancial instruments to the buyer.

Premium. Created when a debt instrument is issued for more than its face value and occurs when the stated rate on the instrument is greater than the market rate at the time of issue.

Principal. See **face value**.

Secured debt. Debt that has collateral to satisfy the obligation if not repaid (e.g., a mortgage on specific property).

Serial bond. Debt whose face value matures in installments.

Stated rate. The interest rate written on the face of the debt instrument.

Straight-line method. The method of amortizing the premium or discount to interest expense such that there is an even allocation of interest expense over the life of the debt.

Take-or-pay contract. A contract in which a purchaser of goods agrees to pay specified fixed or minimum amounts periodically in return for products, even if delivery is not taken. It results from a project financing arrangement where the project produces the products.

Through-put agreement. An agreement similar to a take-or-pay contract except a service is provided by the project under the financing arrangement.

Troubled debt restructure. Occurs when the creditor, for economic or legal reasons related to the debtor's financial difficulties, grants a concession to the debtor (deferment or reduction of interest or principal) that it would not otherwise consider.

Unconditional purchase obligation. An obligation to transfer a fixed or minimum amount of funds in the future or to transfer goods or services at fixed or minimum prices.

Yield rate. See **market rate**.

CONCEPTS, RULES, AND EXAMPLES

Notes and Bonds

Notes are a common form of exchange in business transactions for cash, property, goods, and services. Notes represent debt issued to a single investor without intending for the debt to be broken up among many investors. A note's maturity, usually lasting one to seven years, tends to be shorter than that of a bond.

Bonds are primarily used to borrow funds from the general public or institutional investors when a contract for a single amount (a note) is too large for any one lender to supply. Dividing up the amount needed into $1,000 or $10,000 units makes it easier to sell the bonds. Bonds also result from a single agreement.

Notes and bonds share common characteristics. They both are promises to pay sums of money at designated maturity dates, plus periodic interest payments at stated rates. They each feature written agreements stating the amounts of principal, the interest rates, when the interest and principal are to be paid, and the restrictive covenants, if any, that must be met.

The interest rate is affected by many factors, including the cost of money, the business risk factors, and general and industry-specific inflationary expectations. The stated rate on a note or bond often differs from the market rate at the time of issuance. When this occurs, the present value of the interest and principal payments will differ from the maturity, or face value. (For a complete discussion of present value techniques see Chapter 1.) If the market rate exceeds the stated rate, the cash proceeds will be less than the face value of the debt because the present value of the total interest and principal payments discounted back to the present yields an amount that is less than the face value. Because an investor is rarely willing to pay more than the present value, the bonds must be issued at a discount. The discount is the difference between the issuance price (present value) and the face, or stated, value of the bonds. This discount is then amortized over the life of the bonds to increase the recognized interest expense so that the total amount of the expense represents the actual bond yield. When the stated rate exceeds the market rate, the bond will sell for more than its face value (at a premium) to bring the effective rate to the market rate. Amortization of the premium over the life of the bonds will decrease the total interest expense.

When the market and stated rates are equivalent at the time of issuance, no discount or premium exists and the instrument will sell at its face value. Changes in the market rate subsequent to issuance are irrelevant in determining the discount or premium or its amortization.

All commitments to pay (and receive) money at a determinable future date are subject to present value techniques and, if necessary, interest imputation with the exception of the following:

1. Normal accounts payable due within one year
2. Amounts to be applied to purchase price of goods or services or that provide security to an agreement (e.g., advances, progress payments, security deposits, and retentions)
3. Transactions between parent and subsidiary

4. Obligations payable at some indeterminable future date (e.g., warranties)
5. Lending and depositor savings activities of financial institutions whose primary business is lending money
6. Transactions where interest rates are affected by prescriptions of a governmental agency (e.g., revenue bonds, tax exempt obligations, etc.)

ASC 835-30 specifies when and how interest is to be imputed when a debt is either noninterest-bearing or the stated rate is not reasonable. ASC 835-30 divides debt into three categories for discussion. The diagram on the following page illustrates the accounting treatment for the three types of debt.

Notes issued solely for cash. When a note is issued solely for cash, its present value is assumed to be equal to the cash proceeds. The interest rate is that rate equating the cash proceeds to the amounts to be paid in the future. For example, a $1,000 note due in three years that sells for $889 has an implicit rate of 4% (= $1,000 × .889, where .889 is the present value factor at 4% for a lump sum due three years hence). This implicit rate, 4%, is to be used when amortizing the discount.

In most situations, a bond will be issued at a price other than its face value. The amount of the cash exchanged is equal to the total of the present values of all the future interest and principal payments. The difference between the cash proceeds and the face value is recorded as a premium if the cash proceeds are greater than the face value or a discount if they are less. The journal entry to record a bond issued at a premium follows:

Cash	(proceeds)	
Bonds payable		(face value)
Premium on bonds payable		(difference)

Example of bonds issued for cash

Enterprise Autos issues $100,000 of 10-year bonds bearing interest at 10%, paid semiannually, at a time when the market demands a 12% return from issuers with similar credit standings. The proceeds of the bond issuance would be $88,500, which is computed as follows:

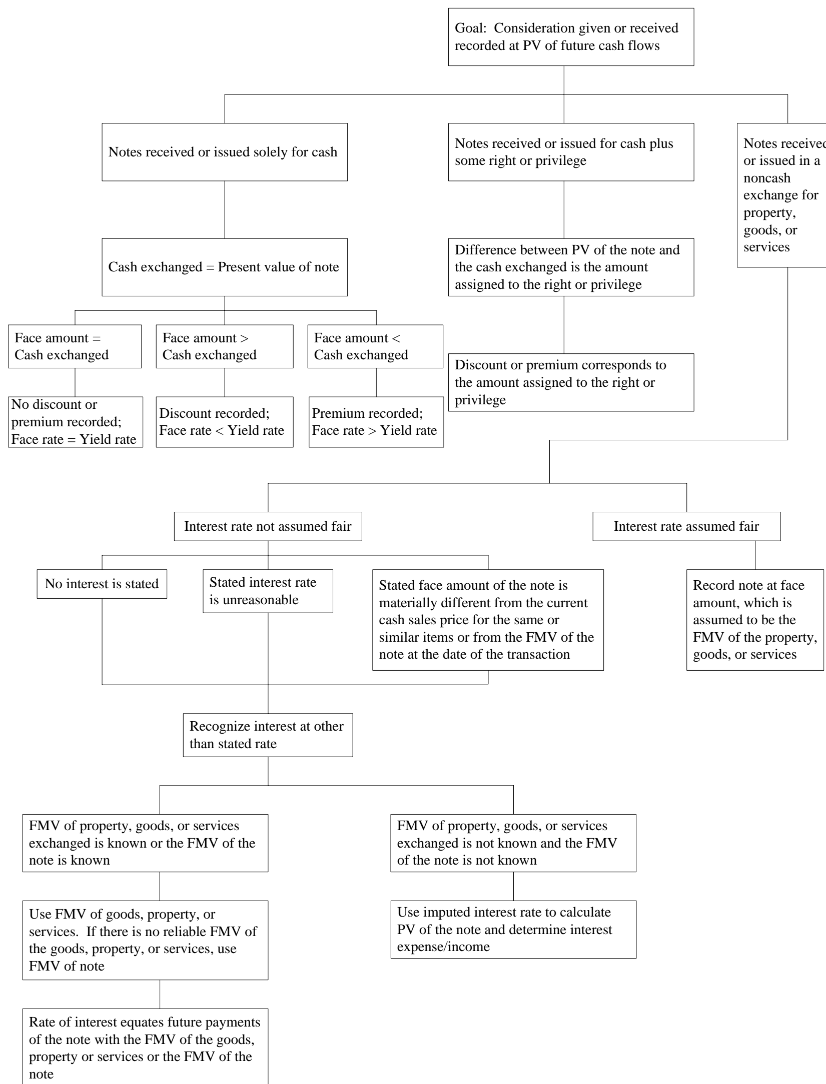
Present value of 20 semiannual interest payments of $5,000 discounted at 12% (6% semiannually: factor = 11.4699)	$57,300
Present value of $100,000 due in 10 years, discounted at 12% compounded semiannually (factor = .31180)	31,200
Present value of bond issuance	$88,500

The journal entry would be

Cash	88,500	
Discount on bonds payable	11,500	
Bonds payable		100,000

Notes issued for cash and a right or privilege. Often when a note bearing an unrealistic rate of interest is issued in exchange for cash, an additional right or privilege is granted, such as the issuer agreeing to sell merchandise to the purchaser at a reduced rate. The difference between the present value of the receivable and the cash loaned is regarded as an addition to the cost of the products purchased for the purchaser/lender and as unearned revenue to the seller/issuer. This treatment stems from an attempt to match revenue and expense in the proper periods and to differentiate between those factors that affect income from operations and income or expense from nonoperating sources. In the situation above, the purchaser/lender will amortize the discount (difference between the cash loaned and the present value of the note) to interest income over the life of the note, and the contractual right to purchase inventory at a reduced rate will be allocated to inventory (or cost of sales) as the right expires. The seller/issuer of the note will amortize the discount to interest expense over the life of the note, and the unearned revenue will be recognized in sales as the products are sold to the purchaser/lender at the reduced price. Because the discount is amortized on a different basis than the contractual right, net income for the period is also affected.

ACCOUNTING FOR MONETARY ASSETS AND LIABILITIES



Example of accounting for a note issued for both cash and a contractual right

1. Miller borrows $10,000 via a noninterest-bearing three-year note from Krueger.
2. Miller agrees to sell $50,000 of merchandise to Krueger at less than the ordinary retail price for the duration of the note.
3. The market rate of interest on a note with similar payment terms and a borrower of similar creditworthiness is 10%.

According to ASC 835-30, the difference between the present value of the note and the face value of the loan is to be regarded as part of the cost of the products purchased under the agreement. The present value factor for an amount due in three years at 10% is .75132. Therefore, the present value of the note is $7,513 (= $10,000 × .75132). The $2,487 (= $10,000 – $7,513) difference between the face value and the present value is to be recorded as a discount on the note pay-

able and as unearned revenue on the future purchases by the debtor. The following entries would be made by the debtor (Miller) and the creditor (Krueger) to record the transaction:

Miller			*Krueger*		
Cash	10,000		Note receivable	10,000	
Discount on note payable	2,487		Contract right with supplier	2,487	
Note payable		10,000	Cash		10,000
Unearned revenue		2,487	Discount on note receivable		2,487

The discount on note payable (and note receivable) is to be amortized using the effective interest method, while the unearned revenue account and contract right with supplier account are amortized on a pro rata basis as the right to purchase merchandise is used up. Thus, if Krueger purchased $20,000 of merchandise from Miller in the first year, the following entries would be necessary:

Miller			*Krueger*		
Unearned revenue [$2,487 × (20,000/50,000)]	995		Inventory (or cost of sales)	995	
Sales		995	Contract right with supplier		995
Interest expense	751		Discount on note receivable	751	
Discount on note payable ($7,513 × 10%)		751	Interest revenue		751

The amortization of unearned revenue and contract right with supplier accounts will fluctuate with the amount of purchases made. If there is a balance remaining in the account at the end of the loan term, it is amortized to the appropriate account in that final year.

Noncash transactions. When a note is issued for consideration such as property, goods, or services, and the transaction is entered into at arm's length, the stated interest rate is presumed to be fair unless (1) no interest rate is stated; (2) the stated rate is unreasonable; or (3) the face value of the debt is materially different from the consideration involved or the current market value of the note at the date of the transaction. According to ASC 835-30, when the rate on the note is not considered fair, the note is to be recorded at the "fair market value of the property, goods, or services received or at an amount that reasonably approximates the market value of the note, whichever is the more clearly determinable." When this amount differs from the face value of the note, the difference is to be recorded as a discount or premium and amortized to interest expense.

Example of accounting for a note exchanged for property

1. Alexis sells Brett a machine that has a fair market value of $7,510.
2. Alexis receives a three-year noninterest-bearing note having a face value of $10,000.

In this situation, the fair market value of the consideration is readily determinable and, thus, represents the amount at which the note is to be recorded. The following entry by Brett is necessary:

Machine	7,510	
Discount on notes payable	2,490	
Notes payable		10,000

The discount will be amortized to interest expense over the three-year period using the interest rate implied in the transaction. The interest rate implied is 10%, because the factor for an amount due in three years is .75132, which when applied to the $10,000 face value results in an amount equal to the fair value of the machine.

If the fair market value of the consideration or note is not determinable, then the present value of the note must be determined using an imputed interest rate. This rate will then be used to establish the present value of the note by discounting all future payments on the note at this rate. General guidelines for imputing the interest rate, which are provided by ASC 835-30, include the prevailing rates of similar instruments from creditors with similar credit ratings and the rate the debtor could obtain for similar financing from other sources. Other

determining factors include any collateral or restrictive covenants involved, the current and expected prime rate, and other terms pertaining to the instrument. The objective is to approximate the rate of interest that would have resulted if an independent borrower and lender had negotiated a similar transaction under comparable terms and conditions. This determination is as of the issuance date, and any subsequent changes in interest rates would be irrelevant.

Example of accounting for a note exchanged to property

1. Alexis sells Brett a used machine. The fair market value is not readily determinable.
2. Alexis receives a three-year noninterest-bearing note having a face value of $20,000. The market value of the note is not known.
3. Brett could have borrowed the money for the machine's purchase from a bank at a rate of 10%.

In this situation, the fair market value of the consideration is not readily determinable, so the present value of the note is determined using an imputed interest rate. The rate used is the rate at which Brett could have borrowed the money—10%. The factor for an amount due in three years at 10% is .75132, so the present value of the note is $15,026. The following entry by Brett is necessary:

Machine	15,026	
Discount on notes payable	4,974	
Notes payable		20,000

Accounting by participating mortgage loan borrowers. Certain mortgage loan agreements provide, generally in exchange for a lower interest rate, that the lender shares in price appreciation of the property securing the loan. Other arrangements provide that the lender receives a share of the earnings or cash flows from the commercial real estate for which the loan was made. ASC 470-30 establishes the borrower's accounting for a participating mortgage loan if the lender participates in increases in the market value of the mortgaged real estate project, the results of operations of that mortgaged real estate project, or both. It requires that certain disclosures be made in the financial statements. In addition, the codification requires the following:

1. At origination, if the lender is entitled to participate in appreciation in the market value of the mortgaged real estate project, the borrower should determine the fair value of the participation feature and should recognize a participation liability for that amount. A corresponding debit should then be recorded to a debt-discount account. The debt discount should be amortized by the interest method, using the effective interest rate. The net result is to include the expected cost of the participating feature in the periodic interest cost associated with the loan.
2. A the end of each reporting period, the balance of the participation liability should be adjusted if necessary, so that the liability equals the fair value of the participation feature at that point in time. The corresponding debit or credit should be adjusted to the related debt-discount account. The revised discount should then be amortized prospectively.

Redeemable instruments. ASC 470-10-55 addressed the classification of certain long-term debt that is subject to a demand from the holder for redemption, subject to a best efforts attempt by the issuer to remarket that date. Thus, there is a possibility that the demand for redemption would not be honored, although a bank letter of credit is also provided as additional security for the lender. Notwithstanding that possibility, this debt must be reported as a current obligation.

Sales of future revenue. ASC 470-10-25 deals with the situation in which a reporting entity receives an initial payment from another party in exchange for a promised stream of

royalties or other revenue-based receipts from a defined business, which could be a segment or product line of the reporting entity. Arguably, the up-front payment could be seen as an advance against the future payments, or as a borrowing by the reporting entity. Clearly, of course, the payment is not revenue to the reporting entity.

The codification states that the initial receipt would be accounted for as either debt or deferred revenue, depending on the facts and circumstances of the transaction. It identifies six factors that would cause the amounts to be recorded as debt, rather than as deferred income. Theses factors are

1. The transaction does not purport to be a sale.
2. The reporting entity has significant continuing involvement in the generation of the cash flows due the other party (referred to as the investor in this consensus).
3. The transaction is cancelable by either party through payment of a lump sum or other transfer of assets by the entity.
4. The investor's rate of return is implicitly or explicitly limited by the terms of the transaction.
5. Variations in the reporting entity's revenue or income underlying the transaction have only a trifling impact on the investor's rate of return.
6. The investor has any recourse to the reporting entity relating to the payments due to the investor.

Amounts recorded as debt should be amortized under the interest method and amounts recorded as deferred income should be amortized under the units-of-revenue method. The proceeds classified as foreign-currency-denominated debt would be subject to recognition of foreign currency transaction (exchange) gains and losses under ASC 830-20.

ASC 815 established cash flow hedge accounting for hedges of the variability of the functional currency equivalent of future foreign-currency-denominated cash flows. If the proceeds are classified as deferred income, this would be a nonmonetary liability. Thus, no foreign exchange gains or losses would arise under ASC 830-20.

Effective Interest Method

The effective interest method is the preferred method of accounting for a discount or premium arising from a note or bond. Under the effective interest method, the discount or premium is amortized over the life of the debt in such a way as to result in a constant rate of interest when applied to the amount outstanding at the beginning of any given period. Therefore, interest expense is equal to the market rate of interest at the time of issuance multiplied by this beginning figure. The difference between the interest expense and the cash paid represents the amortization of the discount or premium.

Amortization tables are often created at the time of the bond's issuance to provide amounts necessary when recording the entries relating to the debt issue. They also provide a check of accuracy since the final values in the unamortized discount or premium and carrying value columns should be equal to zero and the bond's face value, respectively.

Example of applying the effective interest method

1. A 3-year, 12%, $10,000 bond is issued at 1/1/2009, with interest payments semiannually.
2. The market rate is 10%.

The amortization table would appear as follows:

Date	Credit cash	Debit int. exp.	Debit prem.	Unamort. prem. bal.	Carrying value
1/1/09				$507.61	$10,507.61[a]
7/1/09	$ 600.00[b]	$ 525.38[c]	$ 74.62[d]	432.99[e]	10,432.99[f]
1/1/10	600.00	521.65	78.35	354.64	10,354.64
7/1/10	600.00	517.73	82.27	272.37	10,272.37
1/1/11	600.00	513.62	86.38	185.99	10,185.99
7/1/11	600.00	509.30	90.70	95.29	10,095.29
1/1/12	600.00	504.71[g]	95.29	--	10,000.00
	$3,600.00	$3,092.39	$507.61		

(a) PV of principal and interest payments at 5% for 6 periods

$10,000(.74622)	=	*$ 7,462.20*
$ 600(5.07569)	=	*3,045.41*
		$10,507.61

(b) $10,000.00 × .12 × one-half year

(c) $10,507.61 × .10 × one-half year

(d) $600.00 – $525.38

(e) $507.61 – $74.62

(f) $10,507.61 – $74.62 (or $10,000 + $432.99)

(g) Rounding error = $.05

Although the effective interest method is the preferred method of amortizing a discount or premium, the straight-line method may be used if the results are not materially different. The amortized portion is equal to the total amount of the discount or premium divided by the life of the debt from issuance in months multiplied by the number of months the debt has been outstanding that year. Interest expense under the straight-line method is equal to the cash interest paid plus the amortized portion of the discount or minus the amortized portion of the premium.

When the interest date does not coincide with the year-end, an adjusting entry must be made to recognize the proportional share of interest payable and the amortization of the discount or premium. Within the amortization period, the discount or premium can be amortized using the straight-line method.

If bonds or notes are issued between interest payment dates, the interest and the amortization must be computed for the period between the sale date and the next interest date. The purchaser usually pays the issuer for the amount of interest that has accrued since the last payment date. That payment is recorded as a payable by the issuer. At the next interest date, the issuer pays the purchaser as though the bond had been outstanding for the entire interest period. The discount or premium is also amortized for the short period.

Example of note issued between payment dates

On June 1, 2009, Acme Manufacturing issues a $100,000 7% bond with a three-year life at 104 (i.e. at 104% of face value). Interest is payable on July 1 and January 1. The computation of the premium would be

Proceeds	$104,000
Face value	100,000
Premium	$ 4,000

The entry to record the bond issuance and the receipt of interest from the purchaser would be

Cash	106,967	
Bonds payable		100,000
Premium on bonds		4,000
Interest payable		2,967

The bonds will be outstanding for two years and seven months. An effective interest rate must be computed that will equate the present value of the future principal and interest payments to the cash received. Using a spreadsheet facilitates the trial and error process. Many inexpensive calculators with financial functions also do this calculation. Alternatively, present value tables can be used to compute the value, as shown below.

First, compute the present value of the interest and principal payments as of 7/1/09 using a guess of 5% annually.

Present value of an annuity due of $3,500 for six periods @ 2.5% = 3,500 × 5.6458 =	19,760
Present value of a single payment of $100,000 in five periods @2.5% = 100,000 × .88385 =	88,385
	108,145

Then, compute the present value of that result one month earlier (at June 1, 2009) using the same interest rate.

Present value of a single payment of $108,145 in one month = 108,145/[1+(.05/12)] = 107,696

The result is more than the cash received ($106,967), so we know that the interest rate must be higher than 5%. Repeat the calculation at a 6% annual rate.

Present value of an annuity due of $3,500 for six periods @3% = 3,500 × 5.5797 =	19,529
Present value of a single payment of $100,000 in five periods @3% =100,000 × .86261 =	86,261
	105,790

Present value of a single payment of $105,790 in one month = 105,790/[1+(.06/12)] = 105,263

The result is less than the cash received ($106,967), so we know the rate is between 5 and 6%. By interpolation, we determine that the rate is 5.3%.

$$\frac{107{,}696 - 106{,}967}{107{,}696 - 105{,}263} \times (6\% - 5\%) = .2996\%$$, which is added to 5% to get the effective rate.

The amortization of the $4,000 premium would be as follows:

	Cash paid (received)	*Interest at 5.3% annually*	*Amortization*	*Interest payable*	*Bond payable*
					104,000
06/01/09	(2,967)			2,967	104,000
07/01/09	3,500	459	74	(2,967)	103,926
01/01/10	3,500	2,754	746		103,180
07/01/10	3,500	2,734	765		102,415
01/01/11	3,500	2,714	786		101,629
07/01/11	3,500	2,693	807		100,822
01/01/12	103,500	2,672	822		100,000

The entry to record the first interest payment would be

Interest payable	2,967	
Interest expense	459	
Premium on bonds	74	
Cash		3,500

Costs may be incurred in connection with issuing bonds. Examples include legal, accounting, and underwriting fees; commissions; and engraving, printing, and registration costs. These costs theoretically should be treated as either an expense in the period incurred or a reduction in the related amount of debt, in much the same manner as a discount (CON 6). These costs do not provide any future economic benefit and, therefore, should not be an asset. Since these costs reduce the amount of cash proceeds, they in effect increase the effective interest rate and probably should be accounted for the same as an unamortized discount. However, in practice, issue costs are treated as deferred charges and amortized using the straight-line method. (FASB, as part of convergence efforts being undertaken with the IASB, has proposed that issuance costs be defined as the incremental costs directly attributable to issuance of an instrument that would not have been incurred if the instrument had not been issued. It would also require that the issuance costs be accounted for as a reduction of the proceeds of issuance.)

Extinguishment of Debt

Management may reacquire or retire outstanding debt before its scheduled maturity. This decision is usually caused by changes in present or expected interest rates or in cash flows.

In-substance defeasance (irrevocably placing assets in a trust that is to be used solely to service the remaining debt payments) does not result in the extinguishment of a liability. Except for items excluded by ASC 405-20, a liability is removed from the balance sheet only if

1. The creditor is paid and the debtor is relieved of the obligation.
2. The debtor is released legally either by the creditor or judicially from being the primary obligor.

FASB had been pursuing a project through its *Accounting for Transfers of Financial Assets* Exposure Draft to clarify the phrase "legally released from being the primary obligor," which is not a legally defined term and thus may be subject to varying interpretations. Although the FASB staff has made recommendations for improved language, FASB has not acted on these and has instead indicated that it will pursue this issue in the context of a broader review of ASC 405-20's extinguishment criteria. FASB has concluded that a derecognition model based solely on legal principles would be inappropriate because of representational faithfulness and operationalizability concerns, and instead is attempting to identify and describe indicators of performance that subsequently might be used to develop models for either derecognition or measurement of performance obligations.

If a debtor becomes secondarily liable, through a third-party assumption and a release by the creditor, the original debtor becomes a guarantor. A guarantee obligation, based on the probability that the third party will pay, is to be recognized and initially measured at fair value. The amount of guarantee obligation increases the loss or reduces the gain recognized on extinguishments. Guarantees are discussed in Chapter 14.

Some financial instruments can have characteristics of either assets or liabilities depending on market conditions (forward contracts, swap contracts, and written commodity options). To be derecognized, those instruments must not only meet the two criteria above, but must also meet the surrender of control criteria of ASC 405-20 (Chapter 8).

Debtor's accounting for a modification or exchange of debt instruments other than in a troubled debt restructuring. An exchange of debt instruments with substantially different terms is a debt extinguishment and should be accounted for in accordance with ASC 405-20. Any substantial modification in the terms of an existing debt, other than for a troubled debt restructuring, should similarly be reported as a debt extinguishment.

An exchange or modification is considered substantial when the present value of cash flows under the new debt instrument is at least 10% different from the present value of the remaining cash flows under the terms of the original instrument. For the purpose of the 10% test, the effective interest rate of the original debt instrument is used as the discount rate.

Cash flows can be affected by changes in principal amounts, interest rates, maturity, or by fees exchanged between the parties. Substantial change can also result from changes in the following provisions:

1. Recourse or nonrecourse features
2. Priority of the obligation
3. Collateralized or noncollateralized features
4. Debt covenants and/or waivers
5. The guarantor
6. Option features

Assuming the 10% test is met and the debt instrument are deemed to be substantially different, the new investment should be initially recorded at fair value and that amount should be compared to the book value of the old debt to determine debt extinguishment gain or loss to be recognized, as well as the effective rate of the new instrument. Fees paid by the debtor to the creditor or received by the debtor from the creditor should be included in determining debt extinguishment gain or loss. Additionally, any costs incurred with third parties should be amortized using the interest method in a manner similar to that used for debt issue costs.

Assuming the 10% test is not met and the debt instruments are not deemed to be substantially different, then the new effective interest is to be determined based on the carrying amount of the original instrument and the revised cash flows. Fees paid by the debtor to the creditor or received by the debtor from the creditor should be amortized as an adjustment to interest expense over the remaining term of the modified debt instrument using the interest method. Additionally, any costs incurred with third parties should be expensed as incurred.

Gain or loss on debt extinguishment. According to ASC 470-50, the difference between the net carrying value and the price paid to acquire the debt instruments is to be recorded as a gain or loss. If the acquisition price is greater than the carrying value, a loss exists. A gain is generated if the acquisition price is less than the carrying value. These gains or losses are to be recognized in the period in which the retirement took place. Debt extinguishment gains and losses are reported as extraordinary only if the event creating the gain or loss is both unusual and infrequently occurring. It is expected that extinguishments of debt will rarely, if ever, meet these dual criteria. Hence, gains and losses on debt extinguishments will be reported in earnings before extraordinary items.

The unamortized premium or discount and issue costs should be amortized to the acquisition date and recorded prior to the determination of the gain or loss. If the extinguishment of debt does not occur on the interest date, the interest payable accruing between the last interest date and the acquisition date must also be recorded.

Example of accounting for the extinguishment of debt

1. A 10%, 10-year, $200,000 bond is dated and issued on 1/1/09 at 98, with the interest payable semiannually.
2. Associated bond issue costs of $14,000 are incurred.
3. Four years later, on 1/1/13, the entire bond issue is repurchased at 102 (i.e., 102% of face value) and is retired.
4. At 1/1/13 the unamortized discount using the effective interest rate of 10.325% is $2,858.

Reacquisition price [(102%) × $200,000]		$204,000
Net carrying amount:		
Face value	$200,000	
Unamortized discount	(2,858)	
Unamortized issue costs [14,000 × (6/10)]	(8,400)	188,742
Loss on bond repurchase		$ 15,258

Troubled Debt Restructurings

Troubled debt restructurings are defined by ASC 470-60 as situations in which the creditor, for economic or legal reasons related to the debtor's financial difficulties, grants the debtor a concession that would not otherwise be granted. As explained in ASC 470-60-55, no single characteristic or factor, taken alone, is determinative of whether a modification of terms or an exchange of a debt instrument is a troubled debt restructuring under ASC 470-60. Thus, making this determination requires the exercise of judgment. ASC 470-60-55 poses two questions to assist in making a determination of whether ASC 470-60 applies in a particular instance.

- Is the debtor experiencing financial difficulty?
- Has the creditor granted a concession?

Both of these questions must be answered in the affirmative for ASC 470-60 to be applicable.

Is the debtor experiencing financial difficulty? If the debtor's creditworthiness has deteriorated since the debt was originally issued, the debtor should evaluate whether it is experiencing financial difficulties. The following factors are indicators that this may be the case:

- The debtor is in default on some of its debt
- The debtor has declared, or is in the process of declaring, bankruptcy
- There is doubt as to whether the debtor is a going concern
- The debtor's securities have been or are likely to be delisted
- The debtor forecasts that its entity-specific cash flows are insufficient to service the debt through its maturity in accordance with its terms
- The debtor cannot obtain resources at the current market rates for nontroubled debtors except through existing creditors

If both of the following factors are present, it would be concluded that the debtor is not experiencing financial difficulty:

- The creditors agree to restructure the old debt solely to reflect either (1) a decrease in the current interest rates for the debtor, or (2) an increase in the debtor's creditworthiness
- The debtor is currently servicing the old debt and can obtain funds to repay the old debt at the current market rate for a nontroubled debtor

Has the creditor granted a concession? The creditor has granted a concession if the debtor's effective borrowing rate on the restructured debt is less than the effective borrowing rate immediately prior to the restructuring. The effective borrowing rate should give effect to all the terms of the restructured debt, including options, warrants, guarantees, and so forth. If the debtor is restructuring the debt for a second time, the effective borrowing rate of the new debt should be compared to the effective borrowing rate of the original debt.

However, in any of the following four situations, a concession granted by the creditor does not automatically qualify as a restructuring:

1. The fair value of the assets or equity interest accepted by a creditor from a debtor in full satisfaction of its receivable is at least equal to the creditor's recorded investment in the receivable.
2. The fair value of the assets or equity interest transferred by a debtor to a creditor in full settlement of its payable is at least equal to the carrying value of the payable.
3. The creditor reduces the effective interest rate to reflect a decrease in current interest rates or a decrease in the risk, in order to maintain the relationship.
4. The debtor, in exchange for old debt, issues new debt with an interest rate that reflects current market rates.

ASC 470-60-55-1 notes that ASC 470-60 does not apply to debtors in bankruptcy unless the restructuring does not result from a general restatement of the debtor's liabilities in bankruptcy proceedings. That is, ASC 470-60 applies only if the debt restructuring is isolated to the creditor.

A troubled debt restructuring can occur one of two ways. The first is a settlement of the debt at less than the carrying amount. The second is a continuation of the debt with a modification of terms (i.e., a reduction in the interest rate, face amount, accrued interest owed, or

an extension of the payment date for interest or face amount). Accounting for such restructurings is prescribed for both debtors and creditors. ASC 470-60-15-3 points out that the debtor and creditor must separately apply ASC 470-60 to the specific fact situation since the tests are not necessarily symmetrical and it is possible for one or the other, but not both, to have a troubled debt restructuring when the debtor's carrying amount and the creditor's recorded investment differ. ASC 310-10-35-16 specifies the accounting by creditors for troubled debt restructurings involving a modification of terms.

Debtors. If the debt is settled by the exchange of assets, a gain is recognized in the period of transfer for the difference between the carrying amount of the debt (defined as the face amount of the debt increased or decreased by applicable accrued interest and applicable unamortized premium, discount, or issue costs) and the consideration given to extinguish the debt. A two-step process is used: (1) any noncash assets used to settle the debt are revalued at fair market value and the associated ordinary gain or loss is recognized and (2) the debt restructuring gain is determined and recognized. The gain or loss is evaluated under the "unusual and infrequent" criteria of ASC 225-20, which are discussed in Chapter 3. If stock is issued to settle the liability, the stock is recorded at its fair market value (ASC 470-60).

Example 1: Settlement of debt by exchange of assets

Assume the debtor company transfers land having a book value of $70,000 and a fair market value of $80,000 in full settlement of its note payable. The note has a remaining life of five years, a principal balance of $90,000, and related accrued interest of $10,000 is recorded. The following entries are required to record the settlement:

Debtor		
Land	10,000	
Gain on transfer of assets		10,000
Note payable	90,000	
Interest payable	10,000	
Land		80,000
Gain on settlement of debt		20,000

If the debt is continued with a modification of terms, it is necessary to compare the total future cash flows of the restructured debt (both principal and stated interest) with the carrying value of the original debt. If the total amount of future cash payments is greater than the carrying value, no adjustment is made to the carrying value of the debt. However, a new lower effective interest rate must be computed. This rate makes the present value of the total future cash payments equal to the present carrying value of debt and is used to determine interest expense in future periods. The effective interest method must be used to compute the expense. If the total future cash payments of the restructured debt are less than the present carrying value, the current debt should be reduced to the amount of the future cash flows and a gain should be recognized. No interest expense would be recognized in subsequent periods, since only the principal is being repaid.

According to ASC 470-60, a troubled debt restructuring that involves only a modification of terms is accounted for *prospectively*. Thus, there is no change in the carrying value of the liability unless the carrying amount of the original debt exceeds the total future cash payments specified by the new agreement.

If the restructuring consists of part settlement and part modification of payments, the part settlement is accounted for first and then the modification of payments.

Example 2: Restructuring with gain/loss recognized (payments are less than carrying value)

Assume that the note has a principal balance of $90,000, accrued interest of $10,000, an interest rate of 5%, and a remaining life of five years. The interest rate is reduced to 4%, the principal is reduced to $72,500, and the accrued interest at date of restructure is forgiven.

Future cash flows (after restructuring):

Principal	$ 72,500
Interest (5 years × $72,500 × 4%)	14,500
Total cash to be paid	$ 87,000
Amount prior to restructure ($90,000 principal + $10,000 accrued interest)	(100,000)
Debtor's gain	$ 13,000

The following entries need to be recorded by the debtor to reflect the terms of the agreement:

Beginning of Year 1

Interest payable	10,000	
Note payable	3,000	
Gain on restructure of debt		13,000

End of Years 1-5

Note payable	2,900	
Cash		2,900

NOTE: $14,500 ÷ 5 yrs. = $2,900; No interest expense is recorded in this case.

End of Year 5

Note payable	72,500	
Cash		72,500

Example 3: Restructuring with no gain/loss recognized (payments exceed carrying value)

Modify Example 2 as follows:

Assume the $100,000 owed is reduced to a principal balance of $95,000. The interest rate of 5% is reduced to 4%.

Future cash flows (after restructuring):	
Principal	$ 95,000
Interest (5 years × $95,000 × 4%)	19,000
Total cash to be received	$ 114,000
Amount prior to restructure ($90,000 principal + $10,000 accrued interest)	(100,000)
Interest expense/revenue over 5 years	$ 14,000

In this example, a new effective interest rate must be computed such that the present value of the future payments equals $100,000. A trial and error approach is used to calculate the effective interest rate that discounts the $95,000 principal and the $3,800 annual interest payments to $100,000, the amount owed prior to restructuring.

Trial and Error Calculation

	(n = 5, i = 2.5%)	(n = 5, i = 3%)
PV of ordinary annuity	4.64583	4.57971
PV of 1	.88385	.86261

2.5%: (.88385 × $95,000) + (4.64583 × $3,800) = $101,620

3%: (.86261 × $95,000) + (4.57971 × $3,800) = $ 99,351

Interpolation:

$$\left[\frac{101{,}620 - 100{,}000}{101{,}620 - 99{,}351}\right] \times (3\% - 2.5\%) = .357\%$$

New effective rate = 2.5% + .357% = 2.857%

Interest amortization schedule:

Year	*Cash*	*Interest at effective rate*	*Reduction in carrying value*	*Carrying amount*
				$100,000
1	$ 3,800[(a)]	$2,857[(b)]	$ 943[(c)]	99,057
2	3,800	2,830	970	98,087
3	3,800	2,802	998	97,089
4	3,800	2,774	1,026	96,063
5	3,800	2,745	1,055	95,000*
	$19,000			

* *Rounded*
(a) *$3,800 = $95,000 × .04*
(b) *$2,857 = $100,000 × 2.857%*
(c) *$943 = $3,800 – $2,857*

The following entries are made by the debtor to recognize the cash payments in the subsequent periods:

End of Year 1

Note payable ($3,800 – $2,857	943	
Interest expense ($100,000 × .02857)	2,857	
Cash		3,800

End of Year 5

Note payable	95,000	
Cash		95,000

When the total future cash payments may exceed the carrying amount of the liability, no gain or loss is recognized on the books of the debtor unless the maximum future cash payments are less than the carrying amount of the debt. For example, if the debtor is required to make interest payments at a higher rate if its financial condition improves before the maturity of the debt, the debtor should assume that the larger payments would have to be made. The contingent payments would be included in the total future cash payments for comparison with the carrying amount of the debt. If the future cash payments exceed the carrying amount, a new effective interest rate should be determined. The new rate should be the rate that equates the present value of the future cash payments with the carrying amount of the liability. Interest expense and principal reduction are then recognized as the future cash payments are made.

Example 4: Contingent payments

Modify Example 2 as follows: The new agreement states that if financial condition at maturity improves as specified, an additional principal payment of $15,000 is required and additional 1% of interest must be paid in arrears for years 4 and 5.

Future cash payments:	
Required principal per agreement	$ 72,500
Required interest per agreement (5 years × $72,500 × 4%)	14,500
Contingent principal payment	15,000
Contingent interest payments (2 years × 72,500 × 1%)	1,450
	$103,450
Amount prior to restructure ($90,000 + $10,000)	(100,000)
	$ 3,450

When computing the new effective interest rate, only as many contingent payments as are needed to make the future cash payments exceed the carrying value are included in the calculation. Thus, the contingent principal payment would be included, but the contingent interest would not. The contingent interest payments would be recognized using the same criteria as are used in ASC 450; that is, the payments are recognized when they are both probable and reasonably estimable.

Substituted debtors in a troubled debt restructuring. ASC 310-40-40-1 addressed the situation of a sale of real estate collateral by a debtor in a troubled debt situation, with the

acquirer assuming the obligation to the creditor (the reporting entity), such that the fair value of the obligation (the present value of payments, less than the net investment) was less than the creditor's carrying value of the loan receivable. In such circumstances, the creditor would be required to recognize a loss in the amount by which the net investment in the loan exceeds the fair value of the payments to be received. The fair value of the payments should be recorded as an asset by the creditor.

ASC 310-10-35 creditors. ASC 310-10-35 applies to all creditors, to all troubled debt restructurings involving a modification of terms, and to all loans except

1. Groups of similar small balance loans that are collectively evaluated
2. Loans measured at fair value or lower of cost or fair value
3. Leases
4. ASC 320 debt securities

If it is probable that a creditor will not collect all amounts (principal and interest) owed to the degree specified in the loan agreement, a loan is considered impaired. A delay does not impair the loan if the creditor collects all amounts due (including accrued interest during the delay at the contractual rate).

An impaired loan can be measured on a loan-by-loan basis in any of the following ways:

1. Present value of expected future cash flows using the loan's original effective interest rate (the contractual interest rate adjusted for premium or discount and net deferred loan costs or fees at acquisition or origination)
2. Loan's observable market price
3. Fair value of the collateral if the loan is collateral dependent (repayment expected to be provided by the collateral). If foreclosure is probable, this measurement must be used.

Other measurement considerations include

1. Costs to sell, on a discounted basis, if they will reduce cash flows to satisfy the loan
2. Creation of or adjustment to a valuation allowance account with the offset to bad-debt expense if the recorded investment is greater than the impaired loan measurement
3. If the contractual interest rate varies based on changes in an independent factor, the creditor can choose between
   a. Calculating the effective interest on the factor as it changes over the loan's life, or
   b. Calculating the effective interest as fixed at the rate in effect at the date of impairment.

   The choice must be consistently applied. Projections of factor changes should not be made.
4. Cash flow estimates should be the creditors' best estimate based on reasonable and supportable assumptions
5. Significant changes occurring in measurement values require recalculation and adjustment of the valuation allowance. Net carrying amount of the loan should not exceed the recorded investment.

After impairment, creditors use existing methods to record, measure, and display interest income. If the existing policy results in a recorded investment less than fair value, no additional impairment is recognized.

Under ASC 310-10-35-16, the creditor would account for the earlier examples as follows:

Example 1

Land	80,000	
Bad debt expense	20,000	
Note receivable		90,000
Interest receivable		10,000

Example 2

Future cash flows (after restructuring) at the agreement's original effective interest rate

		5% 5 yrs PV Factor
Principal	$ 56,806	($72,500 × .78353)
Interest	12,555	($ 2,900 × 4.32948)
Total present value	$ 69,361	
Amount prior to restructure ($90,000 principal + $10,000 accrued interest)	(100,000)	
Creditor's loss	$(30,639)	

Beginning of Year 1

Bad debt expense	30,639	
Interest receivable		10,000
Valuation allowance		20,639

End of Year 1

Cash	2,900	
Valuation allowance	568	
Bad debt expense (or interest income)		3,468 (69,361 × .05)

End of Year 2

Cash	2,900	
Valuation allowance	596	
Bad debt expense (or interest income)		3,496 [(69,361 + 568) = 69,929 × .05]

End of Year 3

Cash	2,900	
Valuation allowance	626	
Bad debt expense (or interest income)		3,526 [(69,929 + 596) = 70,525 × .05]

End of Year 4

Cash	2,900	
Valuation allowance	658	
Bad debt expense (or interest income)		3,558 [(70,525 + 626) = 71,151 × .05]

End of Year 5

Cash	2,900	
Valuation allowance	691	
Bad debt expense (or interest income)		3,591 [(71,151 + 658) = 71,809 × .05]
Cash	72,500	
Valuation allowance	17,500	
Note receivable		90,000

Example 3

Future cash flows (after restructuring) at the agreement's original effective interest rate

		5% 5 yrs PV Factor
Principal	$ 74,435	($95,000 × .78353)
Interest	16,452	($ 3,800 × 4.32948)
Total present value	$ 90,887	
Amount prior to restructure ($90,000 principal + $10,000 accrued interest)	(100,000)	
Creditor's loss	$(9,113)	

Beginning of Year 1		
Bad debt expense	9,113	
Note receivable—new	95,000	
Note receivable—old		90,000
Interest receivable		10,000
Valuation allowance		4,113
End of Year 1		
Cash	3,800	
Valuation allowance	744	
Bad debt expense (or interest income)		4,544 (90,887 × .05)
End of Year 2		
Cash	3,800	
Valuation allowance	781	
Bad debt expense (or interest income)		4,581 [(90,887 + 744) = 91,631 × .05]
End of Year 3		
Cash	3,800	
Valuation allowance	821	
Bad debt expense (or interest income)		4,621 [(91,631 + 781) = 92,412 × .05]
End of Year 4		
Cash	3,800	
Valuation allowance	862	
Bad debt expense (or interest income)		4,662 [(92,412 + 821) = 93,233 × .05]
End of Year 5		
Cash	3,800	
Valuation allowance	905	
Bad debt expense (or interest income)		4,705 [(93,233 + 862) = 94,095 × .05]
Cash	95,000	
Note receivable		95,000

Convertible Debt

Bonds are frequently issued with the right to convert into common stock of the company at the holder's option. Convertible debt is typically used for two reasons. First, when a specific amount of funds is needed, convertible debt often allows a lesser number of shares to be issued (assuming conversion) than if the funds were raised by directly issuing the shares. Thus, less dilution occurs. Second, the conversion feature allows debt to be issued at a lower interest rate and with fewer restrictive covenants than if the debt was issued without it.

This dual nature of debt and equity, however, creates a question as to whether the equity element should receive separate recognition. Support for separate treatment is based on the assumption that this equity element has economic value. Since the convertible feature tends to lower the rate of interest, a portion of the proceeds should be allocated to this equity fea-

ture. FASB concurred, and it issued proposed standards under a "Liabilities and Equity" project that would, among other things, require convertible debt to be divided into its liability components and equity components. Those components would be separately presented in the balance sheet. If issued (the draft remains outstanding as of early 2008), those standards would replace that under ASC 470-20-05, which require that the instrument be reported as either all debt or all equity. (FASB is now waiting for another round of comments in early 2008.) For more details, see the discussion of the proposed standards later in this chapter.

Features of convertible debt typically include (1) a conversion price 15-20% greater than the market value of the stock when the debt is issued; (2) conversion features (price and number of shares) which protect against dilution from stock dividends, splits, etc.; and (3) a callable feature at the issuer's option, which is usually exercised once the conversion price is reached (thus forcing conversion or redemption).

Convertible debt also has its disadvantages. If the stock price increases significantly after the debt is issued, the issuer would have been better off by simply issuing the stock. Additionally, if the price of the stock does not reach the conversion price, the debt will never be converted (a condition known as overhanging debt).

When convertible debt is issued and the conversion price is greater than the market value of the stock on the issuance date, no value is apportioned to the conversion feature when recording the issue (ASC 470-20-05). The debt and its interest are reported as if it were a nonconvertible debt. Upon conversion, the stock may be valued at either the book value or the market value of the bonds.

If the book value approach is used, the new stock is valued at the carrying value of the converted bonds. This method is widely used since no gain or loss is recognized upon conversion, and the conversion represents the transformation of contingent shareholders into shareholders. It does not represent the culmination of an earnings cycle. The primary weakness of this method is that the total value attributed to the equity security by the investors is not given accounting recognition.

Example of book value method

Assume that a $1,000 bond with an unamortized discount of $50 and a market value of $970 is converted into 10 shares of $10 par common stock whose market value is $97 per share. Conversion using the book value method is recorded as follows:

Bonds payable	1,000	
Discount on bonds payable		50
Common stock		100
Additional paid-in capital		850

The alternative market value approach assumes the new stock issued is valued at market (i.e., the market price of the stock issued or the market price of the bonds converted, whichever is more easily determinable). A gain (loss) occurs when the market value of the stocks or bonds is less (greater) than the carrying value of the bond.

Example of the market value method

Assume the same facts as the example above. The entry to record the conversion is

Bonds payable	1,000	
Loss on redemption (ordinary)	20	
Discount on bonds payable		50
Common stock		100
Additional paid-in capital		870

The weakness of this method is that a gain or loss can be reported as a result of an equity transaction. Only the existing shareholders are affected, as their equity will increase or decrease, but the firm as a whole is unaffected. For this reason, the market value approach is not widely used.

When convertible debt is retired, the transaction is handled in the same manner as nonconvertible debt: the difference between the acquisition price and the carrying value of the bond is reported currently as a gain or loss.

Accrued interest upon conversion of convertible debt. Per ASC 470-20-40-11, if terms of the convertible debt instrument provide that any accrued interest at the date of conversion is forfeited by the former debt holder, the accrued interest (net of income tax) from the last payment date to the conversion date should be charged to interest expense and credited to capital as a part of the cost basis of the securities issued.

Convertible bonds with a "premium put." Some convertible bonds contain mutually exclusive features, with one obviously being the right to convert to the issuer's common or preferred stock. In some instances the other feature is the right, usually on specified dates before or at the stated maturity of the debt, to cause the issuer to repurchase the debt at a price higher than par or the issuance price. This is known as a "premium put" feature. An early view of premium puts held that the issuer should accrue a liability for the put premium over the period from the date of issuance to the initial put date, and that this accrual should continue regardless of market value changes. It further held if the put expires unexercised and if—as would be highly likely if the holders chose to ignore the right to put the debt back to the issuer—the market value of the common stock exceeds the put price at expiration date, the put premium should be credited to additional paid-in capital. Additionally, it held that if the put were to expire unexercised (in the situation where the debt maturity is later than the last put exercise date) and if the put price exceeds the market value of the common stock at that date, the put premium should be amortized as a yield adjustment over the remaining term of the debt, reducing interest cost.

Under ASC 815, an embedded put is a derivative instrument subject to that standard. This "grandfathered" permission for entities not to account separately for embedded premium puts in pre-1998 or pre-1999 hybrid instruments issued at par; the earlier view was to continue to apply to an entity which elected not to separately account for the embedded derivative. However, separate accounting was required for convertible debt not "grandfathered" under this provision, and thus, ASC 815 does apply to more recently issued convertible debt having premium put features.

ASC 460-10 requires explicit recognition of guarantees at their inceptions (see Chapter 14 for complete discussion of this topic). A premium put is a form of guarantee arrangement, and thus the fair value of the put must now be recognized at the date of issuance of the convertible debt bearing this feature, unless the put is accounted for as a derivative (and thus also recorded at fair value) under ASC 815. As a practical matter, in either case a liability will be recognized for the fair value of the put option embedded in the convertible debt.

Under ASC 815 this derivative financial instrument will be marked to fair value at each financial reporting date. Whether the adjustment increases or decreases the recorded amount from one period to the next depends largely on the price performance of the issuer's stock, since increasing value of the stock raises the likelihood of conversion and thus decreases the perceived value of the put option. In the authors' opinion, any adjustment to the carrying value of the put option should result in adjustments to the entity's interest expense for the period.

Debt convertible into the stock of a consolidated subsidiary. According to ASC 470-20-25, in the consolidated financial statements, (1) debt issued by a consolidated subsidiary that is convertible into that subsidiary's stock and (2) debt issued by a parent company that is convertible into the stock of a consolidated subsidiary should be accounted for in accordance with ASC 470-20-05. That is, no portion of the proceeds from the issuance of the debt should be accounted for as attributable to the conversion feature. ASC 470-20-25 did not apply to convertible debt instruments that require a cash settlement by the issuer of an in-the-

money conversion feature, that provide the holder an option to receive cash for an in-the-money conversion feature, or that have a beneficial conversion feature.

Accounting for a convertible instrument granted or issued to a nonemployee. ASC 470-20-30 describes the accounting for a convertible instrument that is used to pay a nonemployee for goods or services if that instrument contains a nondetachable conversion option. The measurement date under ASC 505-50 should be used to measure the intrinsic value of the conversion option rather than the commitment date. The proceeds from issuing the instrument for purposes of determining whether a beneficial conversion option exists is the fair value of the instrument or the fair value of the goods and services received, whichever is more reliably measured. The fair value of the convertible instrument can be measured by applying ASC 505-50. (For details, see Chapter 19.) Once the convertible instrument is issued, distributions paid or payable are financing costs rather than adjustments of the cost of the goods or services received.

If a purchaser of a convertible instrument that contains an embedded beneficial conversion option provides goods or services to the issuer under a separate contract, the contracts should be considered separately unless the separately stated pricing is not equal to fair value. If not equal to fair value, the terms of the respective transactions should be adjusted. The convertible instrument should be recognized at its fair value with a corresponding increase or decrease to the purchase price of the goods or services.

Convertible bonds with issuer option to settle for cash upon conversion. ASC 815-15-55 addressed a variant of convertible bonds which give the issuer (the reporting entity) the option of settling for cash, rather than stock, at the time conversion is elected by holders. In some versions of this arrangement, the debtor would be obligated to settle in cash, based on the stock price at the conversion date. In others, the issuer would have the option to deliver shares or cash based on the contractual conversion rate, or more complex formulae might cause partial settlement in cash.

ASC 815 requires that in the situation of a mandatory cash settlement upon conversion, the embedded derivative (which is a cash-settled written call option) has to be accounted for separately from the debt, and changes in the derivative's fair value will be reported currently in earnings. When the conversion option can be settled in stock, however, the embedded derivative is indexed only to the issuer's stock and thus, under ASC 815-40 would not be separately accounted for.

If a convertible bond is issued with terms that require the issuer to satisfy the obligation (the amount accrued to the benefit of the holder exclusive of the conversion spread) in cash and to satisfy the conversion spread (the excess conversion value over the accreted value) in either cash or stock, the debt should be accounted for like convertible debt (that is, as a combined instrument under current GAAP) if the conversion spread meets the requirements of ASC 815-40. If the conversion spread feature does not meet those provisions, ASC 815 requires that the embedded derivative be separated from the debt host contract and accounted for by the issuer separately as a derivative instrument.

If a convertible bond is issued with terms that permit the issuer to satisfy the entire obligation in either stock or cash, the bond should be accounted for as conventional convertible debt. If the holder exercises the conversion and the issuer pays cash, the debt is extinguished and the issuer should account for the transaction in accordance with ASC 470-50. ASC 470-50-45-1 removed the mandatory extraordinary item treatment for any gain or loss on debt extinguishment, but if the criteria in ASC 225-20-45 are met (which is thought to be unlikely) extraordinary classification is still possible.

ASC 470-20-40-12 provides accounting guidance with respect to a financial instrument which contains the following provisions:

- Instrument is convertible at the option of its holder into a fixed number of shares of the issuer's common stock.
- At conversion, the issuer must settle the obligation to the holder as follows:
  - Payment in cash for the accreted value of the obligation (for a zero-coupon obligation, the accreted value is the amount received from the holder at issuance plus interest accreted from date of issuance to date of settlement)
  - Payment in either cash or stock to satisfy the conversion spread (the difference between the conversion value over the accreted value)
- If the holder does not exercise the conversion option, the issuer is obligated to settle the accreted value of the debt in cash at maturity.

Questions have arisen regarding the accounting for the *settlement* of this instrument partially in cash (the recognized liability) and partially in stock (the unrecognized equity instrument). ASC 470-20-40-12 states that only the cash payment is to be considered in computing gain or loss on settlement of the recognized liability. Shares transferred to the holder to settle the excess conversion spread represented by the embedded equity instrument are not considered part of the settlement of the debt component of the instrument.

Convertible Securities with Beneficial or Contingent Conversion Features

Beneficial conversion. Reporting entities sometimes issue convertible securities (debt or preferred stock) that are "in the money" at the issuance date (i.e., where it would be economically advantageous to the holders if the securities were converted immediately). That type of conversion feature is called an "embedded beneficial conversion feature." Variations of such securities may be converted at a fixed price, a fixed discount to the market price at date of conversion, a variable discount to the market price at conversion, or the conversion price may be dependent upon future events. In addition, the conversion feature can be exercisable at issuance, at a stated date in the future, or upon the happening of a future event (such as an IPO). ASC 470-20 addressed the assorted accounting issues arising for issuers of such securities (the reporting entity or debtor).

In contrast with current GAAP governing convertible securities lacking this feature, embedded beneficial conversion features are valued separately at issuance. The feature is recognized as additional paid-in capital by allocating a portion of the proceeds equal to the intrinsic value of the feature. The intrinsic value is computed at the commitment date as (1) the difference between the conversion price and the fair value of the common stock (or other securities) into which the security is convertible, multiplied by (2) the number of shares into which the security is convertible.

For convertible debt securities, a discount on the debt may result from the allocation of a portion of the proceeds to the conversion feature. That discount should be amortized over the period to the earliest conversion date. If conversion can take place immediately, the discount is charged to interest expense at once, rather than being amortized. For convertible preferred securities, any "discount" on issuance is analogous to a dividend to the preferred shareholder and should be recognized as a return to them, using the effective interest method, through the date of the earliest permitted conversion.

If the conversion feature has multiple steps, the computation of the intrinsic value is made using the conversion terms most beneficial to the investor. For example, if the security was convertible at a 10% discount to market price after three months and then at a 25% discount to market price after one year, the 25% discount terms would be used to measure the intrinsic value of the feature. Any resulting discount on the convertible debt would be amortized to the earliest date at which the particular discount (25% in this case) could be achieved

(one year). However, at any financial statement date, the cumulative amortization recorded must be the greater of (1) the amount computed using the effective interest method of amortization or (2) the amount of the benefit the investor would receive if the securities were converted at that date. If the securities are converted prior to the full amortization of the discount, the unamortized discount is to be included in the amount transferred to equity upon conversion.

If a convertible debt security having a beneficial feature is extinguished prior to conversion, a portion of the reacquisition price of the debt security is allocated to the beneficial conversion feature. That portion is measured as the intrinsic value of the conversion feature at the extinguishment date. Since the beneficial conversion feature was originally recognized as equity, the redemption or cancellation of this feature would give rise not to gain or loss, but rather to an adjustment within stockholders' equity. For example, if $2,000 of the redemption payment was identified with the beneficial feature to which $1,200 had originally been allocated, the net result would be that the original allocation would be eliminated and an $800 charge would be made against retained earnings (analogous to a loss on a treasury stock transaction). Any residual beyond the allocated cost of redeeming the beneficial conversion feature would be allocated to the retirement of the debt security, and a gain or loss on extinguishment would be reported in current earnings.

Contingent conversion. If the security becomes convertible only upon occurrence (or failure to occur) of a future event outside the control of the investor or if the conversion terms change based on the occurrence (or failure to occur) of a future event, the value of the contingent beneficial conversion feature should be measured as of the commitment date, but it is not recognized in the financial statements until the contingency is resolved. This may be combined with a beneficial conversion feature. For example, a debt instrument issued with a conversion feature at 20% below then-market price, to become effective conditioned on the consummation of a planned refinancing, would be contingently convertible with a beneficial feature. According to ASC 470-20, any contingent beneficial conversion feature should be measured at the commitment date, but not reflected in earnings until the contingent condition has been met.

The definition of "conventional contingently convertible debt instrument" is later addressed by ASC 815-40-25. The issue arises because of one of the requirements under ASC 815—namely, that embedded derivatives be bifurcated and accounted for separately under certain conditions, but with an exception for accounting for conversion privileges by issuers of certain convertible securities. Thus, instruments that provide holders the right to convert at a fixed ratio (or equivalent cash value, at the issuer's discretion), for which option exercise is based on either the passage of time or a contingent event are deemed "conventional."

ASC 815-15 also states that, when a previously bifurcated conversion option in a convertible debt instrument no longer meets the bifurcation criteria in ASC 815, one should reclassify the fair value of the liability for the conversion option to shareholders' equity. If a debt discount was recognized when the conversion option was bifurcated, then it should continue to be amortized. Disclosure requirements include a description of the changes causing the termination of bifurcation, as well as the amount of the liability reclassified to stockholders' equity.

ASC 470-20 covers convertible securities with beneficial conversion features. The following summarizes this topic:

1. If an instrument includes both detachable instruments (e.g., stock purchase warrants) and an embedded beneficial conversion option, the proceeds of issuance should first be allocated among the convertible instrument and the other detachable instruments based on their relative fair values. Then, ASC 470-20-35 should be ap-

plied to determine the amount allocated to the convertible instrument if the embedded conversion option has an intrinsic value.

2. If the conversion price could change upon the occurrence of a future event, assume that there are no changes to the current circumstances except the passage of time. Use the most favorable price that would be in effect if nothing were changed at the conversion date in order to measure the intrinsic value of an embedded conversion option. Changes to the conversion terms that are caused by future events not controlled by the issuer are recognized if and when the trigger event occurs.
3. If there is no intrinsic value to a conversion right at issuance, but the conversion price resets after the commitment date and, upon reset, the conversion price is greater than the fair market value of the underlying stock, the beneficial conversion amount is recognized when the reset occurs. The beneficial conversion amount is measured by the number of shares that will be issued upon conversion multiplied by the decrease in price between the original conversion price and the reset price.
4. The definition of commitment date for purposes of applying ASC 470-20 should be the same as the definition of a firm commitment in ASC 815. If an instrument includes both detachable instruments and an embedded beneficial conversion option, the commitment date should also be used when determining the relative fair values of all the instruments issued.
5. If a convertible instrument has a stated redemption date, a discount resulting from recording a beneficial conversion option should be amortized from the date of issuance to the stated redemption date, regardless of when the earliest conversion occurs. If the instrument has beneficial conversion features, the unamortized discount remaining at the date of conversion should be immediately recognized as interest expense or as a dividend, as appropriate.
6. If the terms of a contingent conversion option do not permit an issuer to compute the number of shares that the holder would receive upon conversion, the issuer should wait until the contingent event occurs and then compute the number of shares that would be received. The number of shares that would be received is compared to the number of shares that would have been received if the contingent event had not occurred to determine the excess number of shares. The number of excess shares multiplied by the stock price as of the commitment date equals the incremental intrinsic value that should be recognized.
7. If an instrument includes a beneficial conversion option that expires at the end of a stated period and the instrument then becomes mandatorily redeemable at a premium, ASC 470-20 states that the proceeds of issuance were to be allocated between the debt and the embedded beneficial conversion features. The debt amount was then to be accreted to the redemption amount over the period to the required redemption date. ASC 480, however, requires that mandatorily redeemable stock be classified as a liability, measured initially at fair value, with a corresponding decrease to equity and no gain or loss recognized. Thus, this situation is no longer governed by ASC 470-20.
8. If interest or dividends are paid in kind, the commitment date for the paid-in-kind securities is the commitment date for the original instrument if the payment in kind is not discretionary. The payment is not discretionary if (1) neither the issuer nor the holder can elect other forms of payment for the interest or dividends and (2) if the original instrument was converted before dividends were declared or interest was accrued, the holder will receive the number of shares as if the accumulated dividends or interest have been paid in kind. If the payment in kind is discretionary,

the commitment date for the paid-in-kind securities is the date that the interest is accrued or the dividends are declared.

9. If an issuer issues a convertible instrument as repayment of a nonconvertible instrument, the fair value of the newly issued convertible instrument equals the redemption amount owed at the maturity date of the old debt. That is, the carrying amount of the old debt is the proceeds received for applying ASC 470-20 to the new debt.

Several tentative conclusions were also expressed, but have not been resolved.

1. If a convertible instrument is extinguished prior to its maturity date, no portion of the reacquisition price should be allocated to the conversion option if that option had no intrinsic value at the issuance date.
2. The intrinsic value of a conversion feature at an early extinguishment date of convertible debt is recorded as a decrease in additional paid-in capital, which may result in a reduction in additional paid-in capital that is larger than the amount originally recorded in paid-in capital at issuance.
3. If an entity redeems convertible preferred stock with a beneficial conversion feature, the intrinsic value of the conversion feature that was recorded at issuance is reversed, and the remaining reacquisition price is allocated to the reacquisition of the stock. Any excess of that portion over the carrying amount of the stock is an adjustment to earnings available to common shareholders.
4. If a company issues a warrant that allows the holder to acquire a convertible instrument for a stated price and that warrant is classified as equity, the date used to measure the intrinsic value of the conversion option is the commitment date for the warrant, not its exercise date, provided that the issuer received fair value for the warrant when issued. The deemed proceeds for determining whether a beneficial conversion option exists are equal to the sum of the proceeds received for the warrant and the exercise price of the warrant. If that sum is less than the fair value of the common stock that would be received upon exercise of the convertible instrument that would be obtained upon exercise of the warrant, the excess represents a deemed distribution to the holder of the warrant, which is to be recognized over the life of the warrant. The deemed distribution is limited to the proceeds received for the warrant; that is, if the deemed distribution is larger than the proceeds received, the difference is not recognized until the warrant is exercised. If the issuer received less than fair value for the warrant upon issuance, the exercise date of the warrant should be used to measure the intrinsic value of the conversion option.
5. If a company issues a warrant that allows the holder to acquire a convertible instrument for a stated price and that warrant is classified as a liability, the date used to measure the intrinsic value of the conversion option is the exercise date for the warrant, not its commitment date. The deemed proceeds for determining whether a beneficial conversion option exists are equal to the sum of the fair value of the warrant on the exercise date and the exercise price of the warrant.
6. If a conversion feature permits the holder to receive both common stock and warrants to acquire common stock, the intrinsic value of the conversion option is measured as the difference between (1) the proceeds allocated to the common stock portion of the conversion feature and (2) the fair value at the commitment date of the common stock to be received by the holder upon conversion.

The guidance in ASC 470-20 should be used to evaluate whether the issuer controls settlement of the conversion feature of convertible preferred stock. If the issuer does not control settlement, the convertible preferred stock is considered temporary equity.

Example 1: Intrinsic value of a conversion feature—fixed dollar terms

Software Solutions issues $1,000,000 of convertible debt, which is convertible into $10 par common stock at a price of $50 per share. The fair value of the common stock on the commitment date of the issue is $60. The intrinsic value of the conversion feature is computed as follows:

$1,000,000/$50 per share = 20,000 shares to be issued upon conversion
($60 fair value – $50 conversion price) × 20,000 shares = $200,000 intrinsic value

Software Solutions would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000	
Discount on bonds payable	200,000	
Bonds payable		1,000,000
Additional paid-in capital		200,000

If the price at which the bond is convertible to stock changes over the life of the bond, the intrinsic value should be computed using the terms that are most beneficial to the holder. The most favorable conversion price that would be in effect assuming that there are no changes to the current circumstances except for the passing of time should be used to measure the intrinsic value.

Example 2: Intrinsic value of a conversion feature—variable terms

American National Biotech issues $1,000,000 of convertible debt, convertible into $10 par common stock at a price 15% below the commitment date market price for years 1 and 2, 20% below the commitment date market price for years 3 to 5, and 25% below the commitment date market price for years 6 to maturity. The fair value of the common stock on the commitment date of the issue is $50. The intrinsic value of the conversion feature is computed as follows:

The most beneficial price is the 25% discount available in years 6 to maturity
That price would be $37.50 ($50 × .75)
$1,000,000/$37.50 per share = 26,667 shares to be issued upon conversion
($50 fair value – $37.50 conversion price) × 26,667 shares = $333,337 intrinsic value

American National Biotech would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000	
Discount on bonds payable	333,337	
Bonds payable		1,000,000
Additional paid-in capital		333,337

In some cases the conversion price will be dependent on a future event, or the bond becomes convertible only upon the occurrence of a future event. In those cases, the contingent beneficial conversion feature should be measured at the commitment date but not recognized in earnings until the contingency is resolved.

Example 3: Intrinsic value of a conversion feature—contingent price terms

Major Manufacturing Co. issues $1,000,000 of convertible debt, which is convertible into $10 par common stock at a discount of 20% off of the conversion date market price. The fair value of the common stock on the commitment date of the issue is $50. The intrinsic value of the conversion feature is computed as follows:

Because the conversion percentage is fixed, the intrinsic value is always $250,000.

Market price at conversion	$40	$50	$60	$70
Conversion price	$32	$40	$48	$56
Number of shares issued	31,250	25,000	20,833	17,857
Discount	$8	$10	$12	$14
Intrinsic value	$250,000	$250,000	$250,000	$250,000

Major Manufacturing Co. would make the following entry to recognize the issuance of bonds at 100:

Cash	1,000,000	
Discount on bonds payable	250,000	
Bonds payable		1,000,000
Additional paid-in capital		250,000

Example 4: Intrinsic value of a conversion feature—contingent conversion

Shoemaker Co. issues $1,000,000 of convertible debt, which is convertible into $10 par common stock at a discount of 25% below the commitment date market price. The fair value of the common stock on the commitment date of the issue is $60, so the conversion price is $45. The debt is convertible only upon an initial public offering. The intrinsic value of the conversion feature is computed as follows:

$1,000,000/$45 per share = 22,222 shares to be issued upon conversion
($60 fair value – $45 conversion price) × 22,222 shares = $333,330 intrinsic value

Shoemaker Co. would not allocate any portion of the proceeds to the conversion feature at issuance. It would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000	
Bonds payable		1,000,000

Upon the occurrence of an initial public offering, Shoemaker would make the following entry:

Discount on bonds payable	333,330	
Additional paid-in capital		333,330

Example 5: Intrinsic value of a conversion feature—contingent conversion with variable terms

Food Franchisers issues $1,000,000 of convertible debt, which is convertible into $10 par common stock at a price of $50. The fair value of the common stock on the commitment date of the issue is $60. The debt is convertible only upon an initial public offering. If the stock's market price is at least 20% higher than the IPO price one year after the IPO, the conversion price will be 70% of the then market price. The intrinsic value of the contingent conversion feature at issuance is computed as follows:

$1,000,000/$50 per share = 20,000 shares to be issued upon conversion
($60 fair value – $50 conversion price) × 20,000 shares = 250,000 intrinsic value

The intrinsic value of the contingent conversion price change is also computed at the commitment date using the assumptions that the IPO price will be the same as the current market price and that the stock price one year after the IPO is 20% higher, as follows:

Contingent conversion price = $60 × 120% × 70% = $50.40
$1,000,000/$50.40 per share = 19,841 shares to be issued upon conversion
($72 fair value – $50.40 conversion price) × 19,841 shares = $428,565 intrinsic value

Food Franchisers would not allocate any portion of the proceeds to the conversion feature at issuance. It would make the following entry to recognize the issuance of the bonds at 100:

Cash	1,000,000	
Bonds payable		1,000,000

Upon the occurrence of an initial public offering at $55, Food Franchisers would make the following entry:

Discount on bonds payable	250,000	
Additional paid-in capital		250,000

If the stock price increased to $66 ($55 × 120%), Food Franchisers would make the following entry for the difference between the two intrinsic values:

Discount on bonds payable	178,565	
Additional paid-in capital		178,565

If a bond with an embedded beneficial conversion feature is extinguished prior to conversion, a portion of the reacquisition price is allocated to the repurchase of the conversion feature. That portion is the intrinsic value of the conversion feature at the extinguishment date, which would be recorded as a decrease in additional paid-in capital. That accounting may result in a reduction in additional paid-in capital that is larger than the amount originally recorded in paid-in capital at issuance. However, no portion of the reacquisition price should be allocated to the conversion feature if that feature had no intrinsic value at the issuance date.

Example of extinguishment of debt with an embedded conversion feature

Software Solutions (Example 1, above) repurchases $500,000 face of its debt at 140. At the date of issuance, the following entry had been made relating to the debt which is later extinguished.

Cash	500,000	
Discount on bonds payable	100,000	
Bonds payable		500,000
Additional paid-in capital		100,000

At the date of the repurchase, the market value of the stock is $85, and the unamortized discount on the debt was $20,000. The intrinsic value of the conversion feature at the date of the repurchase is computed as follows:

$500,000/$50 per share = 10,000 shares to be issued upon conversion
($85 fair value – $50 conversion price) × 10,000 shares = $350,000 intrinsic value

Software Solutions would make the following entry to recognize the retirement of the bonds:

Bonds payable	500,000	
Additional paid-in capital	350,000	
Discount on bonds payable		20,000
Gain on extinguishment of debt		130,000
Cash		700,000

Questions have arisen regarding the accounting for the settlement of this instrument partially in cash (the recognized liability) and partially in stock (the unrecognized equity instrument). ASC 470-20-40-12 states that only the cash payment is to be considered in computing gain or loss on settlement of the recognized liability. Shares transferred to the holder to settle the excess conversion spread represented by the embedded equity instrument are not considered part of the settlement of the debt component of the instrument.

Contingent conversion rights triggered by issuer call. In some instances a debt instrument may include a contingent conversion privilege that becomes exercisable if the issuer attempts to call the debt before maturity, even if the stated contingency (e.g., the underlying stock price hitting some predefined threshold value) has not occurred, at which time the holders may elect to surrender the debt for cash (perhaps with a call premium, if the indenture contains such a provision) or to convert at a defined ratio for stock. If the debt remains outstanding until scheduled redemption, there will be no opportunity to convert. (Another variant exists where the debt has a contingent conversion feature at inception, e.g., where the debt becomes convertible if some other event, such as a refinancing, occurs, as well as if the issuer attempts to call the debt.)

ASC 470-20-40 states that no gain or loss should result from the creation of a conversion opportunity caused by the issuer's exercise of its call option, if the debt as originally issued contained a substantive conversion feature. In such circumstances, conversion of the debt to equity—assuming the existence of substantive rights in the original debt issuance—would be accounted for as a book value swap. On the other hand, if the conversion feature had not been substantive, the conversion triggered by the exercise by the issuer of its call option

would be accounted for as a debt extinguishment, with the fair value of the equity being issued used to define the cost of the extinguishment. This would create a gain or loss to be recognized in virtually all situations. Such gain or loss is no longer permitted to be reported as extraordinary, however.

ASC 470-20-40 defines a *substantive* conversion feature as a conversion feature that was, when the debt instrument was first issued, at least *reasonably possible* of being exercisable in the future, absent the issuer's exercise of a call option—where reasonably possible has the same meaning as under ASC 450. In practical terms, evaluation of whether the original conversion feature had been substantive, in the context of the facts and circumstances at the date of issuance, might include consideration of the interest yield of the contingently convertible debt compared to equivalent rates then required for debt lacking that feature, the likelihood of the occurrence of the defined contingent event, and the relative value of the conversion feature versus the related debt instrument.

Modifications to conversion privileges. Under provisions of ASC 470-50, the debtor's (issuer's) accounting for a modification of a debt issue or an exchange for another issue was based on whether the modifications were substantial. Based on the results of the analysis, extinguishment of the original debt could be found to have occurred, with financial reporting ramifications. Subsequently, the SEC took a position on this matter which added further complexity.

ASC 470-50-40 holds that debt extinguishment accounting be used if (1) the change in the fair value of the embedded conversion option is at least 10% of the carrying value of the original debt instrument just prior to the debt being modified or exchanged, or (2) the debt instrument modification or exchange adds or eliminates a substantive conversion option. If this analysis does not result in extinguishment accounting, then an increase in the fair value of the conversion option would reduce the debt and increase additional paid-in capital, while a decrease in the fair value of the conversion option would not be recognized.

ASC 470-50-40 also holds that the modification of a convertible debt instrument will affect subsequent recognition of interest expense for the associated debt instrument for changes in the fair value of the embedded conversion option. The change in the fair value of an embedded conversion option will be calculated as the difference between the fair value of the embedded conversion option immediately before and after the modification. The value exchanged by the holder for the modification of the conversion option is to be recognized as a discount (or premium) with a corresponding increase (or decrease) in additional paid-in capital.

Finally, ASC 470-50-40 concluded that issuers should not recognize a beneficial conversion feature or reassess an existing beneficial conversion feature at the date of the modification of a convertible debt instrument.

Tax effect of accounting for beneficial conversion feature. The existence of beneficial conversion features, as noted in the preceding discussion, requires that a portion of the proceeds from issuing debt with such an attribute be credited to a paid-in capital account. The offset to this will generally be a discount related to the convertible debt, meaning the book (carrying) value of the debt will differ from the tax basis, since tax law does not recognize the beneficial conversion feature as an equity element. ASC 740-10-55-51 has concluded that the difference between the "tax" and "book" bases of the convertible debt is a temporary difference within the meaning of ASC 740, and that deferred tax accounting is accordingly warranted. It further concluded that the deferred tax effect upon issuance should be included in paid-in capital, to be amortized as the debt discount is amortized to interest expense.

Put simply, "book" interest expense will exceed "tax" interest expense due to the impact of the debt discount amortization, so that "book" net income will be lower than "tax" earnings. The amount of excess current income tax payable (versus what the GAAP-basis financial statements would suggest) is created via the amortization of the deferred tax obligation established in paid-in capital upon issuance of the convertible debt. Upon adoption of ASC 740-10-55-51, retrospective application per ASC 250 is required, meaning that deferred tax must be provided for the yet-unamortized debt discount created when convertible debt with beneficial features was issued in past years, if such debt remains outstanding.

Disclosure of contingently convertible securities. Allegations had been raised that disclosures regarding contingently convertible securities have often been inconsistent across companies, and have often been inadequate. To address this problem, ASC 505-10-50 states how to disclose contingently convertible securities. This applies to all contingently convertible securities, even those that are not included in the computation of diluted EPS. ASC 505-10-50-6 identifies the qualitative and quantitative terms that must be disclosed so that users can understand the potential impact of conversion, including: events or changes in circumstances that would cause the contingency to be met and features necessary to understand the conversion rights, the conversion price and number of shares, events or changes that could adjust or change any features of the securities, and the manner of settlement upon conversion. Disclosures should indicate whether shares that would be issued upon conversion are included in the calculation of EPS. Disclosures should also include information about derivative transactions related to the securities.

Induced Conversion of Debt

A special situation exists in which the conversion privileges of convertible debt are modified after issuance. These modifications may take the form of reduced conversion prices or additional consideration paid to the convertible debt holder. The debtor offers these modifications or "sweeteners" to induce prompt conversion of the outstanding debt.

ASC 470-20 specifies the accounting method used in these situations and only applies when the convertible debt is converted into equity securities. Upon conversion, the debtor must recognize an expense for the excess of the fair value of all the securities and other consideration given over the fair value of the securities specified in the original conversion terms. The reported expense should not be classified as an extraordinary item.

Determining applicability of ASC 470-20. ASC 470-20 specifies the accounting for "sweeteners" used to induce the conversion of convertible debt. Traditionally, this involves enhancements offered by the debtor to encourage conversions, often motivated by the desire to bring an end to interest payments on the convertible debt. ASC 470-20-40-13 addresses the related circumstance of conversions when the enhanced terms are proposed or requested by the creditors/debtholders. In some instances, only the requesting parties are granted the sweetened terms. Thus, ASC 470-20 applies to all conversion of convertible debts that (1) occur pursuant to changed conversion privileges, (2) are exercisable only for a limited period of time, and (3) include the issuance of all of the equity securities issuable pursuant to conversion privileges included in the terms of the debt at issuance for each debt instrument that is converted, regardless of the party that initiates the offer or whether the offer relates to all debtholders.

Example of induced conversion expense

1. January 1, 2009, XYZ Company issued ten 8% convertible bonds at $1,000 par value without a discount or premium, maturing December 31, 2019.

2. The bonds are initially convertible into no par common stock of XYZ at a conversion price of $25.
3. On July 1, 2013, the convertible bonds have a market value of $600 each.
4. To induce the convertible bondholders to quickly convert their bonds, XYZ reduces the conversion price to $20 for bondholders who convert before July 21, 2013 (within twenty days).
5. The market price of XYZ Company's common stock on the date of conversion is $15 per share.

The fair value of the incremental consideration paid by XYZ upon conversion is calculated for each bond converted before July 21, 2013.

Value of securities issued to debt holders:		
Face amount	$1,000	per bond
÷ New conversion price	÷ $20	per share
Number of common shares issued upon conversion	50	shares
× Price per common share	× $15	per share
Value of securities issued	$ 750	(a)
Face amount	$1,000	per bond
÷ Original conversion price	÷ $25	per share
Number of common shares issuable pursuant to original conversion privilege	40	shares
× Price per share	× $15	per share
Value of securities issuable pursuant to original conversion privileges	$ 600	(b)
Value of securities issued	$ 750	(a)
Value of securities issuable pursuant to the original conversion privileges	600	(b)
Fair value of incremental consideration	$ 150	

The entry to record the debt conversion for each bond is

Convertible debt	1,000	
Debt conversion expense	150	
Common stock—no par		1,150

Debt Issued with Stock Warrants

Warrants are certificates enabling the holder to purchase a stated number of shares of stock at a certain price within a certain time period. They are often issued with bonds to enhance the marketability of the bonds and to lower the bond's interest rate.

When bonds with detachable warrants are issued, the purchase price must be allocated between the debt and the stock warrants based on relative market values (ASC 470-20). Since two separate instruments are involved, a market value must be determined for each. However, if one value cannot be determined, the market value of the other should be deducted from the total value to determine the unknown value.

Example of accounting for a bond with a detachable warrant

1. A $1,000 bond with a detachable warrant to buy 10 shares of $10 par common stock at $50 per share is issued for $1,025.
2. Immediately after the issuance the bonds trade at $995 and the warrants at $35.
3. The market value of the stock is $48.

The relative market value of the bonds is 96.6% [995/(995 + 35)] and the warrant is 3.4% [35/(995 + 35)]. Thus, $34.85(3.4% × $1,025) of the issuance price is assigned to the warrants. The journal entry to record the issuance is

Cash	1,025.00	
Discount on bonds payable	9.85	
Bonds payable		1,000.00
Paid-in capital—warrants (or "Stock options outstanding")		34.85

The discount is the difference between the purchase price assigned to the bond, $990.15 (96.6% × $1,025), and its face value, $1,000. The debt itself is accounted for in the normal fashion.

The entry to record the subsequent future exercise of the warrant would be

Cash	500.00	
Paid-in capital—warrants	34.85	
Common stock		100.00
Paid-in capital		434.85 (difference)

Assuming the warrants are not exercised, the journal entry is

Paid-in capital—warrants	34.85	
Paid-in capital—expired warrants		34.85

Debt Issued with Conversion Features and Stock Warrants

ASC 470-20 states that when a debt instrument includes both detachable instruments such as warrants, and an embedded beneficial conversion option, the proceeds of issuance should first be allocated among the convertible instrument and the other detachable instruments based on their relative fair values. Following this, the ASC 470-20 model should be applied to the amount allocated to the convertible instrument to determine if the embedded conversion option has an intrinsic value.

Example of convertible debt issued with stock warrants

Cellular Communicators issues $1,000,000 of convertible debt with 100,000 detachable warrants. The debt is convertible into $10 par common stock at a price of $50 per share. At the commitment date of this issuance, the common stock is trading at $46 per share. Immediately after the issuance, the bonds trade at 85 and the warrants trade at $2. The issuance proceeds of $1,000,000 is allocated to the two instruments as follows:

$850,000 /($850,000 + $200,000) × $1,000,000 = $809,524 to the debt
$200,000/($850,000 + $200,000) × $1,000,000 = $190,476 to the warrants

The intrinsic value of the conversion feature is next computed as follows:

$1,000,000/$50 per share = 20,000 shares to be issued upon conversion
The effective conversion price is the bond's allocated proceeds of $809,524 divided by 20,000 shares or $40.48
($46 current fair value of the stock – $40.48 effective conversion price) × 20,000 shares = $110,476, which is the implied discount granted on the bonds in connection with the conversion feature

Cellular Communicators would make the following entry to recognize the issuance of the bonds with warrants at 100:

Cash	1,000,000	
Discount on bonds payable	110,476	
Bonds payable		809,524
Additional paid-in capital		110,476
Paid-in capital—warrants		190,476

There are a wide range of features that may be incorporated into stock purchase warrants and it will often be a challenge to identify the substance of these features, and to then prescribe the proper accounting for each feature. One such example involves warrants that are issued with put options, sometimes called "puttable warrants." Such warrants allow the holder to purchase a fixed number of the issuer's shares at a fixed price (common to all warrants), but also are puttable by the holder at a specified date for a fixed monetary amount that the holder could require the issuer to pay in cash. For example, assume the warrants are issued when the entity's shares are trading at $12, and each warrant permits the purchase of 100 shares at $15 through April 30, 2010. If not previously exercised, the warrant holders can put each warrant back to the issuer for the equivalent of $14 per share, that is, for 100 ×

($14 – $12) = $200 per warrant. The warrant holder is thus assured (given the underlying stock price at inception) of at least $2 per share income, and of course may reap a much larger reward if the share price has risen beyond $15 by the expiration date.

ASC 480 applies to all freestanding instruments including those composed of more than one option or forward contract embodying obligations that require or that may require settlement by transfer of assets. The embedded put option in the foregoing example of a warrant does create a liability, since the issuer (the reporting entity) may be called upon to distribute assets (cash) to the holders of those put options. ASC 480-10-55 states that this is a liability even if the repurchase feature is conditional on a defined contingency in addition to the level of the issuer's share price. The warrant is not an outstanding share and therefore does not meet the exception for outstanding shares set forth by ASC 480.

ASC 480-10-55 provides examples of put options which are subject to only cash payment and also of those which could be settled by an issuance of stock. The former case is straightforward: the instrument must be classified as a liability if the share price at the reporting date is such that a cash payment would be demanded by the holders of the puttable warrants. If the share price at that date is such that exercise of the warrant would be elected over exercise of the put option, then the warrant would be included in equity, not in liabilities. In other words, classification would depend on current stock price and could change from period to period, although ASC 480-10-55 is not explicit on this point.

Other put arrangements call for settlement in shares. That is, if advantageous to do so, the warrant holders exercise the warrants and acquire shares, but if the strike price has not been attained at expiration date, the put is exercised and the reporting entity would have to settle, but instead of paying cash it would issue shares having an aggregate value equal to the put amount. Thus, at inception, the number of shares that the puttable warrant obligates the reporting entity to issue can vary, and the instrument must be examined under the provisions of ASC 480 that deal with obligations to issue a variable number of shares. The facts and circumstances must be considered in judging whether the *monetary value* of the obligation to issue a number of shares that varies is predominantly based on a fixed monetary amount known at inception; if so; it is a liability under ASC 480.

Yet another variation, also illustrated by ASC 480-10-55, is the warrant for the purchase of shares, which shares are puttable. The holder can exercise the warrant and then immediately force the issuer to repurchase the shares thereby issued. The price at which the shares could be put would be defined in the warrant, and the likelihood that the put option would be exercised would vary with the market value of the shares. Obviously, if the shares acquired by exercise of the warrant had a greater market value than the put price, the put would not be invoked. Accordingly, whether these warrants would be classified as equity or liability would depend on the market value of the underlying shares, and this could change from one balance sheet date to the next. However if the shares to be issued upon warrant exercise were to have a mandatory redemption feature, then the warrants would be reportable as liabilities in any case.

ASC 480-10-55 offers several other examples, illustrating more complex features that may be found in stock purchase warrants which, depending on circumstances, might necessitate classification as liabilities in the balance sheet.

Through-Put and Take-or-Pay Contracts

Through-put and take-or-pay contracts are sometimes used to help a supplier pay for new facilities, machines, or other expenditures. They are negotiated as a way of arranging financing for the facilities that will produce the goods or provide the services desired by a purchaser. A through-put contract is an agreement between the owner of a transportation

facility or manufacturing facility (such as a pipeline) and a purchaser (such as an oil processor) that requires the purchaser to pay specified amounts at future dates to the owner in return for the transportation or manufacture of a product. A take-or-pay contract is similar. It is an agreement between a purchaser and a supplier that requires the purchaser to pay specified amounts at future dates in return for products or services. In both types of contracts, the purchaser is required to make the specified payments even if it does not receive goods or services.

Some of these contracts are reported on the balance sheet as an asset and a liability. Others are not reported. Other than standards relating to recognition of losses on unconditional purchase obligations (ASC 330-10-35), there are no standards that require the contracts to be recognized on the balance sheet. However, ASC 440 requires certain disclosures to be made.

Example of a through-put contract

Aramarck Oil contracts with the Persian Pipeline Company to ship a minimum of three million barrels a month of unprocessed sour crude oil from is Ahwaz oil field in Iran to the pipeline terminus at Char Bahar, an amount which constitutes 1/3 of the capacity of the pipeline. The contract term is twelve years. Under the contract, Aramarck is obligated to pay Persian for 1/3 of the fixed operating costs of the pipeline, depreciation, interest on the $500 million of 5% debt used to finance the pipeline (to be paid off in equal annual payments over twelve years), and a 7% rate of return on equity to Persian. Estimated annual payments are $20 million. Aramarck's disclosure of the agreement follows:

> Aramarck has signed an agreement reserving pipeline capacity for twelve years. Under the terms of the agreement, Aramarck is obligated to make the following minimum payments, whether or not it ships through the pipeline:

2008 through 2012 ($20 million annually)	$100,000,000
Later years	140,000,000
Total	240,000,000
Less: Amount representing interest	(58,984,000)
Total at present value	$181,016,00

Mandatorily Redeemable Shares and Similar Instruments

ASC 480 requires that shares of stock (typically, but not necessarily, preferred shares) that are issued with mandatory redemption features be reported as liabilities rather than equity instruments. Payments or accruals of "dividends" and other amounts to be paid to holders of such shares are to be reported as interest expense. The only exception to those rules is for shares that are required to be redeemed only upon the liquidation or termination of the issuer, since the fundamental "going concern assumption" underlying GAAP financial statements means that such an eventuality is not given recognition.

For all other financial instruments that are mandatorily redeemable, the classification, measurement, and disclosure provisions of ASC 480 were deferred *indefinitely*, pending further FASB action. During this deferral period, FASB expressed its plans to reconsider implementation issues and, perhaps, classification or measurement guidance for those instruments in conjunction with its larger, ongoing project on liabilities and equity. As of early 2009 these matters remain unresolved.

In the authors' opinion, financial statement preparers should not presume that this application of ASC 480 will be rescinded, although that remains a possibility. There would not appear to be a conceptually sound argument for why public entities having such mandatorily redeemable instruments would be required to report these as liabilities, while granting nonpublic ones an exemption. Accordingly, at minimum, nonpublic entities having mandatorily redeemable shares should educate lenders and other financial statement users to the implica-

tions of the new standard and, where necessary and feasible, arrange to amend loan agreements containing covenants which would be violated by a sudden, major change in apparent debt/equity ratios. In other cases, it might be wise, or necessary, to revise the underlying shareholder agreements that define the mandatory redemption provisions. For example, "buy sell" agreements might be superseded by agreements between the individual shareholders themselves, providing for buyouts of retiring or deceased shareholders by the other owners, rather than by the entity itself, and thereby averting liability classification.

Note also (as also set forth in ASC 480-10-65) that deferral of the disclosure requirements under ASC 480, as described above, does not remove the requirements under ASC 505-10-50, which requires the disclosure of information about the pertinent rights and privileges of the various securities outstanding, including mandatory redemption requirements.

ASC 480-10-65 has also deferred indefinitely the *measurement* provisions of ASC 480, both as to the parent in consolidated financial statements and as to the subsidiary that issued the instruments that resulted in mandatorily redeemable noncontrolling interests before November 5, 2003. For those instruments, the measurement guidance for redeemable shares and noncontrolling interests under GAAP (e.g., ASC 480-10-S99) continues to apply during the deferral period. However, the *classification* provisions were not deferred.

The SEC subsequently further clarified the interaction between ASC 480 and D-98 for conditionally redeemable shares. Accounting for these shares, prior to the date on which the condition is first met, is not governed by ASC 480, but for a publicly held company the shares would not be permitted to be included in equity. A "mezzanine" classification would be acceptable until the condition is met, at which point reclassification as liabilities is necessary. Reclassification is akin to redemption, to be recognized at fair value via a charge or credit to equity, with concomitant impact on earnings per share computations in the period when the reclassification takes place.

If on the date of adoption the redemption price is greater than the book value of the shares, the company would *recognize a liability* for the redemption price of the shares that are subject to mandatory redemption, reclassifying amounts previously recognized in equity accounts. The difference between the redemption price and amounts previously recorded in equity is reported on the income statement as a cumulative effect transition adjustment loss. If the redemption price exceeds the company's equity balance, the cumulative transition loss should be reported as an excess of liabilities over assets (a deficit in the stockholders' equity section). In the opposite case, it is reported as an excess of assets over liabilities (i.e., as positive equity).

Shares are mandatorily redeemable if the issuer has an unconditional obligation to redeem the shares by transferring its assets at a specified or determinable date (or dates) or upon an event certain to occur (for example, the death of the holder). The obligation to transfer assets must be unconditional—that is, there is no specified event that is outside the control of the issuer that will release the issuer from its obligation. Thus, callable preferred shares, which are redeemable at the issuer's option, and convertible preferred shares, which are redeemable at the holder's option, are not mandatorily redeemable shares.

ASC 480 requires this reporting for all mandatorily redeemable financial instruments, unless the redemption is required to occur only upon the liquidation or termination of the reporting entity. The exception exists because the fundamental *going concern* assumption underlying GAAP financial reporting would be violated if a classification was imposed in GAAP financial statements that presumed or was conditioned on the reporting entity's cessation as a going concern. However, the exception under ASC 480 did not, as issued, extend to mandatorily redeemable financial instruments of a consolidated subsidiary, in the consolidated financial statements of its parent entity. Since it is the *going concern* status of the reporting entity (i.e., the parent) that is of significance, the mandatory redemption feature of

the subsidiary's instruments, albeit conditional, was to be reported consistent with ASC 480's provisions. However, subsequently ASC 480-10-65 has indefinitely postponed the effective date of this provision for noncontrolling interests. This deferral is applicable to both publicly held and nonpublic reporting entities.

Example of mandatorily redeemable preferred shares

On June 1, 2009, Verde Corporation issues 1,000 shares of mandatorily redeemable 5% preferred stock with a par value $100 for $110,330. The shares are redeemable at $150 on May 31, 2016. At issuance, Verde Corporation recognizes a liability of $110,330.

Some corporations and partnerships, primarily closely held ones, issue shares or units that are redeemed at the death of the holder. If those shares or units represents the only shares or units in the entity, the entity reports those instruments as liabilities and describes them in its statement of financial position as shares (or units) subject to mandatory redemption, to distinguish them from other liabilities. The classification is unaffected by any insurance policies that the entity may have on the holders' lives. The entity presents interest expense and payments to holders of those instruments separately, apart from interest and payments to other creditors in its statements of income and cash flows. The entity also discloses that the instruments are mandatorily redeemable upon the death of the holders.

Example of shares that are mandatorily redeemable at the death of the holder

Mike and Ike are equal shareholders in M&I's Auto Repair, Inc. Upon the death of either shareholder, the corporation will redeem shares of the deceased for half of the book value of the corporation. The following information would be disclosed in the notes to the financial statements:

All of the corporation's shares are subject to mandatory redemption upon death of the shareholders, and are thus reported as a liability. The liability amount consists of

Common stock—$100 par value, 1,000 shares authorized, issued and outstanding	$100,000
Undistributed earnings attributable to those shares	50,000
Accumulated other comprehensive income	(2,000)
Total liability	$148,000

After issuance, the amount of the liability for the mandatorily redeemable shares should be adjusted using the effective interest method if both the amount to be paid and the settlement date are fixed. If either the amount to be paid or the settlement date varies based on specified conditions, the liability is measured subsequently at the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date, recognizing the resulting change in that amount from the previous reporting date as interest cost.

Example of mandatorily redeemable preferred shares (continued)

The effective interest rate, calculated as described in the "Effective Interest Method" section of this chapter, is 8.5%. Continuing the example above, of Verde Corporation, it would recognize the following annual interest expense and liability amounts:

	Cash paid	*Interest at 8.5% annually*	*Change in liability*	*Ending liability*
06/01/09				110,330
05/31/10	5,000	9,378	4,378	114,708
05/31/11	5,000	9,750	4,750	119,458
05/31/12	5,000	10,154	5,154	124,612
05/31/13	5,000	10,592	5,592	130,204
05/31/14	5,000	11,067	6,068	136,271
05/31/15	5,000	11,583	6,583	142,854
05/31/16	155,000	12,146	(142,854)	0

The entry to record the first "dividend" payment would be

Interest expense	9,378	
Liability		4,378
Cash		5,000

If shares have a conditional redemption feature, which requires the issuer to redeem the shares by transferring its assets upon an event not certain to occur, the shares become mandatorily redeemable—and, therefore, become a liability—if that event occurs, the event becomes certain to occur, or the condition is otherwise resolved. The fair value of the shares is reclassified as a liability, and equity is reduced by that amount, recognizing no gain or loss.

Note that when redemption value is based on a notion of fair value, defined in the underlying agreement, the initial recognition of the difference between this computed amount and the corresponding book value will almost inevitably result in a surplus or deficit. In other words, the promised redemption amount, measured at transition and again at each balance sheet date, will not equal the book value of the equity which is subject to redemption. This discrepancy must be reflected in stockholders' equity, even though the redeemable equity is reclassified to a liability. In effect, the redemption arrangement will result in either a residual in equity (assuming redemption were to fully occur at the balance sheet date) or a deficit, because the agreement provides that redeeming shareholders are entitled to more or less than their respective pro rata shares of the book value of their equity claims. If the redemption price of mandatorily redeemable shares is greater than the book value of those shares, the company should report the excess as a deficit (equity), even though the mandatorily redeemable shares are reported as a liability.

Common shares that are mandatorily redeemable are not included in the denominator when computing basic or diluted earnings per share. If any amounts, including contractual (accumulated) dividends, attributable to shares that are to be redeemed or repurchased have not been recognized as interest expense, those amounts are deducted in computing income available to common shareholders (the numerator of the calculation), consistently with the "two-class" method set forth in ASC 260 (Chapter 20). The redemption requirements for mandatorily redeemable shares for each of the next five years are required to be disclosed in the notes to the financial statements.

ASC 480-10-S99 addresses concerns raised by the SEC regarding the financial statement classification and measurement of securities subject to mandatory redemption requirements or whose redemption is outside the control of the issuer. Certain rules of the SEC were withdrawn upon promulgation of ASC 480, but with the postponement of certain aspects of the new standard, questions arose regarding disclosures needed to comply with SEC requirements.

These rules require securities with redemption features that are not solely within the control of the issuer to be classified outside of permanent equity. The SEC staff believes that all of the events that could trigger redemption should be evaluated separately and that the possibility that *any* triggering event that is not *solely* within the control of the issuer could occur—without regard to probability—would require the security to be classified outside of permanent equity. Determining whether an equity security is redeemable at the option of the holder or upon the occurrence of an event that is solely within the control of the issuer can be complex. Accordingly, all of the individual facts and circumstances should be considered in determining how an equity security should be classified.

ASC 480-10-S99 offers several examples of complex fact patterns to help registrants in determining whether classification as a liability or as equity would be appropriate.

For example, if a preferred security has a redemption provision stating that it may be called by the issuer upon an affirmative vote by the majority of its board of directors, but the

preferred security holders control a majority of the votes of the board of directors through direct representation on the board of directors or through other rights, the preferred security is effectively redeemable at the option of the holder and its classification outside of permanent equity is required. Thus, in assessing such situations, any provision that requires approval by the board of directors cannot be assumed to be within the control of the reporting entity itself. All of the relevant facts and circumstances would have to be considered.

As another example, if a security with a deemed liquidation clause that provides that the security becomes redeemable if the stockholders of the reporting entity (those immediately prior to a merger or consolidation) hold, immediately after such merger or consolidation, stock representing less than a majority of the voting power of the outstanding stock of the surviving corporation, this would not be permanent equity. A purchaser could acquire a majority of the voting power of the outstanding stock, without company approval, thereby triggering redemption.

Securities with provisions that allow the holders to be paid upon occurrence of events that are solely within the issuer's control should thus always be classified outside of permanent equity. Such events include

1. The failure to have a registration statement declared effective by the SEC by a designated date
2. The failure to maintain compliance with debt covenants
3. The failure to achieve specified earnings targets
4. A reduction in the issuer's credit rating

ASC 480-10-S99 notes that if a reporting entity issues preferred shares that are conditionally redeemable (e.g., at the holder's option or upon the occurrence of an uncertain event not solely within the company's control), the shares are not within the scope of ASC 480 because there is no unconditional obligation to redeem the shares by transferring assets at a specified or determinable date or upon an event certain to occur. If the uncertain event occurs, the condition is resolved, or the event becomes certain to occur, then the shares become mandatorily redeemable under FAS 150 and would require reclassification to a liability. Under SEC rules, however, these shares cannot be included in permanent equity, and thus would be displayed as a "mezzanine" equity category. Note that mezzanine capital is an SEC reporting concept which has no analog under GAAP rules.

ASC 480 requires that the issuer measure that liability initially at fair value and reduce equity by the amount of that initial measure, recognizing no gain or loss. ASC 480-10-S99 observes that this reclassification of shares to a liability is akin to the redemption of such shares by issuance of debt. Similar to the accounting for the redemption of preferred shares, to the extent that the fair value of the liability differs from the carrying amount of the preferred shares, upon reclassification that difference should be deducted from or added to net earnings available to common shareholders in the calculation of earnings per share.

Obligations to Issue or Repurchase Shares

ASC 480 also requires that certain financial instruments that require an entity to purchase or issue its own equity shares be reported as liabilities. ASC 480 does not apply to financial instruments that are issued as contingent consideration in a business combination (Chapter 13) or obligations under stock-based compensation plans that are accounted for under ASC 718 (Chapter 19). It also does not apply to an embedded feature of a financial instrument unless that financial instrument is a derivative in its entirety.

Additional discussion and examples of ASC 480 are found in Chapter 19.

Obligations to issue shares. If an entity enters into a contract that requires it or permits it at its discretion to issue a variable number of shares upon settlement, that contract is rec-

ognized as a liability if at inception the monetary value of the obligation is based solely or predominantly on one of the following criteria:

1. A fixed monetary amount known at inception (e.g., a $100,000 payable can be settled by issuing shares worth $100,000 at the then-current market value).
2. An amount that varies based on something other than the fair value of the issuer's equity shares (for example, a financial instrument indexed to the Dow that can be settled by issuing shares worth the index-adjusted amount at the then-current market value).
3. Variations inversely related to changes in the fair value of the entity's equity shares (i.e., a written put option that could be net share settled).

Contracts that meet one of the above criteria are recognized at fair value at the date of issuance and at every measurement date afterwards. The changes in the fair value are recognized in earnings unless the contract falls within the scope of ASC 718 and that statement requires the changes to be recognized elsewhere.

Example of a contract with a fixed monetary amount known at inception

Numero Uno Corp. purchases equipment worth $100,000 and agrees to pay $110,000 at the end of one year or, at its option, to issue shares worth $112,000. The contract is recognized as a liability at issuance of $100,000. Subsequent to issuance the liability is remeasured at the fair value of the contract, which would be the accreted value of the cash payment amount ($110,000).

Obligations to repurchase shares. If an entity (the issuer) enters into a contract that obligates it to transfer assets to either repurchase its own equity shares or to pay an amount that is indexed to the price of its own shares, the contract is to be reported as a liability (or in certain cases, as an asset, if the fair value of the contract is favorable to the issuer). Examples of that type of financial instrument are written put options on the option writer's (issuer's) equity shares, and forward contracts to repurchase an issuer's own equity shares if those instruments require physical or net cash settlement. (If the repurchase obligation is a redemption feature of common or preferred shares issued, see "Mandatorily Redeemable Shares" in this chapter.)

ASC 480 requires that an issuer classify a financial instrument that is within its scope as a liability (or as an asset in some circumstances) because that financial instrument embodies an obligation of the issuer. ASC 480 addresses three types of freestanding financial instruments that embody obligations of the issuer: mandatorily redeemable financial instruments, obligations to repurchase the issuer's equity shares by transferring assets, and certain obligations to issue a variable number of shares. Instruments within the scope of ASC 480 should be classified and measured in accordance with ASC 480 per ASC 480-10-S99.

Written put options are measured initially and subsequently at fair value. Forward contracts are initially measured at the fair value of the shares to be repurchased (adjusted by any consideration or unstated rights or privileges) if the contract requires physical settlement for cash. The offset to the liability entry is a debit to equity. Subsequent to issuance, forward contracts are remeasured in one of two ways.

1. If both the amount to be paid and the settlement date are fixed, the contract is measured at the present value of the amount to be paid, computed using the rate implicit in the contract at inception.
2. If either the amount to be paid or the settlement date varies based on specified conditions, the contract is measured at the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date.

Under either measure, the amount of the change from the previous reporting date is recognized as interest cost.

Example of a written put option on a fixed number of shares

Numero Dos Corp. writes a put allowing the purchaser to sell 100 shares of Numero Dos common stock at $20 per share in six months. The purchaser pays Numero Dos $300 for the right to put the 100 shares. Numero Dos's common stock is currently trading at $23. Numero Dos reports a liability of $300. The liability is subsequently remeasured at the fair value of the put option.

Example of a forward contract with a variable settlement date

Numero Tres Corp. enters into a contract to purchase 200 shares of its subsidiary at $25 in two years. However, if the holder of the shares dies before the settlement date, Numero Tres agrees to purchase the shares at the present value of $25 at the settlement date computed using the then-current prime rate. The shares are currently trading at $22. The liability to repurchase shares is initially reported at $4,400. At each subsequent measurement date, Numero Tres would adjust the liability to the present value of $25 at settlement date using the discount rate implicit in the contract, unless the holder of the shares had died. If the holder of the shares had died, Numero Tres would adjust the liability to the present value of $25 at settlement date using the then-current prime rate. For example, if one year from issuance date the holder is still alive, the liability would be adjusted to $4,690 using the 6.6% rate implicit in the agreement. The adjustment amount of $290 would be charged to interest expense. If instead the holder had died and the prime rate was 5%, the liability would be adjusted to $4,762 ($5,000/1.05) and the adjustment of $362 would be charged to interest expense.

An entity that has entered into a forward contract that requires physical settlement by repurchase of a fixed number of its equity shares of common stock in exchange for cash does not include those shares in the denominator when computing basic or diluted earnings per share. If any amounts, including contractual (accumulated) dividends, attributable to shares that are to be redeemed or repurchased have not been recognized as interest expense, those amounts are deducted in computing income available to common shareholders (the numerator of the calculation), consistently with the "two-class" method set forth in ASC 260 (Chapter 20).

Measuring Liabilities at Fair Value

Under GAAP, until extinguished, long-term debt is measured at the amount recorded at the date of issuance, reduced by payments made and adjusted for any amortization since issuance. This historical cost-based approach is not, however, universally viewed as contributing to the most meaningful financial reporting. In recent years, FASB has indicated its belief that more appropriate financial reporting would result if all financial liabilities (and assets) were reported at their respective fair values, rather than at amounts based on historical cost. Fair value of a liability is an estimated market exit price (as defined extensively in Chapter 6), that is, an estimate of the amount that would have been paid if the entity had settled the liability on the balance sheet date.

Many preparers and users of financial statements question the relevance of information about the fair value of a financial liability, given that management does not intend, and may not even be able, to settle the obligation before the stated maturity. In effect, the fair value amounts are purely hypothetical and do not alter the real obligation represented by the cost-based carrying amount of the liability at issue.

On the other hand, under the current reporting model it is entirely possible that an entity will report gains from debt extinguishment as a result of the early retirement of a debt obligation carrying a below-market interest rate, even if that extinguishment is funded by the immediate issuance of debt bearing the current market rate. Notwithstanding that the entity's

real economic position has not been improved (and may have been diminished), a gain has been reported, which many would agree is misleading. The following example illustrates this problem.

Example

Company A and Company B are competitors, they both are publicly held, and both have bonds outstanding. On December 31, 2009, Company A owes $2,000,000 due in 6 years that carries a fixed interest rate of 10%. Company B also owes $2,000,000 due in 6 years, but Company B issued its bonds in a less favorable interest rate environment. Its debt carries an interest rate of 14%. The two companies have equivalent credit ratings. The prevailing market interest rate for both companies changes to 12% on December 31, 2009. Under historical cost-based GAAP, each company will report $2,000,000 of outstanding debt in its statement of financial position dated December 31, 2009. The fair value of Company A's debt at that date is $1,835,500, while the fair value of Company B's debt is $2,164,500—both fair values computed at the present value of the interest and principal payments at the prevailing market rate of 12%.

If Company A paid off its bonds, it would recognize a gain of $164,500 ($2,000,000 – $1,835,500). But for Company A to recognize its gain, it would have had to repay debt that carried a favorable interest rate. Company A would lose its economically advantageous position of being a company with below-market financing. In addition, if Company A had not used $1,835,500 to repay the debt, it could have invested that amount in its own operations and perhaps earned a higher return. Moreover, if Company A continues to need financing, it will have to refinance at the higher current interest rate. Repurchasing its bonds might not have been the best way for Company A to invest its resources, and might have been motivated, in part, by the desire to manage reported earnings in 2009.

If Company B retired its bonds, it would recognize a loss of $164,500 ($2,000,000 – $2,164,500). As an alternative, Company B could leave its bonds outstanding and realize its loss by paying above-market rates during the remaining 6 years of their term. Depending on the available alternative uses of its money, repaying the bonds and relieving future operations of the burden of above-market interest payments may be the best use of its resources, but Company B would suffer a loss as a result—a loss that can be avoided simply by choosing to not repay its debt.

Company A's gain and Company B's loss would be caused by changes in interest rates—not by a decision to repay debt. The existing measurement model for liabilities sometimes provides an incentive for unwise actions. If Company A wanted to report a gain, it could pay off its debt, even though that might not have been the best use of its resources. If Company B wanted to avoid a loss, it could allow its bonds to remain outstanding, even though the best economic decision would have been to retire them.

The effects of financing decisions, including that of leaving existing financing in place, whether made actively or indirectly through inattention, can significantly impact entity performance. Investors and creditors need information that will help them evaluate the effects of an entity's decision to settle a liability or allow it to remain outstanding. From this perspective, it is logical that information based on prices that reflect the market's assessment, under current conditions, of the present values of the future cash flows embodied in an entity's financial instruments would be more relevant for investors' and creditors' decisions than information based on historic, superseded market prices. Those older market prices reflect both an old interest rate and an outdated assessment of the amounts, timing, and uncertainty of future cash flows.

The project to replace historical data about financial liabilities with fair value data continues to be very controversial. Among opponents are financial institutions that would have to reprice virtually the entire balance sheet at each reporting date and that might see a significant increase in periodic earnings volatility (albeit, reflecting economic reality). It is not clear whether FASB will be successful in changing this longstanding tradition of reporting essentially all financial liabilities at historical cost.

Proposed Standards for Convertible Debt and Debt Issued with Warrants

FASB has exposed its preliminary views on its *Liabilities and Equity* project, the comments on which were received through mid-2008. It believes that separate balance sheet presentation of liability components and equity components of a compound instrument more faithfully represents the rights and obligations embedded in that instrument than does presenting the instrument entirely as a liability or entirely as equity.

With certain exceptions, the proposed standard would require that proceeds received from the issuance of a compound financial instrument be allocated to its components based on the relative fair values of those components. Under a "relative-fair-value method," the fair value of each of the separately classified components is determined independently of the fair values of the other components. The proceeds of issuing the compound financial instrument are then allocated to the components on a pro rata basis.

If it is impracticable to apply the relative-fair-value method because the fair value of one of the components cannot be reliably determined, the proceeds would be allocated to the components by means of the "with-and-without method." Under that alternative method, the fair value of the compound financial instrument is compared to the fair value of a hypothetical financial instrument that contains all the same components except the specific component being valued. The value of the component or components that can be reliably measured is measured at its fair value determined as if it were freestanding. The value of the remaining component is the difference between the amount assigned to the component(s) that can be reliably measured and the proceeds of issuance of the compound financial instrument.

If a financial instrument contains a component that is a derivative, the proceeds of issuing that financial instrument would be allocated to its components using the with-and-without method, first allocating to the derivative component the amount of proceeds that would be equal to its fair value as if it were freestanding. That is, the value of the nonderivative component is the difference between the amount assigned to the derivative component and the proceeds of issuance of the compound financial instrument.

Because ASC 470-20, which would be superseded by the proposed standards, required use of the relative-fair-value method for allocating the proceeds of debt issued with stock purchase warrants, no changes in accounting for those compound instruments are expected.

Certain financial instruments, in addition to containing a liability component, an equity component, or both, also contain a component that, freestanding, would be classified as an asset. An example of that type of financial instrument is callable convertible debt, which contains a call option, a debt, and a conversion option. Unless the asset component is required by GAAP to be separated (e.g., per ASC 815), the effect of the asset component would be incorporated into the determination of the fair values of the liability component and the equity component.

For purposes of initial measurement of the components of compound financial instruments, the following general rules would be applied under the proposed standard:

- If a compound financial instrument has no component that is an outstanding share of stock, the obligation that is classified as a liability would be considered an unconditional obligation, and the obligation that is classified as equity would be considered a conditional obligation.
- If a compound financial instrument has a component that is an outstanding share of stock (other than mandatorily redeemable stock), the instrument would be considered to be (1) an outstanding equity share and (2) a conditional obligation.

Example comparing existing and proposed standards—issuance of convertible debt

An entity issues at par 10,000 noncallable bonds, for a total issue proceeds of $10,000,000. Each bond can be converted by the holder into 100 shares of the entity's $10 par common stock. The noncallable bonds contain the following components:

1. An obligation to repay principal
2. An obligation to pay interest periodically
3. An obligation to issue equity shares if the conversion option is exercised

The first two components are liabilities. The third component is an equity component because it requires the issuance of a fixed number of shares. Because none of the components are outstanding shares of stock, the liability components are unconditional. The fair value of comparable nonconvertible debt is $850; the fair value of the conversion feature is $150.

Entry upon issuance of the bonds	*Proposed standards*		*Existing standards*	
Cash	10,000,000		10,000,000	
Discounts on bonds payable	1,500,000			
Bonds payable		10,000,000		10,000,000
Paid-in capital from conversion option		1,500,000		

The discount on the bonds payable would be amortized over the life of the debt instrument using the effective interest method.

The proposed standard also provides guidance on the accounting for costs incurred to issue a financial instrument. Costs incurred to issue a financial instrument would be accounted for as a reduction of the proceeds of issuance before allocation of those proceeds to the components. Issuance costs are only the incremental costs directly attributable to issuance of an instrument that would not have been incurred if the instrument had not been issued.

It would also be required that a gain or loss, if any, on the liability component of convertible debt be recognized in earnings if the debt were extinguished by repayment or by conversion. That gain or loss would be calculated as the difference between the portion of the consideration paid (or in the case of conversion, the fair value of the compound convertible debt instrument at the date of conversion) that is attributed to the liability component and its carrying amount at the date it is extinguished. The amount of consideration or fair value that is attributed to the liability component would be determined using the relative-fair-value method unless the use of that method is impracticable, in which case the with-and-without method would be used.

Example comparing existing and proposed standards—conversion of convertible debt

Assume that $50,000 face value of the bonds in the previous example are converted when the market price of the convertible bonds is $55,500, the market price of the common stock is $11 per share, and the unamortized discount on those bonds is $6,500. The fair value of comparable nonconvertible debt is $850 per bond; the fair value of the conversion feature is $250.

Entry upon conversion of the bonds	*Proposed standards*		*Existing standards using Book value*		*Market value*	
Bonds payable	50,000		50,000		50,000	
Paid-in capital from conversion option	7,114					
Loss on conversion shares					12,000	
Discount on bonds payable		6,500				6,500
Common stock		50,000		50,000		50,000
Additional paid-in capital						5,500
Gain on conversion of shares		614				

The gain on conversion under the proposed standards is the difference between the fair value of the liability component on the date of conversion and the carrying value of the liability component. The fair value of the liability component is computed as follows:

$$\$850/(\$850 + \$250) \times \$55,500 = \$42,886$$

> The book value of the liability component is $50,000 – $6,500 = $43,500. The gain is $614. The proceeds from issuing the common shares are $50,386, which is the $7,500 from issuance plus the $42,886 value of the liability component surrendered. Those proceeds are recorded in the common stock account ($50,000) and paid-in capital from conversion option ($386, which is the $7,500 initially recorded less the adjustment of $7,114 at the time of conversion).

The proposal discussed above was to have been adopted years ago, but a number of contentious issues remain unresolved as of mid-2008. Accordingly, it is not possible to predict when, or even if, this standard will be adopted. For more information about this proposed standard, see Chapter 19.

PERSPECTIVE AND ISSUES

Introductory Discussion

Lease transactions became enormously popular over the years as businesses sought new ways to finance long-lived assets. Leasing offered two attractive advantages: (typically) 100% financing, coupled with (very often) off-the-books obligations. As of 2005, the Securities and Exchange Commission had estimated that, collectively for all publicly held companies, there were approximately $1.3 trillion of off-balance-sheet lease obligations outstanding. FASB is continuing, as of early 2009, its reexamination of lease accounting and is

now anticipating a preliminary views document to be issued in early 2009. FASB, together with the international standard-setting body, IASB, well may decree that all, or nearly all leases (e.g., those over one year in duration) be reported on the balance sheet—as capital leases are under ASC 840 and associated literature today. If this happens, there may well be a significant impact on the leasing industry.

While favorable financial reporting effects certainly stimulated interest in leasing, there are several economic reasons why the lease transaction is considered a viable alternative to outright purchase. These would likely remain strong motivations even if lease accounting rules were to be revised.

1. The lessee (borrower) is frequently able to obtain 100% financing.
2. Income tax benefits may be available to one or both of the parties.
3. The lessor receives the equivalent of interest as well as an asset with some remaining residual value at the end of the lease term.
4. In some cases, equipment or other assets are not available for outright purchase.

A lease agreement involves at least two parties, a lessor and a lessee, and an asset that is to be leased. The lessor, the party that either owns or commits to purchase the asset, agrees to grant the lessee the right to use it for a specified period of time in return for periodic rent payments.

The lease transaction derives its accounting complexity from the number of alternatives available to the parties involved. Leases can be structured to allow differing assignments of income tax benefits associated with the leased asset to meet the objectives of the transacting parties. Leases can be used to transfer ownership of the leased asset, and they can be used to transfer the risks and rewards of ownership. In any event, the substance of the transaction dictates, with certain exceptions, the accounting treatment, irrespective of its legal form. The lease transaction is probably the best example of the accounting profession's substance-over-form argument. If the transaction effectively transfers the risks and rewards of ownership to the lessee, then the substance of the transaction is that of a sale and, accordingly, it is recognized as such for accounting purposes even though the transaction is legally structured as a lease.

Variable interest entities. There later developed the practice of using nonsubstantive lessors (which often were related entities) to assist in keeping leases off the balance sheet of lessees. These entities were frequently used to exclude liabilities from the lessee's consolidated balance sheet in order to more favorably portray the lessee's financial condition. ASC 810 remediated much of the confusion created by the original interpretation. (A comprehensive discussion of variable interest entities and ASC 810 is included in Chapter 13.) Under the provisions of ASC 810, many more lessor entities are required to be consolidated with the financial statements of the lessee, especially in situations where the lessor and lessee have common or related-party ownership.

It is necessary for the lessee to first apply ASC 810 to evaluate its relationship with the lessor and, in that respect, ASC 810 takes precedence over ASC 840. This is because if ASC 810 requires the lessee to consolidate the lessor, the effects of the lease transaction between the parties will be removed from the consolidated financial statements via an eliminating entry and, consequently, the consolidated reporting entity will depreciate the leased asset and reflect all of the costs of acquiring, holding, maintaining, and disposing of the asset. This makes the issue of distinguishing between operating and financial leases moot for any leases between a VIE and its primary beneficiary.

The lessor will, of course, in any separately issued financial statements, account for the lease in accordance with the appropriate lease accounting requirements that would apply absent ASC 810. Certain concepts and definitions discussed herein are also explained in

Chapter 13 but are repeated and expanded upon here for completeness and further clarification in the context of lease transactions.

Recent Developments

Lease accounting restatements. Responding to a request from the AICPA's Center for Public Company Audit Firms (CPCAF), in early 2005 the SEC Chief Accountant set forth the staff's views ("the SEC Letter") pertaining to the following issues:

1. The life over which to amortize leasehold improvements,
2. Accounting for periods for which, under the lease, no rental payments are due (referred to as "rent holidays"), and
3. Accounting for landlord/tenant incentives.

Following the release of the SEC Letter (available at www.sec.gov) more than 300 public companies announced restatements related to lease accounting corrections. In addition to the public embarrassment caused by the restatements, these also necessitated acknowledgements by the entities of material weaknesses in their internal controls over their financial reporting processes, in accordance with requirements established by the Sarbanes-Oxley Act of 2002. This put lease accounting in the same category as revenue recognition, stock option accounting, and accruals for restructurings and other contingencies, in terms of being associated with error corrections and acknowledged control weaknesses.

As with all SEC staff interpretations, the SEC Letter only purported to interpret GAAP that was already established, not imposing new requirements. As such, the SEC's views should be deemed equally applicable to publicly held and closely held businesses, as well as to not-for-profit organizations. This leads to the inescapable conclusion that similar instances of failure to adhere to GAAP exist within the financial statements of non-SEC registrants, some fraction of which may have not yet have been dealt with by preparers and auditors of those entities.

The required accounting for the issues described in the SEC Letter follows:

1. Leasehold improvements made by a lessee to property it leases under an operating lease are to be amortized over the shorter of their useful lives or the terms of the respective leases. The lease terms used for this purpose are the initial terms of the leases plus any renewal periods for which renewal has been determined to be reasonably assured, as defined by ASC 840. Leasehold improvements cannot be amortized over longer terms. Leasehold improvements are discussed in detail in Chapter 11.
2. Rent holidays, which are periods during which no rent is due under an operating lease, typically offered as an inducement for signing a new lease, are to bear a portion of the cost of the operating lease by ratably charging the minimum lease payments under the lease obligation to all periods that are covered by the lease including the holiday period. This is normally done using the straight-line method of allocation, unless another method more accurately represents the time pattern in which the leased property is used. Rent holiday periods cannot be made to appear as not incurring rent expense.
3. Incentive or allowance payments made by a lessor to a lessee to help fund leasehold improvements are not permitted to be netted against the cost of the leasehold improvements in the lessee's financial statements. Instead, the leasehold improvements are to be recorded gross and amortized as described in issue 1. above. The incentive payment is to be recorded as deferred rent and amortized as reductions to rent expense over the term of the lease. In the lessee's statement of cash flows, the

incentive payments are to be classified as cash provided by operating activities and the acquisition of the leasehold improvements is to be classified as cash used for investing activities.

SEC staff report on off-balance-sheet arrangements. In mid-2005, the SEC issued its *Report and Recommendations Pursuant to Section 401(c) of the Sarbanes-Oxley Act of 2002 on Arrangements with Off-Balance-Sheet Implications, Special-Purpose Entities, and Transparency of Filings by Issuers* (the "Report"). The Report makes many important recommendations regarding the improvement of US GAAP including standards regarding lease accounting. The Report criticizes the current rules' extensive reliance on bright line tests that it says, for a lessee, "…the accounting can flip between recording no assets and liabilities at lease inception to recording the entire leased asset and entire loan price with only a very small change in economics." The Report urged FASB to undertake a joint project with the International Accounting Standards Board (IASB) to reconsider the accounting for leases. While acknowledging that such a project would be controversial, lengthy and expensive, the Report expressed the SEC staff's belief such a project would be justified by the potential benefits.

FASB and IASB lease accounting projects. In mid-2006, FASB announced that it was adding a project to its agenda to reconsider the accounting for leases, and that the project would be conducted jointly with the IASB. The Boards have since tentatively concluded that a "right-of-use" model would be appropriate for recognizing the rights and obligations inherent in a typical noncancelable lease arrangement. This model may also be extended to other arrangements that convey rights to use other entities' assets. A right to use is seen as being generically distinct from both intangible assets and tangible assets similar to the leased item. If this model were adopted, the lessee would recognize an asset representing its right to use the leased property during the lease term and a corresponding liability for its noncancelable obligation to make the lease payments. The lessee, as is currently the case, could also be required to recognize an asset retirement obligation and/or an obligation arising out of a contractual requirement contained in the lease that the leased property be returned to the lessor in a specified condition at the end of the lease term. Questions to be resolved include which initial and subsequent measurements are to be applicable to the right to use, as well as the accounting for options to either extend the lease or cancel it, and for other corollary obligations by the lessee, such as to return the leased property in specified condition and to maintain the property during use.

The lessor would recognize assets for its right to receive payments from the lessee and its interest in the residual value of the leased property at the end of the lease term.

These tentative conclusions have not been fully deliberated and, until they have been exposed for public comment and subject to the Boards' normal due process procedures, they could change substantially. A preliminary views document has been promised for early 2009.

850	Related-Party Disclosures
860	Transfers and Servicing
Industry	
946	Financial Services—Investment Companies

DEFINITIONS OF TERMS

Bargain purchase option. A provision allowing the lessee the option of purchasing the leased property for an amount, exclusive of lease payments, which is sufficiently lower than the expected fair value of the property at the date the option becomes exercisable. Exercise of the option must appear reasonably assured at the inception of the lease. GAAP does not offer additional guidance defining "sufficiently lower," in which many factors such as the time value of money, usage, and technological changes influence whether the option fulfills the criteria for a bargain.

Bargain renewal option. A provision allowing the lessee the option to renew the lease agreement for a rental payment sufficiently lower than the expected fair rental of the property at the date the option becomes exercisable. Exercise of the option must appear reasonably assured at the inception of the lease.

Contingent rentals. Rentals that represent the increases or decreases in lease payments that result from changes in the factors on which the lease payments are based occurring subsequent to the inception of the lease. However, changes due to the pass-through of increases in the construction or acquisition cost of the leased property or for increases in some measure of cost during the construction or preconstruction period are excluded from contingent rentals. Also, provisions that are dependent only upon the passage of time are excluded from contingent rentals. A lease payment that is based upon an existing index or rate, such as the consumer price index or the prime rate, is a contingent payment, and the computation of the minimum lease payments is based upon the index or rate applicable at the inception of the lease.

Controlling financial interest. The at-risk equity investors hold a controlling financial interest in an entity if they collectively

1. Have voting or similar rights (such as the rights of a common stockholder or general partner, or LLC member) to make decisions, directly or indirectly, about the entity's activities that significantly affect the entity's success.

   NOTE: If none of the investors hold these rights this criterion is not satisfied. In addition, if some investors' voting rights are not proportional to their obligations to absorb the entity's expected losses, or to receive the entity's expected residual rewards, or both, and substantially all of the entity's activities involve or are conducted on behalf of an investor that has disproportionately few voting rights, this criterion is not satisfied.

2. Are obligated to absorb the entity's expected losses. If the investors are directly or indirectly protected from these losses or guaranteed a return by the entity (or by other parties involved with the entity) this criterion is not satisfied.
3. Are entitled to receive the entity's expected residual returns. If the investors' return is limited by (a) the entity's governing documents, (b) arrangements with other variable interest holders (e.g., holders of debt, beneficial interests, etc.), or (c) with the entity itself, this criterion is not satisfied.

If any one of these three criteria is absent, the at-risk equity investors collectively lack a controlling financial interest and, therefore, only have a controlling voting interest. The

controlling financial interest, in this case, would be held collectively by the variable interest holders.

Estimated economic life of leased property. At the inception of the lease, the estimated remaining time, with normal maintenance and repairs, that the property is expected to be economically usable for its intended purpose by one or more users. The economic life will be affected by such factors as technological changes, normal deterioration, and physical usage. Judgments regarding these matters are influenced by knowledge gained from previous experience. The estimated time period is not limited by the lease term.

Estimated residual value of leased property. The estimated fair value of the leased property at the end of the lease term.

Equity investment. An interest in an entity that under GAAP is reportable as equity on the entity's balance sheet. The practical application of this definition to certain types of instruments (e.g., mandatorily redeemable preferred stock) has been affected by ASC 480, *Distinguishing Liabilities from Equity,* and the subsequent partial deferral of certain of its provisions by ASC 480-10-65-1.

Executory costs. Those costs such as insurance, maintenance, and real estate taxes incurred for the leased property, whether paid by the lessor or lessee. Amounts paid by a lessee as consideration for a guarantee from an unrelated third party of the residual value are also considered executory costs. If executory costs are paid by the lessor, any lessor's profit on those costs is considered in the same manner as the actual executory costs.

Expected losses and expected residual returns. Expected losses represent the expected negative variability in the fair value of an enterprise's net assets exclusive of variable interests. Expected residual returns represent the expected positive variability in the fair value of an enterprise's net assets exclusive of variable interests. The expected variability (separately defined below and illustrated in this chapter and Chapter 13) in an enterprise's net income or loss is included in the determination of expected losses and expected residual returns.

Expected variability. When estimating an entity's expected future cash flows in accordance with CON 7, *Using Cash Flow Information and Present Value in Accounting Measurements* (discussed more fully in Chapter 1), a range of probability-weighted expected outcomes is computed and discounted to present value. Mathematically, this is simply a weighted-average calculation. The expected variability of the cash flows included in that calculation is computed by: (1) computing the difference between each individual estimated outcome and the weighted-average, (2) multiplying each difference computed in the previous step by the probability of occurrence assigned to that individual outcome, and (3) separately summing the positive (favorable) variations (expected residual returns) and negative (unfavorable) variations (expected losses). The absolute value of the sum of the expected residual returns will always equal the absolute value of the sum of the expected losses. The sum of the absolute values of the expected residual returns and the expected losses represents the expected variability in both directions associated with that estimate of discounted probability-weighted expected cash flows.

Fair value of leased property. The price that would be received to sell the property in an orderly transaction on the measurement date between market participants that are not related parties.

When the lessor is a manufacturer or dealer, the fair value of the property at the inception of the lease will ordinarily be its normal selling price net of volume or trade discounts. In some cases, due to market conditions, fair value may be less than the normal selling price or even the cost of the property.

When the lessor is not a manufacturer or dealer, the fair value of the property at the inception of the lease will ordinarily be its cost net of volume or trade discounts. However, if a significant amount of time elapses between the acquisition of the property by the lessor and the inception of the lease, fair value is determined in light of market conditions prevailing at the inception of the lease. Thus, fair value may be greater or less than the cost or carrying amount of the property.

Fair value determinations made for lease classification or measurement purposes are to be performed as defined by ASC 840, not as later set forth by ASC 820, other than as pertains to business combinations accounted for under ASC 805. For acquisition accounting applications, ASC 820 is the relevant guidance to be followed.

Implicit interest rate. The discount rate that, when applied to the minimum lease payments, excluding that portion of the payments representing executory costs to be paid by the lessor, together with any profit thereon, and the unguaranteed residual value accruing to the benefit of the lessor, causes the aggregate present value at the beginning of the lease term to be equal to the fair value of the leased property to the lessor at the inception of the lease, minus any investment tax credit retained and expected to be realized by the lessor (and plus initial direct costs in the case of direct financing leases).

Inception of the lease. The date of the written lease agreement or commitment (if earlier) wherein all principal provisions are fixed and no principal provisions remain to be negotiated.

Incremental borrowing rate. The rate that, at the inception of the lease, the lessee would have incurred to borrow over a similar term (i.e., a loan term equal to the lease term) the funds necessary to purchase the leased asset.

Initial direct costs.[1] Only those costs incurred by the lessor that are (1) costs to originate a lease incurred in transactions with independent third parties that (a) result directly from and are essential to acquire that lease and (b) would not have been incurred had that leasing transaction not occurred and (2) certain costs directly related to specified activities performed by the lessor for that lease. Those activities are: evaluating the prospective lessee's financial condition; evaluating and recording guarantees, collateral, and other security arrangements; negotiating lease terms; preparing and processing lease documents; and closing the transaction. The costs directly related to those activities include only that portion of the employees' total compensation and payroll-related fringe benefits directly related to time spent performing those activities for that lease and other costs related to those activities that would not have been incurred but for that lease. Initial direct costs do not include costs related to activities performed by the lessor for advertising, soliciting potential lessees, servicing existing leases, and other ancillary activities related to establishing and monitoring credit policies, supervision, and administration. Initial direct costs do not include administrative costs, rent, depreciation, any other occupancy and equipment costs and employees' compensation and fringe benefits related to activities described in the previous sentence, unsuccessful origination efforts, and idle time.

Investment company. A separate legal entity whose business purpose and activities consist of investing in multiple substantive investments pursuant to investment plans that include exit strategies and that expects to obtain from those investments current income, capital appreciation, or both. Consequently, an investment company does not acquire or hold investments for strategic operating purposes. To be considered an investment company, an investor cannot be entitled to receive benefits from its investments that would not

---

[1] *Initial direct costs are offset by nonrefundable fees that are yield adjustments as prescribed in ASC 310-20,* ***Receivables—Nonrefundable Fees and Other Costs.***

be available to other noninvestor entities that are not related parties of the investee. (ASC 946-10-55).

Investment tax credit (ITC). The ITC was an income tax incentive that the US Congress enacted and repealed several times between 1962 and 1986. The ITC resulted in a direct reduction of the taxpayer's income tax that would have been otherwise payable and was computed by multiplying the eligible, tangible long-lived assets placed in service during the tax year by a statutory percentage. The credit was initially enacted in 1962, with the stated goal of providing an incentive to businesses to acquire machinery and equipment in order to raise productivity, maintain the level of employment, and alleviate a serious balance of payments problem that existed at the time. The credit was repealed in 1986 and has not reappeared since that time; however, it is discussed at length in the current GAAP lease literature because it was an important economic factor in the terms of many leases initiated at that time. The authors have retained in this chapter the discussion regarding the applicability of ITC to leasing transactions given the fact that, over time, the credit has been enacted, repealed and reinstated several times, and could be a model for future capital investment tax incentives.

Lease. An agreement conveying the right to use property, plant, or equipment (land or depreciable assets or both) usually for a stated period of time.

Lease term. The fixed noncancelable term of the lease plus the following:

1. Periods covered by bargain renewal options
2. Periods for which failure to renew the lease imposes a penalty on the lessee in an amount such that renewal appears, at the inception of the lease, to be reasonably assured
3. Periods covered by ordinary renewal options during which a guarantee by the lessee of the lessor's debt directly or indirectly related to the leased property is expected to be in effect or a loan from the lessee to the lessor directly or indirectly related to the leased property is expected to be outstanding
4. Periods covered by ordinary renewal options preceding the date that a bargain purchase option is exercisable
5. Periods representing renewals or extensions of the lease at the lessor's option

However, the lease term does not extend beyond the date a bargain purchase option becomes exercisable or beyond the useful life of the leased asset.

Minimum lease payments. For the lessee: The payments that the lessee is or can be required to make in connection with the leased property. Contingent rental guarantees by the lessee of the lessor's debt, and the lessee's obligation to pay executory costs are excluded from minimum lease payments. Additionally, if a portion of the minimum lease payments (MLP) representing executory costs is not determinable from the provisions of the lease, an estimate of executory costs is excluded from the calculation of the minimum lease payments. If the lease contains a bargain purchase option, only the minimum rental payments over the lease term and the payment called for in the bargain purchase option are included in minimum lease payments. Otherwise, minimum lease payments include the following:

1. The minimum rental payments called for by the lease over the lease term
2. Any guarantee of residual value at the expiration of the lease term made by the lessee (or any party related to the lessee), whether or not the guarantee payment constitutes a purchase of the leased property. When the lessor has the right to require the lessee to purchase the property at termination of the lease for a certain or determinable amount, that amount is considered a lessee guarantee. When the lessee agrees to make up any deficiency below a stated amount in the lessor's realization

of the residual value, the guarantee to be included in the MLP is the stated amount rather than an estimate of the deficiency to be made up. ASC 840 provides additional guidance regarding residual guarantees, as follows:

a. Lease provisions requiring the lessee to reimburse the lessor for residual value deficiencies due to damage, extraordinary wear and tear, or excessive usage are analogous to contingent rentals since, at the inception of the lease, the amount of the deficiency is not determinable. Therefore, these payments are not included in the MLP as residual value guarantees.
b. Some leases contain provisions limiting the lessee's obligation to reimburse the lessor for residual value deficiencies to an amount less than the stipulated residual value of the leased property at the end of the lease term. In computing the MLP associated with these leases, the amount of the lessee's guarantee is limited to the specified maximum deficiency the lessee can be required to reimburse to the lessor.
c. A lessee may contract with an unrelated third party to guarantee the residual for the benefit of the lessor. The MLP can only be reduced by the third party guarantee to the extent that the lessor explicitly releases the lessee from the obligation to make up the deficiency, even if the guarantor defaults. Amounts paid by the lessee to the guarantor are executory costs and are not included in the MLP, and

3. Any payment that the lessee must or can be required to make upon failure to renew or extend the lease at the expiration of the lease term, whether or not the payment would constitute a purchase of the leased property

For the lessor: The payments described above plus any guarantee of the residual value or of the rental payments beyond the lease term by a third party unrelated to either the lessee or lessor (provided the third party is financially capable of discharging the guaranteed obligation).

Noncancelable in this context means that a lease is cancelable only if one of the following conditions is satisfied:

1. The occurrence of some remote contingency
2. The permission of the lessor
3. The lessee enters into a new lease with the same lessor
4. Payment by the lessee of a penalty in an amount such that continuation of the lease appears, at inception, reasonably assured

Nonrecourse financing. Lending or borrowing activities in which, in the event of default, the collateral available to the creditor is limited to certain assets specifically agreed to in the loan agreement and does not include the general assets of the debtor.

Penalty. Any requirement that is imposed or can be imposed on the lessee by the lease agreement or by factors outside the lease agreement to pay cash, incur or assume a liability, perform services, surrender or transfer an asset or rights to an asset or otherwise forego an economic benefit, or suffer an economic detriment.

Primary beneficiary. A variable interest holder that is required to consolidate a variable interest entity (VIE). Consolidation is required when the holder of one or more variable interests would absorb a majority of the VIE's expected losses, receive a majority of the VIE's expected residual returns, or both. If one holder would absorb a majority of the VIE's expected losses and another holder would receive a majority of the VIE's expected residual returns, the holder absorbing the majority of the expected losses is the primary beneficiary and is thus required to consolidate the VIE.

Profit recognition. Any method to record a transaction involving real estate, other than the deposit method, or the methods to record transactions accounted for as financing, leasing, or profit-sharing arrangements. Profit recognition methods commonly used to record transactions involving real estate include, but are not limited to, the full accrual method, the installment method, the cost recovery method, and the reduced profit method.

Related parties. Entities that are in a relationship where one party has the ability to exercise significant influence over the operating and financial policies of the related party. Examples include the following:

1. A parent company and its subsidiaries
2. An owner company and its joint ventures and partnerships
3. An investor and its investees

The ability to exercise significant influence must be present before the parties can be considered related. Significant influence may also be exercised through guarantees of indebtedness, extensions of credit, or through ownership of debt obligations, warrants, or other securities. If two or more entities are subject to the significant influence of a parent, owner, investor, or common officers or directors, then those entities are considered related to each other.

Related parties and de facto principals and agents. In determining whether a holder of an interest in a variable interest entity is the VIE's primary beneficiary, the holder and its related parties are treated collectively as a single party. For this purpose, ASC 810 expands the definition of related parties to include additional parties that act as "de facto agents or principals" of the variable interest holder including

1. A party unable to finance its operations without receiving subordinated financial support from the VIE interest holder such as another VIE of which the holder is the primary beneficiary
2. A party that received its interests in the VIE as a contribution or loan from the holder
3. An officer, employee, or member of the governing board of the holder
4. A party that has agreed not to sell, transfer, or encumber its interest in the VIE without prior approval of the holder when that agreement could constrain the party's ability to manage the economic risks or realize the economic rewards with respect to its interests in the VIE to which it would otherwise be entitled
5. A party with a close business relationship to the holder such as the relationship between a professional service provider (e.g., attorney, accountant, banker, consultant, etc.) and one of its significant clients

Upon the application of this related-party attribution rule, if two or more related parties (including de facto agents or principals) hold variable interests in the same VIE for which the parties collectively would be the primary beneficiary, a determination is required of which party will individually be considered the primary beneficiary (i.e., will consolidate the VIE in its financial statements). The party whose activities are most closely associated with the VIE is deemed to be the primary beneficiary. Among the factors that are to be considered when making this determination are

1. The existence of principal/agency relationships between members of the related-party group
2. The significance of the VIE's activities to the members of the related-party group
3. The relationship of the members of the related-party group to the VIE's activities
4. The exposure of a member of the related-party group to the VIE's expected losses
5. The design (structure) of the VIE

Renewal or extension of a lease. The continuation of a lease agreement beyond the original lease term, including a new lease where the lessee continues to use the same property.

Rent holiday. A contractual period of time set forth in a lease, during which the lessee is not obligated to pay rent to the lessor, most commonly the first month(s) under the lease.

Sale-leaseback accounting. A method of accounting for a sale-leaseback transaction in which the seller-lessee records the sale, removes all property and related liabilities from its balance sheet, recognizes gain or loss from the sale, and classifies the leaseback in accordance with this section.

Total at-risk investment. The following criteria are set forth in ASC 810 for determining the total at-risk equity investment in an entity:

1. Include only equity investments that participate significantly in profits and losses, even if the investments have no voting rights.
2. Exclude equity interests issued by the entity in exchange for subordinated interests in other variable interest entities.
3. Exclude amounts provided to the equity investor (e.g., fees, charitable contributions, or other payments) directly or indirectly by the entity or other parties involved with the entity unless the provider is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.
4. Exclude amounts financed for the equity investor (e.g., by loans or guarantees of loans) directly by the entity or by other parties involved with the entity, unless the party is a parent, subsidiary, or affiliate of the investor that is required to be included in the same set of consolidated financial statements as the investor.

It is a rebuttable presumption that an equity investment of less than 10% of an entity's total assets is insufficient to permit the entity to finance its activities without additional subordinated financial support. In order to overcome this presumption, one or more of the following conditions must be present:

1. Performance—The entity has demonstrated that it can finance its activities without additional subordinated financial support.
2. Comparability—The entity's invested equity is at least as much as other entities holding similar assets of similar quality in similar amounts and who operate without additional subordinated financial support.
3. Reasonable forecast—Based on reasonable quantitative evidence, the entity's invested equity exceeds the estimate of the entity's expected losses.

This 10% threshold was intended by FASB to apply only in one direction (i.e., a less-than 10% investment is considered insufficient but a 10% or more investment is not necessarily presumed to be sufficient). Many entities engaged in high-risk activities, holding high-risk assets, or carrying significant off-balance-sheet exposures require more than 10% equity investment in order to finance their activities. Consequently, irrespective of the 10% threshold, an evaluation must be done to determine whether a particular entity with which the enterprise is involved requires an equity investment of 10% or greater in order to finance its activities without additional subordinated financial support.

Unguaranteed residual value. The estimated residual value of the leased property exclusive of any portion guaranteed by the lessee, by any party related to the lessee, or any party unrelated to the lessee. If the guarantor is related to the lessor, the residual value is considered unguaranteed.

Unrelated parties. All parties that are not related parties as defined above.

Variable interest. Ownership, contractual, or other monetary interests in an entity that are either entitled to received expected favorable variability ("expected residual returns") or obligated to absorb expected unfavorable variability ("expected losses").

Variable interest entity (VIE). An entity financially controlled by parties that are not its majority voting owners. Financial control is evidenced by a controlling party being exposed to the majority of the financial risks associated with the VIE performing worse than expected, *or* being entitled to the majority of the rewards associated with the VIE performing better than expected. This situation arises either because (1) the entity's at-risk equity is insufficient to absorb its expected losses *or* (2) because the entity's at-risk equity holders do not meet all three criteria necessary to be considered to possess a controlling financial interest in the entity.

CONCEPTS, RULES, AND EXAMPLES

Variable Interest Entities

The complex and evolving rules for lease accounting from the standpoint of the lessee and of the lessor are set forth in this chapter. From the standpoint of the lessee, it is critical for the accountant to first determine whether the relationship between the entities requires consolidation as a variable interest entity (VIE) under ASC 810, which is discussed in detail in Chapter 13. If consolidation is required, the effects of the lease recorded by the parties will be eliminated in the consolidated financial statements and the lease accounting will, in effect, be moot from the standpoint of the lessee.

In essence, a VIE is an entity that, by design, is not funded with an amount of at-risk equity sufficient to enable it to sustain itself in the face of reasonably possible losses without obtaining additional support (*"subordinated financial support"*) from existing or additional sources. In practical terms, in the context of leasing, the lessee is at risk for an amount greater than the contractual rental payments—such as for the lessor's debt arising from financing the leased property.

Determination of whether an entity is a VIE involves analysis of the individual facts, circumstances, relationships, structures, risks, and rewards associated with the entity and the parties with whom it is involved. Often, especially when related parties are involved, this analysis can be performed qualitatively without laborious numeric estimates of expected variability. That is because even a superficial review of the relationships and transaction details will reveal that the entity in question is indeed a VIE, or that it clearly is not one.

In more complex situations, however, or when qualitative analysis does not yield a conclusive answer, the holder of one or more variable interests may be required to estimate the present value of the probability-weighted expected cash flows associated with the entity in order to determine the expected variability of the entity's future cash flows as well as the portion of that expected variability that is allocable to the various holders of variable interests.

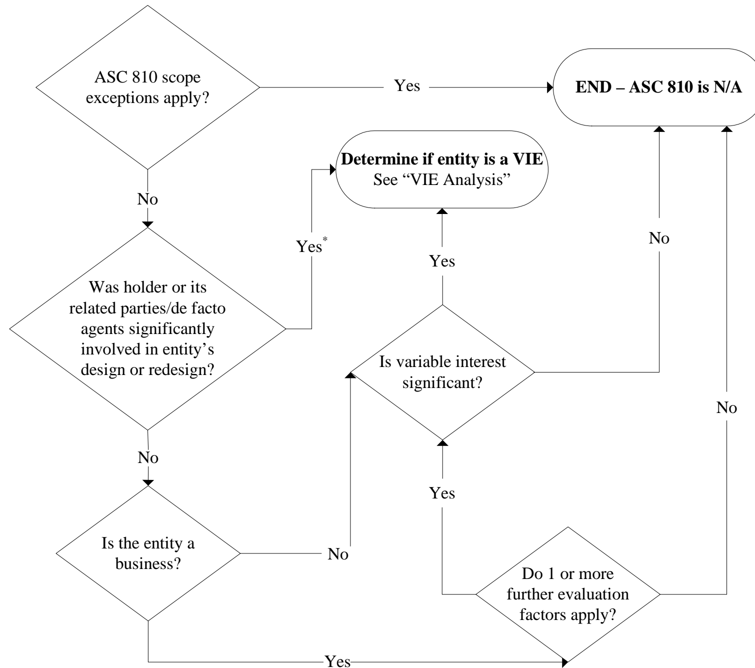
Decision diagrams. The following decision diagrams are used to discuss the illustrative examples of leasing transactions presented in this chapter.

APPLYING ASC 810

Date on which holder initially obtains interest in entity or subsequent reconsideration date.

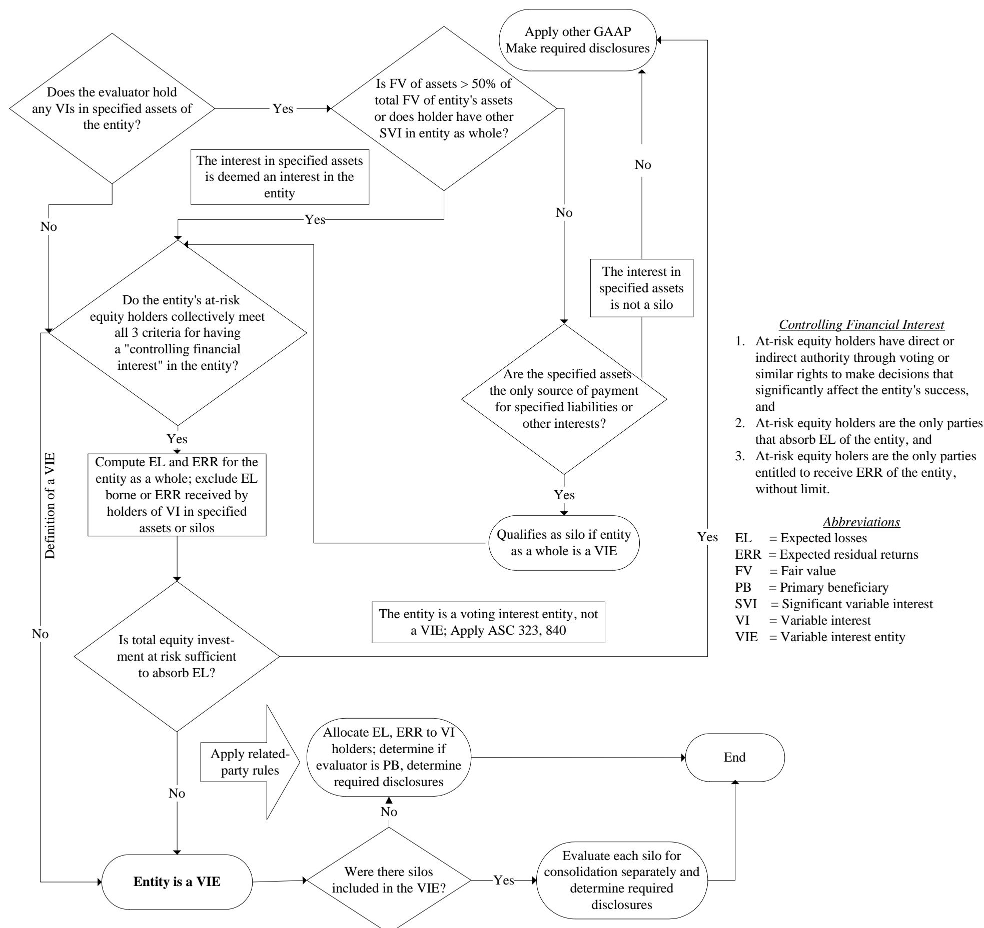
Entity is the enterprise that is being evaluated as to whether it is a VIE.

Holder is a party that holds a variable interest in the entity and needs to determine whether the entity is a VIE and, if so, whether the holder must consolidate.



* *This factor is not considered when the entity is an operating joint venture jointly controlled by the variable interest holder, and either an independent party or a franchisee. De facto agents, for this purpose, exclude parties that require the variable interest holder's prior approval to sell, transfer, or encumber their interest in the entity.*

VIE ANALYSIS



Entities excluded from the scope of ASC 810. The following scope exceptions are specified in ASC 810:

1. Not-for-profit organizations as defined in the Master Glossary, unless the organization was organized to avoid VIE status
2. Employer/sponsors of employee benefit plans including ESOP, pension, profit sharing, 401(k), postretirement, and postemployment plans
3. Separate accounts of life insurance entities
4. A "qualifying special-purpose entity" (QSPE) or a "formerly qualifying SPE" (FQSPE) under the provisions of ASC 860, *Transfers and Servicing,* are not to be consolidated by entities and their affiliates who transfer financial assets to them. Note that the entire subject of QSPE accounting is likely to be reexamined and may well be revised by FASB as early as 2009, potentially limiting or eliminating this exemption.
5. Enterprises holding variable interests in a QSPE or FQSPE are not to consolidate that entity unless the holder has the unilateral ability to cause the entity's liquidation

or change the entity so that it ceases to meet the conditions set forth by ASC 860 to be considered a QSPE or FQSPE

6. A governmental organization
7. A nongovernmental financing entity established by a governmental organization unless the financing entity is being used to circumvent ASC 810 to avoid consolidation
8. An entity created prior to December 31, 2003, for which, after expending "exhaustive efforts," management of the variable interest holder is unable to obtain information needed to determine whether the entity is a VIE, to determine whether the holder is the primary beneficiary, or to make the required consolidating/eliminating entries required by ASC 810.

   NOTE: With respect to this exception, however, management of the variable interest holder is required to continue to make these efforts after initial adoption of ASC 810. If the variable interest holder significantly participated in the design/redesign of the entity, it would be unusual for it to be able to contend that it was unable to obtain the necessary information.

9. An entity that qualifies to be treated as a business, as defined below. However, this scope exception *does not apply* and the entity would be required to be evaluated as to whether it is a VIE by the holders of its variable interests if *any one or more* of the following conditions exists (these are referred to in the decision diagram as "further evaluation factors" for ease of understanding:
   a. The variable interest holder and/or its related parties/de facto agents[2] (de facto agents are discussed later in this chapter) participated significantly in the design or redesign of the entity. This factor is not considered when the entity is an operating joint venture jointly controlled by the variable interest holder, and either an independent party or a franchisee.
   b. The design of the entity results in substantially all of its activities either involving or being conducted on behalf of the variable interest holder and its related parties
   c. Based on the relative fair values of interests in the entity, the variable interest holder and its related parties provide more than half of its total equity, subordinated debt, and other forms of subordinated financial support
   d. The entity's activities relate primarily to one or both of the following:
      (1) Single-lessee leases
      (2) Securitizations or other forms of asset-backed financings
10. Entities that meet the definition of an investment company after adoption of ASC 946-10-55 will continue to apply investment company accounting to their investments, and those investments will not be subject to the ASC 810 consolidation requirements. ASC 946-10-55 is delayed indefinitely.

Definition of a business. A business is defined, in the context of ASC 810, as

...a self-sustaining integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. A business consists of (a) inputs, (b) processes applied to those inputs, and (c) resulting outputs that are used to generate revenues. For a set of activities and assets to be a business, it must contain all of the inputs and processes necessary for it to conduct normal operations, which include the ability to sustain a revenue stream by providing its outputs to customers.

---

[2] *Only for the purposes of applying factor a. above, de facto agents exclude parties that require the variable interest holder's prior approval to sell, transfer, or encumber their interest in the entity.*

In evaluating whether an entity is a business, consideration must be given to unique factors relating to the industry and the activities being performed including

Inputs

1. Fixed assets either owned or leased
2. Intangibles either owned or licensed
3. Access to materials or rights needed to perform its activities
4. Employees

Processes

1. Strategic management
2. Operations
3. Resource management

Outputs

1. Access to customers (clients)

A three-step process is provided in order to assess whether a set of activities ("set") qualifies as a business:

1. Identify elements included in the "set" (i.e., determine the existing inputs, processes, and outputs.)
2. Compare the elements identified in 1. to the elements necessary for the set of activities to be conducted as a normal business operation.
3. If any elements are missing, assess the degree of effort or investment relative to the fair value of the set of activities needed to acquire or gain access to the missing elements. If a significant effort or investment would be required, it can be concluded that the set of activities is not a business; conversely, a de minimis amount of effort or investment to supply the missing elements would lead to the conclusion that the set of activities is a business.

Variable interests in "silos." A party may hold a variable interest in specific assets of a VIE (e.g., a guarantee or a subordinated residual interest). In computing expected losses and expected residual returns, as defined above, a holder of a variable interest in specified assets of a VIE must determine if the interest it holds qualifies as an interest in the VIE itself. The variable interest is considered an interest in the VIE itself if either (1) the fair value of the specific assets is more than half of the total fair value of the VIE's assets, or (2) the interest holder has another significant variable interest in the entity as a whole.

If the interests are deemed to be interests in the VIE itself, the expected losses and expected residual returns associated with the variable interest in the specified assets are treated as being associated with the VIE.

If the interests are not deemed to be interests in the VIE itself, the interests in the specified assets are treated as a separate VIE (referred to as a "silo") if the expected cash flows from the specified assets (and any associated credit enhancements, if applicable) are essentially the sole source of payment for specified liabilities or specified other interests. Under this scenario, expected losses and expected residual returns associated with the silo assets are accounted for separately to the extent that the interest holder either bears the expected losses or is entitled to receive the expected returns. Any excess of expected losses or residual returns not borne (received) by the variable interest holder is considered attributable to the entity as a whole.

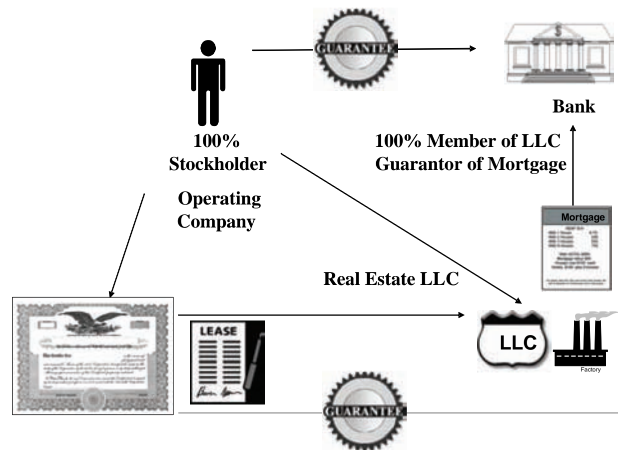
If one interest holder is required to consolidate a silo of a VIE, other VIE interest holders are to exclude the silo from the remaining VIE.

Example of application of ASC 810 to related-party leases

The most commonly encountered potential VIE situations that occur in practice involve related-party leases. Business owners often organize a partnership or LLC (for this discussion we will assume an LLC) to own property that is leased to a business with the same or similar ownership. The transaction is structured in this manner for a number of reasons that include avoidance of double taxation of the gain on the eventual sale of the property and legal protection of the building from creditors of the operating business in the event of business bankruptcy.

In attempting to avoid lessee capitalization, the lease is often structured with a short initial term (e.g., three years) with the lessee having successive options to renew the lease at similar terms. The building is pledged as collateral under a mortgage with a third-party lender. The lessor entity is thinly capitalized (i.e., it has very little owner-invested equity). Consequently, the lender, besides holding a mortgage on the building as collateral, has further protected its interests by obtaining a loan guarantee from the lessee, an assignment of rents, and a personal guarantee of the owner.

These relationships are illustrated in the following diagram:



Analysis under ASC 810

Following the decision diagrams and using the related-party/de facto principal and agent rules included in ASC 810

1. The lessee holds a variable interest in the lessor in the form of the guarantee of the lessor's mortgage debt.
2. The lessor entity is not "scoped out" of ASC 810.
3. The lessor entity is a business. It has inputs (owned fixed assets), processes for managing its investment, and outputs relative to access to the lessee.
4. The following "further evaluation factors" apply:
   a. The lessee/variable interest holder and its related parties participated significantly in the design of the lessor.
   b. The design of the lessor LLC results in all of its activities involving and being conducted on behalf of the lessee/variable interest holder.
   c. The lessee/variable interest holder and its related parties provided 100% of the subordinated financial support for the lessor entity.
   d. The lessor entity's activities relate to a single-lessee lease.
5. The lessee/evaluator and its related-party owner were involved in the design of the lessor entity.

6. The lessee's variable interest is assumed to be *significant* for the purpose of this analysis. ASC 810 does not provide guidance on making this determination.
7. The lessee's variable interest is in the leased asset.
8. The fair value of the leased asset represents 100% of the total fair value of the lessor's assets and thus is deemed to be an interest in the lessor as a whole versus an interest in just the specified assets of the lessor.
9. The at-risk equity holder of the lessor does not meet the second criterion for being considered to hold a controlling financial interest (i.e., the variable interest holder/lessee could potentially absorb expected losses of the lessor should the lessee be called upon by the lender to perform under the guarantee of the lessor's indebtedness). Note that, in this case, the other two criteria for controlling financial interest are met.
10. As a result of the analysis up to this point, it can be concluded that the lessor is a variable interest entity.
11. No silos exist, since 100% of the fair value of the assets is leased to the single lessee.
12. Application of the related-party/de facto principal and agent rules to the variable interests in the lessor indicates that 100% of the expected losses and expected residual returns from the lessor are allocable to the members of the related-party group (the lessee and the related-party owner of both). Thus, collectively, the lessee and its 100% stockholder are the primary beneficiary of the VIE/lessor. The party most closely associated with the leased property is the lessee who, consequently, is considered the primary beneficiary that is required to consolidate the lessor in its financial statements.

Other lease terms and provisions. The following discussion examines the effect that certain changes to the above facts would have on the foregoing conclusions:

Existence or absence of guarantees. Even if the stockholder/member's guarantee of the mortgage is not required by the lender and only the lessee guaranteed the debt, the analysis above would be identical. Due to the fact that the lessee/variable interest holder is exposed to the expected losses of the lessor under the terms of the guarantee, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

Conversely, when ASC 810 was originally issued, many observers initially believed if the lessee was not required by the lender to guarantee the mortgage, and the only guarantee was that of the stockholder/member, that the absence of an explicit variable interest held by the lessee would preclude the conclusion that the lessor was a VIE.

This situation illustrates one of the most misunderstood provisions of ASC 810—referred to as an *implicit variable interest*—which the FASB Staff attempts to clarify in ASC 810-10-25.

Even though the lessee did not directly guarantee the debt of the lessor, consideration must be given to the likely scenarios if the lessor/LLC should be close to a default on the mortgage payments. Realistically, what is the likelihood that the sole stockholder/sole member would perform under his or her personal guarantee obligation rather than directing the lessee to pay additional rent sufficient to enable the LLC to keep its mortgage payments current?

Clearly, it would not make economic sense for the sole stockholder/member to perform personally under the guarantee as this would, in substance, result in the stockholder/member making a loan or capital contribution to an otherwise insolvent LLC. Instead, it would logically follow that the best course of action would be for the lessee to pay rent in amounts ade-

quate to fund the LLC's mortgage payments so that the lessee would continue to have use of the leased premises without concern over whether the bank will foreclose on and sell the property to a third party. If the lessee were having difficulty funding the rent payments, its owner would probably authorize it to borrow money or sell assets in order to enable it to do so before its owner used personal funds to perform under the guarantee.

After analyzing this situation, with appropriate attention to the substance rather than simply its form, it can be seen that the lessee is the holder of an implicit variable interest in the lessor in the form of an implicit guarantee of the lessor's mortgage debt.

The remainder of the analysis would be identical to what was presented earlier. Due to the fact that the lessee/variable interest holder is exposed to the expected losses of the lessor under the terms of the implicit guarantee, the lessor/LLC's sole member (and at-risk equity holder) is not the only party that potentially would absorb expected losses of the lessor.

Finally, consider the situation where neither the lessee nor the owner is required to guarantee the debt. A prudent lender would probably not waive both guarantees unless the lessor was sufficiently capitalized by the owner's at-risk equity. That is, there is a presumption that the lessor in such an instance is not a VIE. Under this scenario the lessee would perform the quantitative analysis required to estimate expected losses and estimated residual returns to determine whether the lessor is a VIE and, if it is, whether it is the primary beneficiary.

Above or below market rentals. Rentals due under related-party leases sometimes exceed arm's-length market rentals because the owner is using the lessor as a conduit for the lessee to indirectly provide additional salary or dividends to the owner (characterized as the excess rent).

Under ASC 810, an operating lease is generally not considered to be a variable interest unless

1. The lease terms include a lessee residual guarantee of the fair value of the leased asset, since this results in the lessee potentially absorbing estimated negative variability that would otherwise be absorbed by the equity holder of the lessor
2. The lease terms include an option for the lessee to purchase the property at the end of the lease term at a specified price, since this means that the lessee potentially may receive estimated positive variability that would otherwise be received by the equity holder of the lessor
3. The lease terms are not indicative of market terms for a similar property in the same geographic location, since this would result in the lessee either receiving estimated positive variability of the lessor (if the lease terms were below market) or absorbing negative variability of the lessor (if the lease terms were above market)

Under each of the foregoing scenarios, the lease is considered a variable interest in determining the primary beneficiary, because the expected losses of the lessor that would be borne by the lessee (the excess of the rentals required over the fair value of the right to use the leased property) exceed the amounts that would have been expected had the rentals been at fair value. Thus, the stockholder/member would not be considered to have a controlling financial interest since s/he was not the only party exposed to the lessor's expected losses.

If the situation reversed, and the rentals were below market amounts, it could be logically concluded that the lessor was absorbing negative variability of the lessee and that, therefore, the lease was a variable interest in the lessee held by the lessor that could potentially result in the lessor being considered the primary beneficiary of the lessee that would necessitate the lessor consolidating the lessee in its financial statements.

Different organizational structures. In some instances, the leased property is owned directly by the owner rather than in an LLC or other entity. This reveals an important "loop-

hole" in the provisions of ASC 810. The ASC 810 definition of a VIE requires that the VIE be a "legal structure used to conduct activities or to hold assets." Examples of these structures identified by ASC 810 include corporations, partnerships, limited liability companies, grantor trusts, and other trusts. It does not include a portion of an individual's privately held assets, however. Therefore, if the property is owned personally, it would not be feasible for the lessee to consolidate a personal financial statement of the property owner.

CAUTIONARY NOTE: *Identification of this "loophole" is not intended to serve as a recommendation, and indeed the contrary may be better advice. Many states have estate laws that require the executors of estates of individuals who own property titled in their name to subject those estates to court-supervised probate proceedings in order to ensure that the assets of the deceased individual are appropriately identified and that the title to those assets is unambiguously transferred to the appropriate beneficiary. Probate is a time-consuming and costly process that most astute estate planners advise their clients to avoid.*

One of the most popular ways to avoid probate is for an individual to transfer the title to all individually owned personal property and real estate to a revocable grantor trust (sometimes called a "living trust"). This trust is an entity that is permitted under the law to hold title to property. The property effectively remains under the control of its former owner since this person, the grantor, is the trustee of the trust.

If the owner of the leased property is a grantor trust, the trust is subject to the provisions of ASC 810 and, if the trust is determined to be a VIE, it would be required to be consolidated by its primary beneficiary.

Renewal options. ASC 810 is silent as to whether a lessee option to renew an operating lease at the end of its initial term is a variable interest. As discussed later in this chapter, renewal options are sometimes required to be included in the minimum lease term for accounting purposes because a nonrenewal election would impose a penalty upon the lessee such that renewal has to be deemed reasonably certain. For this purpose, the implicit penalty could be the abandonment of substantial leasehold improvements constructed by the lessee, or the continuation of a guarantee of the lessor's mortgage obligation notwithstanding nonrenewal. These renewal features are not themselves variable interests because they are considered to be integral parts of the contractual term of the underlying lease. Lease renewal options that cover periods beyond the minimum lease term, however, can be considered to be variable interests.

Renewal options are customarily structured to convey, from the lessor to the lessee, the right to renew the lease at the expiration of its term. As a result of the lessee possessing this right, the lessor is precluded from re-leasing the assets to another party until such time as the lessee decides whether or not it will exercise its option. The existence of the option limits the lessor's ability to lease the space to another tenant. Thus, during the term during which the option is exercisable, there is an adverse effect on the fair value and residual of the leased property. If the option period is not included by the lessee in the minimum lease term, the option conveys to the lessee the right to elect to control and use the leased asset during a period of time when that control and use could have been conveyed by the lessor to another party. In effect, this is a transfer of a portion of the lessor's expected residual rewards to the lessee. This would be true in both related-party and arm's-length leases.

Other contractual arrangements. Leases are often accompanied by other contractual arrangements between the lessee and lessor. Such contractual arrangements can include management, marketing, brokerage, and other types of service agreements. These agreements must be carefully analyzed, as ASC 810 provides restrictive rules that often result in such agreements being characterized as variable interests.

All parties affected by these transactions should seek expert professional advice prior to either structuring a new transaction or modifying an existing transaction. For example, ad-

verse income tax consequences could result from the transfer of property from one form of ownership to another.

Example: Arm's-length leases—computing expected losses and expected residual returns

The application of ASC 810 is, of course, not limited to related-party arrangements. The following is an example of the quantitative analysis (versus the qualitative analysis illustrated in the related-party example above) that might be necessary in an arm's-length leasing arrangement.

NOTE: The terms of the leases below are not intended to represent current market conditions, but rather have been designed to best illustrate the concepts of ASC 810.

Lawrence Lessor, LLC (referred to herein as "the Entity" since it is the entity that the variable interest holders will be evaluating as to whether it is a VIE) is a limited liability company organized specifically for the purpose of building, owning, and operating a single-lessee retail discount warehouse club store on land that it has recently acquired. The store is the only asset owned by the Entity. The 148,000 square foot store will be occupied by Clubco, a nationally known chain that is unrelated to Lawrence Lessor.

The Entity's voting owners (the LLC members) wish only to invest a minimal amount of equity in the Entity and, consequently, the mortgage lender insisted on obtaining a third-party guarantee of the mortgage which Lawrence obtained from an unrelated third-party and paid a premium for.

The terms of the lease with the retailer are as follows: (assumed to be an operating lease):

Description of space	148,000 square foot retail discount warehouse club store
Lessee	Clubco Stores, Inc.
Initial lease term	Three years
Lease commencement date	1/1/09
Annual base rent	$600,000
Contingent rent	1% of annual sales over $30 million
Purchase options:	$9 million–not a bargain purchase option in accordance with ASC 840
Residual guarantee	Lessee guarantees to lessor that residual value of the building at the end of the lease term will be at least equal to the $7,500,000 fair value of the store land and building at inception or it will pay the lessor the difference
Executory costs	All real estate taxes, maintenance, insurance, and common area expenses are to be borne by the lessee

The construction has been completed, the occupancy permits issued, and the construction financing settled with the proceeds of a 25-year, 6% mortgage loan on December 1, 2008. The mortgage loan is guaranteed by an unrelated third-party guarantor. The store is opening and commencing business on January 1, 2009.

Mortgage details are as follows:

Summary Amortization Schedule for Mortgage

25-year, 6% mortgage, original principal amount of $7,275,750

Year	*Payments*	*Interest*	*Principal*	*Balance*
Original loan				$7,275,750
2009	$562,533	$433,022	$129,511	7,146,239
2010	562,533	425,034	137,499	7,008,740
2011	562,533	416,553	145,980	6,862,760
	$1,687,599	$1,274,609	$412,990	

The Entity's recorded aggregate carrying amount of $7,500,000 for the land and building represents the fair value at lease inception with the land's fair value representing 10%, or $750,000.

The rental terms for the store are considered to be at market rates. If the terms were not at market rates, additional expected variability would be assigned to the lease (in addition to the expected variability resulting from the purchase option and residual value guarantee).

Expected cash flows are discounted to their present value using an assumed 3% interest rate representing the interest rate available on risk-free investments. To simplify the example, cash

flows are assumed to occur at the end of each annual period for the purpose of discounting them to present value. A copy of the balance sheet from the Entity's annual partnership return at lease inception is as follows:

Schedule L		**Balance Sheets per Books**				
		Assets	*Beginning of tax year*		*End of tax year*	
			(a)	(b)	(c)	(d)
1.		Cash				1,000
2.	a.	Trade notes and accounts receivable				
	b.	Less allowance for bad debts				
3.		Inventories				
4.		US government obligations				
5.		Tax-exempt securities				
6.		Other current assets (*attach schedule*)				
7.		Mortgage and real estate loans				
8.		Other investments (*attach schedule*)				
9.	a.	Buildings and other depreciable assets			6,750,000	
	b.	Less accumulated depreciation				6,750,000
10.	a.	Depletable assets				
	b.	Less accumulated depletion				
11.		Land (net of any amortization)				750,000
12.	a	Intangible assets (amortizable only)				
	b	Less accumulated amortization				
13.		Other assets (*attach schedule*)				
14.		Total assets				7,501,000
		Liabilities and Capital				
15.		Accounts payable				
16.		Mortgages, notes, bonds payable in less than 1 year				
17.		Other current liabilities (*attach schedule*)				
18.		All nonrecourse loans				7,275,750
19.		Mortgages, notes, bonds payable in 1 year or more				
20.		Other liabilities (*attach schedule*)				
21.		Partners' capital accounts				225,250
22.		**Total** liabilities and capital				7,501,000

Analysis by Clubco (See the decision diagrams earlier in this chapter.)

1. Clubco holds a variable interest in Lawrence Lessor ("the Entity") in the form of the lease. Expected variability results from the purchase option and the residual value guarantee.
2. The Entity is not scoped out of ASC 810.
3. The Entity is a business.
4. Further evaluation factor d. applies; that is, this is a single-lessee lease.
5. Clubco was not involved in the design of the Entity.
6. For illustrative purposes, assume that the purchase option is significant to Clubco.
7. Clubco holds a variable interest in the leased store (the specified assets) in the form of the lease containing a purchase option and residual value guarantee.
8. The fair value of the building leased by Clubco is 100% of the fair value of the Entity's assets. Therefore, Clubco is deemed to hold a variable interest in the Entity as a whole.
9. In applying the test to determine if the members of the LLC/entity have a controlling financial interest (distinguished from a controlling voting interest, which they clearly have), the following results are determined:

    a. The LLC members are the sole voting interest holders and, therefore, meet the voting test.

    b. The LLC members are *not* the only parties that absorb expected losses of the lessor due to the existence of the residual value guarantee provision in the lease that potentially could result in Clubco bearing a portion of the expected losses.

c. The LLC members are also *not* the only parties entitled to receive the expected residual returns from the property due to the existence of the purchase option provision in the lease that potentially could result in Clubco receiving a portion of the expected residual returns.

10. As a consequence of the analysis up to this point, Clubco can conclude that its variable interest is in a lessor that is a VIE.
11. Since Clubco leases 100% of the fair value of the assets held by entity, there are no silos included therein.
12. To determine whether or not it is the primary beneficiary of the VIE/lessor, Clubco must determine if it either will bear the majority of the expected losses, or receive the majority of the expected residual returns. One form this calculation might take is illustrated below.

Computation of expected cash flow possibilities for the lease term

	2009					
Probability	5%	15%	30%	35%	10%	5%
Assumptions						
Annual store sales	$25,000,000	$30,000,000	$40,000,000	$50,000,000	$55,000,000	$60,000,000
Percentage rent base	$30,000,000	$30,000,000	$30,000,000	$30,000,000	$30,000,000	$30,000,000
Percentage rent rate	1%	1%	1%	1%	1%	1%
Possible cash flow outcomes						
Rent—Base	$ 600,000	$ 600,000	$ 600,000	$ 600,000	$ 600,000	$ 600,000
Rent—Percentage	--	--	100,000	200,000	250,000	300,000
Total rental income	600,000	600,000	700,000	800,000	850,000	900,000
Mortgage payments	562,533	562,533	562,533	562,533	562,533	562,533

Note that, in the forecast for 2011, the effects of the purchase option and residual value guarantee are ignored. They are considered later in the analysis of which variable interest holders participate in expected losses and expected residual returns.

13. Calculation of probability-weighted discounted expected cash flows.

Scenario	*Present value of possible cash flows*	*Estimated probability*	*Discounted probability-weighted expected cash flows*
1	$ 231,573	5%	$ 11,579
2	1,146,715	15%	172,007
3	2,368,914	30%	710,674
4	3,582,357	35%	1,253,825
5	5,564,528	10%	556,453
6	6,644,145	5%	332,207
		100%	$3,036,745

This computation uses the expected cash flow methodology prescribed by CON 7, which is also used in estimation of fair value for the purposes of impairment testing of goodwill and tangible long-lived assets, and in computing asset retirement obligations.

14. Calculations of expected losses and expected residual returns (and the related expected variability).

Scenario	*Present value of possible cash flows*	*Discounted/ probability-weighted expected cash flows*	*Variance from expected outcome*	*Estimated probability*	*Expected Losses*	*Expected residual returns*
1	$ 231,573	$3,036,745	$(2,805,172)	5%	$(140,259)	
2	1,146,715	3,036,745	(1,890,030)	15%	(283,505)	
3	2,368,914	3,036,745	(667,831)	30%	(200,349)	
4	3,582,357	3,036,745	545,612	35%		$190,965
5	5,564,528	3,036,745	2,527,783	10%		252,778
6	6,644,145	3,036,745	3,607,400	5%		180,370
				100%	$(624,113)	$624,113

ASC 810 requires consideration of the "expected variability" inherent in the estimate of probability-weighted expected cash flows, in this case $3,036,745. This amount represents a weighted-average of the various expected outcomes multiplied by their respective probabilities. As is always the case when averaging numbers, the sums of the positive and negative differences between each value included in the average and the average itself are always equal. This explains why the expected losses and expected residual returns both equal $624,113. Therefore, the expected variability in both directions is the sum of the two absolute values (i.e., $624,113 + $624,113 = $1,248,226).

Another important point to note is that the terms "expected losses" and "expected residual returns" are not associated with traditional GAAP income or cash flow mea-

sures. The entity illustrated above has positive expected cash flows under all six scenarios for all three years. Notwithstanding that fact, the computation shows that it will experience expected losses and expected residual returns—variations from expectation, positive or negative, that could occur as a result of operations or of changes in the fair value of the property. This will always be the case, irrespective of how profitable an entity is or how much cash flow it generates.

15. For each scenario, the facts are analyzed to determine which of the variable interest holders will bear the expected losses. There were no silos included in the VIE, therefore only a single primary beneficiary determination is required. The results of the analysis are aggregated as follows:

	Expected losses
Scenario 1	$(140,259)
Scenario 2	(283,505)
Scenario 3	(200,349)
	$(624,113)

Scenario	*Estimated residual value of store*	*Expected losses*	*Clubco*	*3rd-party guarantor*	*At-risk equity holders of entity*	*Mortgage Lender*	*Notes*
1	7,000,000	$(140,259)	$(140,259)				$7.5MM guarantee $7 MM residual
2	8,000,000	(283,505)			$(283,505)		
3	9,000,000	(200,349)			(200,349)		
Excess of share of losses over equity				(258,604)	(258,604)		
		$(624,113)	$(140,259)	$(258,604)	$(225,250)	$ --	
		100%	22%	42%	36%	0%	

Total equity at risk is $225,250 which would not be sufficient for the entity to absorb the expected losses of $624,113 without receiving additional subordinated financial support. Consequently, the Entity (Lawrence Lessor, LLC) by definition is a variable interest entity.

Note that, based on the analysis of the expected losses, no variable interest holder will absorb a majority (>50%) of the Entity's losses. Consequently, the expected residual returns need to be analyzed.

Scenario	*Estimated residual value of store*	*Expected residual returns*	*Clubco*	*At-risk equity holders of entity*	*Guarantor*	*Notes*
4	$10,000,000	$190,965	$190,965			Exercise of $9MM Option
5	12,000,000	252,778	252,778			Exercise of $9MM Option
6	13,000,000	180,370	180,370			Exercise of $9MM Option
		$624,113	$624,113			
		100%	100%			

16. Since 100% of the expected residual returns will be received by Clubco, it is the primary beneficiary, the party that is required to consolidate Lawrence Lessor, LLC in its financial statements.

Lease or Sale—The Interplay of Lease and Revenue Recognition Accounting

ASC 840-10-35, determining whether an arrangement contains a lease. ASC 840 defines a lease as "an agreement conveying the right to use property, plant, or equipment (land and/or depreciable assets) usually for a stated period of time." ASC 840-10-35 provides guidance on determining when all or part of an arrangement constitutes a lease.

Scope of ASC 840-10-35. Property, plant, or equipment, as the term is used in ASC 840, includes only land and/or depreciable assets. Therefore, inventory (including equipment parts inventory) cannot be the subject of a lease because inventory is not depreciable. Although specific property, plant, or equipment may be explicitly identified in an arrange-

ment, it is not the subject of a lease if the arrangement can be fulfilled without using the specified property, plant, or equipment. For example, if the owner/seller is obligated to deliver a specified quantity of goods or services but can provide those goods or services using property, plant, or equipment other than that specified in the arrangement, then the arrangement does not contain a lease.

In addition, ASC 840 contains specific scope exceptions with respect to agreements concerning

1. Exploration or exploitation of natural resources (e.g., oil, gas, minerals, and timber).
2. Intangible licensing rights (e.g., motion pictures, plays, manuscripts, patents, and copyrights).

Lease treatment is not precluded in situations where the owner or manufacturer of the property has extended a product warranty that includes a provision for replacement of the property if it is not operating adequately. Similarly, if the arrangement includes a provision permitting the equipment owner the right to substitute other equipment on or after a specified date, irrespective of the reason, the arrangement can still qualify as a lease.

Right to use property, plant, or equipment. The right to use the specified property, plant, or equipment is conveyed if any one of the following conditions is met:

- A *party* (for the purpose of this discussion, we will refer to this party, the potential lessee, as "the recipient" of the rights) has the ability or right to operate the property, plant, or equipment or direct others to do so as the recipient specifies, while attaining or controlling more than a minor portion of the output (or service utility),
- The recipient has the ability or right to control physical access to the specified property, plant, or equipment while attaining or controlling more than a minor portion of the output (or other service utility), or
- Analysis of the relevant facts and circumstances indicates that it is remote (as that term is used in ASC 450-20) that a party (or parties) other than the recipient will attain more than a minor amount of the output (or other service utility) that will be produced or generated by the specified property, plant, or equipment during the term of the arrangement, *and* the price that the recipient will pay for the output is neither contractually fixed per unit of output nor equal to the market price per unit of output at the time delivery of the output is received.

Timing of initial assessment and subsequent reassessments. The assessment of whether an arrangement contains a lease is to be made at the inception of the arrangement. A reassessment of whether the arrangement contains a lease is to be made only if (a) the contractual terms are modified, (b) a renewal option is exercised or the parties to the arrangement agree on an extension of its term, (c) there is a change in the determination as to whether or not fulfillment of the arrangement is dependent on the property, plant, or equipment that was originally specified, or (d) the originally specified property and equipment undergoes a substantial physical change. Remeasurement/redetermination is not permitted merely because of a change in an estimate made at inception (e.g., the number of expected units of output or the useful life of the equipment).

Aggregation of separate contracts. There is a rebuttable presumption that separate contracts between the same parties (or related parties) that are executed on or near the same date were negotiated together as a package.

This issue also provides accounting guidance for any recognized assets and liabilities existing at the time that an arrangement (or a portion of an arrangement) either ceases to qualify as a lease or commences to qualify as a lease due to a reassessment in the circumstances as described above.

Sales with a guaranteed minimum resale value. In order to provide sales incentives, manufacturers sometimes include in a sales contract, a guarantee that the purchaser will, upon disposition of the property, receive a minimum resale amount. Upon disposition, the manufacturer either reacquires the property at the agreed-upon minimum price or reimburses the purchaser for any shortfall between the actual sales proceeds and the guaranteed amount.

ASC 605-50-60 states that transactions containing guarantees of resale value of equipment by a manufacturer are to be accounted for as leases and not as sales. The minimum lease payments used to determine if the criteria have been met for lessor sales-type lease accounting, described later in this chapter, are computed as the difference between the proceeds received from the transferee/lessee upon initial transfer of the equipment and the amount of the residual value guarantee on its first contractual exercise date.

If the lease is accounted for as an operating lease because it does not qualify for sales-type lease accounting (as discussed and illustrated later in this chapter), the manufacturer/lessor is to record the proceeds received at inception as a liability which is subsequently reduced by crediting revenue pro rata from the inception of the lease until the first guarantee exercise date so that, on that exercise date, the remaining liability is the guaranteed residual amount. If the lessee elects, under the terms of the arrangement, to continue to use the leased asset after the first exercise date, the manufacturer/lessor will continue to amortize the liability for the remaining residual amount to revenue to reduce it further to any remaining guarantee, if applicable.

The foregoing prescribed accounting is followed by manufacturers even when there is dealer involvement in the transaction when it is the manufacturer who is responsible for the guarantee to the purchaser.

ASC 460-10-55-17 states that ASC 460-10-55 does not apply to these transactions irrespective of whether they are accounted for as operating leases or sales-type leases because, in either case, the underlying of such a guarantee is an asset owned by the guarantor.

Equipment sold and subsequently repurchased subject to an operating lease. ASC 605-15-25-5 specifies that if four conditions are satisfied, a manufacturer can recognize a sale at the time its product is transferred to a dealer for subsequent sale to a third-party customer even if this ultimate customer (the dealer's customer) enters into an operating lease agreement with the same manufacturer or the manufacturer's finance affiliate.

1. The dealer must be an independent entity that conducts business separately with manufacturers and customers,
2. The passage of the product from the manufacturer to the dealer fully transfers ownership,
3. The manufacturer (or finance affiliate) has no obligation to provide a lease arrangement for the dealer's customer, and
4. The dealer's customer is in control of selecting which of the many financing options available will be used.

Lessee Classification

For accounting and reporting purposes the lessee has two possible classifications for a lease.

1. Operating
2. Capital

The proper classification of a lease is determined by the circumstances surrounding the transaction. According to ASC 840, if substantially all of the benefits and risks of ownership have been transferred to the lessee, the lessee records the lease as a capital lease at its

inception. Substantially all of the risks or benefits of ownership are deemed to have been transferred if any one of the following criteria is met:

1. The lease transfers ownership to the lessee by the end of the lease term.
2. The lease contains a bargain purchase option.
3. The lease term is equal to 75% or more of the estimated economic life of the leased property, and the beginning of the lease term does not fall within the last 25% of the total economic life of the leased property.
4. The present value (PV) of the minimum lease payments at the beginning of the lease term is 90% or more of the fair value to the lessor less any investment tax credit[3] retained by the lessor. This requirement cannot be used if the lease's inception is in the last 25% of the useful economic life of the leased asset. The interest rate, used to compute the PV, is the incremental borrowing rate of the lessee unless the implicit rate is available and lower. For the purpose of this test, lease structuring fees or lease administration fees paid by the lessee to the lessor are included as part of the minimum lease payments (ASC 840-10-25).

If a lease agreement meets none of the four criteria set forth above, it is classified as an operating lease by the lessee.

Lessor Classification

There are four possible classifications that apply to a lease from the standpoint of the lessor.

1. Operating
2. Sales-type
3. Direct financing
4. Leveraged

The conditions surrounding the origination of the lease determine its classification by the lessor. If the lease meets any one of the four criteria specified above for lessees and both of the qualifications set forth below, the lease is classified as either a sales-type lease, direct financing lease, or leveraged lease depending upon the conditions present at the inception of the lease.

1. Collectibility of the minimum lease payments is reasonably predictable
2. No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor under the lease

If a lease transaction does not meet the criteria for classification as a sales-type lease, a direct financing lease, or a leveraged lease as specified above, it is classified by the lessor as an operating lease. The classification testing is performed prior to considering the proper accounting treatment.

It is a common practice in equipment leasing transactions for the lessor to obtain, from an unrelated third party, a full or partial guarantee of the residual value of a portfolio of leased assets. These transactions are structured in such a manner that the third-party guarantor provides a guarantee of the aggregate residual value of the portfolio but does not individually guarantee the residual value of any of the individually leased assets included in that portfolio. To the extent that a specific leased asset's residual value exceeds the guaranteed

---

[3] *See the Definitions of Terms at the beginning of this chapter for details regarding the investment tax credit (ITC).*

minimum amount, that excess is used to offset shortfalls relating to other specific leased assets whose residual values are below the guaranteed minimum amount.

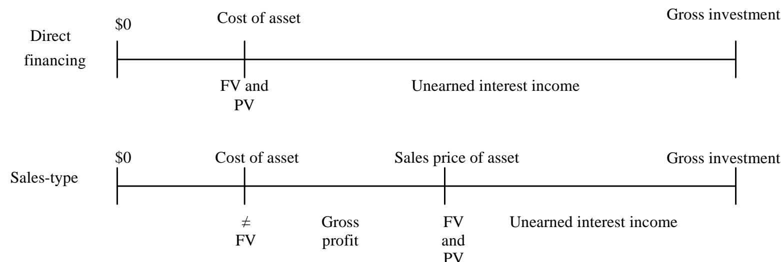
In ASC 840-30-S99, the SEC staff observer announced the SEC staff's position that the expected proceeds from these types of portfolio residual guarantees are to be *excluded* from minimum lease payments in computing the present value of the minimum lease payments for the purpose of determining the lessor's classification of the lease transaction. The SEC believes this treatment to be appropriate because, under the terms of this portfolio guarantee, the lessor is unable to determine, at lease inception, the guaranteed residual amount of any individually leased asset.

Distinctions among sales-type, direct financing, and leveraged leases. A lease is classified as a sales-type lease when the criteria set forth above have been met and the lease transaction is structured in such a way that the lessor (generally a manufacturer or dealer) recognizes a profit or loss on the transaction in addition to interest income. In order for this to occur, the fair value of the property (FV) must be different from the cost (carrying value). The essential substance of this transaction is that of a sale, and thus its name. Common examples of sales-type leases: (1) when a customer of an automobile dealership opts to lease a car in lieu of an outright purchase, and (2) the re-lease of equipment coming off an expiring lease. Note however, that a lease involving real estate must transfer title (i.e., criterion 1. above) by the end of the lease term for the lessor to classify the lease as a sales-type lease.

A direct financing lease differs from a sales-type lease in that the lessor does not realize a profit or loss on the transaction other than interest income. In a direct financing lease, the fair value of the property at the inception of the lease is equal to the cost (carrying value). This type of lease transaction most often involves lessor entities engaged in financing operations. The lessor (a bank, or other financial institution) purchases the asset and then leases the asset to the lessee. This transaction merely replaces the conventional lending transaction where the borrower uses the borrowed funds to purchase the asset. There are many economic reasons why the lease transaction is considered. They are as follows:

1. The lessee (borrower) is able to obtain 100% financing
2. Flexibility of use for the tax benefits
3. The lessor receives the equivalent of interest as well as an asset with some remaining value at the end of the lease term

In summary, it may help to visualize the following chart when considering the classification of a lease from the lessor's standpoint:



One form of a direct financing lease is a leveraged lease which is discussed later in this chapter. This type is mentioned separately because it receives a different accounting treatment by the lessor. A leveraged lease meets all the definitional criteria of a direct financing lease, but differs because it involves at least three parties: a lessee, a long-term creditor, and a lessor (commonly referred to as the equity participant). Other characteristics of a leveraged lease are as follows:

1. The financing provided by the long-term creditor must be without recourse to the general credit of the lessor, although the creditor may hold recourse with respect to the leased property. The amount of the financing must provide the lessor with substantial "leverage" in the transaction.
2. The lessor's net investment declines during the early years and rises during the later years of the lease term before its elimination.

Lessee Accounting

As discussed in the preceding section, there are two classifications that apply to a lease transaction from the standpoint of the lessee, operating or capital.

Operating leases. The accounting treatment accorded an operating lease is relatively simple; the rental payments are charged to expense as the payments are made or become payable. This assumes that the lease payments are being made on a straight-line basis (i.e., an equal payment per period over the lease term).

If the lease agreement calls for either an alternative payment schedule or a scheduled rent increase over the lease term, per ASC 840-20-25, the lease expense is recognized on a straight-line basis over the lease term unless another systematic and rational basis is a better representation of the actual physical usage of the leased property. In addition, the lessor may grant various incentives to the lessee during the lease term such as a rent holiday, or allowances to fund leasehold improvements. Incentives paid to or incurred on behalf of the lessee by the lessor are an inseparable part of the lease agreement. These amounts are recognized as reductions to rental expense on a straight-line basis over the term of a lease as described in the preceding paragraph.

In these instances, it is necessary to record either a prepaid asset or a liability depending upon the structure of the payment schedule. If the scheduled increase(s) is due to additional leased property, recognition is to be based on the portion of the leased property that is being utilized with the increased rents recognized over the years that the lessee has control over the use of the additional leased property.

Notice that in the case of an operating lease there is no balance sheet recognition of the leased asset because the substance of the lease is merely that of a rental. There is no reason to expect that the lessee will derive any future economic benefit from the leased asset beyond the lease term.

Capital leases. Recall that the classification of a lease is determined prior to the consideration of the accounting treatment. Therefore, it is necessary to first examine the lease transaction against the four criteria (transfer of title, bargain purchase option, 75% of useful life, or 90% of net FV). Should the lease agreement satisfy one of these, it is accounted for as a capital (also referred to as financing) lease.

The lessee records a capital lease as an asset and an obligation (liability) at an amount equal to the present value of the minimum lease payments at the beginning of the lease term. For the purposes of the 90% test, the present value is computed using the incremental borrowing rate of the lessee unless it is practicable for the lessee to determine the implicit rate used by the lessor, and the implicit rate is less than the incremental borrowing rate. The incremental borrowing rate is defined as the rate at lease inception at which the lessee would have been able to borrow over a loan term equivalent to the lease term had it chosen to purchase the leased asset. If the lessee determines a secured borrowing rate that is reasonable and consistent with the financing that would have been used, then it is acceptable to use a secured borrowing rate.

The asset is recorded at the lower of the present value of the minimum lease payments or the fair value of the asset. When the fair value of the leased asset is less than the present

value of the minimum lease payments, the interest rate used to amortize the lease obligation will differ from the interest rate used in the 90% test.

The interest rate used in the amortization will be the same as that used in the 90% test when the fair value is greater than or equal to the present value of the minimum lease payments. For purposes of this computation, the minimum lease payments are considered to be the payments that the lessee is obligated to make or can be required to make excluding executory costs such as insurance, maintenance, and taxes.

The minimum lease payments generally include the minimum rental payments, any guarantee of the residual value made by the lessee, and the penalty for failure to renew the lease, if applicable. If the lease includes a bargain purchase option (BPO), the amount required to be paid under the BPO is also included in the minimum lease payments.

The lease term used in this present value computation is the fixed, noncancelable term of the lease plus the following:

1. All periods covered by bargain renewal options
2. All periods for which failure to renew the lease imposes a penalty on the lessee
3. All periods covered by ordinary renewal options during which the lessee guarantees the lessor's debt on the leased property
4. All periods covered by ordinary renewals or extensions up to the date a BPO is exercisable
5. All periods representing renewals or extensions of the lease at the lessor's option

Remember, if the amount computed as the present value of the minimum lease payments exceeds the fair value of the leased property at the inception of the lease, the amount recorded is limited to the fair value.

The amortization of the leased asset will depend upon how the lease qualifies as a capital lease. If the lease transaction meets the criteria of either transferring ownership, or containing a bargain purchase option, then the asset arising from the transaction is amortized over the estimated useful life of the leased property. If the transaction qualifies as a capital lease because it meets either the 75% of useful life or 90% of FV criteria, the asset is amortized over the lease term. The conceptual rationale for this differentiated treatment arises because of the substance of the transaction. Under the first two criteria, the asset actually becomes the property of the lessee at the end of the lease term (or upon exercise of the BPO). In the latter situations, the title to the property remains with the lessor, and thus, the lessee ceases to have the right to use the property at the conclusion of the lease term.

The leased asset is amortized (depreciated) over the lease term if title does not transfer to the lessee, while the asset is depreciated in a manner consistent with the lessee's normal depreciation policy if the title is to eventually transfer to the lessee. This latter situation can be interpreted to mean that the asset is depreciated over the useful economic life of the leased asset. The treatment and method used to amortize (depreciate) the leased asset is very similar to that used for any other long-lived asset. The amortization entry requires a debit to amortization expense and a credit to accumulated amortization. The leased asset is not amortized below the estimated residual value.

In some instances when the property is to revert back to the lessor, there may be a guaranteed residual value. This is an amount that the lessee guarantees to the lessor. If the FV of the asset at the end of the lease term is greater than or equal to the guaranteed residual amount, the lessee incurs no additional obligation. On the other hand, if the FV of the leased asset is less than the guaranteed residual value, then the lessee must make up the difference, usually with a cash payment. The guaranteed residual value is often used as a tool to reduce the periodic payments by substituting the lump-sum amount at the end of the term that results from the guarantee. In any event the amortization must still take place based on the

estimated residual value. This results in a rational and systematic allocation of the expense to the periods of usage and avoids a large loss (or expense) in the last period as a result of the guarantee.

The annual (periodic) rent payments made during the lease term are allocated between a reduction in the obligation and interest expense in a manner such that the interest expense represents the application of a constant periodic rate of interest to the remaining balance of the lease obligation. This is commonly referred to as the effective interest method.

The following examples illustrate the treatment described in the foregoing paragraphs.

Example of accounting for a capital lease—Asset returned to lessor

1. The lease is initiated on 1/1/09 for equipment with an expected useful life of three years. The equipment reverts back to the lessor upon expiration of the lease agreement.
2. The FV of the equipment at lease inception is $135,000.
3. Three payments are due to the lessor in the amount of $50,000 per year beginning 12/31/09. An additional sum of $1,000 is to be paid annually by the lessee for insurance.
4. The lessee guarantees a $10,000 residual value on 12/31/11 to the lessor.
5. Irrespective of the $10,000 residual value guarantee, the leased asset is expected to have only a $1,000 salvage value on 12/31/11.
6. The lessee's incremental borrowing rate is 10%. (The lessor's implicit rate is unknown.)
7. The present value of the lease obligation is as follows:

PV of guaranteed residual value	= $10,000 ×	7513 *	= $ 7,513
PV of annual payments	= $50,000 ×	2.4869 **	= 124,345
			$131,858

* *The present value of an amount of $1 due in three periods at 10% is .7513.*
** *The present value of an ordinary annuity of $1 for three periods at 10% is 2.4869.*

The first step in dealing with any lease transaction is to classify the lease. In this case, the lease term is for three years, which is equal to 100% of the expected useful life of the asset. Note that the 90% test is also fulfilled as the PV of the minimum lease payments ($131,858) is greater than 90% of the FV (90% × $135,000 = $121,500). Thus, the lessee accounts for the lease as a capital lease.

In number 7. (above) the present value of the lease obligation is computed. Note that the executory costs (insurance) are not included in the minimum lease payments and that the incremental borrowing rate of the lessee was used to determine the present value. This rate was used because the lessor's implicit rate was not determinable.

NOTE: In order to have used the implicit rate it would have to have been less than the incremental borrowing rate.

The entry necessary to record the lease on 1/1/09 is

Leased equipment	131,858	
Lease obligation		131,858

Note that the lease is recorded at the present value of the minimum lease payments that, in this case, is less than the FV. If the present value of the minimum lease payments had exceeded the FV, the lease would have been recorded at the FV.

The next step is to determine the proper allocation between interest and reduction of the lease obligation for each lease payment. This is done using the effective interest method as illustrated below.

Year	Cash payment	Interest expense	Reduction in lease obligation	Balance of lease obligation
Inception of lease				$131,858
2009	$50,000	$13,186	$36,814	95,044
2010	50,000	9,504	40,496	54,548
2011	50,000	5,452	44,548	10,000

The interest is calculated at 10% (the incremental borrowing rate) of the balance of the lease obligation for each period, and the remainder of each $50,000 payment is allocated as a reduction in the lease obligation. The lessee is also required to pay $1,000 for insurance on an annual basis. The entries necessary to record all payments relative to the lease for each of the three years are shown below.

	12/31/09		*12/31/10*		*12/31/11*	
Insurance expense	1,000		1,000		1,000	
Interest expense	13,186		9,504		5,452	
Lease obligation	36,814		40,496		44,548	
Cash		51,000		51,000		51,000

The leased equipment recorded as an asset must also be amortized (depreciated). The initial unamortized balance is $131,858; however, as with any other long-lived asset, it cannot be amortized below the estimated residual value of $1,000 (note that it is amortized down to the actual estimated residual value, not the guaranteed residual value). In this case, the straight-line amortization method is applied over a period of three years. This three-year period represents the lease term, not the life of the asset, because the asset reverts back to the lessor at the end of the lease term. Therefore, the following entry will be made at the end of each year:

Amortization expense	43,619		
Accumulated amortization		43,619	[($131,858 – 1,000) ÷ 3]

Finally, on 12/31/11 we must recognize the fact that ownership of the property has reverted back to the owner (lessor). The lessee made a guarantee that the residual value would be $10,000 on 12/31/11; as a result, the lessee must make up the difference between the guaranteed residual value and the actual residual value with a cash payment to the lessor. The following entry illustrates the removal of the leased asset and obligation from the lessee's accounting records:

Lease obligation	10,000	
Accumulated amortization	130,858	
Cash		9,000
Leased equipment		131,858

The foregoing example illustrated a situation where the asset was to be returned to the lessor. Another situation exists (under BPO or transfer of title) where ownership of the asset is expected to transfer to the lessee at the end of the lease term. Remember that leased assets are amortized over their useful life when title transfers or a bargain purchase option exists. At the end of the lease, the balance of the lease obligation should equal the guaranteed residual value, the bargain purchase option price, or termination penalty for failure to renew the lease.

Example of accounting for a capital lease—Asset ownership transferred to lessee

1. A three-year lease is initiated on 1/1/09 for equipment with an expected useful life of five years.
2. Three annual lease payments of $52,000 are required beginning on 1/1/09 (note that the payment at the beginning of the year changes the PV computation from the previous example). The lessee pays $2,000 per year for insurance on the equipment and this amount is included in the annual payments.
3. The lessee can exercise a bargain purchase option on 12/31/11 for $10,000. The expected residual value at 12/31/11 is $18,000.
4. The lessee's incremental borrowing rate is 10% (the lessor's implicit rate is unknown).
5. The fair value of the leased property at the inception of the lease is $140,000.

Once again, the classification of the lease must be determined prior to computing the accounting entries to record it. This lease is classified as a capital lease because it contains a BPO. In this case, the 90% test is also fulfilled.

The PV of the lease obligation is computed as follows:

PV of bargain purchase option	=	$10,000	×	7513 *	= $ 7,513
PV of annual payments	=	($52,000 – $2,000)	×	2.4869 **	= 136,755
					$144,268

* *.7513 is the PV of an amount due in three periods at 10%.*
** *2.7355 is the PV of an annuity due for three periods at 10%.*

Since the lessee pays $2,000 a year for insurance, this payment is treated as executory costs and excluded from the calculation of the present value of the annual payments. Note that the present value of the lease obligation is greater than the FV of the asset. Because of this, the lease obligation must be recorded at the FV of the leased asset.

1/1/09 Leased equipment	140,000	
Obligation under capital lease		140,000

According to ASC 840, the allocation between interest and principal is determined so that interest expense is computed using a constant periodic rate of interest applied to the remaining balance of the obligation. If the FV of the leased asset is greater than or equal to the PV of the lease obligation, the interest rate used is the same as that used to compute the PV (i.e., the incremental borrowing rate or the implicit rate). In cases such as this when the PV exceeds the FV of the leased asset, a new rate must be computed through a series of manual trial and error calculations. Alternatively, spreadsheet or loan amortization software can be used to solve for the unknown effective interest rate. In this situation the interest rate used was 13.267%. The amortization of the lease takes place as follows:

Date	*Cash payment*	*Interest expense*	*Reduction in lease obligation*	*Balance of lease obligation*
Inception of lease				$140,000
1/1/09	$50,000	$ --	$50,000	90,000
1/1/10	50,000	11,940	38,060	51,940
1/1/11	50,000	6,891	43,109	8,831
12/31/11	10,000	1,169	8,831	--

The following entries are required in years 2009 through 2011 to recognize the payment and amortization.

		2009		*2010*		*2011*	
1/1	Insurance expense	2,000		2,000		2,000	
	Obligation under capital lease	50,000		38,060		43,109	
	Accrued interest payable			11,940		6,891	
	Cash		52,000		52,000		52,000
12/31	Interest expense	11,940		6,891		1,169	
	Accrued interest payable		11,940		6,891		1,169
12/31	Amortization expense	24,400		24,400		24,400	
	Accumulated amortization		24,400		24,400		24,400
	[($140,000 – $18,000) ÷ 5 years)]						
12/31	Obligation under capital lease					8,831	
	Accrued interest payable					1,169	
	Cash						10,000

Lessor Accounting

As previously noted, there are four classifications of leases with which a lessor must be concerned. They are operating, sales-type, direct financing, and leveraged.

Operating leases. As in the case of the lessee, the operating lease requires a less complex accounting treatment. The payments received by the lessor are recorded as rent revenues in the period in which the payment is received or becomes receivable. As with the lessee, if either the rentals vary from a straight-line basis, the lease agreement contains a scheduled rent increase over the lease term, or the lessor grants incentives to the lessee such as a rent holiday or leasehold improvement allowance, the revenue is recorded on a straight-line basis unless an alternative basis of systematic and rational allocation is more representative of the time pattern of physical usage of the leased property. If the scheduled

increase(s) is due to the lessee leasing additional property under a master lease agreement, the increase is allocated proportionally to the additional leased property and recognized on a straight-line basis over the years that the lessee has control over the additional leased property. ASC 840-20-25 prescribes that, in this case, the total revised rent be allocated between the previously leased property and the additional leased property based on their relative fair values.

The lessor presents the leased property on the balance sheet under the caption "Investment in leased property." This caption is shown with or near the fixed assets of the lessor, and depreciated in the same manner as the lessor's other fixed assets.

Any initial direct costs are amortized over the lease term as the related lease revenue is recognized (i.e., on a straight-line basis unless another method is more representative). However, these costs may be charged to expense as incurred if the effect is not materially different from straight-line amortization.

Any incentives made by the lessor to the lessee are treated as reductions of rent and recognized on a straight-line basis over the term of the lease.

In most operating leases, the lessor recognizes rental income over the lease term and does not measure or recognize any gain or loss on any differential between the fair value of the property and its carrying value. One exception to this rule is set forth in ASC 840-40. The exception applies when an operating lease involving real estate is not classified as a sales-type lease because ownership to the property does not transfer to the lessee at the end of the lease term. In this case, if at the inception of the lease the fair value of the property is less than its carrying amount, the lessor must recognize a loss equal to that difference at the inception of the lease.

Sales-type leases. In accounting for a sales-type lease, it is necessary for the lessor to determine the following amounts:

1. Gross investment
2. Fair value of the leased asset
3. Cost

Note that, following the promulgation of ASC 820, there was some confusion over the definition of fair value to be employed for purposes of lease determination and measurement. ASC 820 does not apply to ASC 840 determinations of lease classifications or measurements. However, ASC 820 is applicable to the determinations to be made in business combinations accounted for under ASC 805.

From these amounts, the remainder of the computations necessary to record and account for the lease transaction can be made. The first objective is to determine the numbers necessary to complete the following entry:

Lease receivable	xx	
Cost of goods sold	xx	
Sales		xx
Inventory		xx
Unearned interest		xx

The gross investment (lease receivable) of the lessor is equal to the sum of the minimum lease payments (excluding executory costs) plus the unguaranteed residual value. The difference between the gross investment and the present value of the two components of gross investment (minimum lease payments and unguaranteed residual value) is recorded as the unearned interest revenue. The present value is computed using the lease term and implicit interest rate (both of which were discussed earlier). The lease term used in this computation includes any renewal options exercisable at the discretion of the lessor. The resulting unearned interest revenue is to be amortized into income using the effective interest method.

This will result in a constant periodic rate of return on the net investment (the net investment is the gross investment less the unearned income).

Recall from our earlier discussion that the fair value (FV) of the leased property is, by definition, equal to the normal selling price of the asset adjusted by any residual amount retained (this amount retained can be exemplified by an unguaranteed residual value, investment credit, etc.). The adjusted selling price used for a sales-type lease is equal to the present value of the minimum lease payments. Thus, we can say that the normal selling price less the residual amount retained is equal to the PV of the minimum lease payments.

The cost of goods sold to be charged against income in the period of the sale is computed as the historic cost or carrying value of the asset (most likely inventory) plus any initial direct costs, less the present value of the unguaranteed residual value. The difference between the adjusted selling price and the amount computed as the cost of goods sold is the gross profit recognized by the lessor at the inception of the lease (sale). Thus, a sales-type lease generates two types of revenue for the lessor.

1. The gross profit on the sale
2. The interest earned on the lease receivable

Note that if the sales-type lease involves real estate, the lessor must account for the transaction under the provisions of ASC 360 in the same manner as a seller of the same property (see Chapter 10).

The application of these points is illustrated in the example below.

Example of accounting for a sales-type lease

Price Inc. is a manufacturer of specialized equipment. Many of its customers do not have the necessary funds or financing available for outright purchase. Because of this, Price offers a leasing alternative. The data relative to a typical lease are as follows:

1. The noncancelable fixed portion of the lease term is five years. The lessor has the option to renew the lease for an additional three years at the same rental. The estimated useful life of the asset is ten years.
2. The lessor is to receive equal annual payments over the term of the lease. The leased property reverts back to the lessor upon termination of the lease.
3. The lease is initiated on 1/1/09. Payments are due annually on 12/31 for the duration of the lease term.
4. The cost of the equipment to Price Inc. is $100,000. The lessor incurs costs associated with the inception of the lease in the amount of $2,500.
5. The selling price of the equipment for an outright purchase is $150,000.
6. The equipment is expected to have a residual value of $15,000 at the end of five years and $10,000 at the end of eight years.
7. The lessor desires a return of 12% (the implicit rate).

The first step is to calculate the annual payment due to the lessor. In order to yield the lessor's desired return, the present value (PV) of the minimum lease payments must equal the selling price adjusted for the present value of the residual amount. The present value is computed using the implicit interest rate and the lease term. In this case, the implicit rate is given as 12% and the lease term is eight years (the fixed noncancelable portion plus the renewal period). Thus, the computation would be as follows:

Normal selling price – PV of residual value = PV of minimum lease payments

Or, in this case,

$150,000 – (.40388* × $10,000 = $4,038.80)	=	4.96764** × Annual minimum lease payment
$\frac{\$145,961.20}{4.96764}$	=	Annual minimum lease payment
$ 29,382.40	=	Annual minimum lease payment

* *.40388 is the present value of an amount of $1 due in eight periods at a 12% interest rate.*
** *4.96764 is the present value of an annuity of $1 for eight periods at a 12% interest rate.*

Prior to examining the accounting implications of the lease, we must first determine the lease classification. Assume that there are no uncertainties regarding the lessor's costs, and the collectibility of the lease payments is reasonably assured. In this example, the lease term is eight years (discussed above) while the estimated useful life of the asset is ten years; thus, this lease is not an operating lease because the lease term covers 80% of the asset's estimated useful life. This exceeds the previously discussed 75% criterion. (Note that it also meets the 90% of FV criterion because the PV of the minimum lease payments of $145,961.20 is greater than 90% of the FV [90% × $150,000 = $135,000]). Next it must be determined if this is a sales-type, direct financing, or leveraged lease. To do this, examine the FV or selling price of the asset and compare it to the cost. Because the two are not equal, this is a sales-type lease.

Next, obtain the figures necessary for the lessor to record the entry. The gross investment is the total minimum lease payments plus the unguaranteed residual value or

($29,382.40 × 8 = $235,059.20) + $10,000 = $245,059.20

The cost of goods sold is the historical cost of the inventory ($100,000) plus any initial direct costs ($2,500) less the PV of the unguaranteed residual value ($10,000 × .40388 = $4,038.80). Thus, the cost of goods sold amount is $98,461.20 (= $100,000 + $2,500 – $4,038.80). Note that the initial direct costs will require a credit entry to record their accrual (accounts payable) or payment (cash). The inventory account is credited for the carrying value of the asset, in this case $100,000.

The adjusted selling price is equal to the PV of the minimum payments, or $145,961.20. Finally, the unearned interest revenue is equal to the gross investment (i.e., lease receivable) less the present value of the components making up the gross investment (the present values of the minimum annual lease payments of $29,382.40 and the unguaranteed residual of $10,000). The computation is [$245,059.20 – ($29,382.40 × 4.96764 = $145,961.20) – ($10,000 × .40388 = 4,038.80) = $95,059.20]. Therefore, the entry necessary for the lessor to record the lease is

Lease receivable	245,059.20	
Cost of goods sold	98,461.20	
Inventory		100,000.00
Sales		145,961.20
Unearned interest		95,059.20
Accounts payable (initial direct costs)		2,500.00

The next step in accounting for a sales-type lease is to determine the proper handling of each payment. Both principal and interest are included in each payment. Interest is recognized using the effective interest rate method so that an equal rate of return is earned each period over the term of the lease. This will require setting up an amortization schedule as illustrated below.

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception of lease				$150,000.00
2009	$ 29,382.40	$18,000.00	$ 11,382.40	138,617.00
2010	29,382.40	16,634.11	12,748.29	125,869.31
2011	29,382.40	15,104.32	14,278.08	111,591.23
2012	29,382.40	13,390.95	15,991.45	95,599.78
2013	29,382.40	11,471.97	17,910.43	77,689.35
2014	29,382.40	9,322.72	20,059.68	57,629.67
2015	29,382.40	6,915.56	22,466.84	35,162.83
2016	29,382.40	4,219.57	25,162.83	10,000.00
	$235,059.20	$95,059.20	$140,000.00	

A few of the columns need to be elaborated upon. First, the net investment is the gross investment (lease receivable) less the unearned interest. Note that at the end of the lease term, the net investment is equal to the estimated residual value. Also note that the total interest earned over the lease term is equal to the unearned interest at the beginning of the lease term.

The entries below illustrate the proper accounting for the receipt of the lease payment and the amortization of the unearned interest in the first year.

Cash	29,382.40	
Lease receivable		29,382.40
Unearned interest	18,000.00	
Interest revenue		18,000.00

Note that there is no entry to recognize the principal reduction. This is done automatically when the net investment is reduced by decreasing the lease receivable (gross investment) by $29,382.40 and the unearned interest account by only $18,000. The $18,000 is 12% (implicit rate) of the net investment. These entries are to be made over the life of the lease.

At the end of the lease term the asset is returned to the lessor and the following entry is required:

Asset	10,000	
Lease receivable		10,000

Direct financing leases. The accounting for a direct financing lease holds many similarities to that for a sales-type lease. Of particular importance is that the terminology used is much the same; however, the treatment accorded these items varies greatly. Again, it is best to preface our discussion by determining our objectives in the accounting for a direct financing lease. Once the lease has been classified, it must be recorded. In order to do this, the following numbers must be obtained:

1. Gross investment
2. Cost
3. Residual value

As noted, a direct financing lease generally involves a leasing company or other financial institution and results in only interest income being earned by the lessor. This is because the FV (selling price) and the cost are equal and, therefore, no profit is recognized on the actual lease transaction. Note how this is different from a sales-type lease that involves both a profit on the transaction and interest income over the lease term. The reason for this difference is derived from the conceptual nature underlying the purpose of the lease transaction. In a sales-type lease, the manufacturer (distributor, dealer) is seeking an alternative means to finance the sale of the product, whereas a direct financing lease is a result of the consumer's need to finance an equipment purchase through a third party. Because the consumer is unable to obtain conventional financing, he or she turns to a leasing company that will purchase the desired asset and then lease it to the consumer. Here the profit on the transaction remains with the manufacturer while the interest income is earned by the leasing company.

Like a sales-type lease, the first objective is to determine the amounts necessary to complete the following entry:

Lease receivable	xxx	
Asset		xxx
Unearned interest		xx

The gross investment is still defined as the minimum amount of lease payments exclusive of any executory costs plus the unguaranteed residual value. The difference between the gross investment as determined above and the cost (carrying value) of the asset is to be recorded as the unearned interest income because there is no manufacturer's/dealer's profit earned on the transaction. The following entry would be made to record the initial direct costs:

Initial direct costs	xx	
Cash (or accounts payable)		xx

The net investment in the lease is defined as the gross investment less the unearned interest income plus the unamortized initial direct costs related to the lease. Initial direct costs are defined in the same way that they were for purposes of the sales-type lease; however, the accounting treatment is different. For a direct financing lease, the unearned lease (interest) income and the initial direct costs are amortized to income over the lease term to yield a constant effective rate of interest on the net investment. Thus, the effect of the initial direct costs is to reduce the implicit interest rate, or yield, to the lessor over the life of the lease.

An example follows that illustrates the preceding principles.

Example of accounting for a direct financing lease

Edwards, Inc. needs new equipment to expand its manufacturing operation; however, it does not have sufficient capital to purchase the asset at this time. Because of this, Edwards has employed Samuels Leasing to purchase the asset. In turn, Edwards (the lessee) will lease the asset from Samuels (the lessor). The following information applies to the terms of the lease:

Lease information

1. A three-year lease is initiated on 1/1/09 for equipment costing $131,858 with an expected useful life of five years. FV at 1/1/09 of the equipment is $131,858.
2. Three annual payments are due to the lessor beginning 12/31/09. The property reverts back to the lessor upon termination of the lease.
3. The unguaranteed residual value at the end of year three is estimated to be $10,000.
4. The annual payments are calculated to give the lessor a 10% return (implicit rate).
5. The lease payments and unguaranteed residual value have a PV equal to $131,858 (FMV of asset) at the stipulated discount rate.
6. The annual payment to the lessor is computed as follows:

PV of residual value	=	$10,000 × .7513* = $7,513
PV of lease payments	=	Selling price – PV of residual value
	=	$131,858 – 7,513 = $124,345
Annual payment	=	$\frac{\$124,345}{PV_3, 10\%} = \frac{\$124,345}{2.4869^{**}} = \$50,000$

* *.7513 is the PV of an amount due in three periods at 10%.*
** *2.4869 is the PV of an annuity of $1 for three periods at a 10% interest rate.*

7. Initial direct costs of $7,500 are incurred by Samuels in the lease transaction.

As with any lease transaction, the first step must be to determine the proper classification of the lease. In this case, the PV of the lease payments ($124,345) exceeds 90% of the FV (90% × $131,858 = $118,672). Assume that the lease payments are reasonably assured and that there are no uncertainties surrounding the costs yet to be incurred by the lessor.

Next, determine the unearned interest and the net investment in the lease.

Gross investment in lease [(3 × $50,000) + $10,000]	$160,000
Cost of leased property	131,858
Unearned interest	$ 28,142

The unamortized initial direct costs are to be added to the gross investment in the lease and the unearned interest income is to be deducted to arrive at the net investment in the lease. The net investment in the lease for this example is determined as follows:

Gross investment in lease	$160,000
Add: Unamortized initial direct costs	7,500
	$167,500
Less: Unearned interest income	28,142
Net investment in lease	$139,358

The net investment in the lease (Gross investment – Unearned revenue) has been increased by the amount of initial direct costs. Therefore, the implicit rate is no longer 10%. We must recompute the implicit rate. The implicit rate is really the result of an internal rate of return calculation. We know that the lease payments are to be $50,000 per annum and that a residual value of $10,000 is expected at the end of the lease term. In return for these payments (inflows) we are giving up equipment (outflow) and incurring initial direct costs (outflows) with a net investment of $139,358 ($131,858 + $7,500). The only way to manually obtain the new implicit rate is through a trial and error calculation as set up below.

$$\frac{50{,}000}{(1+i)^1} + \frac{50{,}000}{(1+i)^2} + \frac{50{,}000}{(1+i)^3} + \frac{10{,}000}{(1+i)^3} = \$139{,}358$$

Where i = implicit rate of interest

This computation is most efficiently performed using either spreadsheet or present value software. In doing so, the $139,358 is entered as the present value, the contractual payment stream and residual value are entered, and the software iteratively solves for the unknown implicit interest rate.

In this case, the implicit rate is equal to 7.008%. Thus, the amortization table would be set up as follows:

	(a) Lease payments	*(b)* Reduction in unearned interest	*(c)* PV × implicit rate (7.008%)	*(d)* Reduction in initial direct costs (b-c)	*(e)* Reduction in PVI net invest. (a-b + d)	*(f)* PVI net invest. in lease $(f)_{(n+1)} = (f)_n - (e)$
						$139,358
1	$ 50,000	$13,186 (1)	$ 9,766	$3,420	$ 40,234	99,124
2	50,000	9,504 (2)	6,947	2,557	43,053	56,071
3	50,000	5,455 (3)	3,929	1,526	46,071	10,000
	$150,000	$28,145*	$20,642	$7,503	$129,358	

* *Rounded*

(b.1) $131,858 × 10% = $13,186
(b.2) [$131,858 – ($50,000 – 13,186)] × 10% = $9,504
(b.3) {$131,858 – [($50,000 – 9,504) + ($50,000 – 13,186)]} × 10% = $5,455

Here the interest is computed as 7.008% of the net investment. Note again that the net investment at the end of the lease term is equal to the estimated residual value.

The entry made to initially record the lease is as follows:

	Debit	Credit
Lease receivable* [($50,000 × 3) + 10,000]	160,000	
Asset acquired for leasing		131,858
Unearned interest		28,142

* *Also the "gross investment in lease."*

When the payment of (or obligation to pay) the initial direct costs occurs, the following entry must be made:

	Debit	Credit
Initial direct costs	7,500	
Cash (or accounts payable)		7,500

Using the schedule above, the following entries would be made during each of the indicated years:

	2009		*2010*		*2011*	
Cash	50,000		50,000		50,000	
Lease receivable*		50,000		50,000		50,000
Unearned interest	13,186		9,504		5,455	
Initial direct costs		3,420		2,557		1,526
Interest revenue		9,766		6,947		3,929

* *Also the "gross investment in lease."*

Finally, when the asset is returned to the lessor at the end of the lease term, it must be recorded by the following entry:

Used asset	10,000	
Lease receivable*		10,000

* *Also the "gross investment in lease."*

Leveraged leases. One of the more complex accounting subjects regarding leases is the accounting for a leveraged lease. Just as is the case with sales-type and direct financing leases, the classification of the lease by the lessor has no impact on the classification of the lease by the lessee. The lessee simply considers whether the lease qualifies as an operating lease or a capital lease. The lessor's accounting issues, however, are substantially more complex.

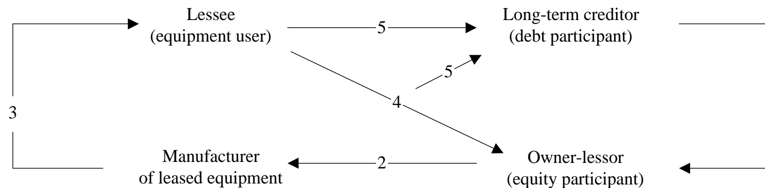
In order to qualify as a leveraged lease, a lease agreement must meet the following requirements, and the lessor must account for the investment tax credit (when in effect) in the manner described below.

NOTE: Failure to do so will result in the lease being classified as a direct financing lease.

1. The lease must meet the definition of a direct financing lease (the 90% of FV criterion does not apply).[4]
2. The lease must involve at least three parties.
   a. An owner-lessor (equity participant)
   b. A lessee
   c. A long-term creditor (debt participant)
3. The financing provided by the creditor is nonrecourse as to the general credit of the lessor and is sufficient to provide the lessor with substantial leverage.
4. The lessor's net investment (defined below) decreases in the early years and increases in the later years until it is eliminated.

This last characteristic poses the accounting issue.

The leveraged lease arose as a result of an effort to maximize the income tax benefits associated with a lease transaction. In order to accomplish this, it was necessary to involve a third party to the lease transaction (in addition to the lessor and lessee); a long-term creditor. The following diagram[5] illustrates the relationships in a leveraged lease agreement:



1. The owner-lessor obtains long-term financing from the creditor, generally in excess of 50% of the purchase price. ASC 840 indicates that the lessor must be provided with sufficient leverage in the transaction, therefore the 50%.
2. The owner then uses this financing along with his/her own funds to purchase the asset from the manufacturer.
3. The manufacturer delivers the asset to the lessee.

---

[4] *A direct financing lease must have its cost or carrying value equal to the fair value of the asset at the lease's inception. So even if the amounts are not significantly different, leveraged lease accounting may not be used.*

[5] *Adapted from "A Straightforward Approach to Leveraged Leasing" by Pierce R. Smith,* ***The Journal of Commercial Bank Lending,*** *July 1973, pp. 40-47.*

4. The lessee remits the periodic rent to the lessor.
5. The debt is guaranteed by either using the equipment as collateral, the assignment of the lease payments, or both, depending on the demands established by the creditor.

The FASB concluded that the entire lease agreement be accounted for as a single transaction and not a direct financing lease plus a debt transaction. The feeling was that the latter did not readily convey the lessor's net investment in the lease to the user of the financial statements. Thus, the lessor records the investment as a net amount. The gross investment is calculated as a combination of the following amounts:

1. The rentals receivable from the lessee, net of the principal and interest payments due to the long-term creditor
2. A receivable for the amount of the investment tax credit (ITC) to be realized on the transaction[6]
3. The estimated residual value of the leased asset
4. The unearned and deferred income consisting of
    a. The estimated pretax lease income (or loss), after deducting initial direct costs, remaining to be allocated to income
    b. The ITC remaining to be allocated to income over the remaining term of the lease[6]

The first three amounts described above are readily obtainable; however, the last amount, the unearned and deferred income, requires additional computations. In order to compute this amount, it is necessary to create a cash flow (income) analysis by year for the entire lease term. As described in 4. above, the unearned and deferred income consists of the pretax lease income (Gross lease rentals – Depreciation – Loan interest) and the unamortized investment tax credit. The total of these two amounts for all of the periods in the lease term represents the unearned and deferred income at the inception of the lease.

The amount computed as the gross investment in the lease (foregoing paragraphs) less the deferred taxes relative to the difference between pretax lease income and taxable lease income is the net investment for purposes of computing the net income for the period. In order to compute the periodic net income, another schedule must be completed that uses the cash flows derived in the first schedule and allocates them between income and a reduction in the net investment.

The amount of income is first determined by applying a rate to the net investment. The rate to be used is the rate that will allocate the entire amount of cash flow (income) when applied in the years in which the net investment is positive. In other words, the rate is derived in much the same way as the implicit rate (trial and error), except that only the years in which there is a positive net investment are considered. Thus, income is recognized only in the years in which there is a positive net investment.

The income recognized is divided among the following three elements:

1. Pretax accounting income
2. Amortization of investment tax credit
3. The tax effect of the pretax accounting income

The first two are allocated in proportionate amounts from the unearned and deferred income included in the calculation of the net investment. In other words, the unearned and deferred

---

[6] *The investment tax credit (ITC) was repealed, effective January 1, 1986. ITC was relevant only for property placed in service prior to this date. We continue to discuss these concepts because Congress has historically reinstated this credit during economic downturns to provide economic stimulus. See the Definitions of Terms section of this chapter for further details.*

income consists of pretax lease accounting income and ITC. Each of these is recognized during the period in the proportion that the current period's allocated income is to the total income (cash flow). The last item, the income tax effect, is recognized in income tax expense for the year. The income tax effect of any difference between pretax lease accounting income and taxable lease income is charged (or credited) to deferred income taxes.

When income tax rates change, all components of a leveraged lease must be recalculated from the inception of the lease using the revised after-tax cash flows arising from the revised income tax rates.

If, in any case, the projected cash receipts (income) are less than the initial investment, the deficiency is to be recognized as a loss at the inception of the lease. Similarly, if at any time during the lease period the aforementioned method of recognizing income would result in a future period loss, the loss is to be recognized immediately.

This situation may arise as a result of the circumstances surrounding the lease changing. Therefore, any estimated residual value and other important assumptions must be reviewed on a periodic basis (at least annually). Any change is to be incorporated into the income computations; however, there is to be no upward revision of the estimated residual value.

The following example illustrates the application of these principles to a leveraged lease:

Example of simplified leveraged lease

1. A lessor acquires an asset for $100,000 with an estimated useful life of three years in exchange for a $25,000 down payment and a $75,000 three-year note with equal payments due on 12/31 each year. The interest rate is 18%.
2. The asset has no residual value.
3. The PV of an ordinary annuity of $1 for three years at 18% is 2.17427.
4. The asset is leased for three years with annual payments due to the lessor on 12/31 in the amount of $45,000.
5. The lessor uses the ACRS method of depreciation (150% declining balance with a half-year convention in the year placed in service) for income tax purposes and elects to reduce the ITC rate to 4% as opposed to reducing the depreciable basis.
6. Assume a constant income tax rate throughout the life of the lease of 40%.

Chart 1 analyzes the cash flows generated by the leveraged leasing activities. Chart 2 allocates the cash flows between the investment in leveraged leased assets and income from leveraged leasing activities. The allocation requires finding that rate of return, which when applied to the investment balance at the beginning of each year that the investment amount is positive, will allocate the net cash flow fully to net income over the term of the lease. This rate can be found only by a computer program or by an iterative trial and error process. The example that follows has a positive investment value in each of the three years, and thus the allocation takes place in each time period. Leveraged leases usually have periods where the investment account turns negative and is below zero.

Allocating principal and interest on the loan payments is as follows:

($75,000 ÷ 2.17427 = $34,494)

Year	*Payment*	*Interest 18%*	*Principal*	*Balance*
Inception of lease	$ --	$ --	$ --	$75,000
1	34,494	13,500	20,994	54,006
2	34,494	9,721	24,773	29,233
3	34,494	5,261	29,233	--

Chart 1

	A	B	C	D	E	F	G	H	I
	Rent	*Depr.*	*Interest on loan*	*Taxable income (loss) (A-B-C)*	*Income tax payable (rcvbl.) Dx40%*	*Loan principal payments*	*ITC*	*Cash flow (A+G-C -E-F)*	*Cumulative cash flow*
Initial	$ --	$ --	$ --	$ --	$ --	$ --	$ --	$(25,000)	$(25,000)
Year 1	45,000	25,000	13,500	6,500	2,600	20,994	4,000	11,906	(13,094)
Year 2	45,000	38,000	9,721	(2,721)	(1,088)	24,773	--	11,594	(1,500)
Year 3	45,000	37,000	5,261	2,739	1,096	29,233	--	9,410	7,910
Total	$135,000	$100,000	$28,482	$ 6,518	$ 2,608	$75,000	$4,000	$ 7,910	

The chart below allocates the cash flows determined above between the net investment in the lease and income. Recall that the income is then allocated between pretax accounting income and the amortization of the investment credit. The income tax expense for the period is a result of applying the income tax rate to the current periodic pretax accounting income.

The amount to be allocated in total in each period is the net cash flow determined in column H above. The investment at the beginning of year one is the initial down payment of $25,000. This investment is then reduced on an annual basis by the amount of the cash flow not allocated to income.

Chart 2

	1	2	3	4	5	6	7
		Cash Flow Assumption				*Income Analysis*	
	Investment beginning of year	*Cash flow*	*Allocated to investment*	*Allocated to income*	*Pretax income*	*Income tax expense*	*Investment tax credit*
Year 1	$25,000	$11,906	$ 7,964	$3,942	$3,248	$1,300	$1,994
Year 2	17,036	11,594	8,908	2,686	2,213	885	1,358
Year 3	8,128	9,410	8,128	1,282	1,057	423	648
		$32,910	$25,000	$7,910	$6,518	$2,608	$4,000

Rate of return = 15.77%

1. Column 2 is the net cash flow after the initial investment, and columns 3 and 4 are the allocation based upon the 15.77% rate of return. The total of column 4 is the same as the total of column H in Chart 1.
2. Column 5 allocates column D in Chart 1 based upon the allocations in column 4. Column 6 allocates column E in Chart 1, (and, of course, is computed as 40% of column 5) and column 7 allocates column G in Chart 1 on the same basis.

The journal entries below illustrate the proper recording and accounting for the leveraged lease transaction. The initial entry represents the cash down payment, investment tax credit receivable, the unearned and deferred revenue, and the net cash to be received over the term of the lease.

The remaining journal entries recognize the annual transactions which include the net receipt of cash and the amortization of income.

	Year 1		*Year 2*		*Year 3*	
Rents receivable [Chart 1 (A-C-F)]	31,518					
Investment tax credit receivable	4,000					
Cash		25,000				
Unearned and deferred income		10,518				
Initial investment, Chart 2 (5+7) totals						
Cash	10,506		10,506		10,506	
Rent receivable		10,506		10,506		10,506
Net for all cash transactions, Chart 1 (A-C-F) line by line for each year						

	Year 1		*Year 2*		*Year 3*	
Income tax receivable (cash)	4,000					
Investment tax credit receivable		4,000				
Unearned and deferred income	5,242		3,571		1,705	
Income from leveraged leases		5,242		3,571		1,705

Amortization of unearned income, Chart 2 (5+7) line by line for each year

The following schedules illustrate the computation of deferred income tax amount. The annual amount is a result of the temporary difference created due to the difference in the timing of the recognition of income for GAAP and income tax purposes. The income for income tax purposes can be found in column D in Chart 1, while the income for GAAP purposes is found in column 5 of Chart 2. The actual amount of deferred income tax is the difference between the income tax computed with the temporary difference and the income tax computed without the temporary difference. These amounts are represented by the income tax payable or receivable as shown in column E of Chart 1 and the income tax expense as shown in column 6 of Chart 2. A check of this figure is provided by multiplying the difference between GAAP income and tax income by the annual rate.

Year 1		
Income tax payable	$ 2,600	
Income tax expense	(1,300)	
Deferred income tax (Dr)		$1,300
Taxable income	$ 6,500	
Pretax accounting income	(3,248)	
Difference	$ 3,252	
$3,252 × 40% = $1,300		

Year 2		
Income tax receivable	$ 1,088	
Income tax expense	885	
Deferred income tax (Cr)		$1,973
Taxable loss	$ 2,721	
Pretax accounting income	2,213	
Difference	$ 4,934	
$4,934 × 40% = $1,973		

Year 3		
Income tax payable	$ 1,096	
Income tax expense	(423)	
Deferred income tax (Dr)		$ 673
Taxable income	$ 2,739	
Pretax accounting income	(1,057)	
Difference	$ 1,682	
$1,682 × 40% = $673		

Interpretive guidance.

Changes in income tax rates. ASC 840 requires that the rate of return and allocation of income to be recalculated from the date of inception of a lease and a gain or loss recognized when an important assumption is changed. Per ASC 840-30-35, the effect on a leveraged lease of a change in the income tax rate is recognized as a gain or loss in the accounting period in which the rate changes. Deferred income taxes relating to the change are recognized in accordance with ASC 740.

Change or projected changes in the timing of cash flows relative to income taxes applicable to a leveraged lease transaction. The US Internal Revenue Service (IRS) may challenge the timing of the lessor's income tax deductions related to certain types of leveraged lease transactions.[7] Upon eventual settlement with the IRS regarding these matters, the eco-

[7] *The transactions that the IRS has reportedly challenged are commonly referred to as Lease In-Lease Out (LILO) and Sale In-Lease Out (SILO) transactions.*

nomics of the lease may be significantly less favorable from the standpoint of the lessor than they were at inception because the originally projected economic benefits resulted heavily from the ability to obtain income tax deductions for accelerated tax depreciation and interest expense that early in the lease term would typically exceed the rental income generated by the lease.

ASC 840 also provides that the projected timing of income tax cash flows attributable to a leveraged lease is to be reviewed annually during the lease term (or between annual reviews if events or changes in circumstances indicate that a change in timing either has occurred or is projected to occur in the future). Upon review, if the projected timing of the lease's income tax cash flows changes, the lessor will be required to recalculate, from the inception of the lease, the rate of return and the allocation of income to positive investment years in accordance with ASC 840-30-35. The net investment amount is adjusted to the recalculated amount with the change recognized as a gain or loss in the year that the assumptions changed. The pretax gain or loss is to be included in income from continuing operations before income taxes in the same financial statement caption in which leverage lease income is recognized with the income tax effect of the gain or loss reflected in the income tax provision or benefit.

The standard further provides that the recalculated cash flows are to exclude interest and penalties, advance payments, and deposits to the IRS (and presumably any other relevant state, local, or foreign taxing jurisdiction). The deposits or advance payments are to be included in the projected amount of the settlement with the taxing authority.

This accounting treatment is applicable only to changes or projected changes in the timing of income taxes that are directly attributable to the leveraged lease transaction. ASC 840-30-35 provides that reporting entities whose tax positions frequently vary between the alternative minimum tax (AMT) and regular tax are not required to annually recalculate the net investment in the lease unless there is an indication that the original assumptions about the leveraged lease's anticipated total after-tax net income were no longer valid.

Another factor to consider in the determination of the after-tax cash flows attributable to a leveraged lease transaction is the application of ASC 740-40-25, *Income Taxes—Recognition*. As discussed in detail in Chapter 17, the lessor is required to assess whether it is more likely than not (i.e., there is a greater than 50% chance probability) that the tax positions it takes or plans to take relative to the transaction would be sustained upon examination by the applicable taxing authorities. If the tax positions do not meet that recognition threshold, the tax benefits associated with taking those positions would be excluded from the leveraged lease calculations and, in fact, would give rise to a liability for unrecognized income tax benefits as well as an accrual for any applicable interest and penalties for all open tax years that are within the statute of limitations. This could obviously have a significant impact on the computed rate of return on the investment attributable to the years in which the net investment is positive.

If, however, the tax positions meet the recognition threshold, then they are subject to measurement to determine the maximum amount that is more than 50% probable of being sustained upon examination. The difference between the income tax position taken or planned to be taken on the income tax return (the "as-filed" benefit), and the amount of the benefit measured using the more than 50% computation, along with any associated penalties and interest, is recorded as the liability for unrecognized income tax benefits as previously described.

The only situation in which this liability, penalties, and interest would not be applicable would be if the tax positions were assessed to be highly certain tax positions, as defined in ASC 740-10-55. Under those circumstances, the entire tax benefit associated with the lease would be recognized and, of course, no interest or penalties would be recognized.

Applicability to real estate leases. The foregoing discussion involved the lease of a manufactured asset. ASC 840-40 clarifies that leases that involve land and buildings or leases in a sale-leaseback transaction potentially qualify as leveraged leases if the criteria to qualify as a leveraged lease are met.

Applicability to existing assets of the lessor. At the inception of a lease, the cost or carrying value and the fair value of an asset must be the same for the lease to be classified as a direct financing lease which is a necessary condition for leveraged lease treatment. The carrying amount of an existing asset before any write-down must equal its fair value in order for the lease to be classified as a leveraged lease (ASC 840-10-55).

Effect of lessor obligation to make capital contributions. In some leases, the lessee is granted a rent holiday with its lease payments not commencing until one to two years after lease inception. In order to ensure that there is sufficient cash flow to repay the debt on the leased property, the lessor contractually agrees to make equity contributions to fund the debt repayments during the holiday period. Even though the creditor often has recourse with respect to the general credit of the lessor for these equity contributions, this does not taint the nonrecourse character of the lease financing necessary for leveraged lease classification. In this situation, the lessor's obligation to make the equity contributions is to be recorded as a liability at present value at lease inception. This will increase the lessor's net investment on which it bases its pattern of income recognition (ASC 840-30-55).

Real Estate Leases

Real estate leases can be divided into the following four categories:

1. Leases involving land only
2. Leases involving land and building(s)
3. Leases involving real estate and equipment
4. Leases involving only part of a building

Leases involving only land.

Lessee accounting. If the lease agreement transfers ownership or contains a bargain purchase option, the lessee accounts for the lease as a capital lease, and records an asset and related liability equal to the present value of the minimum lease payments. If the lease agreement does not transfer ownership or contain a bargain purchase option, the lessee accounts for the lease as an operating lease.

Lessor accounting. If the lease gives rise to dealer's profit (or loss) and transfers ownership (i.e., title), the lease is classified as a sales-type lease and accounted for under the provisions of ASC 360-20 in the same manner as a seller of the same property (profit recognition on real estate sales is discussed in detail in Chapter 10). If the lease transfers ownership, both the collectibility and no material uncertainties criteria are met, but does not give rise to dealer's profit (or loss), the lease is accounted for as a direct financing or leveraged lease as appropriate. If the lease does not transfer ownership, but it contains a bargain purchase option and both the collectibility and no material uncertainties criteria are met, the lease is accounted for as a direct financing, leveraged, or operating lease using the same lessor classification criteria as any other lease. If the lease does not meet the collectibility and/or no material uncertainties criteria, the lease is accounted for as an operating lease.

Leases involving land and building.

Lessee accounting. If the agreement transfers title or contains a bargain purchase option, the lessee accounts for the agreement by separating the land and building components and capitalizing each separately. The land and building elements are allocated on the basis of their relative fair values measured at the inception of the lease. The land and building components are separately accounted for because the lessee is expected to own the real es-

tate by the end of the lease term. The building is amortized over its estimated useful life without regard to the lease term.

When the lease agreement neither transfers title nor contains a bargain purchase option, the fair value of the land must be determined in relation to the fair value of the aggregate property included in the lease agreement. If the fair value of the land is less than 25% of the aggregate fair value of the leased property, then the land is considered immaterial. Conversely, if the fair value of the land is 25% or greater of the fair value of the aggregate leased property, then the land is considered material and the land and building must be treated separately for accounting purposes.

When the land component of the lease agreement is considered immaterial (FV land < 25% of the total FV), the lease is accounted for as a single unit. The lessee capitalizes the lease if one of the following applies:

1. The term of the lease is 75% or more of the economic useful life of the building.
2. The present value of the minimum lease payments equals 90% or more of the fair value of the leased real estate less any lessor investment tax credit.

If neither of the above two criteria is met, the lessee accounts for the lease agreement as a single operating lease.

When the land component of the lease agreement is considered material (FV land ≥ 25% of the total FV), the land and building components are separated. By applying the lessee's incremental borrowing rate to the fair value of the land, the annual minimum lease payment attributed to land is computed. The remaining payments are attributed to the building. The division of minimum lease payments between land and building is essential for both the lessee and lessor. The portion of the lease involving the land is always accounted for as an operating lease. The lease involving the building(s) must meet either the 75% or 90% test to be treated as a capital lease. If neither of the two criteria is met, the building(s) are also accounted for as an operating lease.

Computing the minimum lease payments.

Construction period lease payments. Payments made by a lessee during construction of the leased asset and prior to the beginning of the lease term (sometimes called "construction period lease payments") are considered part of the minimum lease payments for the purpose of the 90% of fair value test. These advance payments are to be included in minimum lease payments at their future value, at the beginning of the lease term, with interest accreted using the same interest rate used to discount payments made during the lease term (ASC 840-10-25).

If the lease is an operating lease, these payments are accounted for as prepaid rent and amortized to expense along with other rental costs over the term of the lease, normally using the straight-line method.

Residual value guarantees. If the terms of the lease include a guarantee of the residual value of the leased property by the lessee, that guarantee is to be included in the minimum lease payments and, in accordance with ASC 840-10-25 is to be allocated entirely to the building. This treatment is consistently followed by both the lessee and the lessor.

Environmental indemnifications. An indemnification by the lessee to the lessor for any environmental contamination that the lessee causes during the lease term does not affect the lessee's classification of the lease as capital or operating.

If the lessee's indemnification covers contamination that occurred prior to the lease term, the lessee is to consider, under the ASC 450 criteria for evaluating contingencies, whether the likelihood of loss is considered remote, reasonably possible, or probable before considering any available reimbursements available from insurance companies or other third parties. If the probability of loss is considered remote, then the indemnification does not

affect the lessee's classification of the lease. If, however, the probability of loss is either reasonably possible or probable, the transaction is subject to the sale-leaseback provisions of ASC 840-40 and the lessee will be considered to have purchased, sold, and then leased back the property. A lessee providing an indemnification that meets certain criteria under ASC 460 is required to record the indemnification as a guarantee and, in addition, is subject to that pronouncement's disclosure provisions.

Lessee obligation to maintain financial covenants. Leases sometimes contain financial covenants similar to those included in loan agreements that obligate the lessee to maintain certain financial ratios. Should the lessee violate these covenants, it is considered an event of default under the lease and the lessor may have a right to put the property to the lessee or require the lessee to make a payment to the lessor. In this case, for the purpose of the 90% of fair value test, the lessee includes in the minimum lease payments the maximum amount it would be required to pay in the event of default unless all of the following conditions exist:

1. The default covenant provision is customary in financing arrangements,
2. The occurrence of the event of default is objectively determinable and is not at the subjective whim of the lessor,
3. The event of default is based on predefined criteria that relate solely to the lessee and its operations, and
4. It is reasonable to assume at the inception of the lease and in considering recent lessee operating trends that the event of default will not occur.

Lessor accounting. The lessor's accounting depends on whether the lease transfers ownership, contains a bargain purchase option, or does neither of the two.

If the lease transfers ownership and gives rise to dealer's profit (or loss), the lessor classifies the lease as a sales-type lease and accounts for the lease as a single unit under the provisions of ASC 360-20 in the same manner as a seller of the same property (see Chapter 10). If the lease transfers ownership, meets both the collectibility and no important uncertainties criteria, but does not give rise to dealer's profit (or loss), the lease is accounted for as a direct financing or leveraged lease as appropriate.

If the lease contains a bargain purchase option and gives rise to dealer's profit (or loss), the lease is classified as an operating lease. If the lease contains a bargain purchase option, meets both the collectibility and no material uncertainties criteria, but does not give rise to dealer's profit (or loss), the lease is accounted for as a direct financing lease or a leveraged lease as appropriate.

If the lease agreement neither transfers ownership nor contains a bargain purchase option, the lessor should follow the same rules as the lessee in accounting for real estate leases involving land and building(s).

However, the collectibility and the no material uncertainties criteria must be met before the lessor can account for the agreement as a direct financing lease, and in no such case may the lease be classified as a sales-type lease (i.e., ownership must be transferred).

The treatment of a lease involving both land and building can be illustrated in the following examples.

Example of lessee accounting for land and building lease containing transfer of title

1. The lessee enters into a ten-year noncancelable lease for a parcel of land and a building for use in its operations. The building has an estimated remaining useful life of twelve years.
2. The FV of the land is $75,000, while the FV of the building is $310,000.
3. A payment of $50,000 is due to the lessor at the beginning of each of the ten years of the lease.

4. The lessee's incremental borrowing rate is 10%. (The lessor's implicit rate is unknown.)
5. Ownership will transfer to the lessee at the end of the lease.

The present value of the minimum lease payments is $337,951 ($50,000 × 6.75902[8]). The portion of the present value of the minimum lease payments to be capitalized for each of the two components of the lease is computed as follows:

FV of land			$ 75,000		
FV of building			310,000		
Total FV of leased property			$385,000		
Portion of PV allocated to land	$337,951	×	75,000 / 385,000	=	$ 65,835
Portion of PV allocated to building	$337,951	×	310,000 / 385,000	=	272,116
Total PV to be capitalized					$337,951

The entry made to initially record the lease is as follows:

Leased land	65,835	
Leased building	272,116	
Lease obligation		337,951

Subsequently, the obligation will be decreased using the effective interest method. The leased building will be amortized over its expected useful life.

Example of lessee accounting for land and building lease without transfer of title or bargain purchase option

Assume the same facts as the previous example except that title does not transfer at the end of the lease.

The lease is still a capital lease because the lease term is more than 75% of the remaining useful life of the building. Since the FV of the land is less than 25% of the aggregate fair value of the leased property, (75,000/385,000 = 19%), the land component is considered immaterial and the lease is accounted for as a single unit. The entry to record the lease is as follows:

Leased property	337,951	
Lease obligation		337,951

Assume the same facts as the previous example except that the FV of the land is $110,000 and the FV of the building is $275,000. Once again title does not transfer.

Because the FV of the land exceeds 25% of the aggregate FV of the leased property (110,000/385,000 = 29%), the land component is considered material and the lease is separated into two components. The annual minimum lease payment attributed to the land is computed as follows:

$$\frac{\text{FV of land}}{\text{PV factor}} \quad \frac{\$110{,}000}{6.75902^{*}} = \$16{,}275$$

* *6.75902 is the PV of an annuity due for ten periods at 10%.*

The remaining portion of the annual payment is attributed to the building.

Annual payment	$ 50,000
Less amount attributed to land	(16,275)
Annual payment attributed to building	$ 33,725

The present value of the minimum annual lease payments attributed to the building is then computed as follows:

Minimum annual lease payment attributed to building	$ 33,725
PV factor	× 6.75902*
PV of minimum annual lease payments attributed to building	$227,948

* *6.75902 is the PV of an annuity due for ten periods at 10%.*

[8] *6.75902 is the PV of an annuity due for ten periods at 10%.*

The entry to record the capital portion of the lease is as follows:

Leased building	227,948	
Lease obligation		227,948

There is no computation of the present value of the minimum annual lease payment attributed to the land since the land component of the lease is treated as an operating lease. For this reason, each year $16,275 of the $50,000 lease payment will be recorded as land rental expense. The remainder of the annual payment ($33,725) will be applied against the lease obligation using the effective interest method.

Leases involving real estate and equipment. ASC 360-20-15, states that sales of integral equipment are within the scope of ASC 360-20, *Property, Plant, and Equipment—Real Estate Sales*. Consequently, the determination of whether equipment is considered to be integral equipment has increased in importance. A determination of whether equipment to be leased is integral is also necessary for proper accounting for sales-type leases by lessors.

According to ASC 360-20-15, the determination of whether equipment is integral is based on two factors.

1. The significance of the cost to remove the equipment from its existing location (which would include the costs of repairing the damage done to that location by the removal).
2. The decrease in value of the equipment that would result from its removal (which is, at minimum, the cost to ship the equipment to the new site and reinstall it). The nature of the equipment and whether others can use it are considered in determining whether there is further diminution in fair value. When the combined total of the cost to remove and any further diminution of value exceeds 10% of the fair value of the equipment (installed), the equipment is considered integral equipment.

ASC 360-20-15 clarifies that ASC 360-20, *Property, Plant, and Equipment—Real Estate Sales,* applies to all sales of real estate including real estate with accompanying property improvements or integral equipment. Consistent with ASC 360-20-15, ASC 840-10-25 specifies that when evaluating a lease that includes integral equipment to determine the classification of the lease under ASC 840, the equipment is to be evaluated as real estate. ASC 840-10-25 also provides guidance on evaluating how to determine transfer of ownership of integral equipment when no statutory title registration system exists in the jurisdiction.

When real estate leases also involve equipment or machinery, the equipment component is separated and accounted for as a separate lease agreement by both lessees and lessors. "The portion of the minimum lease payments applicable to the equipment element of the lease shall be estimated by whatever means are appropriate in the circumstances." The lessee and lessor apply the capitalization requirements to the equipment lease independently of accounting for the real estate lease(s). The real estate leases are handled as discussed in the preceding two sections. In a sale-leaseback transaction involving real estate with equipment, the equipment and land are not separated.

Refer to the Profit Recognition on Real Estate Sales section of Chapter 10 for a further discussion of ASC 360-20-15.

Leases involving only part of a building. It is common to find lease agreements that involve only part of a building as, for example, when leasing a floor of an office building or a store in a shopping mall. A difficulty that arises in this situation is that the cost and/or fair value of the leased portion of the whole may not be objectively determinable.

Lessee accounting. If the fair value of the leased property is objectively determinable, then the lessee follows the rules and accounts for the lease as described in "Leases involving land and building." If the fair value of the leased property cannot be objectively determined,

consider whether the agreement satisfies the 75% test. This calculation is made using the estimated remaining economic life of the building in which the leased premises are located. If the test is met (i.e. the term of the lease is 75% or more of the estimated remaining economic life of the building), the lease is accounted for as a capital lease. If the test is not met, the lease is accounted for as an operating lease.

Lessor accounting. From the lessor's position, both the cost and fair value of the leased property must be objectively determinable before the procedures described under "Leases involving land and building" will apply. If either the cost or the fair value cannot be determined objectively, the lessor accounts for the agreement as an operating lease.

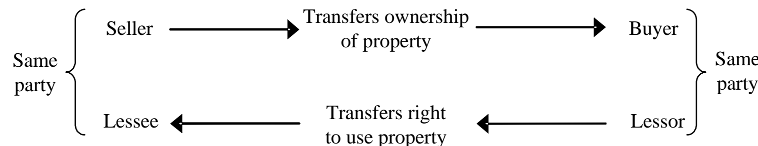
Operating leases with guarantees. It is important to note that, for any operating lease where the terms include a guarantee of the residual value of the leased asset, two issues require consideration:

1. Since a guarantee constitutes a variable interest in the lessor or in the leased assets, does the guarantee cause the lessee to be the primary beneficiary of the lessor that would be required to consolidate the lessor? (See discussion of ASC 810 earlier in this chapter.)
2. Is the guarantee required to be recognized as a liability at inception on the balance sheet of the lessee under ASC 460? (Discussed in Chapter 14.)

Lessee-incurred real estate development or construction costs. Lessees sometimes incur real estate development or construction costs prior to executing a lease with the developer/lessor. The lessee records these costs as construction in progress on its balance sheet and any subsequent lease arrangement is accounted for as a sale-leaseback transaction under ASC 840-40, as discussed in the following section.

Sale-Leaseback Transactions

Sale-leaseback describes a transaction where the owner of property (seller-lessee) sells the property, and then immediately leases all or part of it back from the new owner (buyer-lessor). These transactions may occur when the seller-lessee is experiencing cash flow or financing problems or because of available income tax advantages. The important consideration in this type of transaction is the recognition of two separate and distinct economic events. It is important to note, however, that in a typical sale-leaseback there is not a change in the party that has the right to use the property. First, there is a sale of property, and second, there is a lease agreement for the same property in which the original seller is the lessee and the original buyer is the lessor. This is illustrated below.

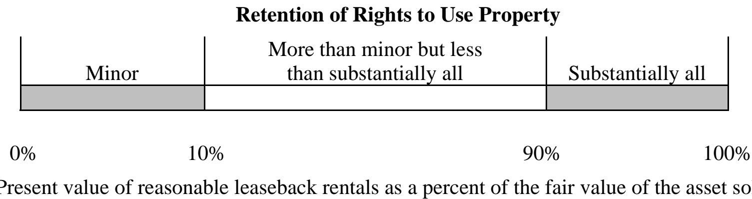


A sale-leaseback transaction is usually structured with the sales price of the asset at or above its current fair value. The result of this higher sales price is higher periodic rental payments over the lease term. The transaction is usually attractive because of the income tax benefits associated with it. The seller-lessee benefits from the higher price because of the increased gain on the sale of the property and the deductibility of the lease payments that are usually larger than the depreciation that was previously being deducted. The buyer-lessor benefits from both the higher rental payments and the larger depreciable income tax basis.

Retention of rights to use the property. The accounting treatment from the seller-lessee's point of view will depend upon the extent to which it retains the rights to use the property which can be characterized as one of the following:

1. Substantially all
2. Minor
3. More than minor but less than substantially all

Retention of Rights to Use Property



Present value of reasonable leaseback rentals as a percent of the fair value of the asset sold

As depicted in the diagram above, the guideline for the determination of substantially all is based upon the classification criteria presented for the lease transaction. That is, if the present value of fair rental payments is equal to 90% or more of the fair value of the asset sold, the seller-lessee is presumed to have retained substantially all of the rights to use the sold property. The test for retention of minor rights would be to substitute 10% or less for 90% or more in the preceding sentence.

If substantially all the rights to use the property are retained by the seller-lessee, and the agreement meets at least one of the criteria for capital lease treatment, the seller-lessee accounts for the leaseback as a capital lease and any profit on the sale is deferred and amortized in proportion to amortization of the leased asset. If the leaseback is classified as an operating lease, it is accounted for as such, and any profit on the sale is deferred and amortized over the lease term in proportion to gross rental charges. Any loss on the sale would also be deferred unless the loss were perceived to be a real economic loss, in which case the loss would be immediately recognized and not deferred.

If only a minor portion of the rights to use are retained by the seller-lessee, the sale and the leaseback are accounted for separately. However, if the rental payments appear unreasonable based upon the existing market conditions at the inception of the lease, the profit or loss is adjusted so the rentals are at a reasonable amount. The amount created by the adjustment is deferred and amortized over the life of the property if a capital lease is involved or over the lease term if an operating lease is involved.

If the seller-lessee retains more than a minor portion but less than substantially all the rights to use the property, any excess profit on the sale is recognized on the date of the sale. For purposes of this paragraph, excess profit is derived as follows:

1. If the leaseback is classified as an operating lease, the excess profit is the portion of the profit that exceeds the present value of the minimum lease payments over the lease term including the gross amount of the guaranteed residual value. The seller-lessee uses its incremental borrowing rate to compute the present value of the minimum lease payments. If the implicit rate of interest in the lease is known and lower, it is substituted for the incremental borrowing rate in computing the present value of the minimum lease payments. The present value is amortized over the lease term while that guaranteed residual is deferred until resolution at the end of the lease term.
2. If the leaseback is classified as a capital lease, the excess profit is the portion of the profit that exceeds the recorded amount of the leased asset.

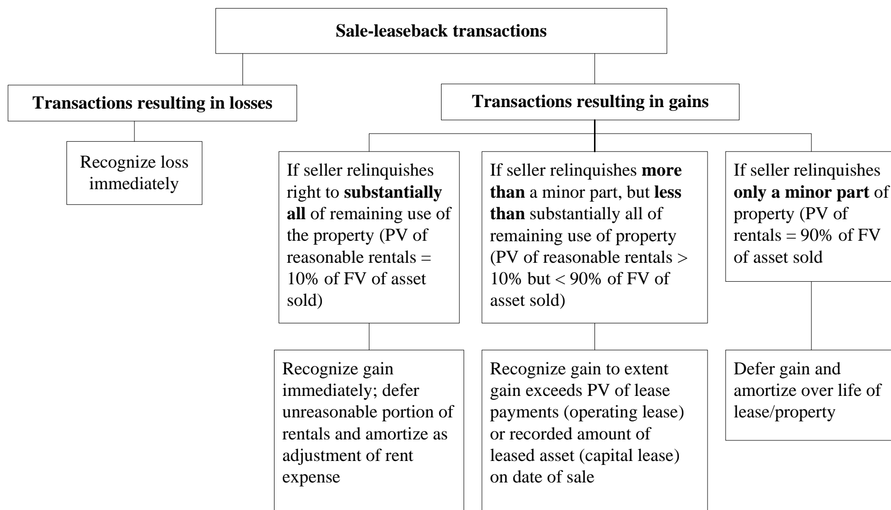
Executory costs are not to be included in the calculation of profit to be deferred in a sale-leaseback transaction (ASC 840-40-30). When the fair value of the property at the time of the leaseback is less than its undepreciated cost, the seller-lessee immediately recognizes a loss for the difference. In the example below, the sales price is less than the book value of the property. However, there is no economic loss because the FV is greater than the book value.

Sales price	Book value	FV and PV
$85,000	$90,000	$100,000

($5,000)
Artificial loss

The artificial loss is deferred and amortized as an addition to depreciation.

The diagram below summarizes the accounting for sale-leaseback transactions.



In the above circumstances, when the leased asset is land only, any amortization is recognized on a straight-line basis over the lease term, regardless of whether the lease is classified as a capital or operating lease.

The buyer-lessor accounts for the transaction as a purchase and a direct financing lease if the agreement meets the criteria of either a direct financing lease or a sales-type lease. Otherwise, the agreement is accounted for as a purchase and an operating lease.

Sale-leaseback involving real estate. Three requirements are necessary for a sale-leaseback involving real estate (including real estate with equipment) to qualify for sale-leaseback accounting treatment. Those sale-leaseback transactions not meeting the three requirements are accounted for using the deposit method (see Chapter 10) or as a financing. The three requirements are

1. The lease must be a normal leaseback (i.e., it involves active use of the leased property in the seller-lessee's trade or business during the lease term).
2. Payment terms and provisions must adequately demonstrate the buyer-lessor's initial and continuing investment in the property as prescribed by ASC 360-20.
3. Payment terms and provisions must transfer all the risks and rewards of ownership as demonstrated by a lack of continuing involvement by the seller-lessee.

Adequacy of initial and continuing investment. The buyer-lessor's initial investment is adequate if it demonstrates the buyer-lessor's commitment to pay for the property and indi-

cates a reasonable likelihood that the seller-lessee will collect any receivable related to the leased property. The buyer-lessor's continuing investment is adequate if the buyer is contractually obligated to pay an annual amount at least equal to the amount of the annual payment sufficient to repay the principal and interest over no more than twenty years for land or the customary term of a first mortgage for other real estate.

Lack of continuing involvement by the seller-lessee. Any continuing involvement by the seller-lessee other than normal leaseback disqualifies the lease from sale-leaseback accounting treatment. Some examples of continuing involvement other than normal leaseback include

1. The seller-lessee has an obligation or option (excluding the right of first refusal) to repurchase the property
2. The seller-lessee (or party related to the seller-lessee) guarantees the buyer-lessor's investment or debt related to that investment or a specified return on that investment
3. The seller-lessee is required to reimburse the buyer-lessor for a decline in the fair value of the property below estimated residual value at the end of the lease term based on other than excess wear and tear
4. The seller-lessee remains liable for an existing debt related to the property
5. The seller-lessee's rental payments are contingent on some predetermined level of future operations of the buyer-lessor
6. The seller-lessee provides collateral on behalf of the buyer-lessor other than the property directly involved in the sale-leaseback
7. The seller-lessee provides nonrecourse financing to the buyer-lessor for any portion of the sales proceeds or provides recourse financing in which the only recourse is the leased asset
8. The seller-lessee enters into a sale-leaseback involving property improvements or integral equipment without leasing the underlying land to the buyer-lessor
9. The buyer-lessor is obligated to share any portion of the appreciation of the property with the seller-lessee
10. Any other provision or circumstance that allows the seller-lessee to participate in any future profits of the buyer-lessor or the appreciation of the leased property

The inclusion of a put provision in the lease as a remedy for the occurrence of an event of default under the lease including for lessee noncompliance with financial covenants violates the continuing involvement criteria in ASC 840-40 when the transaction is part of a sale-leaseback. This would necessitate accounting for the transaction using the deposit method or as a financing depending on the application of ASC 360-20 to the circumstances.

When one member of a consolidated group provides an uncensored guarantee of lease payments for another member of the same consolidated group, this is not held to be continuing involvement on the part of the consolidated group. Therefore, sale-leaseback accounting is appropriate in the consolidated financial statements. In the separate financial statements of the subsidiary/seller-lessee, however, the guarantee is a form of continuing involvement that precludes sale-leaseback accounting because the guarantee provides the buyer-lessor with additional collateral that reduces the buyer-lessor's risk of loss (ASC 840-40-25).

An uncollateralized irrevocable letter of credit is not a form of continuing involvement that precludes sale-leaseback accounting unless a contract exists between the seller-lessee and third-party guarantor that would create collateral (e.g. right of offset of amounts on deposit). All written contracts between the seller-lessee and the issuer of the letter of credit must be evaluated to determine if other forms of collateral exist (ASC 840-40-25).

Example of accounting for a sale-leaseback transaction

To illustrate the accounting treatment in a sale-leaseback transaction, suppose that Seller/Lessee Corporation sells equipment that has a book value of $80,000 and a fair value of $100,000 to Buyer/Lessor Corporation for $100,000 in cash, and then immediately leases it back under the following conditions:

1. The sale date is January 1, 2009, and the equipment has a fair value of $100,000 on that date and an estimated remaining useful life of fifteen years.
2. The lease term is fifteen years, noncancelable, and requires equal rental payments of $13,109 at the beginning of each year.
3. Seller/Lessee Corp. has the option to annually renew the lease at the same rental payments upon expiration of the original lease.
4. Seller/Lessee Corp. has the obligation to pay all executory costs.
5. The annual rental payments provide the Buyer/Lessor Corp. with a 12% return on investment.
6. The incremental borrowing rate of Seller/Lessee Corp. is 12%.
7. Seller/Lessee Corp. depreciates similar equipment on a straight-line basis.

Seller/Lessee Corp. will classify the agreement as a capital lease since the lease term exceeds 75% of the estimated remaining economic life of the equipment, and because the present value of the lease payments ($13,109 × 7.62817[9] = $100,000) is greater than 90% of the fair value of the equipment. Assuming that collectibility of the lease payments is reasonably predictable and that no important uncertainties exist concerning the amount of unreimbursable costs yet to be incurred by Buyer/Lessor Corp., Buyer/Lessor Corp. will classify the transaction as a direct financing lease because the present value of the minimum lease payments is equal to the fair value of $100,000.

Seller/Lessee Corp. and Buyer/Lessor Corp. would make the following journal entries during the first year:

Upon Sale of Equipment on January 1, 2009

Seller/Lessee Corp.			*Buyer/Lessor Corp.*		
Cash	100,000		Equipment	100,000	
Equipment*		80,000	Cash		100,000
Unearned profit on sale-leaseback		20,000			
Leased equipment	100,000		Lease receivable		
Lease obligations		100,000	($13,109 × 15)	196,635	
			Equipment		100,000
			Unearned interest		96,635

* *Assumes new equipment; for used equipment the accumulated depreciation would also be debited to remove it.*

To Record First Payment on January 1, 2009**

Seller/Lessee Corp.			*Buyer/Lessor Corp.*		
Lease obligations	13,109		Cash	13,109	
Cash		13,109	Lease receivable		13,109

** *No interest is recorded in connection with the first payment since it is made at the inception of the lease.*

To Record Incurrence and Payment of Executory Costs

Seller/Lessee Corp.			*Buyer/Lessor Corp.*
Insurance, taxes, etc.	xxx		(No entry)
Cash (or accounts payable)		xxx	

To Record Amortization Expense on the Equipment, December 31, 2009

Seller/Lessee Corp.			*Buyer/Lessor Corp.*
Amortization expense	6,667		(No entry)
Accum. amort.— capital leases ($100,000 ÷ 15)		6,667	

[9] *7.62817 is the present value of an annuity due for fifteen periods at a 12% interest rate.*

To Amortize Profit on Sale-Leaseback by Seller/Lessee Corp., December 31, 2009

Seller/Lessee Corp.			*Buyer/Lessor Corp.*		
Unearned profit on sale-leaseback	1,333		(No entry)		
Amortization expense ($20,000 ÷ 15)		1,333			

To Record Interest for 2008, December 31, 2009

Seller/Lessee Corp.			*Buyer/Lessor Corp.*		
Interest expense	10,427		Unearned interest	10,427	
Accrued interest payable		10,427	Interest income		10,427

Partial Lease Amortization Schedule**

Date	*Cash payment*	*Interest expense*	*Reduction of obligation*	*Lease obligation*
Inception of lease				$100,000
1/1/09	$13,109	$ --	$13,109	86,891
1/1/10	13,109	10,427	2,682	84,209

** *No interest is recorded in connection with the first payment since it is made at the inception of the lease.*

Supplemental guidance. The following paragraphs provide supplemental guidance regarding the application of sale-leaseback accounting.

Property sold subject to seller's preexisting operating lease. ASC 840-40-55 considers the situation where the reporting entity is an investor in a partnership that owns property with respect to which the reporting entity is also a lessee under an operating lease that covers all or a portion of the property. The reporting entity sells its interest in the partnership or the partnership sells the property to an independent party with the preexisting operating lease continuing in effect.

If the leased property is within the scope of ASC 840-40 (real estate or real estate with integral equipment), ASC 840-40-55 requires recognition of the transaction as a sale-leaseback if the preexisting lease is significantly modified in connection with the sale. If no changes are made to the lease or changes are insignificant profit is deferred and recognized in accordance with ASC 360-20 and ASC 840-40 for real estate, property improvements, and integral equipment.

The computation of any deferred profit is not affected by the seller-lessee's prior ownership percentage in the property. In addition, exercise of renewal options or sublease provisions contained in the preexisting lease that were included in the original minimum lease term do not affect the accounting for the transaction. ASC 840-40 would apply, however, to renewal options not contained in the original minimum lease term. These renewal options would be treated as a new lease. Finally, leases between parties under common control are not considered preexisting leases for this purpose and ASC 840-40 applies unless one of the parties is a regulated enterprise such as a public utility under the provisions of ASC 980 (ASC 840-40-55).

Sale-leaseback of an asset leased to another party. A variation of the previous issue arises when a leaseback involves an asset that is personal property falling outside coverage of ASC 840-40 and either (1) subject to an operating lease or (2) subleased or intended to be subleased to another entity under an operating lease. The standard specified that the seller-lessee-sublessor is to account for the transaction by recording the sale, removing the asset from its balance sheet, classifying the leaseback based on the normal criteria for determining lease classification, and recognizing or deferring any gain on the transaction as previously discussed (ASC 840-40-55).

Other Lease Issues

Accounting for a sublease. A sublease is an arrangement where the original lessee re-leases the leased property to a third party (the sublessee), and the original lessee acts as a sublessor. Normally, the nature of a sublease agreement does not affect the original lease agreement, and the original lessee/sublessor retains primary liability to the lessor.

The original lease remains in effect, and the original lessor continues to account for the lease as before. The original lessee/sublessor accounts for the lease as follows:

1. If the original lease agreement transfers ownership or contains a BPO and if the new lease meets any one of the four specified criteria (i.e., transfers ownership, BPO, 75% test, or 90% test) and both the collectibility and uncertainties criteria, then the sublessor classifies the new lease as a sales-type or direct financing lease; otherwise as an operating lease. In either situation, the original lessee/sublessor continues accounting for the original lease obligation as before.
2. If the original lease agreement does not transfer ownership or contain a BPO, but it still qualifies as a capital lease, then the original lessee/sublessor (with one exception) applies the usual criteria in classifying the new agreement. If the new lease qualifies, the original lessee/sublessor accounts for it as a direct financing lease, with the unamortized balance of the asset under the original lease being treated as the cost of the leased property. However, the original lessee/sublessor should recognize a loss on the sublease if its carrying amount exceeds the total sublease rentals and the estimated residual value (ASC 840-20-25). The one exception arises when the circumstances surrounding the sublease suggest that the sublease agreement was an important part of a predetermined plan in which the original lessee played only an intermediate role between the original lessor and the sublessee. In this situation, the sublease is classified by the 75% and 90% criteria as well as collectibility and uncertainties criteria. In applying the 90% criterion, the fair value for the leased property is the fair value to the original lessor at the inception of the original lease. Under all circumstances, the original lessee continues accounting for the original lease obligation as before. If the new lease agreement (sublease) does not meet the capitalization requirements imposed for subleases, then the new lease is accounted for as an operating lease.
3. If the original lease is an operating lease, the original lessee/sublessor accounts for the new lease as an operating lease and accounts for the original operating lease as before.

Example of a direct-financing sublease

The Silver Pick Mine obtains a $300,000 ore carrier truck under a five-year capital lease at 8% interest. Annual lease payments are $75,137. Silver Pick reduces its lease liability in accordance with the following amortization table:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$300,000
1	$75,137	$24,000	$51,137	248,863
2	75,137	19,909	55,228	193,635
3	75,137	15,419	59,646	133,989
4	75,137	10,719	64,418	69,571
5	75,137	5,566	69,571	0
	$375,685	$75,685	$300,000	

At the end of Year 2, silver prices drop too low for ongoing mining operations to be profitable, so Silver Pick subleases the ore carrier via a direct financing lease to the Lead Bottom Mine for the remaining three years of the lease at the same interest rate. Silver Pick should use the

unamortized balance of $193,635 at the end of Year 2 as the cost basis of the sublease, but Lead Bottom negotiates a lower inception value of $160,000, resulting in the following amortization table:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$160,000
3	$62,085	$12,800	$49,285	110,715
4	62,085	8,857	53,228	57,487
5	62,085	4,598	57,487	0
	$186,255	$26,255	$160,000	

At the inception of the sublease, Silver Pick records a loss of $39,156 to reflect the negotiated $33,635 drop in the cost basis of the sublease, from $193,635 to $160,000, as well as a reduction of sublease interest income of $5,521, also due to the reduced cost basis. The summary entry for the final three years of Silver Pick's payments under the original lease agreement and its receipts under the sublease follows:

	Years 3-5 of original lease transaction		*Total of sublease transactions*		*Variance*	
Lease liability	193,635			160,000		33,635
Interest expense	31,776			26,255		5,521
Cash		225,411	186,255		39,156	

Lease escalations. Virtually all commercial leases contain provisions obligating the lessee to pay the lessor various additional sums, often referred to as lease escalations, that supplement the specified fixed rentals. It is important that the parties to the lease properly classify these payments because the way they are characterized can affect whether the lease is accounted for in the correct manner.

Escalating base rents. These are periodic increases in the fixed monthly rentals scheduled to occur at one or more points during the lease term. Escalating base rents are included in minimum lease payments.

Variations of this type of escalation occur when the fixed (or base) rent is structured at inception to include a future escalation based on the expected growth of the lessee requiring it to physically use additional portions of the premises that it was not using at inception or an actual addition or based on the lessee actually adding space or capacity.

ASC 840-20-25 prescribes the following two rules:

1. If, at the inception of the lease, the lessee takes possession of or controls the physical use of the leased property, all rentals including the escalated rents are to be recognized by the lessee and lessor as rental expense and rental revenue, respectively, on a straight-line basis commencing with the beginning of the lease term.
2. If rents escalate under a master lease agreement because the lessee obtains access to or control of additional leased property at the time of the escalation, the escalated rents are considered by the lessee and lessor as rental expense and rental revenue respectively that is attributable to the newly leased property. This additional rental expense or rental revenue is to be computed based on the relative fair values of the original leased property and the additional leased property as determined at the inception of the lease and allocated to the time periods during which the lessee controls the use of the additional leased property.

Executory costs. These represent reimbursements to the lessor of costs associated with owning and maintaining the leased property. The most common executory costs are real estate taxes, insurance, and maintenance. Amounts paid by a lessee as consideration for a guarantee from an unrelated third party of the residual value are also considered executory costs. If executory costs are paid by the lessor, any lessor's profit on those costs is

considered in the same manner as the actual executory costs. Executory costs are excluded from minimum lease payments.

Contingent rentals. These are additional rentals due that are computed based on changes that occur subsequent to the inception of the lease in factors, other than the passage of time, on which the lease payments were based. Examples of contingent rentals include real estate rentals based on a percentage of the lessee's retail sales over a certain dollar amount (often referred to as percentage rent or overage rent) and equipment rentals based on machine hours of use. One type of escalation that many commercial leases contain is a required rent increase based on increases in an index such as the prime interest rate or the Consumer Price Index (CPI). Depending on how the terms are structured, these payments might actually consist of two elements that must be separately considered. The portion attributable to the index or rate that was in effect at the inception of the lease (considered part of the minimum lease payments) and the portion representing subsequent increases in that index or rate (considered to be contingent rentals) as illustrated in the following examples.

Example 1

A three-year lease requires fixed rentals of $1,000 per month plus $10 for every full percentage point of the prime interest rate or fraction thereof determined as of the beginning of the month. The prime interest rate at the inception of the lease is 6% and on the first day of the fourth month of the lease term the prime interest rate increased to 7%.

At lease inception, the minimum rentals are computed as follows:

$1,000 + ($10 × 6 percentage points = $60) = $1,060 per month × 36 months = $38,160

The increase in rent due at the beginning of the fourth month would be allocated as follows:

Minimum rentals:	$10 × 6 percentage points	=	$60
Contingent rentals:	$10 × 1 percentage points	=	10
			$70

Example 2

Same facts as Example 1 except that the lease requires the lessee to pay fixed rentals of $1,000 per month plus $10 for every full percentage point or fraction thereof that the prime interest rate determined as of the beginning of the month exceeds 6%.

At lease inception, the minimum rentals are computed as follows:

$1,000 per month × 36 months = $36,000

The increase in rent due at the beginning of the fourth month would be allocated as follows:

Minimum rentals:			$ --
Contingent rentals:	$10 × 1 percentage point	=	10
			$10

As illustrated in the examples, amounts determined to be contingent rentals are excluded from minimum lease payments.

As discussed previously, leases for retail space often contain percentage rent provisions that obligate the lessee to pay the lessor a percentage of retail sales over a certain dollar amount. These dollar thresholds are often expressed in terms of annual targets such as one-half of one percent of annual sales over $10 million. This type of lease provision raises the accounting issue of how the lessor and lessee are to account for the lease during the interim periods prior to the attainment of the contractual target.

ASC 840-10-25 and ASC 840-10-40 prescribes the accounting as follows:

Lessor: No revenue recognition until the actual target is achieved and surpassed.

Lessee: Recognize contingent rental expense during interim periods if it is probable that the target will be reached by the end of the fiscal year. If, subsequently, the specified target is not met, previously recorded expense is reversed at the time it becomes probable that the target will not be met.

Lessee involvement in asset construction. A lessee often has substantial involvement in construction activities with respect to an asset to be leased under a long-term lease agreement. This involvement can take many forms that can include

1. Providing the construction financing directly or indirectly
2. Guaranteeing the construction debt
3. Serving as primary or secondary obligor under construction contracts
4. Acting as the real estate developer or general contractor
5. Agreeing to purchase the asset if the construction is not completed by a specified date
6. Agreeing to fund construction cost overruns
7. Serving as an agent of the lessor for the construction, financing, or ultimate sale of the asset
8. Agreeing to a date-certain lease that obligates the lessee to commence rental payments on a certain date irrespective of whether the construction is complete by that date

These various forms of involvement raise important substance-over-form considerations that must be carefully considered in light of evolving GAAP literature.

Construction period rent associated with land and building leases. In certain instances, the lessee will delay occupancy or usage of leased property until, for example, leasehold improvements have been completed. ASC 840-20-25 states that a lease conveys to the lessee the right to control the use of property, such as leased land and building, both during and after any construction period necessary to construct leasehold improvements to the property. Consequently, rental expense is required to be allocated to periods during which construction activities are occurring even though the lessee has not yet commenced operations on the premises. It further provides that the rentals allocated to the construction period are not to be capitalized as part of the cost of the leasehold improvements but rather are to be recorded as a period expense as a charge against income from continuing operations in the lessee's financial statements.

Transfer of construction period risks. A lessee is considered the owner of a real estate project during its construction period if the lessee bears substantially all of the construction period risks (ASC 840-40).

Under ASC 840-40, if the lessee is determined to bear substantially all of the construction risks, it is considered to be the owner of the asset during the construction period. If that is the case, then a sale-leaseback of the asset occurs upon the completion of construction and the commencement of the lease term.

The primary test to be used in determining if a lessee has substantially all of the construction period risks is virtually the same as the 90% of fair value test for determining if a lease is to be classified as a capital lease by a lessee. Beginning with the earlier of the date of the inception of the lease or the date that the construction terms are agreed to, if at any time during the construction period the documents governing the construction project could require, under any circumstance, that the lessee pay 90% or more of the total project costs, excluding land acquisition costs, then the lessee is considered to be the owner of the real estate project during its construction period.

Even if the present value of the lessee's maximum guarantee is less than 90% of total project costs, ASC 840-40 provides six examples of when the lessee would still be considered the owner of a real estate project.

For the purposes of this 90% test, the lessee's maximum guarantee includes any payments the lessee could be required to make in connection with the construction project. The lessee's maximum guarantee includes, but is not limited to

1. Lease payments that must be made regardless of when or whether the project is complete
2. Guarantees of the construction financing
3. Equity investments made in the owner-lessor or any party related to the owner-lessor
4. Loans or advances made to the owner-lessor or any party related to the owner-lessor
5. Payments made by the lessee in the capacity of a developer, a general contractor, or a construction manager/agent that are reimbursed less frequently than is normal or customary
6. Primary or secondary obligations to pay project costs under construction contracts
7. Obligations that could arise from being the developer or general contractor
8. An obligation to purchase the real estate project under any circumstances
9. An obligation to fund construction cost overruns
10. Rent or fees of any kind, such as transaction costs, to be paid to or on behalf of the lessor by the lessee during the construction period
11. Payments that might be made with respect to providing indemnities or guarantees to the owner-lessor

The scope of ASC 840-40 includes government-owned property under construction and subject to a future lease of the completed improvements (ASC 840-40-15).

Any direct or indirect financial interests of the lessee in the leased asset or in the lessor must be analyzed by the lessee to determine if

1. They require accounting recognition as a guarantee obligation under ASC 460.
2. They result in the lessee holding a variable interest in the lessor or in the lessor's specified assets (the project) that potentially could require the lessee to consolidate the lessor as the primary beneficiary of a variable interest entity (VIE) or consolidate the specified assets and related liabilities (referred to as "silo" or a "virtual VIE").

Variable interest entities are discussed earlier in this chapter and in Chapter 13; guarantees are discussed in Chapter 14. If the lessee consolidates the lessor or the project, intercompany transactions and balances will be eliminated in consolidation.

Change in residual value. For any of the foregoing types of leases, the lessor is to review the estimated residual value at least annually. If there is a decline in the estimated residual value, the lessor must make a determination as to whether this decline is temporary or permanent. If temporary, no adjustment is required; however, if the decline is other than temporary, then the estimated residual value must be revised to conform to the revised estimate. The loss that arises in the net investment is recognized in the period of decline. Under no circumstance is the estimated residual value to be adjusted to reflect an increase in the estimate. ASC 840-30-35 clarifies that this prohibition against reflecting an increase in the estimated residual value also extends to increases in the guaranteed portions of the residual value that result from renegotiations between the parties.

Example of a permanent decline in residual value.

Hathaway Corporation enters into a sales-type leasing transaction as the lessor of a fire truck. The following table shows key information about the lease:

Lease term	10 years
Implicit interest rate	8%
Lease payments	One payment per year
Normal selling price	$300,000
Asset cost	$200,000
Residual value	$50,000

After one year, immediately after the first lease payment has been received, Hathaway determines that an indicated decline in residual value from $50,000 to $30,000 is other than temporary. The calculation it originally used to determine the annual minimum lease payment follows:

$$\frac{\text{Selling price—(Present value of residual value due in 10 years at 8\% interest} \times \text{residual value)}}{\text{Present value of an annuity of \$1 for 10 years at 8\% interest}}$$

$$= \frac{\$300{,}000 - (0.46319 \times \$50{,}000)}{6.71008}$$

= $41,257.33 Annual minimum lease payment

Hathaway calculates the following reduction in the residual present value of the fire truck, using a multiplier of 0.5002 to obtain the present value of the residual value due in nine years at an interest rate of 8%:

Accreted original residual asset present value = ($50,000) × (Present value of 0.5002) = $25,010

Less: Revised residual asset present value = ($30,000) × (Present value of 0.5002) = $15,006

Equals net change in residual asset present value = ($10,004)

The following table shows the original and revised elements of Hathaway's lease transaction entry:

	*Initial entry**		*Revised residual value*		*Entry net of Residual value change*	
Less receivable	462,572			20,000	442,572	
Cost of goods sold	176,840				176,840	
Loss on residual reduction			10,004		10,004	
Inventory		200,000				200,000
Sales		276,840				276,840
Unearned interest		162,572	9,996			152,576

* *Lease receivable = (Total minimum lease payments) + (Residual asset value)*
Cost of goods sold = (Inventory cost) – (Present value of residual asset value)
Sales = (Present value of minimum lease payments)
Unearned interest = (Lease receivable) – (Present value of minimum lease payments) – (Present value of residual asset value)

The following amortization table tracks the net impact of these changes, resulting in a $30,000 residual value at the end of Year 10:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$300,000
1	$41,257	$24,000	$17,257	282,743
Adjustment			10,004	272,739
2	41,257	21,819	19,438	253,301
3	41,257	20,264	20,993	232,308
4	41,257	18,584	22,673	209,635
5	41,257	16,770	24,487	185,148
6	41,257	14,811	26,446	158,702
7	41,257	12,696	28,561	130,141
8	41,257	10,411	30,846	99,295
9	41,257	7,943	33,314	65,981
10	41,257	5,276	35,981	30,000
	$412,570	$152,574	$270,000	

Thus, net of rounding errors, the total of all payments on the amortization table and the $30,000 revised residual value equals the revised lease receivable of $442,572. Similarly, the total of all interest payments on the amortization table matches the adjusted unearned interest entry.

Change in the provisions of a lease. Accounting issues arise when the lessee and lessor agree, subsequent to its inception, to change the provisions of the lease (other than by renewals or term extensions that are discussed later). If, from the standpoint of the lessee, the revised lease terms would have, at the inception of the original lease, resulted in a differ-

ent lease classification (e.g., operating lease versus capital lease or vice versa), the revised agreement is considered to be a new agreement.

If the original lease was accounted for as a capital lease and the revised lease qualifies for treatment as an operating lease, they are to be accounted for as sale-leaseback transactions (discussed later in this chapter).

If the original lease was accounted for as an operating lease and the revised lease is a capital lease, then on the date of the revision, the lessee records an asset and an obligation based on the present value of the remaining lease payments (or the fair value of the leased property, if less).

Finally, if the original and revised leases are both capital leases, then the lessee adjusts the recorded asset and obligation by an amount equal to the difference between the present value of the future minimum lease payments under the revised agreement and the recorded balance of the obligation. For the purposes of this calculation, the rate of interest to be used is the rate that was used to record the lease initially. The adjustment is recognized as a gain or loss of the period in which the revision is made.

In the case of either a sales-type or direct financing lease where there is a change in the provisions of a lease, the lease is accounted for by the lessor as discussed below.

Changes in the provisions that affect the amount of the remaining minimum lease payments can result in one of the following three outcomes:

1. The change does not give rise to a new agreement. A new agreement is defined as a change that, if in effect at the inception of the lease, would have resulted in a different classification.
2. The change does give rise to a new agreement that would be classified as a direct financing lease.
3. The change gives rise to a new agreement that would be classified as an operating lease.

If either 1. or 2. occurs, the balance of the minimum lease payments receivable and the estimated residual value (if affected) are adjusted to reflect the effect of the change. The net adjustment is charged (or credited) to unearned income, and the accounting for the lease over its remaining term is adjusted to reflect the change.

If the new agreement is an operating lease, then the remaining net investment (lease receivable less unearned income) is written off and the leased asset is recorded by the lessor at the lower of its cost, present fair value, or carrying value. The net adjustment resulting from these entries is charged (or credited) to income of the period in which the revision is made. Thereafter, the new lease is accounted for as any other operating lease.

The lessee and the lessor may negotiate a shortened lease term and an increase in the lease payments over the revised lease term. ASC 840-20-55 observes that the nature of the modification is a matter of judgment that depends on the relevant facts and circumstances. If the modification is deemed only a change in future lease payments, the increase is amortized over the remaining term of the modified lease. On the other hand, a modification deemed a termination penalty is to be recognized in the period of modification. Termination penalties are calculated as the excess of the modified lease payments over the original lease payments that would have been required during the shortened lease term.

ASC 840-20-55 provides that consideration is to be given to (1) the length of the modified lease period compared to the remaining term of the original lease, and (2) the difference between the modified lease payments and comparable market rents in determining whether the modification is a termination penalty.

Early termination of a lease. Accounting for premature lease termination from the standpoints of the lessee and lessor follows.

Lessee accounting. Discontinuation of business activities in a particular location is considered an exit activity, the accounting for which is specified in ASC 420 (see Chapter 3).

Operating leases. In connection with lease termination the lessee may incur (1) costs to terminate the lease prior to the end of its noncancelable term and/or (2) continuing lease costs incurred during the remainder of the lease term for which the lessee receives no economic benefit because the premises are no longer in use. On the date the lessee terminates the lease, the lessee recognizes a liability for the fair value of the termination costs. The termination date is the date that the lessee provides written notice to the lessor in accordance with the notification requirements contained in the lease or the date the lessee and lessor agree to a negotiated early termination.

The fair value of rentals that continue to be incurred under the lease during its remaining term without benefit to the lessee is recognized as a liability on the date that the lessee ceases to use the property (referred to as the cease-use date). Fair value is computed based on the remaining rentals due under the lease, adjusted for any prepaid or deferred rent under the lease, and reduced by estimated sublease rentals that are reasonable to expect for the property. The fair value measurement requires that reasonable sublease rentals be included in the computation even if the lessee does not intend to sublease the property.

In periods subsequent to the recognition of these liabilities but prior to their settlement, changes in fair value are measured using the credit-adjusted risk-free rate of interest (in essence, the lessee's incremental borrowing rate) used to initially measure the liability.

Upon initial recognition of these liabilities, the related costs are recognized in the lessee's income statement as operating expense (or income from continuing operations if no measure of operations is presented) unless required to be presented as part of discontinued operations. The cumulative effects of any subsequent period changes in liabilities that result from changes in the estimates of either the amounts or timing of cash flows are reported in the same income statement caption used to initially recognize the costs. Changes to the liabilities as a result of the passage of time increase their carrying amount and are recorded as accretion expense, which is also considered an operating expense.

Capital leases. If the lease is a capital lease, it is subject to the provisions of ASC 360 with respect to long-lived assets to be disposed of other than by sale (see Chapter 11) either individually (in which case the gain or loss is recorded as a component of operating expense) or as part of a disposal group (in which case the gain or loss is presented as a part of discontinued operations). During the time period between the termination date and the cease-use date, the capital lease asset continues to be classified as "held and used," is subject to impairment evaluation, and its remaining carrying value is amortized over that shortened time period.

Lessor accounting. Lessor accounting for an early lease termination is as follows.

Sales-type and direct financing leases. The lessor records the leased equipment as an asset at the lower of its original cost, present fair value, or current carrying value. The difference between the remaining net investment in the lease and the amount of the adjustment to recognize the leased equipment is reflected in income of the period in which the lease is terminated.

Example of lessor accounting for the early termination of a sales-type lease

La Crosse Corporation enters into a sales-type leasing transaction as the lessor of a digital color copier. The following table shows key information about the lease:

Lease term	5 years
Implicit interest rate	8%
Lease payments	One payment per year
Normal selling price	$80,000
Asset cost	$50,000
Residual value	$10,000
Present value of ordinary annuity of 1 for 5 years at 8%	3.9927
Present value of 1 due in 5 years at 8%	0.6806

Based on the information in the table, La Crosse calculates an annual minimum lease payment of $18,332, which is reflected in the following amortization table:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$80,000
1	$18,332	$6,400	$11,932	68,068
2	18,332	5,445	12,887	55,181
3	18,332	4,414	13,918	41,263
4	18,332	3,301	15,031	26,232
5	18,332	2,100	16,232	10,000
	$91,660	$21,660	$70,000	

At the end of Year 3, the lessee cancels the lease. At that time, the fair value of the color copier is $35,000, which is $6,263 less than the $41,263 current carrying value indicated at the end of Year 3 in the amortization table. This change is reflected in the following table, which notes the original and revised elements of La Crosse's lease transaction:

	*Initial entry**		*Total of transactions for first 3 years*		*Lease cancellation entry*	
Cash			54,996			
Lease receivable	101,660			54,996		46,664
Cost of goods sold	43,194					
Inventory		50,000			35,000	
Sales		73,194				
Interest income				16,259		
Loss on early lease termination					6,263	

* *Lease receivable = (Total minimum lease payments) + (Residual asset value)*
Cost of goods sold = (Inventory cost) – (Present value of residual asset value)
Sales = (Present value of minimum lease payments)
Unearned interest = (Lease receivable) – (Present value of minimum lease payments) – (Present value of residual asset value)

Operating leases. Accounting for the leased asset is subject to the provisions of ASC 360. Between the termination date and the cease-use date, the leased asset continues to be presented as held-and-used and depreciated subject to an impairment evaluation that considers the likelihood and timing of replacing the tenant and market rents that would be realized. On the cease-use date, the leased asset is reclassified from held-and-used to the category of idle property and equipment with the associated temporary suspension of depreciation.

Upon receiving notice of termination, the lessor recognizes a receivable for the fair value of any termination fees to be received from the lessee as a result of early cancellation and a corresponding deferred rent liability that is recorded as an adjustment to any previously recorded deferred rent liability or prepaid rent. The remaining rental stream to be received thereafter is recognized on a straight-line basis over the remainder of the time period during which such payments were agreed to continue by adjusting any remaining prepaid rent, deferred rent, and/or unamortized initial direct costs so that they will be fully amortized by the date on which the lessee's payment obligation is fully satisfied.

Renewal or extension of an existing lease. The renewal or extension of an existing lease agreement affects the accounting of both the lessee and the lessor. There are two basic

situations: (1) the renewal occurs and makes a residual guarantee or penalty provision inoperative or (2) the renewal agreement does not do the foregoing and the renewal is treated as a new agreement. The accounting treatment prescribed under the latter situation for a lessee is as follows:

1. If the renewal or extension is classified as a capital lease, then the (present) current balances of the asset and related obligation are adjusted by the difference between the present value of the future minimum lease payments under the revised agreement and the (present) current balance of the obligation. The present value of the minimum lease payments under the revised agreement is computed using the interest rate in effect at the inception of the original lease.
2. If the renewal or extension is classified as an operating lease, then the current balances of the asset and liability are written off and a gain (loss) recognized for the difference. The new lease agreement resulting from a renewal or extension is accounted for in the same manner as other operating leases.

Under the same circumstances, the following treatment is followed by the lessor:

1. If the renewal or extension is classified as a direct financing lease, then the existing balances of the lease receivable and the estimated residual value are adjusted for the changes resulting from the revised agreement.

   NOTE: Remember that an upward adjustment to the estimated residual value is not allowed.

   The net adjustment is charged or credited to unearned income.
2. If the renewal or extension is classified as an operating lease, then the remaining net investment under the existing sales-type lease or direct financing lease is written off and the leased asset is recorded as an asset at the lower of its original cost, present fair value, or current carrying amount. The difference between the net investment and the amount recorded for the leased asset is charged to income of the period that includes the renewal or extension date. The renewal or extension is then accounted for prospectively as any other operating lease.
3. If the renewal or extension is classified as a sales-type lease and it occurs at or near the end of the existing lease term, then the renewal or extension is accounted for as a sales-type lease.

   NOTE: A renewal or extension that occurs in the last few months of an existing lease is considered to have occurred at or near the end of the existing lease term.

If the renewal or extension causes the guarantee or penalty provision to be inoperative, the lessee adjusts the current balance of the leased asset and the lease obligation to the present value of the future minimum lease payments (according to ASC 840 "by an amount equal to the difference between the PV of the future minimum lease payments under the revised agreement and the present balance of the obligation"). The PV of the future minimum lease payments is computed using the rate used in the original lease agreement.

Given the same circumstances, the lessor adjusts the existing balance of the lease receivable and estimated residual value to reflect the changes of the revised agreement (remember, no upward adjustments to the residual value). The net adjustment is charged (or credited) to unearned income.

Example of lessor accounting for extension of a sales-type lease

Entré Computers enters into a sales-type leasing transaction as the lessor of a corporate computer system. The following table shows key information about the lease:

Lease term	6 years
Implicit interest rate	10%
Lease payments	One payment per year
Normal selling price	$240,000
Asset cost	$180,000
Residual value	$450,000
Present value of ordinary annuity of 1 for 6 years at 10%	4.3553
Present value of 1 due in 6 years at 10%	0.5645

Based on the information in the table, Entré calculates an annual minimum lease payment of $49,273, which is reflected in the following amortization table:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$240,000
1	$49,273	$24,000	$25,273	214,727
2	49,273	21,472	27,801	186,926
3	49,273	18,692	30,581	156,345
4	49,273	15,634	33,639	122,706
5	49,273	12,270	37,003	85,703
6	49,273	8,570	40,703	45,000
	$295,638	$100,638	$195,000	

After making the Year 3 payment, the lessee requests a lease extension in order to reduce the annual payment amount. To do so, Entré extends the lease duration by two years and assumes the same residual value. Entré calculates the revised annual minimum lease payment under the assumption that the selling price is the balance of the net investment at the end of Year 3, as noted in the preceding amortization table:

$$\frac{\text{Selling price—(Present value of residual value due in 5 years at 10\% interest} \times \text{residual value)}}{\text{Present value of an annuity of \$1 for 5 years at 10\% interest}}$$

$$= \frac{\$156{,}345 - (0.6209 \times \$45{,}000)}{3.7908}$$

$$= \$33{,}873 \text{ Annual minimum lease payment}$$

The revised lease payment and residual value is shown in the following amortization table, which includes both the first three years of the original lease agreement and the full five years of the lease extension agreement:

Year	*Cash payment*	*Interest*	*Reduction in principal*	*Balance of net investment*
Inception				$240,000
1	$49,273	$24,000	$25,273	214,727
2	49,273	21,472	27,801	186,926
3	49,273	18,692	30,581	156,345
4	33,873	15,635	18,238	138,107
5	33,873	13,811	20,062	118,045
6	33,873	11,805	22,068	95,977
7	33,873	9,598	24,275	71,702
8	33,873	7,171	26,702	45,000
	$317,184	$122,184	$195,000	

This change is reflected n the following table, which notes the original and revised elements of Entré's lease transaction:

	*Initial entry**		*Revised entry*		*Net entry required*	
Lease receivable	340,638		362,184		21,546	
Cost of goods sold	154,597		154,597			
Inventory		180,000		180,000		
Sales		214,597		214,597		
Unearned interest		100,638		122,184		21,546

* *Lease receivable = (Total minimum lease payments) + (Residual asset value)*
Cost of goods sold = (Inventory cost) – (Present value of residual asset value)
Sales = (Present value of minimum lease payments)
Unearned interest = (Lease receivable) – (Present value of minimum lease payments) – (Present value of residual asset value)

Leases between related parties. Leases between related parties are classified and accounted for as though the parties are unrelated, except in cases where it is certain that the terms and conditions of the agreement have been influenced significantly by the fact that the lessor and lessee are related. When this is the case, the classification and/or accounting is modified to reflect the true economic substance of the transaction rather than the legal form. Under ASC 810, discussed earlier in this chapter, many related-party lessors will qualify as variable interest entities (VIE). When this is the case, the lessee will present consolidated financial statements that include the lessor's assets, liabilities, and results of operations. The elimination of intercompany transactions and balances will result in the rental expense and rental income being removed from the consolidated financial statements, which will instead reflect the depreciation of the leased asset and the interest expense on any related debt.

ASC 850 requires that the nature and extent of leasing activities between related parties be disclosed. ASC 810 requires the following disclosures by the primary beneficiary of a VIE:

1. The nature, purpose, size, and activities of the VIE
2. The carrying amount and classification of consolidated assets that collateralize the VIE's obligations
3. Any lack of recourse that VIE creditors or holders of VIE beneficial interests have to the general credit of the primary beneficiary

Indemnification provisions in lease agreements. Some lease agreements contain a provision whereby the lessee indemnifies the lessor on an after-tax basis for certain income tax benefits that the lessor might lose if a change in the income tax law should occur.

An indemnification agreement of this kind is considered a guarantee that is subject to the recognition and disclosure requirements of ASC 460 discussed in detail in Chapter 14. Any payments that might be required under the indemnification clause are, therefore, not considered contingent rentals.

Accounting for leases in a business combination. A business combination, in and of itself, has no effect upon the classification of a lease. However, if, in connection with a business combination, a lease agreement is modified to change the original classification of the lease, it is considered a new agreement and accounted for as previously discussed.

In most cases, a business combination will not affect the previous classification of a lease unless the provisions have been modified as indicated in the preceding paragraph.

The acquiring company applies the following procedures to account for a leveraged lease in a business combination:

1. The classification as a leveraged lease is retained.
2. The net investment in the leveraged lease is assigned a fair value (present value, net of income taxes) based upon the remaining future cash flows. Also, the estimated income tax effects of the cash flows are recognized.
3. The net investment is broken down into three components: net rentals receivable, estimated residual value, and unearned income.

4. Thereafter, the leveraged lease is accounted for as described in the discussion earlier in this chapter.

In a business combination where a lease is acquired that does not conform to ASC 840 (pre-1979), the acquiring company accounts for the lease by retroactively applying ASC 840 at the date of combination.

ASC 805 significantly alters the accounting for business combinations. It requires the use of the acquisition method, which requires that assets acquired and liabilities assumed in such a transaction be accounted for at fair values. This means, among other things, that capital leases under which the acquiree entity was obligated at the acquisition date are to be revalued at fair value at the date of the acquisition. The amounts of depreciation and interest to be recognized in subsequent periods by the acquirer will accordingly, in most instances, vary from the amounts that would have been recognized by the acquiree absent the business combination.

For example, if the fair value of the leased property under a capital lease is greater than its carrying value (the depreciated capitalized value as of that date), future amortization will be greater than would otherwise have been the case. Given that rental payments will not be altered by the acquisition transaction, this means that the effective interest cost will be reduced. A new effective interest rate will need to be computed in order to properly record the accounting implications of future rental payments, in such a circumstance. Contrariwise, if the fair value of the leased property is lower than its precombination carrying (book) value, the effective interest rate will be greater than had previously been determined.

ASC 805 states that the determination of the classification of an existing lease is generally not reassessed at the date of a business combination, and that the determination made at the lease inception is not to be reconsidered. However, if the terms of an operating lease are favorable or unfavorable compared with the market terms of leases of the same or similar items at the acquisition date, accounting ramifications must be addressed. The acquirer in such a circumstance is to recognize an intangible asset if the terms of an operating lease are favorable relative market terms, and is to recognize a liability if the terms are unfavorable relative to market terms.

An identifiable intangible asset may be associated with an operating lease, which may be objectively revealed by market participants' willingness to pay a price for the lease even if its terms are already at market. For example, a lease of gates at an airport or of retail space in a prime shopping area might provide entry into a market or other future economic benefits that qualify as identifiable intangible assets—for example, as a customer relationship. In that situation, the acquirer is to recognize the associated identifiable intangible asset(s). Under ASC 805, the identifiable intangible assets acquired in a business combination are to be recognized distinct from goodwill. An intangible asset is *identifiable* if it meets either the separability criterion or the contractual-legal criterion described by ASC 805.

If the acquiree in a business combination has assets (e.g., building or equipment) that are subject to operating leases (that is, the acquiree is a lessor), ASC 805 directs that such assets are to be recorded at fair value determined without regard to the terms of the associated leases. The extent to which the lease terms are favorable or unfavorable relative to the market at the acquisition date, however, will be reflected in the additional intangible asset or liability to be recognized by the acquirer.

Accounting for changes in lease agreements resulting from refunding of tax-exempt debt. Tax-exempt debt is often "refunded" by the issuer of the debt instruments. Refunding is a refinancing that enables the issuer (i.e., a municipality that issued bonds) to take advantage of favorable interest rates. A current refunding is effected when the debt becomes call-

able and the issuer issues new debt in order to use the proceeds to retire the original debt. An advance refunding is a more complex variation that occurs prior to the call date of the original instruments. It entails issuance of new tax-exempt debt at the lower interest rate with a similar maturity to the original issuance. The proceeds of the new debt are invested in a portfolio of market-traded US Treasury securities and other obligations that effectively "defease" the original bonds (see Chapter 15 for a discussion of debt defeasance). If, during the lease term, a change in the lease results from a refunding by the lessor of tax-exempt debt (including an advance refunding) and (1) the lessee receives the economic advantages of the refunding and (2) the revised agreement can be classified as a capital lease by the lessee and a direct financing lease by the lessor, the change is accounted for as follows:

1. If the change is accounted for as an extinguishment of debt
   a. Lessee accounting. The lessee adjusts the lease obligation to the present value of the future minimum lease payments under the revised agreement. The present value of the minimum lease payments is computed using the interest rate applicable to the revised agreement. Any gain or loss is recognized currently as a gain or loss on the extinguishment of debt in accordance with the provisions of ASC 470-50-45 (discussed in detail in Chapter 15).
   b. Lessor accounting. The lessor adjusts the balance of the lease receivable and the estimated residual value, if affected, for the difference in present values between the old and revised agreements. Any resulting gain or loss is recognized currently.
2. If the change is not accounted for as an extinguishment of debt
   a. Lessee accounting. The lessee accrues any costs in connection with the debt refunding that are obligated to be reimbursed to the lessor. These costs are amortized by the interest method over the period from the date of refunding to the call date of the debt to be refunded.
   b. Lessor accounting. The lessor recognizes as revenue any reimbursements to be received from the lessee, for costs paid in relation to the debt refunding. This revenue is recognized in a systematic manner over the period from the date of refunding to the call date of the debt to be refunded.

Sale or assignment to third parties; nonrecourse financing. The sale or assignment of a lease or of property subject to a lease that was originally accounted for as a sales-type lease or a direct financing lease will not affect the original accounting treatment of the lease. Any profit or loss on the sale or assignment is recognized at the time of the transaction except under the following two circumstances:

1. When the sale or assignment is between related parties, apply substance versus form provisions presented above under "leases between related parties."
2. When the sale or assignment is with recourse, it is accounted for using the provisions of ASC 860.

The sale of property subject to an operating lease is not treated as a sale if the seller (or any related party to the seller) retains "substantial risks of ownership" in the leased property. A seller may retain "substantial risks of ownership" by various arrangements. For example, if the lessee defaults upon the lease agreement or if the lease terminates, the seller may arrange to do one of the following:

1. Acquire the property or the lease
2. Substitute an existing lease
3. Secure a replacement lessee or a buyer for the property under a remarketing agreement

A seller does not retain substantial risks of ownership by arrangements where one of the following occurs:

1. A remarketing agreement includes a reasonable fee to be paid to the seller.
2. The seller is not required to give priority to the releasing or disposition of the property owned by the third party over similar property owned by the seller.

When the sale of property subject to an operating lease is not accounted for as a sale because the substantial risk factor is present, it is accounted for as a borrowing. The proceeds are recorded by the seller as an obligation. Rental payments made by the lessee under the operating lease are recorded as revenue by the seller even if the payments are paid to the third-party purchaser. The seller accounts for each rental payment by allocating a portion to interest expense (to be imputed in accordance with the provisions of ASC 835-30), and the remainder to reduce the existing obligation. Other normal accounting procedures for operating leases are applied except that the depreciation term for the leased asset is limited to the amortization period of the obligation.

The sale or assignment of lease payments under an operating lease by the lessor are accounted for as a borrowing as described above.

Nonrecourse financing is a common occurrence in the leasing industry, whereby the stream of lease payments on a lease is discounted on a nonrecourse basis at a financial institution with the lease payments collateralizing the debt. The proceeds are then used to finance future leasing transactions. Even though the discounting is on a nonrecourse basis, the offsetting of the debt against the related lease receivable is prohibited unless a legal right of offset exists or the lease qualified as a leveraged lease at its inception. The SEC in a Staff Accounting Bulletin has also affirmed this position.

Money-over-money lease transactions. A money-over-money lease transaction occurs when an enterprise manufactures or purchases an asset, leases the asset to a lessee and obtains nonrecourse financing in excess of the asset's cost using the leased asset and the future lease rentals as collateral. ASC 840-30-55 prescribes that this series of transactions should be accounted for as follows:

1. Record the purchase or manufacture of the asset,
2. Record the lease as an operating, direct financing, or sales-type lease as appropriate,
3. Record nonrecourse debt.

The only income that is recognizable by the reporting entity in this transaction would be any manufacturer's or dealer's profit that arises if the lease is classified as a sales-type lease. With respect to balance sheet presentation, offsetting of any assets recorded as a result of the transaction with the nonrecourse debt is not permitted unless a right of setoff exists.

Wrap-lease transactions. A wrap-lease transaction (see diagram) occurs when a reporting enterprise

1. Purchases an asset,
2. Leases the asset to a lessee,
3. Obtains nonrecourse financing using the lease rentals and/or the asset as collateral,
4. Sells the asset to an investor, subject to the lease and the nonrecourse debt, and
5. Leases the asset back while remaining the substantive principal lessor under the original lease.

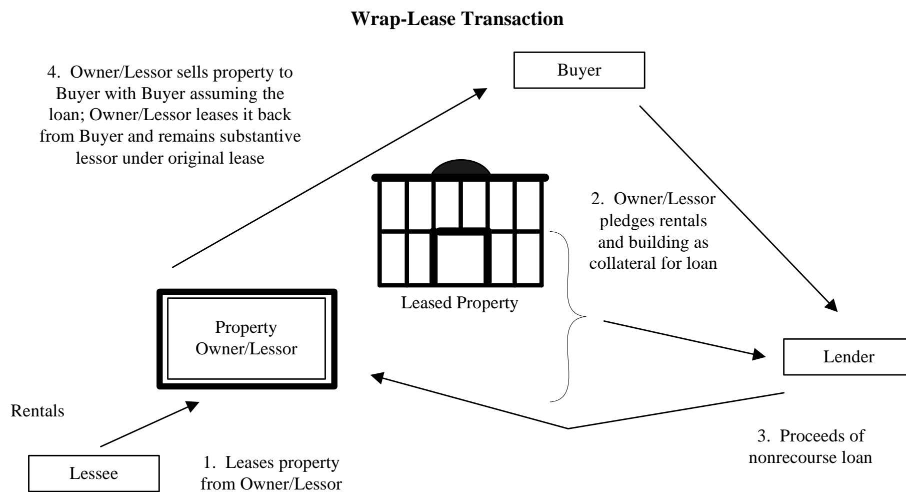
If the asset is real estate, the specialized rules with respect to sale-leaseback of real estate set forth in ASC 840-40 apply (see example of accounting for a sale-leaseback transaction in this chapter).

If the asset is personal property, the accounting would be as follows:

1. The asset is removed from the accounting records of the original reporting entity,
2. The leaseback is classified in accordance with the normal criteria for the classification of leases,
3. Gain on the transaction is recognized or deferred/amortized following the criteria in ASC 840-40-25,
4. The reporting entity reflects the following items on its balance sheet or statement of financial position:
   a. Any retained interest in the residual value of the leased asset
   b. Gross sublease receivable
   c. Note receivable from the investor
   d. Nonrecourse third-party debt
   e. Leaseback obligation
   f. Deferred revenue related to any future remarketing rights for which the remarketing services had not yet been performed

The sublease asset and related nonrecourse debt are not permitted to be offset on the balance sheet unless a right of setoff exists.

Wrap-Lease Transaction



Cash Flows

Lessee pays rentals to Lessor.
Lessor pays rentals to Buyer.
Buyer pays loan principal and interest to Lender.

Transfers of residual value (ASC 860). Acquisitions of interests in residual values of leased assets may be effected by companies whose primary business is other than leasing or financing. This generally occurs through the outright purchase of the right to own the leased asset or the right to receive the proceeds from the sale of a leased asset at the end of its lease term.

In instances such as these, the rights are recorded by the purchaser at the fair value of the assets surrendered net of the present value of any liabilities assumed, unless the fair value of the residual is more objectively determinable. Increases in the estimated value of

the interest in the residual (i.e., residual value accretion) to the end of the lease term are permitted to be recognized only for *guaranteed* residual values because they are financial assets. However, recognition of such increases is prohibited for *unguaranteed* residual values. A nontemporary write-down of a residual value interest (guaranteed/unguaranteed) is recognized as a loss and is not permitted to be subsequently restored. This guidance also applies to lessors who sell the related minimum lease payments but retain the interest in the residual value irrespective of whether the residual is guaranteed.

Example of the transfer of residual value.

Longbottom Lease Brokers obtains an interest in the residual value of a cable placer truck as a fee for its assistance in leasing the truck to a third party. The fair value of Longbottom's interest in the residual value of the truck is estimated by an appraiser to be $47,000. Since the fair value of Longbottom's interest in the residual value is the most clearly evident valuation, Longbottom uses it as the basis for the following entry:

Interest in asset residual value	47,000	
Revenue—leasing services rendered		47,000

In another transaction, Longbottom pays $32,000 for the residual value of an aerial truck. Longbottom records the transaction as follows:

Interest in asset residual value	32,000	
Cash		32,000

After six months, Longbottom appraises its interest in the residual value of both trucks, and finds that the value of the cable placer has declined from $47,000 to $41,000, while the residual value of the aerial truck has increased from $32,000 to $35,000. Longbottom uses the following entry to record the reduction of value in its cable placer truck:

Loss on interest in asset residual value	6,000	
Interest in asset residual value		6,000

Longbottom records no entry for the $3,000 increase in value of its aerial truck.

Leases involving government units. Leases that involve government units (i.e., airport facilities, bus terminal space, etc.) usually contain special provisions that prevent the agreements from being classified as anything but operating leases. These special provisions, referred to as fiscal funding clauses, include the governmental body's authority to abandon a facility at any time during the lease term, thus making its economic life indeterminable. These leases also do not contain a BPO or transfer ownership. The fair value is generally indeterminable because neither the leased property nor similar property is available for sale.

However, leases involving government units are subject to the same classification criteria as nongovernment units, except when all of the following six criteria are met:

NOTE: If all six conditions are met, the agreement is classified as an operating lease by both lessee and lessor.

1. A government unit or authority owns the leased property
2. The leased property is part of a larger facility operated by or on behalf of the lessor
3. The leased property is a permanent structure or part of a permanent structure that normally cannot be moved to another location
4. The lessor, or a higher governmental authority, has the right to terminate the lease at any time under the lease agreement or existing statutes or regulations
5. The lease neither transfers ownership nor allows the lessee to purchase or acquire the leased property
6. The leased property or similar property in the same area cannot be purchased or leased from anyone else

If any one of the six conditions that qualify the lease for automatic operating lease treatment is not met, then the lease is evaluated to determine the likelihood of future cancellation. Using the loss contingency criteria from ASC 450, if it is remote (i.e., the chances are slight) that the lease will be canceled, then the lease agreement qualifies as a noncancelable lease and is classified the same as any other such lease with a nongovernmental lessee. Otherwise, the lease is considered to be cancelable and accounted for as an operating lease (ASC 840-10-25).

Balance sheet classification. The balance of the lease payments receivable (lessor) and the lease obligation (lessee) must be allocated between their current and noncurrent portions. First, the current portion is computed at the date of the financial statements as the present value of the lease payments (or receipts) to be paid (received) within twelve months of the balance sheet date. The noncurrent portion is computed as the difference between the current portion and the balance of the lease obligation at the end of the period. The conceptual justification for this treatment is the fact that the total lease obligation is equal to the present value of the future minimum lease payments. Therefore, it follows that the current portion is the present value of the lease payments due within one year while the noncurrent portion is the present value of all other remaining lease payments.

Summary of Accounting for Selected Items (See following page)

TREATMENT OF SELECTED ITEMS IN ACCOUNTING FOR LEASES

	Lessor		Lessee	
	Operating	*Direct financing and sales-type*	*Operating*	*Capital*
Initial direct costs	Capitalize and amortize over lease term in proportion to rent revenue recognized (normally SL basis)	Direct financing: Record in separate account Add to net investment in lease Compute new effective rate that equates gross amt. of min. lease payments and unguar. residual value with net invest. Amortize so as to produce constant rate of return over lease term Sales-type: Expense in period incurred as part of cost of sales	N/A	N/A
Investment tax credit retained by lessor	N/A	Reduces FV of leased asset for 90% test	N/A	Reduces FV of leased asset for 90% test
Bargain purchase option	N/A	Include in: Minimum lease payments 90% test	N/A	Include in: Minimum lease payments 90% test
Guaranteed residual value	N/A	Include in: Minimum lease payments 90% test Sales-type: Include PV in sales revenues	N/A	Include in: Minimum lease payments 90% test
Unguaranteed residual value	N/A	Include in: "Gross investment in lease" Not included in: 90% test Sales-type: Exclude from sales revenue Deduct PV from cost of sales	N/A	N/A
Contingent rentals	Revenue in period earned	Not part of minimum lease payments; revenue in period earned	Expense in period incurred	Not part of minimum lease payments; expense in period incurred
Amortization period	Amortize down to estimated residual value over estimated economic life of asset	N/A	N/A	Amortize down to estimated residual value over lease term or estimated economic life[b]
Revenue (expense)[a]	Rent revenue (normally SL basis) Amortization (depreciation expense)	Direct financing: Interest revenue on net investment in lease (gross investment less unearned interest income) Sales-type: Dealer profit in period of sale (sales revenue less cost of leased asset) Interest revenue on net investment in lease	Rent expense (normally SL basis)[c]	Interest expense and amortization (depreciation) expense

a *Elements of revenue (expense) listed for the above items are not repeated here (e.g., treatment of initial direct costs).*
b *If lease has automatic passage of title or bargain purchase option, use estimated economic life; otherwise, use the lease term.*
c *If payments are not on a SL basis, recognize rent expense on a SL basis unless another systematic and rational method is more representative of use or benefit obtained from the property, in which case, the other method should be used.*

PERSPECTIVE AND ISSUES

Reporting entities are required to file income tax returns and pay income taxes in the domestic (federal, state, and local) and foreign jurisdictions in which they do business. GAAP

requires that financial statements be prepared on an accrual basis and that, consequently, the reporting entity is required to accrue a liability for income taxes owed or expected to be owed with respect to income tax returns filed or to be filed for all applicable tax years and in all applicable jurisdictions.

A longstanding debate has involved the controversial recognition of benefits (or reduced obligations) related to income tax positions that are uncertain or aggressive and which, if challenged, have a more-than-slight likelihood of not being sustained, resulting in the need to pay additional income taxes, often with interest and—sometimes—penalties added. Preparers have objected to presenting income tax obligations for such positions, often on the not-unreasonable theory that to do so would provide taxing authorities with a ”road map” to the challengeable income tax positions taken by the reporting entity. With the June 2006 issuance of ASC 740-10-05, *Accounting for Uncertainty in Income Taxes*, uncertain income tax positions were to become subject to formal recognition and measurement criteria, as well as to extended disclosure requirements under GAAP. To respond to the concerns of its private company constituents, FASB granted a one-year deferral of the effective date of ASC 740-10-05 for certain nonpublic enterprises. As the end of the deferral period approaches, those same constituents are requesting either an outright exemption for nonpublic enterprises or an additional deferral until the conclusion of an ongoing joint project between the FASB and IASB to converge US GAAP and IFRS income tax accounting standards. ASC 740-10-05 is explained and illustrated in detail in this chapter.

The computation of taxable income for the purpose of filing federal, state, and local income tax returns differs from the computation of net income under GAAP for a variety of reasons. In some instances, referred to as temporary differences, the timing of income or expense recognition varies. In other instances, referred to as permanent differences, income or expense recognized for income tax purposes is never recognized under GAAP, or vice versa. An objective under GAAP is to recognize the income tax effects of transactions in the period that those transactions occur. Consequently, deferred income tax benefits and obligations frequently arise in financial statements.

The basic principle is that the deferred income tax effects of all temporary differences (which are defined in terms of differential bases in assets and liabilities under income tax and GAAP accounting) are to be formally recognized. To the extent that deferred income tax assets are of doubtful realizability—are not “more likely than not to be realized”—a valuation allowance is provided, analogous to the allowance for uncollectible receivables.

The process of *interperiod* income tax allocation, which gives rise to deferred income tax assets and liabilities, has been required under GAAP for decades, although the measurement philosophy has evolved substantially over the years. As with many accounting measurements, the prescribed methodology has varied depending upon whether the primary objective was accuracy of the balance sheet or of the income statement. While the income statement had long been viewed as being of greatest concern, with the completion of the FASB’s current conceptual framework several decades ago the emphasis shifted to the balance sheet. This ultimately precipitated a major change in the interperiod income tax allocation rules, culminating in the issuance of ASC 740.

Under ASC 740, *purchase price allocations* made pursuant to purchase-method business combinations under ASC 805 (and *recognized values* pursuant to acquisition-method business combinations under its replacement standard, ASC 805 are made gross of income tax effects, and any associated income tax benefit or obligation is recognized separately.

Postcombination changes in valuation allowances for an acquired entity’s deferred income tax assets no longer automatically reduce recorded goodwill and intangibles. The accounting depends upon whether the changes occur during or after the expiration of the measurement period.

If the change occurs during the prescribed measurement period, not to exceed one year from the acquisition date, it is first applied to adjust goodwill until goodwill is eliminated, with any excess adjustment remaining being recorded as a gain from a bargain purchase. If the change occurs subsequent to the measurement period, it is recognized in the period of change as a component of income tax expense or benefit, or, in the case of certain specified exceptions, as a direct adjustment to contributed capital. Notably, the transition provisions of ASC 805 require this treatment to be applied prospectively after the effective date of the standard, even with respect to acquisitions that were originally recorded under the predecessor standard.

The income tax effects of net operating loss or tax credit carryforwards are treated as deferred income tax assets just like any other deferred income tax benefit. With its balance sheet orientation, ASC 740 requires that the amounts presented be based on the amounts expected to be realized, or obligations expected to be liquidated. Use of an average effective income tax rate convention is permitted. The effects of all changes in the balance sheet deferred income tax assets and liabilities flow through the income tax provision in the income statement; consequently, income tax expense is normally not directly calculable based on pretax accounting income in other than the simplest situations.

Discounting of deferred income taxes has never been permitted under GAAP, even though the ultimate realization and liquidation of deferred income tax assets and liabilities is often expected to occur far in the future. The issuance of CON 7, which deals with the use of present value in accounting measurements, did not end this prohibition. In any event, the inability to predict accurately the timing of the realization of deferred income tax benefits or the payment of deferred income tax payments would make discounting very difficult to accomplish.

As this publication was being finalized, FASB and IASB were conducting a joint project on accounting for income taxes, in order to improve the standards in this area and to converge US GAAP and International Financial Reporting Standards. The current project agenda states an expected issuance date of an Exposure Draft in the fourth quarter of 2008, although, as is common, this schedule may be delayed. Progress on the project can be monitored at both the FASB and IASB Web sites.

DEFINITIONS OF TERMS

Conduit bond obligor. The party on behalf of whom a state or local government agency raises funds by issuing bonds (commonly referred to as municipal bonds, industrial revenue bonds, or private activity bonds). Interest on the bonds typically is exempt from federal income tax to the investor and in order to qualify for this exemption, the proceeds from the bond must be used by the conduit bond obligor for purposes permitted under the federal income tax code. If the proceeds from the bonds are used to provide funding to multiple parties that participate in a pool (a pooled conduit debt security), all of the individual conduit bond obligors that participate are considered individually to be conduit bond obligors.

Conduit debt securities. Certain limited-obligation revenue bonds, certificates of participation, or similar debt instruments issued by a state or local governmental entity (issuer) for the purpose of providing financing for a specific third party (the conduit bond obligor) that is not a part of the issuer's reporting entity. Even though these securities bear the issuer's name, the issuer often has no obligation with respect to the debt other than as provided in a lease or loan agreement with the conduit bond obligor on whose behalf the securities are issued. The conduit bond obligor is responsible for making or funding all principal and interest payments when due and is also responsible for future financial reporting requirements with respect to the securities.

Deferred income tax asset. The asset recognized to reflect the expected future benefit available to be realized upon the reversal of deductible temporary differences.

Deferred income tax liability. The liability recognized to reflect the expected future income taxes that will be payable upon the reversal of taxable temporary differences.

Effective settlement. A conclusion reached by applying criteria specified in ASC 740-10-25, that a taxing authority has, in effect, made its final determination with respect to the portion of a tax position, if any, that it will accept and that management considers the possibility of further examination or reexamination of any aspect of the position to be remote.

Future deductible temporary difference. The difference between the GAAP carrying amount and income tax basis of an asset or liability that will reverse in the future and result in future income tax deductions; these give rise to deferred income tax assets.

Future taxable temporary difference. Temporary differences that result in future taxable amounts; that give rise to deferred income tax liabilities.

Gains and losses included in comprehensive income but excluded from net income. Certain items which, under GAAP, are events occurring currently but that are reported directly in equity as accumulated other comprehensive income, such as changes in the fair values of available-for-sale portfolios of marketable equity securities.

Highly certain income tax position. An income tax position that, based on clear and unambiguous tax law, rulings, regulations and interpretations, has a remote likelihood of being disallowed by the applicable taxing jurisdiction examining it with full possession of all relevant facts.

Income tax position. Each judgment that management makes on an income tax return that has been or will be filed that affects the measurement of current or deferred income tax assets and liabilities at an interim or year-end balance sheet date. The effects of taking an income tax position can result in a permanent reduction of income taxes payable or deferral of the payment of income taxes to a future year. The taking of an income tax position can

also affect management' estimate of the valuation allowance sufficient to reflect the amount of deferred income tax assets that it believes will be realizable.

Interperiod tax allocation. The process of apportioning income tax expense among reporting periods without regard to the timing of the actual cash payments for income taxes. The objective is to reflect fully the income tax consequences of all economic events reported in current or prior financial statements and, in particular, to report the expected future income tax effects of the reversals of temporary differences existing at the reporting date.

Intraperiod tax allocation. The process of apportioning income tax expense applicable to a given period between income before extraordinary items and those items required to be shown net of tax such as extraordinary items, discontinued operations, and prior period adjustments.

Nonpublic enterprise. An entity (1) whose debt or equity securities are not traded in a public market and (2) is not a conduit bond obligor for conduit debt securities traded in a public market. For the purpose of this definition, a public market can be a domestic or foreign exchange or over-the-counter market, even if the securities are only quoted locally or regionally. It is important to note that GAAP does not contain uniform definitions of public or nonpublic enterprises. Thus, the use of this terminology must be evaluated in the context of the specific standard in which it is used.

Operating loss carryback or carryforward. The excess of income tax deductions over taxable income. To the extent that this results in a carryforward, the income tax effect is included in the reporting entity's deferred income tax asset.

Ordinary income or loss (used in interim accounting for income taxes). In GAAP this term is defined differently than it is for income tax purposes. For GAAP purposes, ordinary income or loss is computed as pretax income (loss) from continuing operations less: (1) extraordinary items, (2) discontinued operations, (3) cumulative effects of changes in accounting principle, and (4) significant unusual or infrequently occurring items.

Permanent differences. Differences between pretax accounting income and taxable income as a result of the treatment accorded certain transactions by the income tax laws and regulations that differ from the accounting treatment. Permanent differences will not reverse in subsequent periods.

Pretax accounting income. Income or loss for the accounting period as determined in accordance with GAAP without regard to the income tax expense for the period.

Public enterprise. An entity (1) whose debt or equity securities are traded in a public market, (2) that is a conduit bond obligor for conduit debt securities traded in a public market, or (3) whose financial statements are filed with a regulatory agency in preparation for the sale of any class of securities. For the purpose of this definition, a public market can be a domestic or foreign exchange or over-the-counter market, even if the securities are only quoted locally or regionally. It is important to note that GAAP does not contain uniform definitions of public or nonpublic enterprises. Thus, the use of this terminology must be evaluated in the contest of the specific standard in which it is used.

Taxable income. The difference between the taxable revenue and deductible expenses as defined by the Internal Revenue Code for a tax period without regard to special deductions (e.g., net operating loss or contribution carrybacks and carryforwards).

Tax credits. Reductions in income tax liability as a result of certain expenditures accorded special treatment under the Internal Revenue Code. Examples of such credits are: the Investment Tax Credit, investment in certain depreciable property; the Jobs Credit, payment of wages to targeted groups; the Research and Development Credit, an increase in qualifying R&D expenditures; and others.

Tax planning strategy. A representation by management of a planned transaction or series of transactions that would affect the particular future years in which temporary differences will result in taxable or deductible amounts.

Temporary differences. In general, differences between income tax and financial reporting bases of assets and liabilities that will result in taxable or deductible amounts in future periods. Temporary differences include "timing differences" as defined by prior GAAP as well as certain other differences, such as those arising from business combinations. Some temporary differences cannot be associated with particular assets or liabilities, but nonetheless do result from events that received financial statement recognition and will have income tax effects in future periods.

Unrecognized income tax benefits. The portion of income tax benefits claimed on income tax returns filed or to be filed for which, in management's judgment, realization would not be more than 50% probable should the income tax position be examined by the applicable taxing authority possessing all relevant information.

Valuation allowance. The contra asset which is to be reflected to the extent that, in management's judgment, it is "more likely than not" that the deferred income tax asset will not be realized.

CONCEPTS, RULES, AND EXAMPLES

Evolution of Accounting for Income Taxes

The differences in the timing of recognition of certain expenses and revenues for income tax reporting purposes versus the timing under GAAP had always been a subject for debates in the accounting profession. The initial debate was over the fundamental principle of whether or not income tax effects of timing difference should be recognized in the financial statements. At one extreme were those who believed that only the amount of income tax currently owed (as shown on the income tax return for the period) should be reported as periodic income tax expense, on the grounds that potential changes in tax law and the vagaries of the entity's future financial performance would make any projection to future periods speculative. This was the "no allocation" or "flow-through" position. At the other extreme were those who held that the matching principle demanded that reported periodic income tax expense be mechanically related to pretax accounting income, regardless of the amount of income taxes actually currently payable. This was the "comprehensive allocation" argument. The middle ground approach, known as "partial allocation," acknowledged the need for some deferred income tax provision, but only when actual future income tax payments or benefits could be accurately predicted. This debate was settled in the late 1960s: comprehensive income tax allocation became GAAP.

The other key debate was over the measurement strategy to be applied to interperiod income tax allocation. When, in the 1960s and 1970s, accounting theory placed paramount importance on the income statement, with much less interest in the balance sheet, the method of choice was the "deferred method," which invoked the matching principle. The annual income tax provision (consisting of current and deferred portions) was calculated so that it would bear the expected relationship to pretax accounting income; any excess or deficiency of the income tax provision over income taxes payable was recorded as an adjustment to the deferred income tax amounts reflected on the balance sheet. This practice, when applied, resulted in a net deferred income tax debit (subject to some limitations on asset realization) or a net deferred income tax credit, which did not necessarily mean that an asset or liability, as defined under GAAP, actually existed for that reported amount.

By the late 1970s, accounting theory (reflected in FASB's conceptual framework) made the financial reporting priority the statement of financial position (balance sheet). Primary

emphasis was placed on the measurement of assets and liabilities—which, under CON 6's definitions, clearly would not include certain deferred income tax benefits or obligations as these were then measured. To compute deferred income taxes consistent with a balance sheet orientation requires use of the "liability method." This essentially ascertains, as of each balance sheet date, the amount of future income tax benefits or obligations that are associated with the reporting entity's assets and liabilities existing at that time. Any adjustments necessary to increase or decrease deferred income taxes to the computed balance, plus or minus the amount of income taxes owed currently, determines the periodic income tax expense or benefit to be reported in the income statement. Put another way, income tax expense is the residual result of several other balance-sheet-oriented computations.

ASC 740 required that all deferred income tax assets are given full recognition, whether arising from deductible temporary differences or from net operating loss or tax credit carryforwards.

Under ASC 740 it is necessary to assess whether the deferred income tax asset is realizable. Testing for realization is accomplished by means of a "more-likely-than-not" criterion that indicates whether an allowance is needed to offset some or all of the recorded deferred income tax asset. While the determination of the amount of the allowance may make use of the scheduling of future expected reversals, other methods may also be employed.

In summary, interperiod income tax allocation under GAAP is currently based on the liability method, using comprehensive allocation. While this basic principle may be straightforward, there are a number of computational complexities to be addressed. These will be presented in the remainder of this chapter.

An example of application of the liability method of deferred income tax accounting follows.

Simplified example of interperiod income tax allocation using the liability method

Caitlyn International has no permanent differences in years 2009 through 2011 (these are discussed later in this chapter). The company has only two balance sheet amounts with temporary differences between their income tax and financial reporting bases, property and equipment; and prepaid rent. No consideration is given to the classification of the deferred income tax amounts (i.e., current or long-term) as it is not considered necessary for purposes of this example.

Details of Caitlyn's temporary differences are as follows:

Caitlyn International Temporary Differences

Prepaid rent future deductible temporary differences

Basis at December 31	*Tax*	*GAAP*	*Future (taxable) deductible amount*
2009	--	$(100,000)	$100,000
2010	--	(80,000)	80,000
2011	--	(125,000)	125,000

Property and equipment future taxable temporary difference

On January 1, 2009, Caitlyn International purchased $400,000 of property and equipment with a 10-year estimated useful life which, under its normal accounting policy, it depreciates using the straight-line method. For income tax purposes, these assets qualify as 5-year personal property under the General Depreciation System (GDS) and consequently income tax depreciation is computed using the Modified Accelerated Cost Recovery System (MACRS) which is equivalent to double-declining balance depreciation with a half-year assumed for the year placed in service and changing to straight-line depreciation when advantageous to the taxpayer. In addition, as permitted by IRC Section 179, Caitlyn elected to deduct $100,000 of these costs in the year placed in service. By making this election, for the purpose of computing income tax cost recovery, Caitlyn is required to reduce the depreciable basis of the eligible assets by the amount of Section 179 deduction taken during the tax year.

	2009	*Tax*	*GAAP*	*Future (taxable) deductible amount*
A	Purchase price of assets	$400,000	$400,000	
B	Section 179 expense election	100,000	--	
C	Adjusted depreciable basis (A – B)	300,000	400,000	
D	Depreciation rate	× 20%	× 10%	
E	2009 depreciation (C × D)	60,000	40,000	
F	Section 179 expense election (B)	100,000	--	
G	2009 depreciation and section 179 (E + F)	160,000	40,000	
H	Basis at 12/31/09 (A – G)	$240,000	$360,000	$(120,000)
	2010			
I	Depreciation rate	× 32%	× 10%	
J	2010 Depreciation (C × I)	96,000	40,000	
K	Basis at 12/31/10 (H – J)	$144,000	$320,000	$(176,000)
	2011			
L	Depreciation rate	× 19.2%	× 10%	
M	2011 Depreciation (C × L)	57,600	40,000	
N	Basis at 12/31/11 (K – M)	$86,400	$280,000	$(193,600)

The computation of deferred income taxes is as follows:

	12/31/2009	*12/31/2010*	*12/31/2011*
Future deductible temporary difference			
Prepaid rent	$100,000	$ 80,000	$125,000
Future (taxable) temporary difference			
Property and equipment	(120,000)	(176,000)	(193,600)
Net (taxable) deductible temporary difference	(20,000)	(96,000)	(68,600)
Effective tax rate	34%	34%	37%
Ending deferred income tax asset (liability)	(6,800)	(32,640)	(25,382)
Beginning deferred income tax asset (liability)	--	(6,800)	(32,640)
Deferred income tax (expense) benefit	$ (6,800)	$ (25,840)	$ 7,258

Note from the computations that, under the liability method, deferred income tax expense or benefit is the amount necessary to adjust the balance sheet to the computed balance. No attempt is made to correlate the amount of deferred income tax expense or benefit to pretax accounting income or loss. Nor is it necessary to track the amount of each temporary difference that originates or reverses during the year.

ASC 740 in Greater Detail

While the liability method is conceptually straightforward, in practice there are a number of complexities to be addressed. Income tax accounting remains one of the more difficult areas of accounting practice. In the following pages, these measurement and reporting issues will be discussed in greater detail:

1. Temporary and permanent differences
2. Treatment of net operating loss carryforwards
3. Measurement of deferred income tax assets and liabilities
4. Considering whether a valuation allowance is needed
5. The effect of tax law changes on previously recorded deferred income tax assets and liabilities
6. The effect of a change in the tax status of the reporting entity from taxable to non-taxable or vice versa on previously recognized deferred income tax assets and liabilities
7. The effect of accounting changes for income tax purposes
8. Income tax effects of dividends paid on shares held by Employee Stock Ownership Plans (ESOP)
9. The income tax effects of business combinations at and after acquisition date

10. Intercorporate income tax allocation
11. Separate financial statements of subsidiaries or investees
12. Asset acquisitions
13. Intraperiod income tax allocation
14. Balance sheet classification
15. Disclosures
16. Interim reporting

Detailed examples of deferred income tax accounting under ASC 740 are presented throughout the following discussion of these issues.

Temporary and Permanent Differences

Deferred income taxes are provided for all temporary differences, but not for permanent differences. Thus, it is important to be able to distinguish between the two.

Temporary differences. While many typical business transactions are accounted for identically for income tax and financial reporting purposes, there are many others subject to different income tax and accounting treatments, often leading to their being reported in different periods in financial statements than they are reported on income tax returns. The term "timing differences," used under prior GAAP, has been superseded by the broader term "temporary differences" under current rules. Under income statement oriented GAAP, timing differences were said to originate in one period and to reverse in a later period. These involved such common items as alternative depreciation methods, deferred compensation plans, percentage-of-completion accounting for long-term construction contracts, and cash basis versus accrual basis accounting.

The more comprehensive concept of temporary differences, consistent with the modern balance sheet orientation of GAAP, includes all differences between the income tax basis and the financial reporting carrying value of assets and liabilities, if the reversal of those differences will result in taxable or deductible amounts in future years. Temporary differences include all the items formerly defined as timing differences, and other additional items.

Temporary differences under ASC 740 that were defined as timing differences under prior GAAP can be categorized as follows:

> **Revenue recognized for financial reporting purposes before being recognized for income tax purposes.** Revenue accounted for by the installment method for income tax purposes, but fully reflected in current GAAP income; certain construction-related revenue recognized using the completed-contract method for income tax purposes, but recognized using the percentage-of-completion method for financial reporting purposes; earnings from investees recognized using the equity method for accounting purposes but taxed only when later distributed as dividends to the investor. These are future taxable temporary differences because future periods' taxable income will exceed GAAP income as the differences reverse; thus they give rise to deferred income tax liabilities.
>
> **Revenue recognized for income tax purposes prior to recognition in the financial statements.** Certain taxable revenue received in advance, such as prepaid rental income and service contract revenue not recognized in the financial statements until later periods. These are future deductible temporary differences, because the costs of future performance will be deductible in the future years when incurred without being reduced by the amount of revenue deferred for GAAP purposes. Consequently, the income tax benefit to be realized in future years from deducting those future costs is a deferred income tax asset.
>
> **Expenses deductible for income tax purposes prior to recognition in the financial statements.** Accelerated depreciation methods or shorter statutory useful lives used for income tax purposes, while straight-line depreciation or longer useful economic lives are used for financial reporting; amortization of goodwill and nonamortizable intangible assets over a 15-year life for income tax purposes while not amortizing them for financial reporting purposes unless

they are impaired. Upon reversal in the future, the effect would be to increase taxable income without a corresponding increase in GAAP income. Therefore, these items are future taxable temporary differences, and give rise to deferred income tax liabilities.

Expenses recognized in the financial statements prior to becoming deductible for income tax purposes. Certain estimated expenses, such as warranty costs, as well as such contingent losses as accruals of litigation expenses, are not tax deductible until the obligation becomes fixed. In those future periods, those expenses will give rise to deductions on the reporting entity's income tax return. Thus, these are future deductible temporary differences that give rise to deferred income tax assets.

In addition to these familiar and well-understood categories of timing differences, temporary differences include a number of other categories that also involve differences between the income tax and financial reporting bases of assets or liabilities. These include

Reductions in tax-deductible asset bases arising in connection with tax credits. Under the provisions of the 1982 income tax act, taxpayers were permitted a choice of either full ACRS depreciation coupled with a reduced investment tax credit, or a full investment tax credit coupled with reduced depreciation allowances. If the taxpayer chose the latter option, the asset basis was reduced for tax depreciation, but was still fully depreciable for financial reporting purposes. Accordingly, this type of election is accounted for as a future taxable temporary difference, that gives rise to a deferred income tax liability.

Investment tax credits accounted for by the deferral method. Under GAAP, investment tax credits could be accounted for by either the "flow through" method (full recognition in the period the asset is placed in service, by far the most common method in practice), or by the "deferral" method (recognition in income over the useful lives of the assets giving rise to the credit). Thus, a future deductible temporary difference existed, with which a deferred income tax asset would be associated.

NOTE: These two categories are no longer of much interest since the investment tax credit was eliminated and is not presently available to taxpayers under current tax law. In the past, however, Congress has reinstated the credit to provide an incentive for businesses to invest in productive equipment. Future reinstatement always remains a possibility, given the cyclical nature of the US economy.

Increases in the income tax bases of assets resulting from the indexing of asset costs for the effects of inflation. Occasionally proposed but never enacted, enacting such a provision to income tax law would allow taxpaying entities to finance the replacement of depreciable assets through depreciation based on current costs, as computed by the application of indices to the historical costs of the assets being remeasured. This reevaluation of asset costs would give rise to future taxable temporary differences that would be associated with deferred income tax liabilities since, upon the eventual sale of the asset, the taxable gain would exceed the gain recognized for financial reporting purposes resulting in the payment of additional tax in the year of sale.

Certain business combinations accounted for by the purchase method or the acquisition method. Under certain circumstances, the amounts assignable to assets or liabilities acquired in business combinations will differ from their income tax bases. Such differences may be either taxable or deductible in the future and, accordingly, may give rise to deferred income tax liabilities or assets. These differences are explicitly recognized by the reporting of deferred income taxes in the consolidated financial statements of the acquiring entity. Note that these differences are no longer allocable to the financial reporting bases of the underlying assets or liabilities themselves, as was the case under the old net of tax method.

A financial reporting situation in which deferred income taxes may or may not be appropriate would include life insurance (such as key person insurance) under which the reporting entity is the beneficiary. Since proceeds of life insurance are not subject to income tax under present law, the excess of cash surrender values over the sum of premiums paid will not be a temporary difference under the provisions of ASC 740, if the intention is to hold the policy until death benefits are received. On the other hand, if the entity intends to

cash in (surrender) the policy at some point prior to the death of the insured (i.e., it is holding the insurance contract as an investment), which would be a taxable event, then the excess surrender value is in fact a temporary difference, and deferred income taxes are to be provided thereon.

Temporary differences from share-based compensation arrangements. ASC 718-50 contains intricate rules with respect to accounting for the income tax effects of different types of share-based compensation awards.

The complexity of applying the income tax provisions contained in ASC 718-50 is exacerbated by the complex statutes and regulations that apply under the US Internal Revenue Code (IRC). The American Job Creation Act of 2004 added IRC §409A that contains complicated provisions regarding the timing of taxability of specified amounts deferred under nonqualified deferred compensation plans. In general, amounts deferred under specified types of nonqualified plans are currently includable in gross income to the extent the benefits are not subject to a substantial risk of forfeiture unless certain requirements are met. An incentive stock option (ISO or statutory option governed by IRC §422) is not subject to §409A; however, certain nonqualified stock option (NQSO or nonstatutory) plans are subject to these requirements.

Differences between the accounting rules and the income tax laws can result in situations where the cumulative amount of compensation cost recognized for financial reporting purposes will differ from the cumulative amount of compensation deductions recognized for income tax purposes. Under current income tax law applicable to certain NQSO awards, an employer recognizes an income tax deduction for the intrinsic value of the option on the date that the employee exercises the option. The intrinsic value is computed as the difference between the option's exercise price and the market price of the stock on the date of exercise. Under ASC 718-50 this type of equity award is recognized at the fair value of the options at grant date with compensation cost recognized over the requisite service period. Consequently, during the period from grant date until the end of the requisite service period, the reporting entity is recognizing compensation cost in its financial statements with no corresponding income tax deduction. Because the award described above is accounted for as equity (and not as a liability), the credit that offsets the debit to compensation cost is to additional paid-in capital. This results in a future deductible temporary difference between the carrying amounts of additional paid-in capital for financial reporting and income tax purposes, thus giving rise to a deferred income tax asset and corresponding deferred income tax benefit.

At exercise, to the extent that the income tax deduction based on intrinsic value exceeds the cumulative compensation cost recognized for financial reporting purposes, the income tax effect (the effective income tax rate multiplied by the cumulative difference) is credited to additional paid-in capital rather than being reflected in the income statement as a deferred income tax benefit.

The IRC provides employers the ability to obtain a current income tax deduction for payments of dividends (or dividend equivalents) to employees that hold nonvested shares, share units, or share options that are classified under ASC 718-50 as equity. Under this scenario, the payment of the dividends is charged to retained earnings under ASC 718-50 irrespective of the fact that the employer/reporting entity obtains a tax deduction for the payment as taxable compensation. The income tax benefit realized from deducting these payments is to be recorded as an increase to additional paid-in capital and, as explained in depth in the discussion of ASC 718-50 in Chapter 19, included in the pool of excess tax benefits available to absorb tax deficiencies on share-based payment awards.

Temporary differences arising from convertible debt with a beneficial conversion feature. Issuers of debt securities sometimes structure the instruments to include a nondetachable conversion feature. If the terms of the conversion feature are "in-the-money" at the date of issuance, the feature is referred to as a "beneficial conversion feature." Beneficial conversion features are accounted for separately from the host instrument under ASC 470-20.

The separate accounting results in an allocation to additional paid-in capital of a portion of the proceeds received from issuance of the instrument that represents the intrinsic value of the conversion feature calculated at the commitment date, as defined. The intrinsic value is the difference between the conversion price and the fair value of the instruments into which the security is convertible multiplied by the number of shares into which the security is convertible. The convertible security is recorded at its par value (assuming there is no discount or premium on issuance). A discount is recognized to offset the portion of the instrument that is allocated to additional paid-in capital. The discount is accreted from the issuance date to the stated redemption date of the convertible instrument or through the earliest conversion date if the instrument does not include a stated redemption date.

For US income tax purposes, the proceeds are recorded entirely as debt and represent the income tax basis of the debt security, thus creating a temporary difference between the basis of the debt for financial reporting and income tax reporting purposes.

ASC 740-10-55 specifies that the income tax effect associated with this temporary difference is to be recorded as an adjustment to additional paid-in-capital. It would not be reported, as are most other such tax effects, as a deferred tax asset or liability in the balance sheet.

Other common temporary differences include

Accounting for investments. Use of the equity method for financial reporting while using the cost method for income tax purposes.

Accrued contingent liabilities. These cannot be deducted for income tax purposes until the liability becomes fixed and determinable.

Cash basis versus accrual basis. Use of the cash method of accounting for income tax purposes and the accrual method for financial reporting.

Charitable contributions that exceed the statutory deductibility limitation. These can be carried over to future years for income tax purposes.

Deferred compensation. Under GAAP, the present value of deferred compensation agreements must be accrued and charged to expense over the employee's remaining employment period, but for income tax purposes these costs are not deductible until actually paid.

Depreciation. A temporary difference will occur unless the modified ACRS method is used for financial reporting over estimated useful lives that are the same as the IRS-prescribed recovery periods. This is only permissible for GAAP if the recovery periods are substantially identical to the estimated useful lives.

Estimated costs (e.g., warranty expense). Estimates or provisions of this nature are not included in the determination of taxable income until the period in which the costs are actually incurred.

Goodwill. For US federal income tax purposes, amortization over fifteen years is mandatory. Amortization of goodwill is no longer permitted under GAAP, but periodic write-downs for impairment may occur, with any remainder of goodwill being expensed when the reporting unit to which it pertains is ultimately disposed of.

Income received in advance (e.g., prepaid rent). Income of this nature is includable in taxable income in the period in which it is received, while for financial reporting purposes, it is considered a liability until the revenue is earned.

Installment sale method. Use of the installment sale method for income tax purposes generally results in a temporary difference because that method is generally not permitted to be used in accordance with GAAP.

Long-term construction contracts. A temporary difference will arise if different methods (e.g., completed-contract or percentage-of-completion) are used for GAAP and income tax purposes.

Mandatory change from the cash method to the accrual method. Generally one-fourth of this adjustment is recognized for income tax purposes each year.

Net capital loss. C corporation capital losses are recognized currently for financial reporting purposes but are carried forward to be offset against future capital gains for income tax purposes.

Organization costs. GAAP requires organization costs to be treated as expenses as incurred. For income tax purposes, organization costs are recorded as assets and amortized over a 60-month period. Also see **Permanent differences** below.

Uniform cost capitalization (UNICAP). Income tax accounting rules require manufacturers and certain wholesalers to capitalize as inventory costs, certain costs that, under GAAP are considered administrative costs that are not allocable to inventory.

Permanent differences. Permanent differences are book-tax differences in asset or liability bases that will never reverse and therefore, affect income taxes currently payable but do not give rise to deferred income taxes.

Common permanent differences include

Club dues. Dues assessed by business, social, athletic, luncheon, sporting, airline and hotel clubs are not deductible for federal income tax purposes.

Dividends received deduction. Depending on the percentage interest of the payer owned by the recipient, a percentage of the dividends received by a corporation are nontaxable. Different rules apply to subsidiaries.

Goodwill—nondeductible. If, in a particular taxing jurisdiction, goodwill amortization is not deductible, that goodwill is considered a permanent difference and does not give rise to deferred income taxes.

Lease inclusion amounts. Lessees of automobiles whose fair value the IRS deems to qualify as a luxury automobile are required to limit their lease deduction by adding to taxable income an amount determined by reference to a table prescribed annually in a revenue procedure.

Meals and entertainment. A percentage (currently 50%) of business meals and entertainment costs are not deductible for federal income tax purposes.

Municipal interest income. A 100% exclusion is permitted for investment in qualified municipal securities. Note that the capital gains applicable to sales of these securities are taxable.

Officer's life insurance premiums and proceeds. Premiums paid for an officer's life insurance policy under which the company is the beneficiary are not deductible for income tax purposes, nor are any death proceeds taxable.

Organization and start-up costs. GAAP requires organization and start-up costs to be treated as expenses as incurred. Certain organization and start-up costs are not allowed amortization under the tax code. The most clearly defined are those expenditures relating to the cost of raising capital. Also see temporary differences above.

Penalties and fines. Any penalty or fine arising as a result of violation of the law is not allowed as an income tax deduction. This includes a wide range of items including parking tickets, environmental fines, and penalties assessed by the US Internal Revenue Service.

Percentage depletion. The excess of percentage depletion over cost depletion is allowable as a deduction for income tax purposes.

Wages and salaries eligible for jobs credit. The portion of wages and salaries used in computing the jobs credit is not allowed as a deduction for income tax purposes.

Treatment of Net Operating Loss Carryforwards

The recognition and measurement of the income tax effects of net operating loss carryforwards under ASC 740 differs materially from how this was dealt with under earlier standards. Historically, it had been presumed that net operating losses would generally not be realizable; accordingly, the income tax effects of carryforwards were not recognized in the financial statements until the future period in which the benefits were realized for income tax

purposes. That is, the provision for income taxes in the loss year only reflected the benefit derived, if any, from carrying back the net operating loss to prior years to obtain a refund. Any excess net operating loss available to offset future years' taxable income was not recognized until actually realized. Consequently, the balance sheet would not display a deferred income tax asset relating to the net operating loss carryforward. This treatment was justified in order to report the entity's assets at amounts that did not exceed their estimated net realizable value. (Only in exceptional cases, when realization of the benefits was deemed to be assured beyond a reasonable doubt, was recognition in the loss period permitted.

With the imposition of ASC 740, all temporary differences and carryforwards have been conferred identical status, and their income tax effects are to be given full recognition on the balance sheet. Specifically, the income tax effects of net operating loss carryforwards are equivalent to the income tax effects of future deductible temporary differences, and the once important distinction between the two has been eliminated. The deferred income tax effects of net operating losses are computed and recorded, but as is the case for all other deferred income tax assets, the need for a valuation allowance must also be assessed (as discussed below). The income tax effects of income tax credit carryforwards (e.g., general business credits, alternative minimum tax credits) are used to increase deferred income tax assets dollar-for-dollar versus being treated in the same manner as future deductible temporary differences as illustrated below.

Example—Net operating loss carryforwards and income tax credit carryforwards

Casey Corporation has the following future deductible temporary differences and available carryforwards at December 31, 2009:

Inventory costs capitalized under Internal Revenue Code §263A	$40,000
Allowance for uncollectible accounts receivable	20,000
Net operating loss carryforward	18,000
General business credit carryforward	14,000

Casey's computation of deferred income taxes at December 31, 2009, is as follows:

Capitalized inventory costs	$40,000
Allowance for uncollectible accounts receivable	20,000
Net operating loss carryforward	18,000
	78,000
Assumed income tax rate	× 34%
	26,520
General business credit carryforward	14,000
Deferred income tax asset	$40,520

Note the net operating loss is multiplied by the income tax rate to compute its effect on the deferred income tax asset since it is available to reduce future years' *taxable income*. In contrast, the general business credit carryforward is not multiplied by the *income tax* rate since it is available to be used to offset future years' income tax.

The reporting of the current income tax benefit of carrying back net operating losses was also changed by the current standard. ASC 740 provides that the income tax benefits of net operating loss carrybacks and carryforwards, with limited exceptions (discussed below), are to be reported in the same manner as the source of either income or loss in the current year. As used in the standard, the phrase "in the same manner" refers to the classification of the income tax benefit in the income statement (i.e., as income taxes on income from continuing operations, discontinued operations, extraordinary items, etc.) or as the income tax effect of gains included in other comprehensive income but excluded from net income on the income statement. The income tax benefits are not reported in the same manner as the source of the net operating loss carryforward or income taxes paid in a prior year, or as the source of the expected future taxable income that will permit the realization of the carryforward.

For example, if the income tax benefit of a loss that arose in a prior year in connection with an extraordinary item is first given recognition in the current year, the benefit would be allocated to income taxes on income from continuing operations if the benefit offsets income taxes on income from continuing operations in the current year. The expression "first given recognition" means that the net deferred income tax asset, after deducting the valuation allowance, reflects the income tax effect of the loss carryforward for the first time.

Under ASC 740, of course, the gross deferred income tax asset will always reflect all future deductible temporary differences and net operating loss carryforwards in the periods they arise. Thus, first given recognition means that the valuation allowance is eliminated for the first time. If it offsets income taxes on extraordinary income in the current year, then the benefits would be reported in extraordinary items. As another example, the tax benefit arising from the entity's loss from continuing operations in the current year would be allocated to continuing operations, regardless of whether it might be realized as a carryback against income taxes paid on extraordinary items in prior years. The income tax benefit would also be allocated to continuing operations in cases where it is anticipated that the benefit will be realized through the reduction of income taxes to be due on extraordinary gains in future years. (See the discussion of intraperiod income tax allocation later in this chapter.)

Thus, the general rule is that the reporting of income tax effects of net operating losses are driven by the source of the tax benefits in the current period. There are only two exceptions to the foregoing rule. The first exception relates to existing future deductible temporary differences and net operating loss carryforwards which arise in connection with business combinations and for which income tax benefits are first recognized. This exception will be discussed below (see income tax effects of business combinations). As in the preceding paragraph, first recognized means that a valuation allowance (as discussed more fully later in this chapter) provided previously is being eliminated for the first time.

The second exception to the aforementioned general rule is that certain income tax benefits allocable to stockholders' equity are not to be reflected in the income statement. Specifically, income tax benefits arising in connection with contributed capital, employee stock options, dividends paid on unallocated ESOP shares, or temporary differences existing at the date of a quasi reorganization are reported as accumulated other comprehensive income in the stockholders' equity section of the balance sheet and are not included in the income statement.

Certain transactions among stockholders that occur outside the company can affect the status of deferred income taxes. The most commonly encountered of these is the change in ownership of over 50% of the company's stock, which limits or eliminates the company's ability to utilize net operating loss carryforwards, and accordingly requires the reversal of deferred income tax assets previously recognized under ASC 740. Changes in deferred income taxes caused by transactions among stockholders are to be included in current period income tax expense in the income statement, since these are analogous to changes in expectations resulting from other external events (e.g., changes in enacted income tax rates). However, the income tax effects of changes in the income tax bases of assets or liabilities caused by transactions among stockholders would be included in equity, not in the income statement, although subsequent period changes in the valuation account, if any, would be reflected in income (ASC 740-20-45).

Measurement of Deferred Income Tax Assets and Liabilities

Scheduling of the reversal years of temporary differences. Under ASC 740 there is no need to forecast (or "schedule") the future years in which temporary differences are expected to reverse except in the most exceptional circumstances. To eliminate the burden, it

was necessary to endorse the use of the expected average (i.e., effective) income tax rate to measure the deferred income tax assets and liabilities, and to forgo a more precise measure of marginal tax effects. Scheduling is now encountered primarily (1) when income tax rate changes are to be phased in over multiple years, and (2) in order to determine the classification (current or noncurrent) of a deferred income tax asset arising from a net operating loss carryforward or income tax credit carryforward or to determine whether such a carryforward might expire unused for the purpose of determining the amount of valuation allowance needed (as discussed in the following section of this chapter).

Determining the appropriate income tax rate. Currently, C corporations with taxable income between $335,000 and $10,000,000 are taxed at an expected income tax rate equal to the 34% marginal rate, since the effect of the surtax exemption has fully phased out at that level, effectively resulting in a flat tax. Thus, the computation of deferred federal income taxes for these entities is accomplished simply by applying the 34% top marginal rate to all temporary differences and net operating loss carryforwards outstanding at the balance sheet date. This technique is applied to future taxable temporary differences (producing deferred income tax liabilities), and to future deductible temporary differences and net operating loss carryforwards (giving rise to deferred income tax assets). The deferred income tax assets computed must still be evaluated for realizability; some, or all, of the projected income tax benefits may fail the "more-likely-than-not" test and consequently may need to be offset by a valuation allowance.

On the other hand, reporting entities that have historically been taxed at an effective federal income tax rate lower than the top marginal rate compute their federal deferred income tax assets and liabilities by using their expected future effective income tax rates. Consistent with the goal of simplifying the process of calculating deferred income taxes, reporting entities are permitted to apply a single, long-term expected income tax rate, without attempting to differentiate among the years when temporary difference reversals are expected to occur. In any event, the inherent imprecision of forecasting future income levels and the patterns of temporary difference reversals makes it unlikely that a more sophisticated computational effort would produce better financial statements. Therefore, absent such factors as the phasing in of new income tax rates, it is not necessary to consider whether the reporting entity's effective income tax rate will vary from year to year.

The effective income tax rate convention obviates the need to predict the impact of the alternative minimum tax (AMT) on future years. In determining an entity's deferred income taxes, the number of computations may be as few as one.

Special deductions. The US income tax code includes economic incentives designed to provide special benefits to certain types of taxpayers and to help stimulate the economy. These special deductions have been quite varied, ranging from statutory depletion deductions for extractive industries to deductions allowed to small insurance companies. A less obscure special deduction results from a provision included in the American Jobs Creation Act of 2004 (AJCA) referred to as the Qualified Production Activities Deduction (AJCA §102). This deduction, effective for taxable years beginning after December 31, 2004, is computed as a specified percentage of the taxpayer's income from qualified domestic production activities for the year. The percentage increases from an initial 3% in 2005 and 2006 to 6% in 2007 through 2009, and finally to 9% for 2010 and later. The computed deduction is subject to certain limitations. For example, the deduction cannot exceed the amount computed by applying the same percentage to taxable income computed prior to considering this deduction nor can the deduction exceed 50% of the wages paid by the taxpayer for the tax year.

In ASC 740-10-55, the FASB staff clarified that this provision of AJCA is not considered a reduction in the enacted income tax rate for qualified taxpayers because the realization of the income tax benefit is contingent upon the taxpayer, in the future, performing qualified

production activities and incurring a sufficient level of wages and profitability. The ability to utilize this special deduction is considered, however, in determining the effective federal income tax rate to apply to future taxable or deductible temporary differences when graduated rates are a significant factor. The future availability of this deduction is also considered in assessing the need for a valuation allowance to reduce a deferred income tax asset.

Computing deferred income taxes. The procedure to compute the gross deferred income tax provision (i.e., before addressing the possible need for a valuation allowance) is as follows:

1. Identify all temporary differences existing as of the reporting date. This process is simplified if the reporting entity maintains both GAAP and income tax balance sheets for comparison purposes.
2. Segregate the temporary differences into future taxable differences and future deductible differences. This step is necessary because a valuation allowance may be required to be provided to offset the income tax effects of the future deductible temporary differences and carryforwards, but not the income tax effects of the future taxable temporary differences.
3. Accumulate information about available net operating loss and tax credit carryforwards as well as their expiration dates or other types of limitations, if any.
4. Measure the income tax effect of aggregate future taxable temporary differences by separately applying the appropriate expected income tax rates (federal plus any state, local, and foreign rates that are applicable under the circumstances). Ensure that consideration is given in making these computations to the federal income tax deductibility of income taxes payable to other jurisdictions.
5. Similarly, measure the income tax effects of future deductible temporary differences, including net operating loss carryforwards.

ASC 740 prescribes that separate computations be made for each taxing jurisdiction. In many cases, this level of complexity is not needed and a single, combined effective income tax rate can be used. However, in assessing the need for valuation allowances, it is necessary to consider the entity's ability to absorb deferred income tax benefits against income tax liabilities. Inasmuch as benefits from one tax jurisdiction will not reduce income taxes payable to another tax jurisdiction, separate calculations will be needed in these situations. Also, for purposes of balance sheet presentation (discussed below), offsetting of deferred income tax assets and liabilities is only permissible within the same jurisdiction.

Separate computations are made for each taxpaying component of the primary reporting entity: if a parent company and its subsidiaries are consolidated for financial reporting purposes but file separate income tax returns, the reporting entity comprises a number of components, and the income tax benefits of any one will be unavailable to reduce the income tax obligations of the others.

The principles set forth above are illustrated by the following example.

Computation of deferred income tax liability and asset—Basic example

Assume that Humfeld Company has a total of $28,000 of future taxable temporary differences, and a total of $8,000 of future deductible temporary differences. There are no available operating loss or tax credit carryforwards. Taxable income is $230,000 and the income tax rate is a flat (i.e., not graduated) 34% for the current year and not anticipated to change in the future. Also assume that there were no deferred income tax liabilities or assets in prior years.

Current income tax expense and income taxes currently payable are computed as taxable income times the current rate ($230,000 × 34% = $78,200). The deferred income tax asset is computed as $2,720 representing 34% of future deductible temporary differences of $8,000. The deferred income tax liability of $9,520 is calculated as 34% of future taxable temporary differences

of $28,000. The deferred income tax expense of $6,800 is the net of the deferred income tax liability of $9,520 and the deferred income tax asset of $2,720.

The journal entry to record the required amounts is

Current income tax expense	78,200	
Deferred income tax asset	2,720	
Income tax expense—deferred	6,800	
Deferred income tax liability		9,520
Income taxes currently payable		78,200

In 2009, Humfeld Company has taxable income of $411,000, aggregate future taxable and future deductible temporary differences are $75,000 and $36,000, respectively, and the income tax rate remains a flat 34%.

Current income tax expense and income taxes currently payable are each $139,740 ($411,000 × 34%).

Deferred amounts are calculated as follows:

	Deferred tax liability	*Deferred tax asset*	*Income tax expense—deferred*
Required balance at 12/31/09			
$75,000 × 34%	$25,500		--
$36,000 × 34%		$12,240	--
Balances at 12/31/08	9,520	2,720	--
Adjustment required	$15,980	$9,520	$6,460

The journal entry to record the deferred amounts is

Deferred income tax asset	9,520	
Income tax expense—deferred	6,460	
Deferred income tax liability		15,980

Because the increase in the liability in 2009 is larger (by $6,460) than the increase in the asset for that year, the result is a deferred income tax expense for 2009.

The Valuation Allowance for Deferred Income Tax Assets Expected to Be Unrealizable

Under prior GAAP, the presentation of deferred income tax assets in the balance sheet was constrained or prohibited entirely. ASC 740 requires that all deferred income tax assets be given full recognition, subject to the possible provision of an allowance when it is determined that this asset is unlikely to be realized. This approach (providing full recognition on a gross basis, but also providing for a valuation allowance to reduce the recorded asset to the expected realizable amount) conveys the greatest amount of useful information to the users of the financial statements.

In dealing with the question of measurement of the valuation account, FASB could well have been guided by ASC 450, which established the standard for recognizing contingent obligations incurred and impairments of assets. Under ASC 450, the threshold for recognition of impairment would have been that the impairment was deemed to be "probable" of realization. FASB rejected the notion of applying that standard to this measurement situation, and instead developed a new measure, the "more-likely-than-not" criterion. (To date, this criterion has been applied exclusively to the deferred income tax asset issue.)

Under this provision of ASC 740, a valuation allowance is to be provided for that fraction of the computed year-end balances of the deferred income tax assets for which it has been determined that it is more likely than not that the reported asset amount will not be realized. As used in this context, "more likely than not" represents a probability of just over 50%. Since it is widely agreed that the term probable, as used in ASC 450, denotes a much higher probability (perhaps 85% to 90%), the threshold for reflecting an impairment of deferred income tax assets is much lower than the threshold for other assets (i.e., in most cases, the likelihood of a valuation allowance being required is greater than, say, the likelihood that a long-lived asset is impaired).

If a higher threshold had been set (such as ASC 450's "probable"), great diversity could have developed in practice as to the amount of valuation allowances offsetting deferred income tax assets, which would not have been consistent with the goal of comparability of financial statements over time and across entities.

Establishment of a valuation allowance

Assume that Couch Corporation has a future deductible temporary difference of $60,000 at December 31, 2009. The tax rate is a flat 34%. Based on available evidence, management of Couch Corporation concludes that it is more likely than not that all sources will not result in future taxable income sufficient to realize an income tax benefit of more than $15,000 (25% of the future deductible temporary difference). Also assume that there were no deferred income tax assets in previous years and that prior years' taxable income was inconsequential.

At 12/31/09 Couch Corporation records a deferred income tax asset in the amount of $20,400 ($60,000 × 34%) and a valuation allowance of $15,300 (34% of the $45,000 difference between the $60,000 of future deductible temporary differences and the $15,000 of future taxable income expected to absorb the future tax deduction arising from the reversal of the temporary difference).

The journal entry at 12/31/09 is

Deferred income tax asset	20,400	
Valuation allowance		15,300
Income tax benefit—deferred		5,100

The deferred income tax benefit of $5,100 represents that portion of the deferred income tax asset (25%) that, more likely than not, is realizable.

Assume that at the end of 2010, Couch Corporation's future deductible temporary difference has decreased to $50,000 and that Couch now has a net operating loss carryforward of $42,000. The total of the net operating loss carryforward ($42,000) plus the amount of the future deductible temporary difference ($50,000) is $92,000. A deferred income tax asset of $31,280 ($92,000 × 34%) is recognized at the end of 2010. Also assume that management of Couch Corporation concludes that it is more likely than not that $25,000 of the tax asset will not be realized. Thus, a valuation allowance in that amount is required, and the balance in the allowance account of $15,300 must be increased by $9,700 ($25,000 – $15,300).

The journal entry at 12/31/10 is

Deferred income tax asset	10,880	
Valuation allowance		9,700
Income tax benefit—deferred		1,180

The deferred income tax asset is debited $10,880 to increase it from $20,400 at the end of 2009 to its required balance of $31,280 at the end of 2010. The deferred income tax benefit of $1,180 represents the net of the $10,880 increase in the deferred income tax asset and the $9,700 increase in the valuation allowance.

While the meaning of the more-likely-than-not criterion is clear (more than 50%), the practical difficulty of assessing whether or not this subjective threshold test is met in a given situation remains. A number of positive and negative factors need to be evaluated in reaching a conclusion as to the necessity of a valuation allowance. Positive factors (those suggesting that an allowance is not necessary) include

1. Evidence of sufficient future taxable income, exclusive of reversing temporary differences and carryforwards, to realize the benefit of the deferred income tax asset
2. Evidence of sufficient future taxable income arising from the reversals of existing future taxable temporary differences (deferred income tax liabilities) to realize the benefit of the deferred income tax asset
3. Evidence of sufficient taxable income in prior year(s) available for realization of a net operating loss carryback under existing statutory limitations

4. Evidence of the existence of prudent, feasible tax planning strategies under management control that, if implemented, would permit the realization of the deferred income tax asset
5. An excess of appreciated asset values over their tax bases, in an amount sufficient to realize the deferred income tax asset
6. A strong earnings history exclusive of the loss creating the deferred tax asset

While the foregoing may suggest that the reporting entity will be able to realize the benefits of the future deductible temporary differences outstanding as of the balance sheet date, certain negative factors must also be considered in determining whether a valuation allowance needs to be established against deferred income tax assets. These factors include

1. A cumulative recent history of losses
2. A history of operating losses, or of net operating loss or tax credit carryforwards that have expired unused
3. Losses that are anticipated in the near future years, despite a history of profitable operations

Thus, the process of evaluating whether a valuation allowance is needed involves the weighing of both positive and negative factors to determine whether, based on the preponderance of available evidence, it is more likely than not that the deferred income tax assets will be realized.

Example of applying the more-likely-than-not criterion to a deferred income tax asset

Assume the following facts:

1. Foy Corporation reports on a calendar year, and it commenced operations and began applying ASC 740 in 2004.
2. As of the December 31, 2009 balance sheet, it has future taxable temporary differences of $85,000 relating to income earned on equity-method investments; future deductible temporary differences of $12,000 relating to deferred compensation arrangements; a net operating loss carryforward (which arose in 2006) of $40,000; and a capital loss carryforward of $10,000 (which arose in 2009).
3. Foy's expected effective income tax rate for future years is 34% for both ordinary income and net long-term capital gains. Capital losses cannot be offset against ordinary income.

The first steps are to compute the deferred income tax asset and/or liability without consideration of the possible need for a valuation allowance.

Deferred income tax liability:	
Future taxable temporary difference (equity-method investment)	$85,000
Effective tax rate	× 34%
Required balance	$28,900
Deferred income tax asset:	
Future deductible temporary differences and carryforwards:	
Deferred compensation	$12,000
Net operating loss carryforward	40,000
	52,000
Effective tax rate	× 34%
Required balance (a)	$17,680
Capital loss	$10,000
Effective tax rate	× 34%
Required balance (b)	$ 3,400
Total deferred income tax asset: (a) + (b)	
Ordinary	$17,680
Capital	3,400
Total required balance	$21,080

The next step is to consider the need for a valuation allowance to partially or completely offset the deferred income tax asset, based on a "more likely than not" assessment of the asset's realizability. Foy management must evaluate both positive and negative evidence to determine the need for a valuation allowance, if any. Assume that management identifies the following factors that may affect this need:

1. Before the net operating loss (NOL) deduction, Foy reported taxable income of $5,000 in 2009. Management believes that taxable income in future years, apart from NOL deductions, should continue at approximately the same level experienced in 2009.
2. The future taxable temporary differences are not expected to reverse in the foreseeable future as the equity method investee is not expected to incur losses or pay dividends to Foy.
3. The capital loss arose in connection with a securities transaction of a type that is unlikely to recur. The company does not generally engage in activities that have the potential to result in capital gains or losses.
4. Management estimates that certain productive assets have a fair value exceeding their respective income tax bases by about $30,000. The entire gain, if realized for income tax purposes, would result in recapture of depreciation previously taken. Since the current plans call for a substantial upgrading of the company's plant assets, management feels it could easily accelerate those actions in order to realize taxable gains, should it be desirable to do so for income tax planning purposes.

Based on the foregoing information, Foy Corporation management concludes that a $3,400 valuation allowance is required. The reasoning is as follows:

1. There will be some taxable operating income generated in future years ($5,000 annually, based on the earnings experienced in 2009), which will absorb a modest portion of the reversal of the deductible temporary difference ($12,000) and net operating loss carryforward ($40,000) existing at year-end 2009.
2. More importantly, the feasible tax planning strategy of accelerating the taxable gain relating to appreciated assets ($30,000) would certainly be sufficient, in conjunction with operating income over several years, to permit Foy to fully realize the income tax benefits of the future deductible temporary difference and NOL carryover.
3. However, since capital losses can only be carried forward for five years, are only usable to offset future capital gains, and Foy management is unable to project future realization of capital gains, it is more likely than not that the associated tax benefit accrued ($3,400) will not be realized, and thus a valuation allowance must be recorded.

Based on this analysis, an allowance for unrealizable deferred income tax benefits in the amount of $3,400 is established by a charge against the current (2009) income tax provision.

Among the foregoing positive and negative factors to be considered, perhaps the most difficult to fully grasp is that of available income tax planning strategies. Since ASC 740 requires that all available evidence be assessed to determine the need for a valuation allowance, the matter of the cost of implementing those strategies is irrelevant. In fact, there is no limitation regarding strategies that may involve significant costs of implementation, although in computing the amount of valuation allowance needed, any costs of implementation must be netted against the benefits to be derived.

For example, if a gross deferred income tax asset of $50,000 is recorded, and certain strategies have been identified by management which would protect realization of the future deductible item associated with the computed income tax benefit, at an implementation cost of $10,000, then the net amount of income tax benefit which is more likely than not to be realizable would not be $50,000. Rather, it may be only $43,400, which is the gross benefit less the after-tax cost of implementation, assuming a 34% tax rate {$50,000 – [$10,000 × (1 – .34)]}. Accordingly, a valuation allowance of $6,600 is established in this example.

Impact of a qualifying tax strategy

Assume that Kruse Company has a $180,000 net operating loss carryforward as of 12/31/09, scheduled to expire at the end of the following year. Future taxable temporary differences of $240,000 exist that are expected to reverse in approximately equal amounts of $80,000 in 2010, 2011, and 2012. Kruse Company estimates that taxable income for 2010 (exclusive of the reversal of existing temporary differences and the operating loss carryforward) will be $20,000. Kruse Company expects to implement a qualifying income tax planning strategy that will accelerate the total of $240,000 of taxable temporary differences to 2010. Expenses to implement the strategy are estimated to approximate $30,000. The tax rate is 34%.

In the absence of the income tax planning strategy, $100,000 of the net operating loss carryforward could be realized in 2010 based on estimated taxable income of $20,000 plus $80,000 of the reversal of future taxable temporary differences. Thus, $80,000 would expire unused at the end of 2010 and the net amount of the deferred income tax asset at 12/31/09 would be recognized as $34,000, computed as $61,200 ($180,000 × 34%) minus the valuation allowance of $27,200 ($80,000 × 34%).

However, by implementing the income tax planning strategy, the deferred income tax asset is calculated as follows:

Taxable income for 2010:	
Expected amount without reversal of taxable temporary differences	$ 20,000
Reversal of taxable temporary differences due to tax-planning strategy, net of costs	210,000
	230,000
Net operating loss to be carried forward	(180,000)
Net operating loss expiring unused at 12/31/10	$ --

The gross deferred income tax asset thus can be recorded at the full benefit amount of $61,200 ($180,000 × 34%). However, a valuation allowance is required for $19,800, representing the net-of-tax effect of the $30,000 in anticipated expenses related to implementation of the strategy. The net deferred income tax asset at 12/31/09 is $41,400 ($61,200 – $19,800). Kruse Company will also recognize a deferred income tax liability of $81,600 at the end of 2009 (34% of the taxable temporary differences of $240,000).

The adequacy of the valuation allowance must be assessed as of each balance sheet date. Adjustments to the amount of the valuation allowance are recorded by a charge against, or a credit to, current earnings, via the current period income tax expense or benefit. Thus, even if the gross amount of future deductible temporary differences has remained constant during a year, income tax expense for that year might be increased or decreased as a consequence of reassessing the adequacy of the valuation allowance at year-end. It is important that these two computational steps be separately addressed: first the computation of the gross deferred income tax assets (the product of the expected effective income tax rate and the total amount of future deductible temporary differences) must be made; then the amount of the valuation allowance to be provided to offset the deferred income tax asset must be assessed (using the criteria set forth above). Although changes in both the deferred income tax asset and valuation allowance affect current period income tax expense, the processes of measuring these two amounts are distinct. Furthermore, ASC 740 requires disclosure of both the gross deferred income tax asset (and also the gross deferred income tax liability) and the change in the valuation allowance for the year. These disclosure requirements underline the need to separately measure these items without offsetting.

Accounting for Uncertainty in Income Taxes

Background. The filing of federal, state, and/or local income tax returns requires management, in consultation with its tax advisors, to make judgments regarding how it will apply intricate and often ambiguous laws, regulations, administrative rulings, and court precedents. If and when the income tax returns are audited by the taxing authority, sometimes years after they are filed, these judgments may be questioned or disallowed all or in part. As a result,

management must make assumptions regarding the likelihood of success in defending its judgments in the event of audit in determining the accounting entries necessary to accurately reflect income taxes currently payable and/or refundable. A project was added to FASB's agenda due to diversity in practice regarding how to exercise those judgments and that project resulted in the issuance of ASC 740-10, in June 2006.

Effective dates. ASC 740-10-05, as issued, was to become fully effective for years beginning after December 15, 2006. This has twice been deferred for many nonpublic companies.

In response to concerns raised by the FASB Private Company Financial Reporting Committee (PCFRC) and other constituent groups, FASB most recently issued FSP FIN 48-3, *Effective Date of FASB Interpretation No. 48 for Certain Nonpublic Enterprises,* on December 31, 2008. (This FSP has not yet been codified.) The FSP amended ASC 740-10 to provide a second one-year deferral of its effective date for certain nonpublic enterprises. The deferral applies to nonpublic reporting entities *except* those that

1. Are consolidated by a public enterprise that applies US GAAP
2. Had already issued a full set of US GAAP annual financial statements prior to the issuance date of the FSP

Entities to which the deferral applies will be required to adopt ASC 740-10 in annual financial statements for fiscal years beginning after December 15, 2008, with application applying to the *beginning* of the reporting entity's fiscal year.

Those entities that do not qualify for the deferral because they had already issued their annual financial statements prior to the issuance of the FSP are required to continue to apply ASC 740-10 and may not derecognize any amounts recorded as result of applying the recognition and measurement provisions of the interpretation.

It is important to note that the definition of "nonpublic enterprise" is considered a public enterprise and is not eligible for the deferred effective date.

On May 30, 2008, the chair of the PCFRC issued a letter to the chairman of FASB recommending that FASB either provide an outright exemption to private companies from all of the requirements of ASC 740-10 or, absent that outcome, recommending that FASB indefinitely defer the effective date of FIN 48 for nonpublic companies until the current joint FASB/IASB convergence project on income tax accounting is completed.[1] That project resulted in the above-cited staff position.

FSP FIN 48-3 postponed the effective date of ASC 740-10-05, for most nonpublic entities, to 2009.

Scope. The term "tax position" is used in FIN 48 to refer to *each* judgment that management makes on an income tax return that has been or will be filed that affects the measurement of current or deferred income tax assets and liabilities at an interim or year-end balance sheet date. Tax positions include

1. Deductions claimed
2. Deferrals of current income tax to one or more future periods
3. Income tax credits applied
4. Characterization as capital gain versus ordinary income
5. Whether or not to report income on an income tax return
6. Whether or not to file an income tax return in a particular jurisdiction

The effects of a tax position can result in a permanent reduction of income taxes payable or deferral of the payment of income taxes to a future year. The taking of a tax position can

---

[1] *http://www.pcfr.org/downloads/PCFRC_Recommendation_Letter_Final_FIN_48_5_30_08_(2).pdf*

also affect management's estimate of the valuation allowance sufficient to reflect its estimate of the amount of deferred income tax assets that are realizable.

ASC 740-10 applies to income taxes accounted for in accordance with ASC 740, and thus does not apply directly or by analogy to other taxes, such as real estate, personal property, sales, excise, or use taxes. The scope of ASC 740-10 includes any entity potentially subject to income taxes including

- Nonprofit organizations
- Flow-through entities (e.g., partnerships, limited liability companies, and S corporations)
- Entities whose income tax liabilities are subject to 100% credit for dividends paid such as real estate investment trusts (REITs) and registered investment companies.

Initial recognition and measurement. ASC 740-10 uses a two-step approach to recognition and measurement.

Initial recognition—Management is to evaluate each tax position as to whether, based on the position's technical merits, it is "more likely than not" that the position would be sustained upon examination by the taxing authority. In making this evaluation, management is required to assume that the tax position will be examined by the taxing authority and that the taxing authority will be provided with all relevant facts and will have full knowledge of all relevant information. Thus, management is prohibited from asserting that a position will be sustained because of a low likelihood that the reporting entity's income tax returns will be examined (a practice that pundits have termed "playing the audit lottery").

The term "more likely than not," consistent with its use in ASC 740, means that there is a probability of more than 50% that the tax position would be sustained upon examination. A judgment of more likely than not represents a positive assertion by management that the reporting entity is entitled to the economic benefits provided by the tax position it is taking. The term "upon examination" includes resolution of appeals or litigation processes, if any, necessary to settle the matter.

It is important to appreciate that this is a new threshold condition for recognition. Unlike the "more likely than not" criterion in ASC 740, which governs the recognition of a valuation allowance to offset all or a portion of deferred income tax assets which have already fully recognized, this establishes a requirement for whether to give any accounting recognition to the income tax effects of questionable tax positions being taken. Failing to meet this threshold test means that, for example, an income tax deduction being claimed would not be accompanied by recognition of a reduction of income tax expense in a GAAP-basis financial statement, and thus that an income tax liability would be required to be reported for the entire tax benefit claimed on the income tax return notwithstanding management's assertion that a deduction claimed on its income tax return was valid.

Positions must be evaluated independently of each other without offset or aggregation. A "unit of account" approach can be taken in this evaluation if it is based on the manner in which management prepares and supports its income tax return and is consistent with the approach that the taxing authority would reasonably be expected to use in conducting an examination.

In considering the technical merits of its tax positions, management is to consider the applicability of the various sources of tax authority (enacted legislation, legislative intent, regulations, rulings, and case law) to the facts and circumstances. Management may also take into account, if applicable, any administrative practices and precedents that are widely understood with respect to the manner that the taxing authority deals specifically with the reporting entity or other similar taxpayers.

Initial measurement—If a tax position meets the initial recognition threshold, it is then measured to determine the amount to recognize in the financial statements. The following considerations apply to the measurement process:

1. Consider if the position is based on clear and unambiguous tax law. If so, and management has a high level of confidence in the technical merits of the position, the position qualifies as a "highly certain tax position" and, consequently, the full benefit would be recognized in the financial statements. Stated in the language of FIN 48, the measurement of the maximum amount of income tax benefit that is more than 50% likely to be realized is 100% of the benefit claimed.

   *NOTE: Management may deem the **amount** of a tax position to be highly certain of being sustained but not highly certain as to the **timing** of the benefit. For example, in deciding whether to record a cost as an expense of the period in which it is incurred or to capitalize it, management may be highly certain that the cost will be deductible in some period but not be highly certain as to whether the proper period to deduct it is in the current period or ratably over multiple future periods. Under these circumstances, management would be required to measure the maximum amount that it believed was more than 50% likely of being sustained in the period that the cost is incurred.*

2. If it is not highly certain that the full benefit of a position would be sustained in the year claimed, then the amount to be recognized for the tax position is measured as management's *best estimate* of the *maximum* benefit that is more than 50% likely of being realized upon effective settlement with a taxing authority possessing full knowledge of all relevant information. Management is to consider the amounts and probabilities of various settlement outcomes based on the facts, circumstances, and information available at the balance sheet date. As stated above, management must assume that the taxing authority will conduct an examination and may not consider the likelihood of this not occurring in this measurement process.

As explained above, measurement under ASC 740-10 can be a fairly complex process. It requires that management consider the amounts and probabilities of various effective settlement outcomes. The amount of the income tax benefit to be given financial statement recognition is the largest (i.e., most favorable) estimated outcome that is more than 50% probable, as illustrated in the following example.

Example of the two-step initial recognition and measurement process

Menkin Manufacturing planned to claim a $10,000 credit for increasing research activities (R&D credit) on its 2009 corporate income tax return. In consultation with its tax advisor, management believes that a portion of the credit is at risk because of ambiguity regarding the technical merits of the decision to classify certain costs as qualifying to be included in the computation of the credit. Management does believe, however, that it is "more likely than not" that the reporting entity will qualify for all or a portion of the R&D credit, and thus recognition will have to be limited to only a portion of the amount it will be claiming on its income tax return.

Since the credit meets the more-likely-than-not threshold for initial recognition, management must measure the amount to be recognized. It has estimated the range of possible outcomes (i.e., of credit allowed) and related likelihoods as follows:

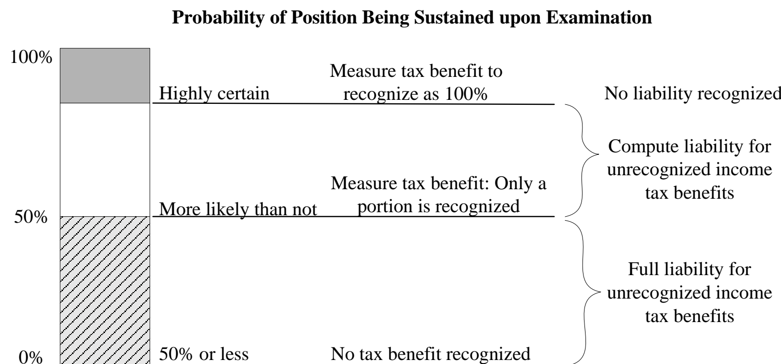
Estimated outcome	*Probability of occurrence*	*Cumulative probability of occurrence*
$10,000	5%	5%
8,500	35%	40%
7,500	25%	65%
7,000	20%	85%
6,500	10%	95%
6,000	5%	100%

The largest outcome above that has a more than 50% cumulative probability of being realized is $7,500, which management has estimated as having a cumulative probability of 65%. Therefore, management would recognize only $7,500 of this tax position in the reporting entity's financial statements. This would result in Menkin Manufacturing reflecting a liability for unrecognized income tax benefits in the amount of $2,500 on its balance sheet as of December 31, 2009.

Note, in the foregoing example, that while the income tax return will claim an R&D credit for the full $10,000, GAAP-basis financial statements will only reflect a credit of $7,500, and thus will report an accrued tax liability of $2,500 pertaining to the credit taken but not likely to be allowed upon examination. The recognition of this liability has created significant controversy in the business community as the liability along with the disclosures required by FIN 48 and discussed later in this chapter arguably provide a "road map" for taxing authorities to use in identifying positions that can be easily challenged. (However, it has been observed that the "Schedule M-3" reconciliation required to accompany corporate tax returns of filers with assets of $10 million or more already does this.) Nonetheless, FIN 48 complies with the GAAP imperative of reporting the entity's assets and liabilities on an appropriate measurement basis. GAAP financial reporting, in other words, is not a tool to be used by management to avoid recording the accounting consequences of the tactical decisions it makes regarding the tax positions it takes.

The following diagram illustrates the application of the recognition and measurement criteria:

Probability of Position Being Sustained upon Examination



Interest. If the relevant taxing jurisdiction requires interest to be paid on income tax underpayments, the reporting entity is to recognize interest expense in the first period that interest would begin to accrue under that jurisdiction's relevant tax law. Interest is to be computed using the following formula:

Amount of tax position claimed (expected to be claimed) on income tax return – Amount of tax position recognized in the financial statements
Portion of tax position claimed not recognized in the financial statements × Jurisdiction's applicable statutory interest rate × Period of time from date that interest first became accruable to reporting date
Accrued interest on tax positions taken but not recognized in the financial statements

Thus, if a tax position taken by the reporting entity fails the "more likely than not" recognition test, the presumption is that the position would not be sustained and that the entire tax benefit and associated interest (and penalties, if applicable) are to be recognized as a liability on the balance sheet. Since interest is a period cost for the use of borrowed funds, it must be accrued until the taxing authorities reject the tax position and formally impose the demand for back taxes and interest, or the statute of limitations for the position lapses.

Penalties. If upon disallowance on examination, a position would subject the taxpayer to penalty, the reporting entity is to recognize an expense for that penalty in the period it claims or expects to claim the position in its income tax return. That is, the penalty must be accrued as the tax position becomes formalized in a tax filing. An exception is permitted if the positions taken that would be subject to penalty are under the minimum threshold that the jurisdiction uses to assess the penalty. If management later changes its assessment of whether the minimum threshold has been exceeded in a subsequent period, the penalty is to be recognized as an expense in that period.

Subsequent recognition, derecognition, and measurement. Judgments regarding initial recognition and measurement are not to be changed based on a reevaluation or reinterpretation of information that was available or should have been available in previous reporting periods. Only if new information becomes available can a new judgment be made. Management's new judgment is to consider the facts, circumstances, and information available at that time. Final certainty is not necessary for this purpose; that is, the position does not have to be subject to final settlement, court ruling, or full resolution to be remeasured.

For tax positions taken by management that do not meet the initial recognition criterion, the benefit becomes recognizable in the first interim period that the position meets any one of the following three conditions:

1. The tax position meets the recognition criterion, and thus its probability of realization is deemed to be more than 50%.
2. The statute of limitations for the relevant taxing authority to examine and challenge the tax position has expired.
3. The tax position is effectively settled through examination, negotiation, or litigation.

In determining whether the condition of "effective settlement" has occurred, FSP FIN 48-1 provides that management is to evaluate whether all of the following conditions have been met:

1. The taxing authority has completed its examination procedures including all levels of appeal and administrative reviews that are required by that authority for the specific tax position.
2. Management does not intend to appeal or litigate any aspect of the position included in the completed examination.
3. The possibility of the taxing authority examining or reexamining any aspect of the tax position is remote considering
   a. The authority's policy on reopening closed examinations,
   b. The specific facts and circumstances of the tax position, and
   c. The authority has full knowledge of all relevant information that might cause it to reopen an examination that had been previously closed.

When a taxing authority conducts an examination of a tax year, it may not choose to examine a particular tax position taken by management. Nevertheless, upon completion of the examination and all levels of appeal and review, management is permitted to consider that position effectively settled for that tax year. Management is not permitted, however, to consider that tax position or a tax position similar to it to be settled for any other open periods that were not subject to examination nor is management permitted to use the "effectively settled" criteria for a tax position as a basis for changing its assessment of the technical merits of any tax position taken in other periods.

Tax positions recognized in previous periods that no longer meet the more-likely-than-not criterion are to be reversed ("derecognized," in FASB terminology) in the first period in which that criterion is no longer met. Importantly, it is not permitted that this objective be

accomplished through the use of a valuation account or allowance to offset the recorded benefit; rather, it must be recorded as a direct reversal of the previously recorded benefit.

The accounting to record a change in judgment depends on whether the amount subject to change had been previously recognized in a prior annual period or in a prior interim period of the same fiscal year.

According to FIN 48, the effects of changes in tax positions taken in prior annual periods (including related interest and penalties, if any) are to be recognized as a "discrete item" in earnings in the period of change. Although the term "discrete item" is not defined or explained, the authors believe that the intent is for the change to be reported and disclosed in the same manner as the effects of a change in the enacted tax rate. This entails charging or crediting income from continuing operations for the period of change. Presumably, this would not require a separate line item on the face of the income statement (which would give disproportionate attention to the item), but would require separate disclosure in the notes to the financial statements as a significant component of income tax expense attributable to continuing operations, as specified in ASC 740.

Changes occurring in interim periods are accounted for differently. A change in judgment that applies to a tax position taken in a previous interim period of the current fiscal year is considered an integral part of the annual reporting period. Consequently, the effects of the change are recognized prospectively, through an adjustment to the estimated annual effective tax rate, in accordance with ASC 270 and ASC 740-270.

Classification. Tax liabilities resulting from applying ASC 740-10 are current tax obligations. They are *not* to be classified as deferred income tax liabilities unless they are recognized as the result of a future taxable temporary difference created by a tax position that meets the more-likely-than-not criterion.

For reporting entities that present a classified balance sheet, the customary classification rules apply; the portion of income tax obligations recognized that are not deferred income tax liabilities under ASC 740 are classified based on management's judgment regarding whether it anticipates the payment of cash within one year or within the reporting entity's next operating cycle, if it exceeds one year. (Deferred income tax assets and liabilities are classified using the same classification as the assets or liabilities to which they relate or, if they do not relate to specific assets or liabilities, based on the year in which the temporary difference is expected to reverse.) The liability for unrecognized income tax benefits (or reduction in amounts refundable) is not permitted to be combined or netted with deferred income tax assets or liabilities.

FIN 48 provides management policy elections with respect to how it accounts for interest and penalties that are required to be accrued on the liability for unrecognized income tax positions:

Interest	Present as additional income taxes or as interest expense
Penalties	Present as additional income taxes or in another expense classification

Management is to elect which of these alternative accounting policies the reporting entity will follow, and then to disclose and consistently apply that policy.

Applicability to business combinations. ASC 805, *Business Combinations*, clarifies that an acquirer is to apply its provisions to income tax positions taken by the acquiree prior to the date of the business combination. Thus, the provisions of ASC 740-10 apply to the determination of the income tax bases used to compute deferred income tax assets and liabilities as well as amounts of income taxes currently payable to or refundable from taxing authorities.

If a change occurs that affects a preexisting income tax position that was assumed as a part of the acquisition or an income tax position that arose as a result of the acquisition, the change is to be recognized as follows:

1. Changes occurring during the measurement period (as defined in ASC 805) that result from new information regarding facts and circumstances that existed on the acquisition date are recognized as an adjustment to goodwill. Should goodwill be reduced to zero, however, the remaining portion of the adjustment is to be recognized as a gain arising from a bargain purchase, in accordance with ASC 805. That standard requires recognition of such gains as part of net income and does not permit characterization as an extraordinary gain, as had been the case with the predecessor standard.
2. All other changes relating to acquired income tax positions are to be accounted for in the same manner as prescribed for other income tax positions.

Transition. At adoption, management is required to identify and evaluate all open tax positions existing on the effective date for all years still open under the statute of limitation for all applicable jurisdictions. In a departure from the retroactive application convention set forth in ASC 250 (discussed in detail in Chapter 5), adoption of FIN 48 is to be effected by recognizing a cumulative effect adjustment to the balance of retained earnings as of the beginning of the period of adoption. The adjustment is to be separately stated and not combined with any other such adjustments. Special adoption provisions relate to the effects, if any, of applying the recognition and measurement rules to income tax positions related to business combinations. To the extent that adoption of FIN 48 affects these amounts, a separate cumulative effect adjustment is computed on a before and after basis (i.e., as the difference between the net assets and liabilities recognized before adoption and after adoption of the interpretation).

Effect on other authoritative literature. The interpretation amends ASC 450, *Contingencies,* to exclude income tax uncertainties from its scope, and provided technical corrections to several other pronouncements.

Disclosures. The disclosures required by ASC 740-10 are discussed later in the chapter along with the disclosures required by other applicable GAAP governing income taxes.

The Effect of Tax Law Changes on Previously Recorded Deferred Income Tax Assets and Liabilities

General rules. The balance-sheet-oriented measurement approach of ASC 740 makes it necessary to reevaluate the deferred income tax asset and liability balances at each year-end. If changes to income tax rates or other provisions of the income tax law (e.g., deductibility of items) are enacted, the effect of these changes must be recognized so that the deferred income tax assets and liabilities are fairly presented on the balance sheet. Any offsetting adjustments are made through the current period's income tax expense or benefit on the income statement; that is, current income tax expense or benefit reflects the income tax effect of current transactions and the revision of previously provided income tax effects for transactions which have yet to reverse.

It might have been argued that the change in the deferred income tax balances should be recognized when first anticipated (e.g., when income tax rate changes are proposed in Congress). However, FASB concluded that it would be more meaningful to report the effects of such changes in the period when the proposed changes in the income tax law have been enacted into law. Enactment is defined by the various taxing jurisdictions; thus for example, federal laws are enacted when the president signs the legislation into law or congress overrides a presidential veto.

This provides a more reliable measure of the impact of such changes and is more consistent with the informational needs of financial statement users.

When income tax rates are revised, this may impact not only the unreversed effects of items which were originally reported in the continuing operations section of the income statement, but also the unreversed effects of items first presented as discontinued operations, extraordinary items, or in other income statement captions. Furthermore, the impact of changes in income tax rates on the accumulated balance of deferred income tax assets or liabilities that arose through charges or credits to other comprehensive income (under ASC 220) is included in income tax expense associated with continuing operations.

For example, if an entity has unrealized gains on holding available-for-sale securities at a time when relevant income tax rates (presumably, the capital gains rates) are lowered, the reduction in the deferred income tax liability associated with these unrealized gains will reduce current period income tax expense associated with continuing operations, despite the fact that the income tax provision was originally reported in other comprehensive income (not net income) and in the equity section of the balance sheet as accumulated other comprehensive income.

Enactment occurring during an interim period. When income tax law changes occur during an interim reporting period, the effects are to be reported in the interim period in which enactment occurs. The effects of the changes are included in continuing operations, whatever the source of the temporary differences being impacted. For example, if in the first fiscal quarter of a year an entity accrued a loss relating to discontinued operations, which is not tax deductible until realized, the income tax effect would be shown in the discontinued operations section of the income statement for that quarter. If income tax rates are changed in the third quarter of the same year, the deferred income tax asset recognized in connection with the loss from discontinued operations would then need to be adjusted upward or downward, based on the difference between the newly enacted income tax rates and the previously effective income tax rates. The income statement effect of this adjustment is included with income tax expense pertaining to income from continuing operations in the third quarter.

Changes in a valuation allowance for an acquired entity's deferred income tax asset. ASC 805 specifies that the acquirer is to recognize changes in a valuation allowance for an acquiree's deferred income tax asset as follows:

1. Changes within the measurement period (defined in ASC 805, ASC 805-10-25) resulting from new information regarding facts and circumstances that existed at the acquisition date are to be recognized through an adjustment to goodwill. Should goodwill be reduced to zero, however, the acquirer is to recognize any additional decrease in the valuation allowance as a gain from a bargain purchase in the period of adjustment. The gain is not permitted to be characterized as an extraordinary gain.
2. Changes related to elimination of valuation allowances with respect to initial recognition of the following items are afforded special accounting treatment directly affecting equity, rather than current net income:
    a. Temporary differences where the deferred income tax effect is recognized by directly charging or crediting contributed capital (e.g., amounts incurred as stock issuance costs that are treated as deductible expenses for income tax purposes but are accounted for as a reduction of proceeds from the issuance of the stock for financial reporting purposes)

   b. Specified temporary differences between GAAP and income tax accounting that give rise to deferred income tax assets attributable to equity-classified employee stock options are treated as additional paid-in capital under ASC 718-50
   c. Temporary differences with respect to dividends paid on unallocated shares held by an employee stock ownership plan (ESOP) that are charged to retained earnings
   d. Temporary differences associated with quasi reorganizations (with limited exceptions) that resulted in the deferred income tax benefit directly increasing contributed capital

3. All other changes in the valuation allowance are to be recognized as either an increase to or reduction of income tax expense.

Special, onetime extension of time to determine effects. The American Jobs Creation Act of 2004 (AJCA) provided a special, onetime dividends received deduction computed as 85% of certain foreign earnings that were repatriated (i.e., distributed to the US parent or investor by the foreign subsidiary or investee company). This provision was effective for certain foreign earnings repatriated either during the taxpayer's last year beginning prior to October 22, 2004 (the AJCA enactment date) or, alternatively, during the taxpayer's first tax year that began in the first year after enactment. Apparent ambiguity in the wording of this provision of AJCA resulted in requests by taxpayers that Congress or the US Treasury clarify certain of its requirements. The interpretation of these provisions affected decisions made by the management of affected taxpayers regarding when and whether to repatriate or reinvest affected foreign earnings.

Leveraged leases. When a change in the income tax law is enacted, all components of a leveraged lease must be recalculated from the inception of the lease based upon the revised after-tax cash flows resulting from the change. Differences from the original computation are included in income in the year in which the tax law changes are enacted (ASC 840-30-S35). In making these revised computations, assumptions are to incorporate expectations regarding the effect, if any, of the alternative minimum tax (ASC 740-10-25).

The US Internal Revenue Service (IRS) may challenge the timing of the lessor's income tax deductions related to certain types of leveraged lease transactions.[2] Upon eventual settlement with the IRS regarding these matters, the economics of the lease may be significantly less favorable from the standpoint of the lessor than they were at inception because the originally projected economic benefits resulted heavily from the ability to obtain income tax deductions for accelerated tax depreciation and interest expense that early in the lease term, would typically exceed the rental income generated by the lease.

ASC 840-30-35 provides that reporting entities whose income tax positions frequently vary between the alternative minimum tax (AMT) and regular tax are not required to annually recalculate the net investment in the lease unless there is an indication that the original assumptions about the leveraged lease's anticipated total after-tax net income were no longer valid.

Another factor to consider in the determination of the after-tax cash flows attributable to leveraged lease transaction is the application of ASC 740-10. As discussed earlier in this chapter, the lessor is required to assess whether it is more likely than not (i.e., there is a greater than 50% probability) that the income tax positions it takes or plans to take relative to the transaction would be sustained upon examination by the applicable taxing authorities. If the income tax positions do not meet that recognition threshold, the income tax benefits as-

---

[2] *The transactions that the IRS has reportedly challenged are commonly referred to as Lease In–Lease Out (LILO) and Sale In–Lease Out (SILO) transactions.*

sociated with taking those positions would be excluded from the leveraged lease calculations and, in fact, would give rise to a liability for unrecognized income tax benefits as well as an accrual for any applicable interest and penalties for all open tax years that are within the statute of limitations. This could obviously have a significant impact on the computed rate of return on the investment attributable to the years in which the net investment is positive.

If, however, the income tax positions meet the recognition threshold, then they are subject to measurement to determine the maximum amount that is more than 50% probable of being sustained upon examination. The difference between the income tax position taken or planned to be taken on the income tax return (the "as-filed" benefit), and the amount of the benefit measured using the more-than-50% computation, along with any associated penalties and interest is recorded as a liability for unrecognized income tax benefits.

The only situation in which this liability, penalties, and interest would not be applicable would be if the tax positions were assessed to be highly certain tax positions, as defined in ASC 740-10. Under those circumstances, the entire income tax benefit associated with the lease would be recognized, and of course no interest or penalties would be recognized. Leveraged leases are discussed in detail in Chapter 16.

Computation of a deferred income tax asset with a change in rates

Assume Campione Company has $80,000 of future deductible temporary differences at the end of 2009, which are expected to result in income tax deductions of approximately $40,000 each on income tax returns for 2010-2011. Enacted tax rates were 50% for years 2006-2009, and are 40% for 2010 and thereafter.

The deferred income tax asset is computed at 12/31/09 under each of the following independent assumptions:

1. If Campione Company expects to offset the future deductible temporary differences against taxable income in years 2010-2011, the deferred income tax asset is $32,000 ($80,000 × 40%).
2. If Campione Company expects to realize an income tax benefit for the future deductible temporary differences by carrying back a loss to pre-2010 tax years to obtain a refund of income taxes previously paid at the higher 50% rate, the deferred income tax asset is $40,000 ($80,000 × 50%).

Assume that Campione Company expects, at the end of 2009, to realize a deferred income tax asset of $32,000 (the first scenario above). Also assume that income taxes payable in *each* of the years 2006-2008 were $8,000 (or 50% of taxable income of $16,000 in each year). Realization of $24,000 (3 years × $8,000 per year) of the $32,000 deferred income tax asset is assured through carryback refunds even if no taxable income is earned in years 2010-2011. Whether a valuation allowance for the remaining $8,000 is needed depends on Campione Company's assessment of the levels of future taxable income.

The foregoing estimate of the *certain* tax benefit, based on a loss carryback to periods of higher tax rates than are statutorily in effect for future periods, should only be utilized when future losses (for income tax purposes) are expected. This restriction applies since the benefit thus recognized (net of any valuation allowance) exceeds benefits that would be available in future periods, when tax rates will be lower.

Reporting the Effect of Tax Status Changes

The reporting of changes in an entity's income tax status is entirely analogous to the reporting of newly enacted income tax rate changes. Such adjustments typically arise from a change from (or to) taxable status to (or from) "flow through" or nontaxable status. When a previously taxable C corporation elects to become a flow-through entity (an S corporation), the stockholders become personally liable for income taxes on the company's earnings. This liability occurs whether the earnings are distributed to them or not, similar to the taxation of partnerships and limited liability companies.

When the income tax status change becomes effective, the effect of any consequent adjustments to deferred income tax assets and liabilities is reported in current income tax expense. This is always included in the income tax provision relating to continuing operations.

Under ASC 740, deferred income taxes are to be eliminated by reversal through current period income tax expense. Thus, if an entity with a net deferred income tax liability elects S corporation status, it will report an income tax benefit in the continuing operations section of its current income statement.

Similarly, if an S corporation elects to convert to a C corporation, the effect is to assume a net income tax benefit or obligation for unreversed temporary differences existing at the date the change becomes effective. Accordingly, the financial statements for the period in which the change becomes effective will include the effects of the event in current income tax expense. For example, if the entity has unreversed future taxable temporary differences at the date its income tax status change became effective, it reports income tax expense for that period. Conversely, if it had unreversed future deductible temporary differences, a deferred income tax asset (subject to the effects of any valuation allowance necessitated by applying the more-likely-than-not criterion) would be recorded, with a corresponding credit to the current period's income tax expense or benefit in the income statement.

Any entity eliminating an existing deferred income tax asset or liability, or recording an initial deferred income tax asset or liability, must fully explain the nature of the events that transpired to cause this adjustment. This is disclosed in the notes to the financial statements for the reporting period.

S corporation elections may be made prospectively at any time during the year preceding the tax year in which the election is intended to be effective and retroactively up to the 16th day of the 3rd month of the tax year in which the election is intended to be effective. The Internal Revenue Service (IRS) normally informs the electing corporation of whether or not its election has been accepted within 60 days of filing. In practice, however, the IRS seldom denies a timely filed election and such elections are considered essentially automatic. Consequently, if a reporting entity files an election before the end of its current fiscal year to be effective at the start of the following year, it is logical that the income tax effects be reported in current year income. For example, an election by a C corporation to become an S corporation that is filed in December 2009, to be effective at the beginning of the company's next fiscal year, January 1, 2010, would give rise to the elimination of the deferred income tax assets and liabilities at the date of filing, the effect of which would be reported in the 2009 financial statements. No deferred income tax assets or liabilities would appear on the December 31, 2009 balance sheet, and income tax expense or benefit for 2009 would include the effects of the reversals of deferred income tax assets and liabilities that had been previously recognized.

There are two situations that could result in an S corporation continuing to recognize deferred income taxes. The first situation arises when the S corporation operates in one or more states that impose state income taxes on the S corporation in an amount that is material to the financial statements. In this situation, the S corporation should compute and recognize deferred state income tax assets and liabilities in the same manner that a C corporation recognizes them for federal income taxes.

The second situation is referred to as "built-in gains tax." Under current income tax law, a C corporation electing to become an S corporation may have built-in gains, which could result in a future corporate income tax liability, under defined circumstances. In such cases the reporting entity, even though it has become an S corporation, will continue to report a deferred income tax liability related to this built-in gain.

Reporting the Effect of Accounting Changes for Income Tax Purposes

Occasionally an entity will initiate or be required to adopt changes in accounting that affect income tax reporting, but which will not impact financial statement reporting. Past examples have included the change to the direct write-off method of bad debt recognition (mandated by a change in the income tax law, while the GAAP requirement to recognize an allowance for uncollectible accounts receivable continued in effect for financial reporting); and the adoption of uniform capitalization for valuing inventory for income tax purposes, while continuing to currently expense certain administrative costs not inventoriable under GAAP for financial reporting.

Generally, these mandated changes involve two distinct types of temporary differences. The first of these changes is the onetime, catch-up adjustment which either immediately or over a prescribed time period impacts the income tax basis of the asset or liability in question (net receivables or inventory, in the examples above), and which then reverses as these assets or liabilities are later realized or settled and are eliminated from the balance sheet. The second change is the ongoing differential in the amount of newly acquired assets or incurred liabilities recognized for income tax and financial reporting purposes; these differences also eventually reverse, when the inventory is ultimately sold or the receivables are ultimately collected. This second type of change is the normal temporary difference that has already been discussed. It is the first type of change which differs from those previously discussed in this chapter, and which will now be illustrated.

Example of adjustment for prospective catch-up adjustment due to change in tax accounting

Blakey Corporation has, at December 31, 2009, accrued interest of $80,000 on its long-term debt. Also assume that expected future taxes will be at a 34% rate and that, effective January 1, 2010, the income tax law is revised to eliminate deductions for accrued but unpaid interest with existing accruals to be taken into income ratably over four years (referred to in tax vernacular as "a four-year spread"). A balance sheet of Blakey Corporation prepared on January 1, 2010, would report

1. A deferred income tax *asset* in the amount of $27,200 (i.e., $80,000 × 34%, which is the income tax effect of future deductions that Blakey will be entitled to take over the succeeding four years for the amount of interest that had been accrued and unpaid at the effective date of the tax law change, taken when specific receivables are written off and bad debts are incurred for income tax purposes);
2. A current income tax liability of $6,800 (one-fourth of the income tax obligation); and a noncurrent income tax liability of $20,400 (three-fourths of the tax income obligation).

The deferred income tax asset is *not* deemed to be identified with the liability, accrued interest (if it were, it would all be reported as a current asset), but rather with the future specific tax benefits expected to be realized from recognizing 25% of the accrual as a deduction in each of the next four years. Accordingly, the deferred income tax asset is categorized as current and noncurrent according to Blakey Corporation's best estimate of the timing of those future income tax benefits.

Income Tax Effects of Dividends Paid on Shares Held by Employee Stock Ownership Plans (ESOP)

ASC 740 affects the accounting for certain ESOP transactions. Under ASC 718-40, dividends paid on unallocated shares are not considered to be dividends for financial reporting purposes. If used to pay down ESOP debt, these dividends are reported as reductions of debt or of accrued interest; if paid to plan participants, such dividends are reported as compensation cost. GAAP requires that the income tax benefits arising from dividends paid on unallocated shares be consistent with the reporting of those dividends. Thus, if the dividends were included in compensation cost, the tax benefit would be included in the income tax provision associated with continuing operations.

Dividends paid on allocated shares are treated as normal dividends for financial reporting purposes. However, per ASC 718-40, any income tax benefits resulting from these dividend payments are also to be credited to income tax expense reported in continuing operations. In FASB's view, income tax deductible dividends for other than unallocated ESOP-held shares represent an exemption from income tax of an equivalent amount of the payor's earnings. For that reason, it concluded that the income tax effects be reported in continuing operations.

FASB's decision regarding the presentation of the income tax effects of ESOP and other stock compensation plans are fully analogous. Given that both types of plans sometimes result in income tax deductions for amounts not recognized as compensation expense under GAAP, it was determined that the resulting income tax benefits be accounted for consistently.

Business Combinations

This explanation and illustration of how to apply income tax accounting rules to business combinations, by necessity, must be divided into separate and distinct sections since business combinations are subject to different recognition and measurement rules depending on when the transaction occurred.

Each time FASB has issued standards making major changes to these rules, it has not required reporting entities to retrospectively restate business combinations accounted for under the superseded standards. Thus, a reporting entity that has entered into numerous business combinations over an extended period of time may be applying a plethora of accounting standards to the various subsidiaries it consolidates in its financial statements. It is important to note, however, that upon the effective date of ASC 805, discussed later in this section, the acquirer will be required to follow the amendments made to ASC 740 and FIN 48 on a prospective basis for all prior business combinations.

Poolings of interests. Under ASC 805, the permissibility of applying poolings of interests accounting has been discontinued for business combinations initiated after June 30, 2001. Reporting entities that had previously recorded poolings were not required to restate those transactions and, consequently, the effects of prior poolings of interests still exist in the financial statements of some companies.

In poolings of interests, the combining entities generally do not adjust the carrying values of their respective assets and liabilities. Reissued or comparative financial statements of periods before the effective date of the combination are restated on a combined basis as if the combining companies had operated together as a single economic unit for all periods presented.

Notwithstanding the general principle of not revising asset or liability carrying amounts, a special rule applies to deferred income tax benefits for which a full or partial valuation allowance had been recognized under the more-likely-than-not criterion of ASC 740.

The standard stipulates that, if one of the combining entities had an unrecognized net deferred income tax benefit (i.e., there was a deferred income tax benefit recognized, gross, which was offset by a valuation allowance), the restated financial statements may or may not reflect the net income tax benefits as an asset. That is, the valuation allowance may be eliminated on a retroactive basis. This treatment depends upon whether the combined entity will be able, under provisions of the income tax laws, to utilize the net operating loss and tax credit carryforwards of the merged companies. If it can do so, then the deferred income tax benefits are recognized in any restated prior period financial statements. If, under the law, the benefits cannot be utilized in a consolidated income tax return or if a consolidated return is not expected to be filed, then the income tax benefits would not be recognized in financial statements restated for the pooling of interests.

Thus, upon recording the pooling, the need for a valuation allowance was subject to a revised analysis, but only the ability to utilize the income tax benefits in a consolidated return was to be considered; other changes in circumstances were handled by adjusting the valuation allowance through current period income tax expense or benefit. This is strictly consistent with the concept of a pooling of interests, in which financial statements are presented for current and prior periods as if the entities had always been combined; had they been combined and had the income tax benefits been available for use in a consolidated return, the valuation allowance would never had been provided.

Under some circumstances, poolings of interests were taxable, meaning that for income tax purposes there was an increase in the income tax basis (referred to as a "step-up") of the net assets of one of the merged (pooled) entities. The differences between the new, stepped-up income tax bases and the carryforward GAAP bases (net book values) utilized for financial reporting purposes are considered future deductible temporary differences giving rise to deferred income tax assets. Whether these assets are recognized is dependent upon whether the more-likely-than-not criterion is met. If the test is not met, a valuation allowance must be established for some or all of the benefits recorded. If a valuation allowance is established, and it is later reduced or eliminated when the likelihood of ultimate realization exceeds the 50% probability threshold, the effect of eliminating the valuation allowance will be reflected in income tax expense or benefit of that period.

Purchase-method accounting under ASC 805. Accounting for the income tax effects of business combinations reported as purchases ASC 805 is one of the more complex aspects of interperiod income tax accounting. The principal complexity relates to the recognition, at the date of the purchase, of the deferred income tax effects of the differences between the income tax and financial reporting bases of the assets and liabilities acquired. Further difficulties arise in connection with the recognition of goodwill or the treatment of negative goodwill from "bargain purchases." In some instances, the reporting entity expects that the ultimate income tax allocation will differ from the initial one (such as when the taxpayer anticipates disallowance by the taxing authorities of an allocation made to identifiable intangibles), and this creates yet another complex accounting matter to be dealt with.

Under ASC 805, purchase price is allocated on a "gross of tax effects" basis, with separate recognition of the deferred income tax assets and obligations.

Under US federal income tax laws and regulations, business combinations can be either taxable or nontaxable in nature. ASC 740 is applicable to differences between the income tax and financial reporting bases of assets acquired and liabilities assumed in both taxable and nontaxable business combinations.

In a taxable business combination, the total purchase price is allocated to assets and liabilities for both income tax and financial reporting purposes, although under some circumstances these allocations may differ.

In a nontaxable business combination, the predecessor entity's income tax bases for the various assets and liabilities are carried forward for income tax purposes, while for financial reporting purposes the purchase price is allocated to the assets and liabilities acquired. Thus, both taxable and nontaxable business combinations will result in significant differences between the income tax and financial reporting bases of the net assets acquired.

Acquisition-date accounting using the purchase method under ASC 805. ASC 740 requires that the income tax effects of the income tax and GAAP basis differences of all assets and liabilities generally be presented as deferred income tax assets and liabilities as of the acquisition date. In general, this "grossing up" of the balance sheet is a straightforward matter.

Goodwill. Goodwill arises when a portion of the price paid in a business combination accounted for as a purchase cannot be allocated to identifiable assets, including intangibles. This excess cost is deemed to relate to the unidentifiable intangible asset known as goodwill that is, in practice, associated with the acquired entity's excess earning power.

Historically, goodwill had been subject to mandatory amortization for purposes of GAAP financial reporting over an estimated useful life that was not to exceed 40 years. Until 1993 amortization of goodwill was not deductible for federal income tax purposes. As part of the Omnibus Budget Reconciliation Act of 1993 (OBRA), goodwill became deductible (IRC §197) for federal income tax purposes, with a mandatory fifteen-year straight-line amortization period. Prior to the 1993 income tax law change, goodwill was generally considered to embody a permanent difference between financial statement income and taxable income, rather than a temporary difference, since recovery would come, if at all, only upon sale or dissolution of the entity as a whole. Accordingly, deferred income taxes were not provided under GAAP that was effective at that time.

In 2001, the FASB issued new business combinations and goodwill accounting requirements (ASC 805 and ASC 350), mandating that goodwill no longer be amortized for financial reporting purposes, but rather be subject to periodic impairment testing. (See Chapters 11 and 13 for complete discussions.) Thus, the relationship of GAAP and income tax accounting for goodwill has varied considerably over the years.

Under ASC 805 and ASC 350, the pre-1993 situation was effectively reversed. Goodwill was now amortizable for federal income tax purposes but was no longer amortizable for financial reporting purposes. Goodwill could potentially be charged to GAAP expense sporadically since it must be regularly tested for impairment and to the extent impaired it must be written down or written off immediately.

Thus income tax/GAAP differences under ASC 805 and ASC 350 were deemed temporary differences for which deferred income taxes were recognized for financial reporting under GAAP.

The following timeline summarizes the multiple changes in both GAAP and tax rules with respect to the accounting for goodwill that have added complexity to accounting for business combinations and the deferred income taxes associated with them.

Timeline of GAAP and Tax Rules with Respect to Goodwill

Relevant rule	*Applicability*	*Amortization provisions*	*Applicability to previously acquired goodwill*
GAAP			
ASC 350	Acquired in a business combination for which the acquisition date was after June 30, 2001	**Nonamortizable**, subject to impairment testing at least annually and more frequently if warranted by events and changes in circumstances	Upon adoption of ASC 350, amortization of previously recognized goodwill was required to cease; goodwill was to be assigned to reporting units, intangibles that did not qualify for separate recognition were to be reclassified as goodwill; portions of previously recognized goodwill that qualified for recognition as separate intangibles were reclassified from goodwill
US Federal Income Tax			
	Acquired on or before 8/10/93	**Nonamortizable**	
IRC §197	Acquired after 8/10/93	**Amortizable** over a 15-year period beginning in the month of acquisition	Previously acquired goodwill was not affected and continued to be nonamortizable

Since, per ASC 740, temporary differences are those arising from differences between the income tax and financial reporting bases of assets and liabilities, deferred income taxes are to be recognized and measured for goodwill. In general, deductible income taxes amortization of goodwill will create a deferred income tax liability in the financial statements, analogous to that arising from the use of accelerated income tax depreciation. If GAAP goodwill is subsequently reduced to reflect impairment, a portion of the deferred income tax liability will be reversed. Some part of the deferred income tax liability will remain on the balance sheet until the goodwill is ultimately eliminated either through full impairment or when the reporting unit is disposed of or ceases operations.

Example of computation of deferred income taxes and goodwill resulting from a nontaxable purchase business combination

Coustan Tacks and Sole Industries Inc. (CTS) acquired substantially all of the assets of Sylvan Shoe Works Inc. (SSW) on January 2, 2008. Following are the facts and assumptions relative to the business combination, the two companies, and the income tax rules that apply:

1. The income tax rate is a flat 34%.
2. The acquisition cost is $500,000.
3. The fair values of the assets acquired total $750,000.
4. The income tax bases of the assets acquired total $600,000.
5. The fair value and income tax bases of the liabilities assumed by CTS in the purchase are $250,000.
6. The difference between the income tax basis and fair values of the assets acquired, $150,000, consists of future taxable temporary differences of $200,000 and future deductible temporary differences of $50,000.
7. There is no doubt as to the realizability of the future deductible temporary differences in this case.

Based on these facts, the GAAP allocation of the purchase price is as follows:

	Assets acquired	*Liabilities assumed*	*Deferred tax asset (liability) at rate of 34%*
GAAP basis at fair value	$750,000	$250,000	
Income tax basis	600,000	250,000	
Temporary difference	$150,000	$ --	
Future deductible temporary differences	$ 50,000		17,000
Future taxable temporary differences	(200,000)		(68,000)
Consideration paid		500,000	
Amounts assigned to acquired net assets			
Assets acquired	750,000		
Deferred income tax asset	17,000		
	767,000		
Liabilities assumed	250,000		
Deferred income tax liability	68,000		
	318,000	449,000	
Excess consideration allocated to goodwill		$ 51,000	

Negative goodwill. In some purchase business combination situations, "negative goodwill" results from what are often referred to as bargain purchases. These are situations in which the fair value of the net identifiable assets acquired exceeds the purchase price. Under ASC 805 and ASC 350, this excess is first allocated on a pro rata basis to all acquired assets other than cash and cash equivalents, trade receivables, inventory, financial instruments that are required to be carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred income tax assets. This will tend to affect the carrying value of long-lived, mostly depreciable, assets, which will reduce future depreciation charges over the respective lives of those assets. Any excess negative goodwill would then be immediately recognized as an extraordinary gain, as distinct from the earlier requirement that this negative goodwill be amortized over up to forty years.

For income tax purposes, negative goodwill is handled in a manner similar to that under GAAP—the cost bases of nonmonetary long-lived assets are proportionally reduced, and any excess is immediately taxable. Thus, a temporary difference probably did not arise from the accounting treatment applied to negative goodwill for income tax and GAAP purposes. In the past, temporary differences arose from the differential treatments (immediate taxability versus amortization for financial reporting), creating deferred income tax assets in many instances.

The accounting for a taxable purchase business combination is similar to that for a nontaxable one. However, unlike the previous example, in which there were numerous assets with different income tax and financial reporting bases, there are likely to be only a few differences in the case of taxable purchases. Previously, because goodwill was not deductible, attempts were often made by the purchaser to allocate, for income tax purposes, excess purchase cost to other intangibles that were subject to deductible amortization, such as covenants not to compete. Since the 1993 income tax act makes all such intangibles including goodwill amortizable over fifteen years, this motive should no longer be encountered. In practice, the accountant, with assistance from a valuation specialist, is often tasked with analyzing the amount allocated to goodwill for income tax purposes to ensure that due care was taken in identifying acquired intangibles that are recognizable for financial reporting purposes separately from goodwill.

Exception for permanent basis differences. US income tax law contains provisions that allow a parent company that owns a majority interest in a domestic subsidiary to avoid future taxation of the excess of the basis of its investment for financial reporting purposes over its basis in the investment for income tax reporting purposes. For example, if the parent's interest in the subsidiary is 80% or more, the parent is permitted to elect to compute the taxable gain or loss on a liquidation of the subsidiary using the income tax basis of the subsidiary's net assets rather than by reference to the parent company's own income tax basis of its investment in the subsidiary's stock (IRC §332). Another variant is a tax-free statutory merger or consolidation (IRC §368). ASC 740 specifies that deferred income tax assets are only recognized if it is apparent that the temporary difference will reverse in the "foreseeable future."

In-process research and development. To the extent that a portion of the purchase price of a business combination was allocated to in-process research and development, ASC 805 and ASC 350 continued the previous practice of immediately expensing these assets upon their acquisition. However, according to ASC 805, on a prospective basis, for business combinations with acquisition dates on or after the beginning of the first annual reporting period beginning on or after December 15, 2008, the acquirer will be required to recognize all tangible and intangible research and development assets acquired in a business combination. For further details, see the section entitled "Acquisition method accounting under ASC 805 and ASC 810-10-65" later in this chapter.

Subsequent accounting. One of the attributes which distinguishes ASC 740 from its predecessors is that net deferred income tax benefits are now fully recognized, subject to the possible need for a valuation allowance. This requirement has a major impact on the accounting for business combinations.

In the example presented above, all future deductible temporary differences were assumed to be fully realizable, and therefore the deferred income tax benefits associated with those temporary differences were recorded as of the acquisition date, with no need for an offsetting valuation allowance. However, in other situations, there may be substantial doubt concerning realizability (i.e., it may be considered more likely than not that the future benefits are unrealizable) and accordingly a valuation allowance would be recognized at the date of the purchase business combination. In such an instance, the allocation of the purchase

price would reflect this fact, which would result in the allocation of a greater share of the purchase cost to goodwill than would otherwise be the case. Under current GAAP goodwill cannot be amortized for financial reporting purposes, and the difference in accounting for goodwill under GAAP and income tax reporting rules will add to the deferred income tax implications of the business combination.

If, at a date subsequent to the business combination transaction, it is determined that the valuation allowance must be reduced or eliminated, ASC 740 stipulates that the effect of this reduction is applied first to eliminate any goodwill recorded in connection with that business combination. Once goodwill has been reduced to zero, the excess is applied to eliminate any noncurrent identifiable intangible assets acquired in that business combination, and any further excess is reflected in the current period income tax expense or benefit. Thus, in this situation the general rule that changes in the allowance are mated to debits or credits in current period income tax expense from continuing operations is not followed.

The transition provisions of ASC 805 relative to income taxes substantially changed the accounting described in the previous paragraph. After the effective date of ASC 805,[3] changes in the valuation allowance for acquired deferred income taxes are to be recognized as an adjustment to income tax expense or, in the case of certain items (employee stock options, dividends on unallocated ESOP shares, and certain quasi reorganizations) as an adjustment to contributed capital. This accounting treatment is to be applied prospectively, even if the acquisition occurred prior to the effective date of ASC 805.

Example of subsequent realization of a deferred income tax asset in a purchase business combination

Assume that Michael Company (acquirer) acquired Reba Enterprises (acquiree) on January 2, 2008, for $2,000,000 in cash. There was no goodwill recognized in the transaction. The income tax basis of the net assets was $6,000,000 (i.e., future deductible temporary differences equal $4,000,000).

Income tax and GAAP bases at acquisition date, 1/1/08

	Income tax basis	*GAAP basis*
Assets	$6,000,000	$6,000,000
Accrued warranty costs	--	(4,000,000)
Basis, net	$6,000,000	$2,000,000

The $4,000,000 of accrued warranty costs (which is not deductible for income tax purposes until actually paid) is expected to reverse as follows: 2008—$1,500,000; 2009—$1,000,000; After 2009—$1,500,000.

The current and expected future income tax rate is a flat 34% and the law restricts use of the acquiree's future deductible temporary differences and carryforwards to its own future taxable income. The acquiree has incurred tax losses in the past three years and 2008 is also expected to result in a tax loss. Thus, Michael Company management concludes that a valuation allowance for the full amount of the deferred income tax asset is required. However, at the end of 2009, Michael Company, due to improved results, decides that a valuation allowance is no longer necessary.

At the date of acquisition the deferred income tax asset was recorded at $1,360,000 ($4,000,000 × 34%) but with a corresponding valuation allowance for the same amount. At the end of 2008, the deferred income tax asset is $850,000 computed as 34% of $2,500,000 ($4,000,000 original warranty liability – $1,500,000 reversal in 2008), again with a corresponding valuation allowance. At the end of 2009, the deferred income tax asset is $510,000 computed as 34% of $1,500,000 ($4,000,000 original warranty liability – the 2008 reversal of $1,500,000 and the 2009 reversal of $1,000,000).

---

[3] *On or after the beginning of the first annual reporting period beginning after December 15, 2008.*

At the end of 2009, when management determines that a valuation allowance is no longer necessary, elimination of the valuation allowance results in a deferred income tax benefit or in a reduction of deferred income tax expense.

The foregoing facts are summarized as follows:

	Future deductible temporary difference	*Deferred income tax asset*	*Valuation allowance*	*Deferred income tax expense (benefit)*
At acquisition	$4,000,000	$1,360,000	$1,360,000	$ --
12/31/2008	2,500,000	850,000	850,000	--
12/31/2009	1,500,000	510,000	--	(510,000)

Thus, the journal entries related to deferred income taxes are

At 1-2-08 (date of acquisition)

Assets acquired	6,000,000	
Deferred income tax asset	1,360,000	
Accrued warranty costs		4,000,000
Cash		2,000,000
Valuation allowance		1,360,000

At 12-31-08

Deferred income tax benefit	510,000	
Deferred income tax asset		510,000

To reduce the gross deferred income tax asset recognized due to reversal of a portion of the temporary difference.

Valuation allowance	510,000	
Deferred income tax benefit		510,000

To reverse the portion of the valuation allowance that related to the prior year's deferred tax asset that reversed in the current year.

At 12-31-09

Valuation allowance	850,000	
Deferred income tax asset		340,000
Deferred income tax benefit		510,000

Note that, in the previous example, had goodwill arisen in the acquisition, the accounting would differ based on whether the change in assessment of the valuation allowance occurred before or after the effective date of FAS 141(R).

Pre-FAS 141(R) — In the postacquisition period in which the tax benefit is realized, the elimination of the valuation allowance is applied to (1) reduce any goodwill recognized in connection with the acquisition, (2) if the goodwill is reduced to zero, any remaining benefit is used to reduce other noncurrent intangible assets included in the acquisition, and (3) if any benefit remains after (1) and (2), it is recognized as a reduction in income tax expense (or an increase in income tax benefit).

Post-FAS 141(R) — If the change occurs during the measurement period and results from new information that bears on facts and circumstances that existed on the acquisition date, the change is recognized by adjusting goodwill. If goodwill is reduced to zero, any excess is recorded currently as a gain from a bargain purchase. Such gains, under FAS 141(R), are no longer characterized as extraordinary.

If the change does not occur during the measurement period, it is reported as a reduction of income tax expense or, if related to dividends on unallocated ESOP shares, employee stock options, or certain quasi reorganizations, as a direct adjustment to contributed capital.

Under ASC 740, the income tax benefits of net operating losses are not distinguished from those arising from future deductible temporary differences. Accordingly, the treatments set forth above for pre- and post-FAS 141(R) are applied here as well. If the benefits are recognized for the first time at a date after the acquisition pre-FAS 141(R) (by reducing or eliminating the valuation allowance), then goodwill arising from the business combination is eliminated, other purchased noncurrent intangibles are reduced to zero, and current income tax expense is reduced. Negative goodwill is neither created nor increased in such circumstances, however.

If, however, the recognition of the benefits occurs after the effective date of FAS 141(R), the benefits do not reduce any assets recorded as a part of the acquisition and, instead, reduce current income tax expense or contributed capital as previously described.

Precisely the same approach is employed in connection with income tax credit carryforwards (investment credit, jobs credit, research and development credit, etc.) which may have existed at the date of the business combination, but which may not have been recognized due to doubtful realizability. While previously the treatments accorded net operating losses and income tax credit carryforwards were dissimilar, under ASC 740 they are identical.

In some instances, entities having unrecognized income tax benefits of net operating losses or income tax credits arising in connection with a purchase business combination may generate other similar income tax benefits after the date of the acquisition. A question in such a circumstance relates to whether a "FIFO" convention should be adopted to guide the recognition of these benefits. While in some instances income tax law may determine the order in which the benefits are actually realized, in other cases the law may not do so. ASC 740 provides that in those latter situations, the benefits realized are to be apportioned, for financial reporting purposes, between pre- and postacquisition income tax benefits. The former are accounted for as above, and the latter reported as reductions of current period income tax expense, consistent with the general rules of ASC 740.

In a period that a subsidiary first meets the criteria in ASC 360 for its operations to be classified as discontinued operations, it becomes apparent that differences between the financial reporting basis and income tax basis of the subsidiary's assets and liabilities will reverse in the foreseeable future. Thus, the parent is to recognize deferred income taxes on the temporary difference between the income tax and financial reporting bases in that period (ASC 740-30-25).

Acquisition-method accounting under ASC 805 and ASC 810-10-65. In general, these standards retain the gross-up approach from ASC 740 whereby deferred income tax assets and liabilities are recorded independently of the acquired assets or assumed liabilities that gave rise to them.

Postcombination changes in a valuation allowance for deferred tax assets of the acquired entity are to be recognized as follows:

1. *Changes during the measurement period*—If a change in the valuation allowance during the measurement period results from new information regarding facts and circumstances existing at the acquisition date, the change is to be recognized as an adjustment to goodwill. If goodwill is reduced to zero by the change, any remaining decrease in the valuation allowance is handled in the same manner as negative goodwill in a bargain purchase; that is, the excess is recorded as a gain.
2. *All other changes*—All other changes in the valuation allowance are to be reflected as an increase or decrease in income tax expense in the period of the change or, with respect to the following items, as a charge or credit to the relevant component of equity:

a. Changes related to tax-deductible costs such as stock issuance costs or debt issuance costs that give rise to temporary GAAP basis/tax basis differences in equity.
b. Changes related to temporary differences related to employee stock options are to be accounted for in accordance with ASC 718-740. Accounting for share-based compensation is discussed in Chapter 19.
c. Dividends paid on unallocated shares held by an Employee Stock Ownership Plan (ESOP) that are charged to retained earnings. Accounting for stock issued to ESOPs is discussed in Chapter 19.
d. Changes that affect deductible temporary differences and carryforwards that existed at the date of certain quasi reorganizations that qualify, under ASC 852-20, to be reported as a direct addition to contributed capital upon recognition of the tax benefits in years subsequent to the quasi reorganization. Quasi reorganizations are discussed in Chapter 19.

Assessment of postcombination realizability of deferred income tax assets. Some tax jurisdictions permit the acquirer to obtain future income tax benefits in postcombination tax years from utilizing deductible temporary differences or carryforwards of its own or of the acquiree.

If the newly consolidated enterprise expects to file a consolidated income tax return, the acquirer may, upon evaluation of the sufficiency of its valuation allowance, determine that the allowance should change. For example, future taxable income generated by the acquiree may allow the consolidated "taxpayer" to utilize net operating loss carryforwards of the acquirer whose future utilization would have otherwise been doubtful. If this were allowable under the tax law of a jurisdiction, the acquirer is to reduce the valuation allowance accordingly. The reduction of the valuation allowance is not, however, accounted for as part of the accounting for the business combination under the acquisition method. Instead, it is recognized as an income tax benefit as a component of income from continuing operations (or credited directly to equity under the specified circumstances discussed previously).

Goodwill. As previously discussed in the context of prior business combinations standards, few areas of income tax accounting are as complex as the treatment of differences between tax and GAAP goodwill.

The carrying value of goodwill for GAAP and income tax purposes will frequently differ. Examples of reasons for these differences include such items as

Example items resulting in tax goodwill in excess of GAAP goodwill

1. The acquirer and acquiree do not fully analyze the nature of the separately identifiable intangible assets included in the acquisition since all intangible assets, including goodwill, are amortized for US federal income tax purposes using the same 15-year statutory life. Upon review for GAAP purposes, certain intangibles are identified that meet the legal/contractual criterion or the separability criterion and are reclassified from goodwill for GAAP purposes.
2. Application of ASC 805 results in recognition of GAAP assets that are not recognized for income tax purposes such as indemnification assets, or in-process research and development assets. As a result, the residual value allocated to goodwill for GAAP purposes is less than goodwill recognized for income tax purposes.
3. Postacquisition impairment write-downs of GAAP goodwill that are not deductible for income tax purposes.

Example items resulting in GAAP goodwill in excess of tax goodwill

1. Application of ASC 805 results in recognition of GAAP liabilities that are not recognized for income tax purposes, such as preacquisition contingencies or contingent consideration. GAAP recognition of these liabilities reduces the aggregate assigned values with respect to the business combination and increases the residual goodwill recognized for GAAP purposes without affecting the goodwill recognized for income tax purposes.
2. Over the US federal 15-year statutory life over which goodwill is amortized, the income tax basis of goodwill is reduced annually, whereas for GAAP purposes, the carrying value of goodwill is not reduced unless it is impaired.

ASC 740 expressly prohibits recognition of a temporary difference or deferred income taxes with respect to goodwill that, in particular taxing jurisdiction, is not deductible.

ASC 740 prescribes a two-component approach to analyzing differences between GAAP and tax-deductible goodwill to determine whether they give rise to a temporary difference and the related deferred income taxes theron.

Component 1. For the purposes of this analysis, the first component of goodwill is the lesser of the amount of goodwill recognized for GAAP purposes or the amount of tax-deductible goodwill recognized for income tax purposes in the particular jurisdiction being analyzed. Obviously, at acquisition, Component 1 goodwill will be the same for GAAP and income tax purposes. However, differences in this component of goodwill that arise in subsequent periods give rise to temporary differences for which deferred income tax assets or liabilities are to be recognized.

Component 2. The second component is the excess of the larger goodwill amount that was not allocated to Component 1. In other words, if GAAP goodwill exceeds tax-deductible goodwill, Component 2 would be that excess amount; if tax-deductible goodwill exceeds GAAP goodwill, Component 2 would be that excess amount.

The deferred income tax treatment afforded differences between GAAP goodwill and tax goodwill varies depending on which basis exceeds the other, as illustrated in the following table.

Recognition of Deferred Income Taxes for GAAP/Tax Differences in Goodwill

	Component 1 goodwill	Component 2 goodwill
At acquisition date		
GAAP goodwill > tax goodwill	At the acquisition date there is no difference between Component 1 GAAP and tax goodwill and, thus, deferred income taxes are not applicable	No deferred income taxes are recognized
Tax goodwill > GAAP goodwill		Deferred income taxes are recognized at acquisition; see examples for how to apply formula to ensure that tax effect of temporary difference is properly considered when computing goodwill or bargain purchase[4]

[4] *Note that in certain circumstances, the formulaic approach illustrated will need to be modified or another computational method substituted. Among these circumstances are situations where (1) the reversal of the temporary differences may be realized for income tax purposes in periods with increasing or decreasing tax rates or (2) where future reversal may be treated as different types of taxable or deductible items (e.g., capital gain vs. ordinary income). In addition, if the acquirer's evaluation of the realizability of a deferred income tax asset necessitates establishing a valuation allowance for all or part of a deferred income tax asset, there may be little, if any effect of deferred income taxes on the amount of goodwill recognized and a trial-and-error method of computation may need to be utilized to determine the amount of the deferred income tax asset to recognize.*

	Component 1 goodwill	*Component 2 goodwill*
Subsequent to acquisition date		
GAAP goodwill > tax goodwill		No deferred income taxes are recognized
Tax goodwill > GAAP goodwill	As deduction are taken on income tax returns for amortization of goodwill or as impairment charges are recognized under GAAP, changes in this component will give rise to deferred income tax assets or liabilities	If change to Component 2 goodwill occurs during the measurement period as a retrospective adjustment to the provisional amount of goodwill, the acquisition-date deferred income taxes are recomputed accordingly; otherwise all changes subsequent to acquisition will only affect Component 1 and there will be no deferred income tax consequences associated with Component 2

Example of deferred income taxes where tax-deductible goodwill exceeds GAAP goodwill

On January 2, 2009, Butler Soccer Supply (BSS) acquired Spector Sod and Turf (SST) in a taxable acquisition. $14,000 of income tax goodwill was allocable for GAAP purposes to an indefinite-lived intangible asset at acquisition thus causing a difference between the goodwill amounts recognized for purposes of GAAP and income tax reporting.

The effective income tax rate for this jurisdiction expected to apply in all applicable periods is a flat 34%.

The acquisition-date allocations resulted in goodwill being recognized for GAAP and income tax purposes as follows:

1.	Tax-deductible goodwill recognized for income tax purposes	$65,000
2.	Goodwill recognized for GAAP purposes	51,000
3.	Excess of tax-deductible goodwill over GAAP goodwill	$14,000

Based on the above, the "components" of goodwill are comprise of

	Tax	*GAAP*
Component 1 (lesser of 1. or 2. above)	$51,000	$51,000
Component 2 (excess excluded from Component 1)	14,000	--
Total tax basis/GAAP carrying value of goodwill	$65,000	$51,000

As previously discussed, at the acquisition date, Component 1 of goodwill will be the same for tax and GAAP purposes. In future periods, however, as income tax deductions are taken for goodwill amortization, these amounts will differ and that difference will give rise to temporary differences necessitating the recognition of deferred income taxes.

The Component 2 tax-deductible goodwill exceeds GAAP goodwill, representing a future deductible temporary difference that requires recognition of a deferred income tax asset at the acquisition date. Application of this principle, however, can produce computational complexity. In theory, recognition of a deferred income tax asset in connection with recording a business combination results in a reduction of GAAP goodwill since the entry to record the deferred income tax asset would be recorded by debiting the deferred income tax asset and crediting goodwill. That hypothetical credit to goodwill would reduce the difference computed above between GAAP goodwill and tax goodwill and, in circular fashion, would affect the computation of the deferred income tax asset. To avoid this circularity, ASC 740 requires the following computational method to determine the amount to recognize as a deferred asset:

DTA	=	Deferred tax asset
TR	=	Tax rate expressed as a percentage
PTD	=	Preliminary temporary difference representing the excess of tax goodwill over GAAP goodwill before giving effect to the income tax benefit associated with goodwill
DTA	=	[TR ÷ (100% – TR)] × PTD

Substituting the known amounts per example

DTA	=	[34% ÷ (100% – 34%)] × $14,000
DTA	=	51.5% × $14,000
DTA	=	$7,212

The entry to record the acquisition-date deferred income tax asset is as follows:

1/2/2009

Deferred income tax asset	7,212	
Goodwill		7,212

To record acquisition-date deferred income tax asset arising from future deductible temporary difference due to excess of the tax basis of deductible goodwill over the carrying amount of goodwill for financial reporting purposes.

To prove the accuracy of the computations, the deferred income tax asset is computed as follows:

Tax goodwill		$65,000
GAAP goodwill, provisional basis before deferred income tax	$51,000	
Adjustment for deferred income taxes per computation	(7,212)	
GAAP goodwill, as adjusted		43,788
Future deductible temporary difference		21,212
× Effective rate		34%
		$7,212

On its consolidate income tax return for the year ended December 31, 2009, BSS deducted amortization of goodwill computed as follows:

Tax basis of goodwill	$65,000
÷ 15-year statutory amortization period (IRC §197)	15
Annual deduction for amortization of goodwill	$4,333

Assuming that no goodwill impairment was recognized for financial reporting purposes for 2009 and that no valuation allowance was needed to reduce the deferred income tax asset to the amount that is more likely than not realizable, the goodwill temporary difference between income tax basis and GAAP carrying amount at 12/31/2009 is

Tax basis of goodwill, at acquisition date	$65,000
Less 2009 amortization	4,333
Tax basis of goodwill at 12/31/2009	60,667
GAAP carrying value of goodwill at 12/31/2009	43,788
Future deductible temporary difference at 12/31/2009	16,879
× Effective tax rate	34%
Deferred income tax asset at 12/31/2009	5,739
Deferred income tax asset at acquisition	7,212
Reduction in deferred asset	$(1,473)

The entry to record the foregoing is as follows:

1/31/2009

Deferred income tax expense (income statement)	1,473	
Deferred income tax asset		1,473

To record reduction in deferred income tax asset and related expense attributable to reduction in temporary difference between GAAP and tax goodwill.

The computation above is easily proven by multiplying the effective tax rate of 34% by the $4,333 change in the future deductible temporary difference, yielding the $1,473 tax effect recorded in the entry.

It is important to note that, on the 2009 consolidated income tax return of BSS and Subsidiary, there will be a deduction for goodwill amortization that will reduce income taxes currently payable that would be recorded as follows, assuming the income tax effects of all other tax positions have been already recorded:

12/31/2009

Income taxes currently payable or refundable (balance sheet)	1,473	
Income tax expense or benefit (income statement)		1,473

To record current income tax effect of deduction for goodwill amortization.

Obviously the effects of the two entries offset each other and result in reducing the deferred income tax asset that existed at acquisition date as the income tax benefits are being realized on currently filed income tax returns.

As a practical matter, it would be a rare situation for an acquirer to have gathered all of the information necessary to establish the appropriate values to record the acquisition in time to issue timely financial statements when due. For this reason, ASC 805 provides for a measurement period during which provisional amounts initially recognized for the transaction are subject to retrospective adjustment. Any such adjustments are to reflect additional information that the acquirer obtains after the acquisition date that was not previously available. In order for the additional information to be relevant for this purpose, it must provide new information regarding facts and circumstances that existed as of the acquisition date that, if known at the time, would have resulted in different measurements of the amounts recognized as of that date.

In addition to causing revisions to previous measurements, the new information may also result in the recognition of additional assets or liabilities that had not been initially identified or recorded when the provisional entries were made to record the combination. The measurement period ends when management of the acquirer obtains the information it needs to make the final determinations (or determines that such information is not available); however, in no case may the measurement period exceed one year from the acquisition date.

Increases and/or decreases in the provisional amounts during the measurement period are reflected as adjustments to goodwill. These adjustments are made retrospectively as if they had been recorded on the acquisition date. Consequently, information for prior periods that is presented for comparative purposes is to be revised to reflect the adjustments and their effect on other measurements such as depreciation, amortization, and, of course, deferred income taxes.

Subsequent to the measurement period, the only changes that are permitted to the accounting for the business combination are restatements to correct errors in accordance with ASC 250, *Accounting Changes and Error Corrections*, which is discussed in detail in Chapter 5.

Effect of deferred income tax liabilities arising from goodwill on analysis of the need for a valuation allowance with respect to deferred income tax assets. In the US, under current federal income tax law, goodwill is amortized over a statutory 15-year life using the straight-line method. The following example illustrates the status of the GAAP tax difference at the end of that 15-year period, assuming no impairment charges are recorded for GAAP.

Example of effect of income tax goodwill amortization on deferred income taxes

On January 2, 2009, Melanie Artist Supply, Inc. (MAS) acquired Larry's Paint-by-Number, Inc. (LPBN) in a taxable acquisition. The difference between tax goodwill and GAAP goodwill was as follows (using the same assumptions from the previous "Butler Soccer Supply" example:

	Tax	*GAAP*
Component 1	$51,000	$51,000
Component 2	14,000	--
Total tax basis and GAAP carrying value of goodwill	$65,000	$51,000

Based on the application of the formulaic approach used in the previous example, GAAP goodwill was adjusted as follows at the acquisition date:

	Tax	*GAAP*
Component 1 (GAAP adjustment: $51,000 – $7,212)	$51,000	$43,788
Component 2	14,000	--
Total tax basis and GAAP carrying value of goodwill	$65,000	$43,788

Assuming that there are no impairment charges incurred for GAAP purposes, and income tax amortization is deducted straight-line in each of the 15 succeeding years ($65,000 ÷ 15 years =

$4,333 per year) the following summarizes the tax and GAAP balances immediately succeeding the final tax amortization deduction:

Carrying value of goodwill for GAAP purposes (same as acquisition date)	$43,788
Income tax basis of goodwill	--
Future taxable temporary difference	43,788
× Assumed flat effective income tax rate	34%
Deferred income tax liability	$14,888

Note that by the end of the 15-year tax amortization period, the acquisition-date deferred income tax asset had fully reversed and had, in fact, become a deferred income tax liability.

In the preceding example, the deferred income tax liability relates to the GAAP carrying value of goodwill that is not amortizable for financial reporting purposes and has an indefinite life. Absent an outright sale or liquidation of the reporting unit, management would be unable to estimate whether the goodwill might give rise to future taxable income prior to the expiration of the statutory net operating loss (NOL) carryforward period which, under current US income tax law is 20 years after the tax year in which the NOL was generated. This same lack of predictability would also apply, for example, to deferred income tax liabilities associated with identifiable, indefinite-life intangibles.

When such a situation arises and management is assessing the realizability of deferred income tax assets to determine the need for a valuation allowance, it would normally not be appropriate to consider the reversal of these types of future taxable temporary differences in assessing whether, in the future, the taxpayer will, more likely than not, be able to generate sufficient taxable income to permit it to obtain the tax benefits associated with its deferred income tax assets. This potentially results in the consolidated reporting entity requiring a full valuation allowance with respect to its deferred income tax assets. If, however, a particular tax jurisdiction were to permit an indefinite carryforward period for an NOL, management would be permitted to consider future reversal of the deferred income tax liability in assessing the need for a valuation allowance.

Negative goodwill and bargain purchases. Chapter 13 discusses in detail the concept of a "bargain purchase" in which the aggregate of the values assigned to the identifiable assets acquired and liabilities assumed exceed the consideration transferred by the acquirer and the noncontrolling interest in the acquiree (if any). This situation can occur when the transaction is a forced sale where the seller is acting under duress if, for example, the seller is at risk because of a personal guarantee of acquiree indebtedness or needs immediate liquidity due to maturing personal debt.

In applying the formulaic approach illustrated in the preceding example, the amount of goodwill recognized for financial reporting purposes may not be sufficient to absorb the adjustment for the amount computed as a deferred income tax asset. When this is the case, the computational approach requires modification as illustrated in the following example.

Example of deferred income taxes where tax-deductible goodwill exceeds GAAP goodwill and adjustment results in gain from a bargain purchase

On January 2, 2009, Novak Condiments Inc. (NI) acquired Jacobson Pickle Corp. (JP) in a taxable acquisition. The effective income tax rate for this jurisdiction expected to apply in all applicable periods is a flat 34%.

The acquisition-date allocations resulted in goodwill being recognized for GAAP and income tax purposes as follows:

1.	Tax-deductible goodwill recognized for income tax purposes	$251,000
2.	Goodwill recognized for GAAP purposes	51,000
3.	Excess of tax-deductible goodwill over GAAP goodwill	$200,000

Based on the above, the "components" of goodwill are comprised of

	Tax	*GAAP*
Component 1 (lesser of 1. or 2. above)	$51,000	$51,000
Component 2 (excess excluded from Component 1)	200,000	--
Total tax basis and GAAP carrying value of goodwill	$251,000	$51,000

Application of the previously illustrated formula yields the following results:

DTA	=	Deferred tax asset
TR	=	Tax rate expressed as a percentage
PTD	=	Preliminary temporary difference representing the excess of tax goodwill over GAAP goodwill before giving effect to the income tax benefit associated with goodwill
DTA	=	[TR ÷ (100% – TR)] × PTD

Substituting the known amounts per example

DTA	=	[(34% ÷ (100% – 34%)] × $200,000
DTA	=	51.5% × $200,000
DTA	=	$103,000

The deferred tax asset (DTA) computed of $103,000 exceeds the GAAP carrying value initially assigned to goodwill of $51,000. If the DTA were recorded without adjustment, it would result in the elimination of the $51,000 of GAAP goodwill and the recognition of an income tax benefit of $52,000. This would not result in the deferred income tax asset being computed at the rate at which it is expected to be realized when the temporary difference reverses.

Acquisition-date basis of goodwill for income tax purposes	$251,000
Acquisition-date carrying value of goodwill for GAAP purposes adjusted for deferred income tax asset	--
Formulaic temporary difference	251,000
× Effective income tax rate	34%
Deferred income tax asset per "proof"	$ 85,340
Deferred income tax asset as computed	$103,000

In order to properly compute the deferred tax adjustment in this case, the formula needs to be modified as follows:

The original formula was

DTA = [TR ÷ (100% – TR)] × PTD

The formula is modified in order to use the limit imposed by the carrying value of the GAAP-basis goodwill to solve for the PTD as follows:

$51,000 (GAAP goodwill)	=	[TR ÷ (100% – TR)] × PTD
$51,000	=	[34% ÷ (100% – 34%)] × PTD
$51,000 ÷ 51.5%	=	PTD
$99,029	=	PTD

Using substitution, the adjustment to GAAP goodwill for the deferred income tax asset is computed/proven as follows:

$51,000 GAAP goodwill limit	=	[TR ÷ (100% – TR)] × PTD
$51,000	=	51.5% × 99,029

The entry to record the reduction of GAAP goodwill to zero is as follows:

1/2/2009

Deferred income tax asset	51,000	
Goodwill		51,000

To record the reduction of goodwill for financial reporting purposes to zero due to the effect of the acquisition-date deferred income tax asset.

The last step is to compute the gain from bargain purchase that arises as a result of recording the remaining deferred income tax asset.

(Original PTD of $200,000 – Revised PTD of $99,029) × 34%	=	gain
($200,000 – $99,029) × 34%	=	gain
	=	$34,330

The entry to record the remainder of the deferred income tax asset and the gain from bargain purchase is as follows:

1/2/2009		
Deferred income tax asset	34,330	
Goodwill		34,330

To record the acquisition-date deferred income tax asset attributable to a gain from bargain purchase.

To prove the accuracy of the computations, the deferred income tax asset is computed as follows:

Portion used to reduce GAAP carrying value of goodwill to zero	$51,000
Portion attributable to bargain purchase	34,330
Total recognized deferred income tax asset	$85,330
Income tax basis of goodwill at acquisition date	$251,000
GAAP carrying value of goodwill as adjusted	--
Temporary difference	251,000
× Effective income tax rate	34%
	85,340
Rounding	(10)
Total recognized deferred income tax asset	$85,330

In-process research and development assets. ASC 805 requires the acquirer to recognize all tangible and intangible R&D assets acquired in a business combination at the acquisition date without immediately writing them off to expense. This treatment is afforded these assets *even if they have no alternative future use.* Accounting subsequent to initial recognition is to be accomplished as follows:

1. Tangible R&D assets are to be accounted for based on their nature (e.g., fixed assets to be held and used, inventory, supplies, etc.)
2. Intangible R&D assets are to be classified as indefinite-lived intangibles until the related R&D project is either completed or abandoned.
3. Upon completion or abandonment of the R&D project to which the assets relate, management of the consolidated reporting entity is to determine the estimated remaining useful life of the assets, if any, and amortize their carrying value over that period.
4. As is the case for other long-lived assets, temporarily idled intangible assets are not to be accounted for as abandoned.
5. During the period of time that the assets are considered to be indefinite-lived, they are subject to the same impairment testing rules that apply to other indefinite-lived intangibles.

If income tax law in an applicable taxing jurisdiction requires acquired R&D assets to be written off (deducted) or recognized at an amount that differs from the foregoing GAAP requirements, then the recognition of these assets for financial reporting purposes will result in a future taxable temporary difference and the related deferred income tax liability would be recognized.

Tax Allocation for Business Investments

As noted in Chapter 12, there are two basic methods for accounting for investments in the common stock of other corporations: (1) the fair value method as set forth in ASC 320, and (2) the equity method, as prescribed by ASC 323. The cost method, previously employed for intercorporate investments lacking the attribute of "significant influence" by the investor, is no longer appropriate, except for the exceedingly rare situation when fair value information is absolutely unavailable. If the cost method is used, however, there will be no deferred income tax consequence, since this conforms to the method prescribed for income tax reporting.

The fair value method is used in instances where the investor is not considered to have significant influence over the investee. The ownership threshold generally used to denote significant influence is 20% of ownership; this level of ownership is not considered an absolute (ASC 323-10-15), but it will be used to identify the break between application of the fair value and equity methods in the illustrations which follow. In practice, the 20% ownership interest defines the point at which there is a rebuttable presumption that the investor has significant influence, and it is often noted that publicly held companies will establish investment ownership percentages very slightly over or under 20%, presumably to support their desires and decisions to use, or not use, the equity method of accounting for those investments.

Under both the cost and fair value methods, ordinary income is recognized as dividends received by the investor, and capital gains (losses) are recognized upon the disposal of the investment. For income tax purposes, no provision is made during the holding period for the allocable undistributed earnings of the investee. There is no deferred income tax computation necessary when using the cost method because there is no temporary difference. Tax allocation issues pertaining to the use of the fair value method are discussed in Chapter 12.

The equity method is generally required whenever an investor owns 20% or more of an investee or has significant influence over the investee's operations with a lower ownership percentage. Under the equity method, the investment is recorded at cost and subsequently increased by the allocable portion of the investee's net income. The investor's share of the investee's net income is then included in the investor's pretax accounting income. Dividend payments are not included in pretax accounting income but instead are considered to be a reduction in the carrying amount of the investment. For income tax purposes, however, dividends received are the only revenue realized by the investor. As a result, the investor must recognize deferred income tax expense on the undistributed net income of the investee that will be taxed in the future. The current effective GAAP in this area consists of ASC 740-30 and ASC 740. These standards are discussed below.

GAAP distinguishes between an investee and a subsidiary and prescribes different accounting treatments for each. An investee is considered to be a corporation whose stock is owned by an investor that holds between 20% and 50% of the outstanding stock. An investee situation occurs when the investor has significant influence but not control over the corporation invested in. A subsidiary, on the other hand, exists when more than 50% of the stock of a corporation is owned by another. This results in a presumption that the investor has direct control over the corporation invested in. ASC 740-30 governs accounting for the income tax effects of owning subsidiaries.

Undistributed earnings of a subsidiary. These accounting requirements are set forth in ASC 740-30. While the timing of distribution of a subsidiary's net income to its parent may be uncertain, it will eventually occur, whether by means of dividends, or via the disposal of the entity and realization of capital gains. Accordingly, deferred income taxes must be provided, but the amount will be dependent upon the anticipated means of realization, which of course may change over time.

The magnitude of the income tax effects to be provided depends upon specific application of the income tax laws and management intent. If the law provides a mechanism under which the parent can recover its investment tax-free, deferred income taxes are not provided. For example, under §332 of the Internal Revenue Code (IRC), a parent corporation can liquidate an 80%-or-more-owned subsidiary without recognizing gain or loss for income tax purposes. Also, under IRC §368, a parent can effect a statutory merger or consolidation with its 80%-or-more-owned subsidiary, under which no taxable gain or loss would be recognized.

In other cases, the minimization or avoidance of income taxes can be achieved only if the parent company owns a stipulated share of the subsidiary's stock. A parent owning less than this threshold level of its subsidiary may express its intent to utilize a tax planning strategy to acquire the necessary additional shares to realize this benefit. In evaluating this strategy, the cost of acquiring the additional shares must be considered, and the benefits to be recognized (i.e., a reduced deferred income tax liability) must be offset by the cost of implementing the strategy as discussed earlier in this chapter.

A distinction exists in the application of ASC 740-30 between differences in income tax and financial reporting basis that are considered "inside basis differences" versus "outside basis differences," and this is clarified by ASC 830-740-25. Certain countries' income tax laws allow periodic revaluation of long-lived assets to reflect the effects of inflation with the offsetting credit recorded as equity for income tax purposes. Because this is an internal adjustment that does not result from a transaction with third parties, the additional basis is referred to as "inside basis." ASC 830-740-25 indicates that the ASC 740-30 indefinite reversal criteria only apply to "outside basis differences," and not to "inside basis differences" arising in connection with ownership of foreign subsidiaries. Therefore, a deferred income tax liability is to be provided on the amount of the increased inside basis.

Certain foreign countries tax corporate income at rates that differ depending on whether the income is distributed as dividends or retained by the corporation. Upon subsequent distribution of the accumulated earnings, the taxpayer receives a tax credit or refund for the difference between the two rates. In the consolidated financial statements of a parent company, the future income tax credit and the deferred income tax effects related to dividends that will be paid in the future are recognized based on the distributed rate if the parent provided for deferred income taxes because it did not invoke the indefinite reversal criteria of ASC 740-30. If the parent did not provide for deferred income taxes as a result of applying the ASC 740-30 criterion, the undistributed rate is to be used (ASC 740-10-25). The treatment of the tax credit in the separate financial statements of the foreign company is discussed later in this chapter in the section captioned Separate Financial Statements of Subsidiaries or Investees.

Undistributed earnings of an investee. When an entity has an equity method investee, it is presumed to be able to exercise significant influence, but lack control. Because the ability to indefinitely postpone income taxes on the investee's net income would be absent in such a case, in contrast to the parent-subsidiary situation above, GAAP requires full interperiod income tax allocation for the effects of undistributed investee net income. The facts and circumstances involved in each situation, however, will be the final determinant of whether this temporary difference is assumed to be a future dividend or a capital gain for purposes of computing the deferred income tax effect.

Example of income tax effects from investee company

To illustrate the application of these concepts, assume Parent Company owns 30% of the outstanding common stock of Investee Company and 70% of the outstanding common stock of Subsidiary company. Additional data for Subsidiary and Investee companies for the year 2009 are as follows:

	Investee Company	*Subsidiary Company*
Net income	\$50,000	\$100,000
Dividends paid	20,000	60,000

The following sections illustrate how the foregoing data are used to recognize the income tax effects of the stated events.

The pretax accounting income of Parent Company will include its equity in Investee Company net income equal to \$15,000 (\$50,000 × 30%). Parent's taxable income, on the other hand, will include dividend income of \$6,000 (\$20,000 × 30%), reduced by a deduction of 80% of the

$6,000, or $4,800. This 80% dividends received deduction is a permanent difference between pretax accounting income and taxable income and is allowed for dividends received from domestic corporations in which the taxpaying corporation's ownership is less than 80% but at least 20%. A lower dividends-received deduction of 70% is permitted when the ownership is less than 20%, and a 100% deduction is provided for dividends received from domestic corporations in which the ownership is 80% to 100%.

In this example, a temporary difference results from Parent's equity ($9,000) in Investee's undistributed income of $30,000 (= $50,000 net income less $20,000 dividends). The amount of the deferred income tax credit in 2009 depends upon the expectations of Parent Company regarding the manner in which the $9,000 of undistributed income will be realized. If the expectation of receipt is via dividends, then the temporary difference is 20% (the net taxable portion, after the dividends received deduction) of $9,000, or $1,800, and the deferred income tax liability associated with this temporary difference in 2009 is the expected effective income tax rate times $1,800. However, if the expectation is that receipt will be through future sale of the investment, then the temporary difference is the full $9,000 and the deferred income tax liability is the current corporate capital gains rate times the $9,000.

The entries below illustrate these alternatives. An assumed tax rate of 34% is used for ordinary income, while a rate of 20% is used for capital gains. It is also assumed that there are no pre-2009 temporary differences to consider. Note that the amounts in the entries below relate only to Investee Company's incremental impact upon Parent Company's income tax assets and liabilities.

	Expectations for undistributed income			
	Dividends		*Capital gains*	
Income tax expense	1,020		2,208	
Deferred income tax liability		612[b]		1,800[c]
Income taxes payable		408[a]		408[a]

[a]Computation of income taxes payable:

Dividend income—30% × ($20,000)	$6,000
Less 80% dividends received deduction	(4,800)
Amount included in Parent's taxable income	$1,200
Tax liability—34% × ($1,200)	$ 408

[b]Computation of deferred income tax liability (dividend assumption):

Temporary difference:	
Parent's share of undistributed income—30% × ($50,000 – $20,000 = $30,000)	$9,000
Less 80% dividends received deduction	(7,200)
Temporary difference	$1,800
Deferred income tax liability—34% × ($1,800)	$ 612

[c]Computation of deferred income tax liability (capital gain assumption):

Temporary difference:	
Parent's share of undistributed income—same as above	$9,000
Deferred income tax liability—20% × ($9,000)	$1,800

Example of income tax effects from subsidiary

The pretax accounting income of Parent Company will also include equity in Subsidiary income of $70,000 (70% × $100,000). This $70,000 will be included in consolidated pretax income in the Parent's consolidated financial statements. For income tax purposes, Parent and Subsidiary cannot file a consolidated income tax return because the minimum level of control (i.e., 80%) is not present. Consequently, the taxable income of Parent will include dividend income of $42,000 (70% × $60,000), and there will be an 80% dividends received deduction of $33,600. The temporary difference discussed in ASC 740-30 results from Parent's 70% equity ($28,000) in the Subsidiary's undistributed earnings of $40,000. The amount of the deferred income tax liability in 2009 depends upon the expectations of Parent Company as to the manner in which this $28,000 of undistributed income will be received. The same expectations can exist as previously discussed, for Parent's equity in Investee's undistributed earnings (i.e., through future dividend distributions or capital gains).

The entries below illustrate these alternatives. A marginal tax rate of 34% is assumed for dividend income, and a rate of 20% applies to capital gains. It is also assumed that there are no

pre-2009 temporary differences to consider. The amounts in the entries below relate only to Subsidiary Company's incremental impact upon Parent Company's income tax assets and liabilities.

	Expectations for undistributed income			
	Dividends		Capital gains	
Income tax expense	4,760		8,456	
Deferred income tax liability		1,904[b]		5,600[c]
Income taxes payable		2,856[a]		2,856[a]

[a]Computation of income taxes payable:

Dividend income—70% × ($60,000)	$42,000
Less 80% dividends received deduction	(33,600)
Amount included in Parent's taxable income	$ 8,400
Tax liability—34% × ($8,400)	$ 2,856

[b]Computation of deferred income tax liability (dividend assumption):

Temporary difference:	
Parent's share of undistributed income—70% × ($40,000)	$28,000
Less 80% dividends received deduction	(22,400)
	$ 5,600
Deferred income tax liability—34% × ($5,600)	$ 1,904

[c]Computation of deferred income tax liability (capital gain assumption):

Temporary difference:	
Parent's share of undistributed income—70% × ($40,000)	$28,000
Deferred income tax liability—20% × ($28,000)	$ 5,600

If a parent company owns 80% or more of the voting stock of a subsidiary and the parent consolidates the subsidiary for both financial reporting and income tax purposes, then no temporary differences exist between consolidated pretax income and taxable income. If, in the circumstances noted above, consolidated financial statements are prepared but a consolidated income tax return is not, IRC §243 allows the Parent to take a 100% dividends received deduction. Accordingly, the temporary difference between consolidated pretax income and taxable income is zero if the parent assumes the undistributed income will be realized in dividends.

Summary of Temporary Differences of Investees and Subsidiaries

Level of Ownership Interest

	0% – <20%	<20% – 50%	50% – >80%	>80% – 100%
Accounting				
Income recognition	Fair value method	Equity Method		
Deferred income tax on undistributed earnings	No temporary difference	Temporary difference		No temporary difference
Income tax				
Dividends recognized	30% of dividends received (70% deduction)	20% of dividends received (80% deduction)		None (100% deduction)

Separate Financial Statements of Subsidiaries or Investees

Push-down accounting. ASC 805-50 addressed a number of issues concerning whether the use of a step-up in the income tax basis of an acquired entity, as permitted by the 1982 tax law, mandated the use of push-down accounting, and the necessary allocation of the income tax provision between parent and subsidiaries if a step-up was not elected. Push-down

accounting is not required for non-SEC registrants. In addition, if the acquiree continues to report its net assets on their historical basis, three alternative methods of allocating consolidated income tax expense or benefit are acceptable: (1) allocation to the acquiree on the preacquisition basis; (2) crediting the income tax benefit of basis step-up to the acquiree's stockholders' equity upon realization; and (3) crediting the income tax benefit to the income of the acquirer when realized as a permanent difference.

Tax credits related to dividend payments. Some taxing jurisdictions have differing income tax rates that are applied to taxable income based on whether that income is distributed to investors or retained in the business. For example, Germany taxes undistributed profits at a 45% rate and distributed profits at a 30% rate. When previously undistributed profits are distributed, the taxpayer earns an income tax credit for the differential between the two rates. ASC 740-10-30 specifies that the accounting for the income tax credit in the separate financial statements of the reporting entity paying the dividend is a reduction of income tax expense in the period that the credit is included in its income tax return. During the period of time that the earnings remain undistributed, the rate applied to the temporary difference in computing deferred income taxes is the rate applicable to the undistributed profits (45% in this example).

Asset Acquisitions

ASC 740 established the principle that the income tax effects of temporary differences related to purchase business combinations are to be "grossed up." ASC 740-10-25 now provides that in situations where an acquiring entity makes an asset acquisition

1. When management recognizes a reduction in the reporting entity's valuation allowance that directly results from the asset acquisition, the reduction is not to enter into the accounting for the asset acquisition. The acquiring entity is to reduce the valuation allowance and either recognize the reduction
   a. As an income tax benefit *or*
   b. As a credit to contributed capital if related to items such as employee stock options, dividends on unallocated ESOP shares, or certain quasi reorganizations
2. Any income tax uncertainties existing at the date of acquisition are to be accounted for in accordance with ASC 740-10.

These specific amendments are to be applied to all asset acquisitions irrespective of when they occurred. This application is on a prospective basis after the effective date of FAS 141(R) which is the first annual reporting period beginning on or after December 15, 2008. Under this transition scenario, the acquirer is to recognize

1. An adjustment to income tax expense (or contributed capital) resulting from post-effective-date changes in a deferred income tax asset valuation allowance
2. Changes in acquired income tax positions in accordance with ASC 740-10

Intraperiod Income Tax Allocation

ASC 740 predominantly deals with the requirements of interperiod income tax allocation (i.e., deferred income tax accounting), but its scope also includes intraperiod income tax allocation. This relates to the matching of various categories of comprehensive income or expense (continuing operations, extraordinary items, corrections of errors, prior period adjustments, etc.) with the income tax effects of those items, as presented in the income (or other financial) statement. The general principle is that the income statement presentation of the effects of income taxes should be the same as items to which the income taxes relate; and in this regard, ASC 740 did not change prior practice. A "with and without" approach is pre-

scribed as the mechanism by which the marginal, or incremental income tax effects of items other than those arising from continuing operations are to be measured. However, under ASC 740 there are some significant departures from past practice, as described in the following paragraphs.

Under prior GAAP, the "with and without" technique was applied in a step-by-step fashion proceeding down the face of the income statement. For example, an entity having continuing operations, discontinued operations, and extraordinary items would calculate income tax expense as follows: (1) Income tax would be computed separately for the aggregate results and for continuing operations. The difference between the two amounts would be allocated to the total of discontinued operations and extraordinary items. (2) Income tax expense would be computed on discontinued operations. The residual amount (i.e., the difference between income tax on discontinued operations and the income tax on the total of discontinued operations and extraordinary items) would then be allocated to extraordinary items. Thus, the amount of income tax expense allocated to any given classification in the statement of income (and the other financial statements, if relevant) was partially a function of the location in which the item was traditionally presented in the income and retained earnings statements.

ASC 740 adopted an incremental calculation of income tax expense to be allocated to classifications other than continuing operations. However, rather than applying successive allocations on the "with and without" basis to determine income tax expense or benefit applicable to each succeeding income statement caption, the income tax effects of all items other than continuing operations are allocated pro rata. That is, once income tax expense or benefit allocable to continuing operations is determined, the residual income tax expense or benefit is apportioned to all the other classifications (discontinued operations, et al.) in the ratios that those other items bear, on a pretax basis, to the total of all such items. Furthermore, income tax expense or benefit on income from continuing operations includes not only income taxes on the income earned from continuing operations, as expected, but also the following items:

1. The impact of changes in income tax laws and rates, which includes the effects of such changes on items which were previously reflected directly in stockholders' equity (accumulated other comprehensive income), as described more fully below
2. The impact of changes in the entity's taxable status
3. Changes in estimates about whether the income tax benefits of future deductible temporary differences or net operating loss or tax credit carryforwards are more likely than not to be realizable (i.e., an adjustment to the valuation allowance for such items)
4. The income tax effects of tax-deductible dividends paid to stockholders, as discussed elsewhere in this chapter

Under ASC 740, stockholders' equity is charged or credited directly with the initial income tax effects of items that are reported in stockholders' equity without being presented on the income statement. These items include the following:

1. Corrections of the effects of accounting errors of previous periods
2. Gains and losses which are defined under GAAP as being part of comprehensive income but are not reported in the income statement, such as foreign currency translation adjustments under ASC 830, and the fair value adjustments applicable to available-for-sale portfolios of debt and marketable equity securities held as investments. As per ASC 220, *Reporting Comprehensive Income*, the income tax effects of these types of items will be reported in the same financial statement where other comprehensive income items are reported. As discussed more fully in Chapter 3,

these items may be reported either in a stand-alone statement of comprehensive income, a combined statement of income and other comprehensive income, or in an expanded version of the statement of changes in stockholders' equity.

3. Taxable or deductible increases or decreases in contributed capital, such as offering costs reported under GAAP as reductions of the proceeds of a capital stock offering, but which are either immediately deductible or amortizable for income tax purposes
4. Increases in the income tax bases of assets acquired in a taxable business combination accounted for as a pooling of interests under GAAP, if an income tax benefit is recognized at the date of the business combination (i.e., if the income tax effects of existing future deductible temporary differences are not fully offset by a valuation allowance at that date)
5. Expenses incurred in connection with stock issued under provisions of compensatory stock option plans, which are recognized for income tax purposes but are reported for accounting purposes in stockholders' equity
6. Dividends paid on unallocated shares held in an ESOP, and that are charged against retained earnings
7. Deductible temporary differences and net operating loss and tax credit carryforwards that existed at the date of a quasi reorganization

The effects of income tax rate or other income tax law changes on items for which the income tax effects were originally reported directly in stockholders' equity are reported in continuing operations, if they occur in any period after the original event. For example, assume the reporting entity recognized a deferred income tax asset related to an employee stock option program amounting to $34,000 in 2009, based on the estimated future income tax deduction it would receive at the then-current and anticipated future income tax rate of 34%. If the statutory income tax rate is reduced to 25% in 2010 before the temporary difference reverses, the adjustment to the deferred income tax asset ($34,000 – $25,000 = $9,000) is reported in income tax expense or benefit applicable to income from continuing operations in 2010.

Comprehensive example of the intraperiod income tax allocation process

Assume $50,000 in future deductible temporary differences at 12/31/09; these differences remain unchanged during the current year, 2010.

	2010
Income from continuing operations	$400,000
Loss from discontinued operations	(120,000)
Extraordinary gain on involuntary conversion (taxable because no replacement property purchased)	60,000
Correction of error: understatement of depreciation in 2009	(20,000)
Income tax credits	5,000

Income tax rates are: 15% on the first $100,000 of taxable income; 20% on the next $100,000; 25% on the next $100,000; 30% thereafter.

Expected future effective income tax rates were 20% at December 31, 2009, but are judged to be 28% at December 31, 2010.

Retained earnings at December 31, 2009, were $650,000.

Intraperiod tax allocation proceeds as follows:

Step 1 — Income tax on total taxable income of $320,000 ($400,000 – $120,000 + $60,000 – $20,000) is $61,000 computed as follows:

Taxable income	*Income tax rate*	*Income tax*	
$100,000	15%	$15,000	
100,000	20%	20,000	
100,000	25%	25,000	
20,000	30%	6,000	
$320,000		$66,000	Income tax before credits
		(5,000)	Tax credit
		$61,000	Income tax payable

Step 2 — Income tax on income from continuing operations of $400,000 is $85,000, net of tax credit computed as follows.

Taxable income	*Income tax rate*	*Income tax*	
$100,000	15%	$15,000	
100,000	20%	20,000	
100,000	25%	25,000	
100,000	30%	30,000	
$400,000		$90,000	Income tax before credits
		(5,000)	Tax credit
		$85,000	Income tax payable

Step 3 — The $24,000 difference is allocated pro rata to discontinued operations, extraordinary gain, and correction of the error in prior year depreciation as follows:

	Gross amount before tax	*Relative %*	*Allocation of difference*
Discontinued operations	$(120,000)	150%	$36,000
Extraordinary gain	60,000	(75%)	(18,000)
Error correction	(20,000)	25%	6,000
	$ (80,000)	100%	$24,000

Step 4 — The adjustment of the deferred income tax asset, amounting to a $4,000 increase due to an effective tax rate estimate change [$50,000 × (.28 – .20)] is allocated to continuing operations, regardless of the source of the temporary difference.

A summary combined statement of income and retained earnings for 2010 is presented below.

Income from continuing operations, before income taxes		$400,000
Income taxes on income from continuing operations:		
Current	$90,000	
Deferred	(4,000)	
Tax credits	(5,000)	81,000
Income from continuing operations, net		319,000
Loss from discontinued operations, net of income tax benefit of $36,000		(84,000)
Extraordinary gain, net of income tax of $18,000		42,000
Net income		277,000
Retained earnings, January 1, 2010 as originally reported		650,000
Correction of accounting error, net of income tax effects of $6,000		(14,000)
Retained earnings, January 1, 2010, as restated		636,000
Retained earnings, December 31, 2010		$913,000

This example does not include items that will, under provisions of ASC 220, be reported in other comprehensive income; the accounting for those is illustrated in Chapter 3.

The income tax effect of a retroactive change in tax rates on current and deferred income tax assets and liabilities is to be determined at the enactment date, using temporary differences and currently taxable income computed as of the date of enactment. The cumulative income tax effect is included in income from continuing operations. Furthermore, the income tax effect of items not included in income from continuing operations (e.g., from discontinued operations) that arose during the current fiscal year and prior to enactment is

measured based on the enacted income tax rate at the time the transaction was recognized for financial reporting purposes; the income tax effect of a retroactive change in rates on current or deferred income tax assets or liabilities related to those items is nevertheless included in income from continuing operations (ASC 740-10-45).

Balance Sheet Classification

Deferred income taxes. A reporting entity that presents a classified balance sheet will classify its deferred income tax liabilities and assets as either current or noncurrent consistent with the classification of the related asset or liability. A deferred income tax asset or liability that is not related to an asset or liability for financial reporting purposes, such as the deferred income tax consequences related to a net operating loss carryforward or income tax credit carryforward, is classified based on the expected reversal or utilization date. These classifications must be made for each separate tax-paying component within each taxing jurisdiction.

Within each of the separate components, the current asset and liability are offset and presented as a single amount, with similar treatment for the noncurrent items. Understandably, offsetting is not permitted for different tax-paying components or for different tax jurisdictions. Thus, a balance sheet may present current and noncurrent deferred income tax assets, along with current and noncurrent deferred income tax liabilities, under certain circumstances.

If the enterprise has recorded a valuation allowance, it must prorate the allowance between current and noncurrent according to the relative size of the gross deferred income tax asset in each classification. The FASB mandated this approach to avoid the necessity of having to estimate which deferred income tax assets would not be recovered.

Payment to retain fiscal year. S corporations and partnerships are permitted to elect tax fiscal years other than a calendar year (IRC §444). If the election is made, however, the electing entity is required to make a payment to the Internal Revenue Service in an amount that approximates the income tax that the stockholders (or partners) would have paid on the income for the period between the fiscal year-end elected and the end of the calendar year. This payment, which is not a tax, is recomputed and adjusted annually and is fully refundable to the electing entity in the future upon liquidation, conversion to a calendar tax year-end or a decline in its taxable income to zero. This "required payment" should be accounted for as an asset, analogous to a deposit (ASC 740-10-55).

Disclosures

ASC 740 is one of a handful of standards that differentiates between public and nonpublic enterprises with respect to the nature and extent of required disclosures. In the Master Glossary, the definition of public enterprises for the purpose of applying certain authoritative GAAP (including ASC 740) includes enterprises that are conduit obligors for conduit debt securities traded in a domestic or foreign market, including an exchange or over-the-counter market, even if the securities are only marketed locally or regionally (definitions of these terms are included earlier in this chapter).

The following disclosures or group of disclosures are applicable in both interim and annual financial statements unless indicated otherwise.

Balance sheet disclosures. A reporting entity is required to disclose the components of the net deferred income tax liability or asset recognized in the balance sheet (statement of financial position) as follows:

1. Total of all deferred income tax liabilities
2. Total of all deferred income tax assets

3. Total valuation allowance
4. Net change in the valuation allowance for the period
5. Narrative description of the types of temporary differences and carryforwards that cause significant portions of deferred income tax assets and liabilities. Public enterprises are additionally required to disclose the approximate income tax effect (not the separate effect for each jurisdiction) of each temporary difference and carryforward (gross, without consideration of any necessary valuation allowance).

When deferred income tax liabilities are not recognized because of the exceptions provided under ASC 740-30 the following information is to be provided:

1. The types of temporary differences and the events that would cause those temporary differences to become taxable
2. The cumulative amount of each type of temporary difference
3. The amount of unrecognized deferred income tax liability for any undistributed foreign earnings, or a statement that such a determination is not practicable
4. The amount of unrecognized deferred income tax liability for other temporary differences that arose prior to the period for which application of this statement was first required for each of those particular differences

Income statement disclosures. ASC 740 places primary emphasis upon the income tax expense or benefit allocated to continuing operations. All significant components of income taxes associated with continuing operations are required to be disclosed for each period for which an income statement is presented. Examples of these components include but are not limited to

1. Current income tax expense or benefit
2. Deferred income tax expense or benefit (exclusive of the effects of other components listed below)
3. General business credits, investment tax credits, or other tax credits
4. Government grants (to the extent recognized as a reduction of income tax expense)
5. The benefits of net operating loss carryforwards
6. Income tax expense that results from allocating certain income tax benefits directly to contributed capital or, if prior to the effective date of ASC 805, from allocating them to reduce goodwill or other noncurrent intangible assets of an acquired entity under the prior rules
7. Adjustments to the deferred income tax liability or asset for enacted changes in income tax laws or rates or a change in the tax status of the reporting entity
8. Adjustments to the beginning of year balance of the valuation allowance because of a change in circumstances that causes a change in judgment about the realizability of the related deferred income tax asset in future years (e.g., when an acquirer recognizes a change in its preacquisition valuation allowance due to income tax benefits it recognizes as a result of a business combination

ASC 740 also requires disclosure of the following:

1. The amounts of income tax expense or benefit allocated to financial statement elements other than continuing operations (e.g., discontinued operations, extraordinary items, other comprehensive income, and retained earnings)
2. The amounts and expiration dates of net operating loss and tax credit carryforwards under the currently enacted tax law
3. The amount of the valuation allowance for which subsequently recognized income tax benefits will be allocated to contributed capital and, if the pre-ASC 805 effective

date accounting was still applicable, tax benefits that were allocated to reduce goodwill or other noncurrent intangible assets of an acquired entity

4. A narrative description of the nature of significant reconciling items between income tax expense or benefit computed on pretax income from continuing operations by applying the statutory federal income tax rate and the actual amount of such expense or benefit reflected in the financial statements. For the purpose of this disclosure, the federal statutory rate is the regular marginal rate to which ordinary taxable income is subjected (currently 34%) without consideration of the effect of graduated rates, alternative minimum tax rates, or income taxes from other state, local or foreign taxing jurisdictions.
5. Public enterprises are additionally required to provide a reconciliation of the differences described in 4. above using either percentages or dollar amounts.

Disclosures added by ASC 740-10. ASC 740-10 requires the following additional disclosures. These disclosures are only required in annual financial statements.

1. The accounting policy for whether
   a. Interest on unrecognized income tax positions are included as a component of income tax expense or as a component of interest expense
   b. Penalties on unrecognized income tax positions are included as a component of income tax expense or as a component of another expense category
2. For each annual reporting period presented in the financial statement of the reporting entity
   a. A reconciliation of changes in the liability for unrecognized income tax benefits that includes at a minimum
      (1) The balance at the beginning of the year
      (2) For income tax positions taken during previous periods
         (a) Gross additions
         (b) Gross reductions
      (3) For income tax positions taken during the current period
         (a) Gross additions
         (b) Gross reductions
      (4) Reductions resulting from settlements with taxing authorities
      (5) Reductions resulting from the lapse of the applicable statute of limitations
      (6) The balance at the end of the year
3. At the date of the latest balance sheet presented
   a. Disclosures regarding "certain significant estimates" (as required by ASC 275 and ASC 450) with respect to items for which it is reasonably possible that there will be a significant increase or decrease in the estimate of the liability for unrecognized income tax benefits within one year of the balance sheet including, at a minimum
      (1) The nature of the uncertainty
      (2) The nature of the event that could occur in the next year that would cause the change
      (3) An estimate of the range of the change that is reasonably possible or, if such an estimate cannot be made, a statement to that effect

4. The total interest and penalties recognized in each balance sheet and income statement (for not-for-profits, in the statement of financial position and statement of activities, respectively)
5. A description of the open tax years by major tax jurisdiction
6. The total amount of unrecognized income tax benefits that, if recognized, would affect the effective income tax rate
7. In the fiscal year of adoption
   a. The nature of and reason for the change in accounting principle
   b. The cumulative effect of the change on retained earnings as of the date of adoption

In the year of adoption, the cumulative effect of initially adopting ASC 740-10 is to be reported as an adjustment to the opening balance of retained earnings (or other components of equity or net assets).

Note that the year-of-adoption disclosures are not required to be repeated in financial statements of subsequent periods.

Other disclosures. If applicable, the following additional disclosures are required:

1. If there are significant matters that affect the comparability of information between periods presented that are not apparent to a financial statement user from the disclosures described above, the nature of such matters and their effect on the financial statements for the periods presented.
2. For each period for which an income statement is presented in the separately issued financial statements of a reporting entity that is a member of an affiliated group that files a consolidated income tax return
   a. The amounts of current and deferred income tax expense included in the statement of income.
   b. The amounts of any income tax-related balances due to or from other companies in the affiliated group at each balance sheet date.
   c. A description of the method used by members of the affiliated group to allocate the consolidated current and deferred income tax expense or benefit between them and the nature of any changes, during the years presented, in this method of allocation or the method of determining amounts due to or from affiliates as described in b. above.
3. The income tax benefit realized during each period presented from employees' exercise of nonqualified employee stock options. This may be presented as a separate line item in the operating section of the statement of cash flows or in the statement of changes in stockholders' equity.
4. It has become generally accepted, although not explicitly required, to disclose the fact that a reporting entity is not subject to federal income taxes (and state income taxes, if applicable) because it is a flow-through entity (e.g., an S corporation, a limited liability company, or partnership). Public companies are required to disclose this fact as well as the net differences between the income tax bases and financial reporting bases of its assets and liabilities.

Accounting for Income Taxes in Interim Periods

Basic rules. ASC 740 essentially left unchanged the principles applicable to accounting for income taxes in financial statements covering interim periods, established by ASC 270 and ASC 740-270. As set forth in those standards, the appropriate perspective for interim period reporting is to view the interim period as an integral part of the year, rather than as a

discrete period. This objective is usually achieved by projecting income for the full annual period, computing the income tax thereon, and applying the "effective rate" to the interim period income or loss, with quarterly (or monthly) revisions to the expected annual results and the income tax effects thereof, as necessary.

While the Board chose to not comprehensively address interim reporting when it deliberated ASC 740, there were certain clear contradictions between ASC 270 and the principles of ASC 740, which the Board did address. As discussed in more detail below, these issues were (1) recognizing the income tax benefits of interim losses based on expected net income of later interim or annual periods, (2) reporting the benefits of net operating loss carryforwards in interim periods, and (3) reporting the effects of income tax law changes in interim periods. Other matters requiring interpretation, which were left to the user to address without official guidance, included the classification of deferred income tax assets and liabilities on interim balance sheets and allocation of interim period income tax provisions between current and deferred expense.

The annual computation of income tax expense is based upon the current income taxes payable or refundable as indicated on the income tax return, plus or minus the adjustment necessary to adjust the deferred income tax asset and liability to the proper balances as of the balance sheet date (including consideration of the need for a valuation allowance, as previously discussed). The computation of interim period income tax expense should be consistent with this asset and liability method.

ASC 740-270 introduced some unfortunate terminology that, although confusing, nevertheless must be understood in the context of interim tax computations. The term "ordinary income" as used in ASC 740-270 is not the same as that term is used in the income tax law to distinguish capital gains, for example, from operating income and deductions. The ASC 740-270 definition of "ordinary income" is, formulaically

Pretax income or loss from continuing operations

+/– Extraordinary items
+/– Discontinued operations
+/– Cumulative effects of changes in accounting principle
+/– Significant unusual or infrequently occurring items

This "ordinary income" is used as the denominator in calculating an effective income tax rate to be used to compute income tax expense currently payable for the interim period. Note that pretax income is *not* adjusted for the effects of permanent or temporary differences.

Below is a relatively simple example that illustrates these basic principles.

Basic example of interim period accounting for income taxes

Boffa, Inc. estimates that pretax accounting income for the full fiscal year ending June 30, 2009, will be $400,000. Boffa does not expect to have any of the items that would adjust its "ordinary income" as defined above either at year-end or during any of its interim quarters. The company expects that it will incur $60,000 of meals and entertainment expenses of which 50% are nondeductible under the current tax law, the annual premium on an officer's life insurance policy is $12,000, and dividend income (from a less than 20% ownership interest) is expected to be $100,000. The company recognized income of $75,000 in the first quarter of the year. The deferred income tax liability arises solely in connection with property and equipment temporary differences; these differences totaled $150,000 at the beginning of the year and are projected to equal $280,000 at year-end after taking into account expected acquisitions and disposals for the remainder of the fiscal year. The graduated statutory income tax rate schedule is provided below. Boffa management used a future expected effective income tax rate of 34% to compute the beginning deferred income tax liability and does not anticipate changing that percentage at the end of the fiscal year. The change in the future taxable temporary difference during the first quarter is $30,000.

Boffa must first calculate its estimated effective income tax rate for the year. This rate is computed using all of the tax planning alternatives available to the company (e.g., tax credits, foreign rates, capital gains rates, etc.).

Estimated annual pretax accounting income (and "ordinary income" as defined in ASC 740-270)			$ 400,000
Permanent differences:			
Add:	Nondeductible officers' life insurance premium	$ 12,000	
	Nondeductible meals and entertainment	30,000	42,000
			442,000
Less:	Dividends received deduction ($100,000 × 70%)		(70,000)
			372,000
Less: Change in future taxable temporary difference			(130,000)
Estimated taxable income for the year			$ 242,000
Annual current tax on estimated taxable income (see below)			$ 70,530
Effective income tax rate for *current* income tax expense (computed as a percentage of "ordinary income") $70,530/400,000			17.6%

Tax rate schedule: At least	Not more than	Rate	Taxable income	Tax
$ --	$ 50,000	15%	$ 50,000	$ 7,500
50,000	75,000	25%	25,000	6,250
75,000	--	34%	167,000	56,780
				$70,530

Computation of the first quarter current income tax expense.

"Ordinary income" for first quarter	$75,000
Estimated annual effective income tax rate per above	× 17.6%
	$13,200

This amount can be "proven" as follows:

Annualized current tax computed above	$70,530
Portion of annual tax attributable to first quarter	
First quarter pretax income as a % of forecast	
$75,000/$400,000	× 18.75%
Result, materially the same as above	$13,224

Computation of the first quarter deferred income tax expense (same method as year-end).

	Future taxable temporary difference	*Effective tax rate estimated for reversal year(s)*	*Computed deferred tax liability*
Property and equipment			
End of first quarter	$180,000	34%	$61,200
Beginning of fiscal year	150,000	34%	51,000
First quarter deferred income tax expense			$10,200

Recap of first quarter income tax expense.

Current	$13,200
Deferred	10,200
Total	$23,400

Finally, the entry necessary to record the income tax expense at the end of the first quarter is as follows:

Income tax expense	23,400	
Income taxes payable—current		13,200
Deferred income tax liability		10,200

In the second quarter, Boffa, Inc. revises its estimate of income for the full fiscal year. It now anticipates only $210,000 of pretax accounting income ("ordinary income"), including only $75,000 of dividend income, because of dramatic changes in the national economy. Other permanent differences are still expected to total $42,000.

Estimated annual pretax accounting income (and "ordinary income" as defined in ASC 740-270)		$210,000
Permanent differences:		
Add: Nondeductible officers' life insurance premium	$12,000	
Nondeductible meals and entertainment	30,000	42,000
		252,000
Less: Dividends received deduction ($75,000 × 70%)		(52,500)
		199,500
Less: Change in future taxable temporary difference		(130,000)
Estimated taxable income for the year		$ 69,500
Annual current tax on estimated taxable income (see below)		$ 12,375
Effective income tax rate for *current* income tax expense (computed as a percentage of "ordinary income" $12,375/$210,000)		5.2%

Tax rate schedule				
At least	*Not more than*	*Rate*	*Taxable income*	*Tax*
$ --	$ 50,000	15%	$ 50,000	$ 7,500
50,000	75,000	25%	19,500	4,875
			$69,500	$12,375

The actual "ordinary income" for the second quarter was $22,000, and the change in the temporary difference was only an additional $10,000. Income tax expense for the second quarter is computed as follows:

Computation of year-to-date and second quarter current income tax expense (benefit).

"Ordinary income" for the half year ($75,000 + $22,000)	$97,000
Estimated annual effective income tax rate per above	× 5.2%
Year-to-date current income tax expense	$ 5,044
Less: Expense recognized in first quarter	13,200
Current income tax (benefit) for second quarter	$ (8,156)

Computation of year-to-date and second quarter deferred income tax expense (benefit).

	Future taxable temporary difference	*Effective tax rate estimated for reversal year(s)*	*Computed deferred tax liability*
Property and equipment			
End of second quarter	$190,000	34%	$64,600
Beginning of fiscal year	150,000	34%	51,000
Year-to-date deferred income tax expense			13,600
Less: Expense recognized in first quarter			10,200
Deferred income tax expense for second quarter			$ 3,400

Recap of second quarter income expense (benefit)

Current	$(8,156)
Deferred	3,400
Total	$(4,756)

Under ASC 270, and also under the general principle that changes in estimate are reported prospectively (as stipulated by ASC 250), the results of prior quarters are not restated for changes in the estimated effective annual tax rate. Given the current and deferred income tax expense that was recognized in the first quarter, shown above, the following entry is required to record the income taxes as of the end of the second quarter:

Income taxes payable—current	8,156	
Income tax expense (benefit)		4,756
Deferred income tax liability		3,400

The foregoing illustrates the basic problems encountered in applying GAAP to interim reporting. In the following paragraphs, we discuss some of the items requiring modifications to the approach described above.

Net operating losses in interim periods. ASC 740-270 sets forth the appropriate accounting when losses are incurred in interim periods or when net operating loss (NOL) carryforward benefits are realized during an interim reporting period.

Carryforward from prior years. The interim accounting for the utilization of a net operating loss (NOL) carryforward is reflected in one of two ways.

1. If the income tax benefit of the NOL is expected to be realized as a result of current year "ordinary income," that income tax benefit is included as an adjustment to the effective annual tax rate computation illustrated above.
2. If the income tax benefit of the NOL is not expected to be realized as described in 1., the benefit is allocated first to reduce year-to-date income tax expense from continuing operations to zero with any excess allocated to other sources of income that would provide the means to utilize the NOL (e.g., extraordinary items, discontinued operations, etc.)

When a valuation allowance is reduced or eliminated because of a revised judgment, the previously unrecognized income tax benefit is included in the income tax expense or benefit of the interim period in which the judgment is revised. An increase in the valuation allowance resulting from a revised judgment would cause a catch-up adjustment to be included in the current interim period's income tax expense from continuing operations. In either situation, the effect of the change in judgment is **not** prorated to future interim periods by means of the effective tax rate estimate.

Example of interim-period valuation allowance adjustments due to revised judgment

Camino Corporation has a previously unrecognized $50,000 net operating loss (NOL) carryforward—that is, Camino had previously established a full valuation allowance for the deferred income tax asset arising from the NOL and thus had not previously recognized any deferred income tax benefit associated with the NOL; a flat 40% tax rate for current and future periods is assumed. Income for the full year (before NOL) is projected to be $80,000, consequently, the management of Camino has revised its judgment as to the future realizability of the NOL. In the first quarter Camino will report a pretax loss of $10,000.

Projected annual income	$ 80,000
× Tax rate	40%
Projected tax liability	$ 32,000

Accordingly, in the income statement for the first fiscal quarter, the pretax operating loss of $10,000 will give rise to an income tax benefit of $10,000 × 40% = $4,000.

In addition, an income tax benefit of $20,000 ($50,000 NOL × 40%) is recognized, and is included in the current quarter's income tax benefit relating to continuing operations. Thus, the total income tax benefit for the first fiscal quarter will be $24,000 ($4,000 + $20,000).

If Camino's second quarter results in pretax operating income of $30,000, and the expectation for the full year remains unchanged (i.e., operating income of $80,000), the second quarter income tax expense is $12,000 ($30,000 × 40%).

The income tax provision for the fiscal first half-year will be a benefit of $12,000, as follows:

Cumulative pretax income through second quarter ($30,000 – $10,000)	$ 20,000
× Effective rate	40%
Income tax provision before recognition of NOL carryforward benefit	8,000
Benefit of NOL carryforward first recognized in first quarter	(20,000)
Total year-to-date tax provision (benefit)	$(12,000)
Consisting of:	
First quarter (benefit)	$(24,000)
Second quarter expense	12,000
Year-to-date benefit, per above	$(12,000)

The foregoing example assumes that during the first quarter Camino's judgment changed as to the full realizability of the previously unrecognized benefit of the $50,000 loss carryforward. Were this not the case, however, the benefit would have been recognized only as actual tax liabilities were incurred (through current period income) in amounts sufficient to offset the NOL benefit.

Example of recognizing NOL loss carryforward benefit as actual liabilities are incurred

To illustrate this latter situation, assume the same facts about net income for the first two quarters, and assume now that Camino's judgment about the realizability of the prior period NOL does not change. Tax provisions for the first quarter and first half are as follows:

	First quarter	*First half-year*
Pretax income (loss)	$(10,000)	$ 20,000
× Effective rate	40%	40%
Tax provision before recognition of NOL carryforward benefit	$ (4,000)	$ 8,000
Benefit of NOL carryforward recognized	--	(8,000)
Tax provision (benefit)	$ (4,000)	--

Notice that recognition of an income tax benefit of $4,000 in the first quarter is based on the expectation of at least a breakeven full year's results. That is, the benefit of the first quarter's loss was deemed more likely than not. Otherwise, no income tax benefit would have been reported in the first quarter.

Estimated loss for the year. When the full year is expected to be profitable, it is irrelevant that one or more interim periods result in a loss, and the expected effective rate for the full year is used to record interim period income tax expense and benefits, as illustrated above. However, when the full year is expected to produce a loss, the computation of the effective annual income tax benefit rate must logically take into account the extent to which a net deferred income tax asset (i.e., the asset less any related valuation allowance) will be recognized at year-end. For the first set of examples, below, assume that the realization of income tax benefits related to NOL carryforwards are not entirely more likely than not. That is, the full benefits will be recognized as deferred income tax assets, but those assets will be offset partially or completely by the valuation allowance.

For each of the following examples we will assume that the Gibby Corporation is anticipating a loss of $150,000 for the fiscal year. The Company's general ledger currently reflects a deferred income tax liability of $30,000; all of the liability will reverse during the fifteen-year carryforward period. Assume future income taxes will be at a 40% rate.

Example 1

Assume that the company can carry back the entire $150,000 NOL to the preceding three years. The income tax potentially refundable by the carryback would (remember this is only an estimate until year-end) amount to $48,000 (an assumed amount). The effective rate is then 32% ($48,000/150,000).

	Ordinary income (loss)		*Tax (benefit) expense*		
Reporting period	*Reporting period*	*Year-to date*	*Year-to-date*	*Less previously provided*	*Reporting period*
1st qtr.	$ (50,000)	$ (50,000)	$(16,000)	$ --	$(16,000)
2nd qtr.	20,000	(30,000)	(9,600)	(16,000)	6,400
3rd qtr.	(70,000)	(100,000)	(32,000)	(9,600)	(22,400)
4th qtr.	(50,000)	(150,000)	(48,000)	(32,000)	(16,000)
Fiscal year	$(150,000)				$(48,000)

Note that both the income tax expense (2nd quarter) and benefit are computed using the estimated annual effective rate. This rate is applied to the year-to-date numbers just as in the previous examples, with any adjustment being made and realized in the current reporting period. This

treatment is appropriate because the accrual of income tax benefits in the first, third and fourth quarters is consistent with the effective rate estimated at the beginning of the year, in contrast to those circumstances in which a change in estimate is made in a quarter relating to the realizability of income tax benefits not previously provided (or benefits for which full or partial valuation allowances were required).

Example 2

In this case assume that Gibby Corporation can carry back only $50,000 of the loss and that the remainder must be carried forward. Realization of future taxable income to fully utilize the NOL is not deemed to be more likely than not. The estimated carryback of $50,000 would generate an income tax refund of $12,000 (again assumed). The company is assumed to be in the 40% tax bracket (a flat rate is used to simplify the example). Although the benefit of the NOL carryforward is recognized, a valuation allowance must be provided to the extent that it is more likely than not that the benefit will not be realized. In this example, management has concluded that only 25% of the gross benefit will be realized in future years. Accordingly, a valuation allowance of $30,000 must be established, leaving a net of $10,000 as an estimated realizable income tax benefit related to the carryforward of the projected loss.

$150,000 loss – $50,000 carried back = $100,000 NOL × 40% tax rate =
$40,000 benefit × 75% portion deemed unrealizable = $30,000 valuation allowance

Considered in conjunction with the carryback refund of $12,000, the company will obtain a $22,000 income tax benefit relating to the projected current year loss, for an effective income tax benefit rate of 14.7%. The calculation of the estimated annual effective rate is as follows:

Expected annual net loss			$150,000
Tax benefit from NOL carryback		$12,000	
Tax benefit of NOL carryforward			
($100,000 × 40%)	$40,000		
Valuation allowance	(30,000)	10,000	
Total recognized benefit			$22,000
Estimated annual effective rate			
($22,000 ÷ $150,000)			14.7%

	Ordinary income (loss)		Tax (benefit) expense			
			Year-to-date		Less	
Reporting period	Reporting period	Year-to-date	Computed	Limited to	previously provided	Reporting period
1st qtr.	$ 10,000	$ 10,000	$ 1,470	$ --	$ --	$ 1,470
2nd qtr.	(80,000)	(70,000)	(10,290)	--	1,470	(11,760)
3rd qtr.	(100,000)	(170,000)	(24,990)	(22,000)	(10,290)	(11,710)
4th qtr.	20,000	(150,000)	(22,000)	--	(22,000)	--
Fiscal year	$(150,000)					$(22,000)

In the foregoing, the income tax expense (benefit) is computed by multiplying the year-to-date income or loss by the estimated annual effective rate, and then subtracting the amount of tax expense or benefit already provided in prior interim periods. It makes no difference if the current period indicates an income or a loss, assuming of course that the full-year estimated results are not being revised. However, if the cumulative loss for the interim periods to date exceeds the projected loss for the full year upon which the effective income tax benefit rate had been based, then no further tax benefits can be recorded, as is illustrated above in the benefit for the third quarter.

The foregoing examples cover most of the situations encountered in practice. The reader is referred to ASC 740-270-55 for additional examples.

Operating loss occurring during an interim period. An instance may occur in which the company expects net income for the year and incurs a net loss during one of the reporting periods. In this situation, the estimated annual effective rate, which was calculated based upon the expected net income figure, is applied to the year-to-date income or loss to arrive at year-to-date income tax expense. The amount previously provided is subtracted from the year-to-date expense to arrive at the expense for the current reporting period. If the current period operations resulted in a loss, then the period will reflect an income tax benefit.

Income tax provision applicable to interim period nonoperating items.

Unusual, infrequent, or extraordinary items. The financial statement presentation of these items and their related income tax effects are prescribed by ASC 740. Extraordinary items and discontinued operations are to be shown net of their related income tax effects. Unusual or infrequently occurring items are separately disclosed as a component of pretax income, and the income tax expense or benefit is included in the income tax expense from continuing operations. Presenting these items net of tax is strictly prohibited so the reader does not mistake them for extraordinary items.

The interim treatment accorded these items does not differ from the fiscal year-end reporting required by GAAP. However, according to ASC 270, these items are not to be included in the computation of the estimated effective annual income tax rate. The opinion also requires that these items be recognized in the interim period in which they occur rather than being prorated equally throughout the year. Examples of the treatment prescribed by the opinion follow later in this section.

Recognition of the income tax effects of a loss due to any of the aforementioned situations is permitted if the benefits are expected to be realized during the year, or if they will be recognizable as a deferred income tax asset at year-end under the provisions of ASC 740.

If a situation arises where realization is not more likely than not in the period of occurrence but becomes assured in a subsequent period in the same fiscal year, the previously unrecognized income tax benefit is reported in income from continuing operations until it reduces the income tax expense to zero, with any excess reported in those other categories of income (e.g., discontinued operations) which provided a means of realization of the tax benefit.

The following examples illustrate the treatment required for reporting unusual, infrequently occurring, and extraordinary items. Again, these items are not to be used in calculating the estimated annual tax rate. For income statement presentation, the income tax expense or benefit relating to unusual or infrequently occurring items is to be included with ordinary income from continuing operations. Extraordinary items are shown net of their applicable tax provision.

The following data apply to the next two examples:

1. Irwin Industries expects fiscal year ending June 30, 2007 income to be $96,000 and net permanent differences to reduce taxable income by $25,500.
2. Irwin Industries also incurred a $30,000 extraordinary loss in the second quarter of the year.

Example 1

In this case, assume that the loss can be carried back to prior periods and, therefore, the realization of any income tax benefit is assured. Based on the information given earlier, the estimated annual effective income tax rate can be calculated as follows:

Expected pretax accounting income	$96,000
Anticipated permanent differences	(25,500)
Expected taxable income	$70,500

Income Tax Calculation "Excluding" Extraordinary Item

$50,000	×	.15	=	$ 7,500
20,500	×	.25	=	5,125
$70,500				$12,625

Effective annual rate = 13.15% ($12,625 ÷ 96,000)

No adjustment in the estimated annual effective rate is required when the extraordinary, unusual, or infrequent item occurs. The income tax (benefit) applicable to the item is computed using the estimated fiscal year ordinary income and an analysis of the incremental impact of the extraordi-

nary item. The method illustrated below is applicable when the company anticipates operating income for the year. When a loss is anticipated but realization of benefits of NOL carryforwards is not more likely than not, the company computes its estimated annual effective rate based on the amount of tax to be refunded from prior years. The income tax (benefit) applicable to the extraordinary, unusual, or infrequent item is then the decrease (increase) in the refund to be received.

Computation of the income tax applicable to the extraordinary, unusual, or infrequent item is as follows:

Estimated pretax accounting income	$96,000
Permanent differences	(25,500)
Extraordinary item	(30,000)
Expected taxable income	$40,500

Income Tax Calculation "Including" Extraordinary Item

$40,500 × .15 = $6,075

Income tax "excluding" extraordinary item	$12,625
Income tax "including" extraordinary item	6,075
Income tax benefit applicable to extraordinary, unusual, or infrequent item	$ 6,550

			Income tax (benefit) applicable to				
			Ordinary income (loss)		Unusual, infrequent, or extraordinary item		
Reporting period	*Ordinary income (loss)*	*Unusual, infrequent, or extraordinary item*	*Reporting period*	*Year-to-date*	*Year-to-date*	*Previously provided*	*Reporting period*
1st qtr.	$10,000	$ --	$ 1,315	$ 1,315	$ --	$ --	$ --
2nd qtr.	(20,000)	(30,000)	(2,630)	(1,315)	(6,550)	--	(6,550)
3rd qtr.	40,000	--	5,260	3,945	(6,550)	(6,550)	--
4th qtr.	66,000	--	8,680	12,625	(6,550)	(6,550)	--
Fiscal year	$96,000	$(30,000)	$12,625				$ (6,550)

Example 2

Again, assume that Irwin Industries estimates net income of $96,000 for the year with permanent differences of $25,500 which reduce taxable income. The extraordinary loss of $30,000 cannot be carried back and the ability to carry it forward is not more likely than not. Because no net deferred income tax assets exist, the only way that the loss can be deemed to be realizable is to the extent that current year ordinary income offsets the effect of the loss. As a result, realization of the loss is assured only as, and to the extent that, there is ordinary income for the year.

			Income tax (benefit) applicable to				
			Ordinary income (loss)		Unusual, infrequent, or extraordinary item		
Reporting period	*Ordinary income (loss)*	*Unusual, infrequent, or extraordinary item*	*Reporting period*	*Year-to-date*	*Year-to-date*	*Previously provided*	*Reporting period*
1st qtr.	$ 5,000	$ --	$ 658	$ 658	$ --	$ --	$ --
2nd qtr.	20,000	(30,000)	2,630	3,288	(3,288)[a]	--	(3,288)
3rd qtr.	(10,000)	--	(1,315)	1,973	(1,973)[a]	(3,288)	1,315
4th qtr.	81,000	--	10,652	12,625	(6,550)[a]	(1,973)	(4,577)
Fiscal year	$96,000	$(30,000)	$12,625				$ (6,550)

[a] *The recognition of the income tax benefit to be realized relative to the unusual, infrequent, or extraordinary item is limited to the lesser of the total income tax benefit applicable to the item or the amount available to be realized. Because realization is based upon the amount of income tax applicable to ordinary income during the period, the year-to-date figures for the income tax benefit fluctuate as the year-to-date income tax expense relative to ordinary income fluctuates. Note that at no point does the amount of the income tax benefit exceed what was calculated above as being applicable to the unusual, infrequent, or extraordinary item.*

Discontinued operations in interim periods. Discontinued operations, according to ASC 270, are included as significant, unusual, or extraordinary items. Therefore, the computations described for unusual, infrequent, or extraordinary items will also apply to the income (loss) from the discontinued component of the entity, including any provisions for operating gains (losses) subsequent to the measurement date.

If the decision to dispose of operations occurs in any interim period other than the first interim period, the operating income (loss) applicable to the discontinued component has already been used in computing the estimated annual effective tax rate. Therefore, a recomputation of the total tax is not required. However, the total tax is to be divided into two components.

1. That tax applicable to ordinary income (loss)
2. That tax applicable to the income (loss) from the discontinued component

This division is accomplished as follows: a revised estimated annual effective rate is calculated for the income (loss) from ordinary operations. This recomputation is then applied to the ordinary income (loss) from the preceding periods. The total income tax applicable to the discontinued component is then composed of two items.

1. The difference between the total income tax originally computed and the income tax recomputed on remaining ordinary income
2. The income tax computed on unusual, infrequent, or extraordinary items as described above

Example

Rochelle Corporation anticipates net income of $150,000 during the fiscal year. The net permanent differences for the year will be $10,000. The company also anticipates income tax credits of $10,000 during the fiscal year. For purposes of this example, we will assume a flat statutory rate of 50%. The estimated annual effective rate is then calculated as follows:

Estimated pretax income	$150,000
Net permanent differences	(10,000)
Taxable income	140,000
Statutory rate	50%
Income tax	70,000
Anticipated credits	(10,000)
Total estimated income tax	$ 60,000
Estimated effective rate ($60,000 ÷ 150,000)	40%

The first two quarters of operations were as follows:

	Ordinary income (loss)		*Tax expense*		
Reporting period	*Reporting period*	*Year-to-date*	*Year-to-date*	*Less previously provided*	*Reporting period*
1st qtr	$30,000	$30,000	$12,000	$ --	$12,000
2nd qtr.	25,000	55,000	22,000	12,000	10,000

In the third quarter, Rochelle made the decision to dispose of Division X. During the third quarter, the company earned a total of $60,000. Upon reclassification of Division X's property and equipment to "held-for-sale" on its balance sheet, the company expects to incur a onetime charge to income of $75,000 and estimates that current year divisional operating losses subsequent to the disposal decision will be $20,000, all of which will be incurred in the third quarter. The company estimates revised ordinary income in the fourth quarter to be $35,000. The two components of pretax accounting income (discontinued operations and revised ordinary income) are shown below.

		Division X	
Reporting period	*Revised ordinary income*	*Loss from operations*	*Asset reclassification*
1st qtr.	$ 40,000	$(10,000)	$ --
2nd qtr.	40,000	(15,000)	--
3rd qtr.	80,000	(20,000)	(75,000)
4th qtr.	35,000	--	--
Fiscal year	$195,000	$(45,000)	$(75,000)

Rochelle must now recompute the estimated annual income tax rate. Assume that all the permanent differences are related to the revised continuing operations. However, $3,300 of the tax

credits were applicable to machinery used in Division X. Because of the discontinuance of operations, the credit on this machinery would not be allowed. Any recapture of prior period credits must be used as a reduction in the income tax benefit from either operations or the loss on disposal. Assume that the company must recapture $2,000 of the $3,300 investment tax credit that is related to Division X.

The recomputed estimated annual rate for continuing operations is as follows:

Estimated (revised) ordinary income	$195,000
Less net permanent differences	(10,000)
	$185,000
Tax at statutory rate of 50%	$ 92,500
Less anticipated credits from continuing operations	(6,700)
Tax provision	$ 85,800
Estimated annual effective tax rate ($85,800 ÷ 195,000)	44%

The next step is to then apply the revised rate to the quarterly income from continuing operations as illustrated below.

	Ordinary income			*Tax provision*		
Reporting period	*Reporting period*	*Year-to-date*	*Estimated annual effective rate*	*Year-to-date*	*Less previously provided*	*Reporting period*
1st qtr.	$ 40,000	$ 40,000	44%	$17,600	$ --	$17,600
2nd qtr.	40,000	80,000	44%	35,200	17,600	17,600
3rd qtr.	80,000	160,000	44%	70,400	35,200	35,200
4th qtr.	35,000	195,000	44%	85,800	70,400	15,400
Fiscal year	$195,000					$85,800

The tax benefit applicable to the operating loss from discontinued operations and the loss from the asset reclassification and remeasurement must now be calculated. The first two quarters are calculated on a differential basis as shown below.

	Tax applicable to ordinary income		
Reporting period	*Previously reported*	*Recomputed (above)*	*Tax (benefit) expense applicable to Division X*
1st qtr.	$12,000	$17,600	$ (5,600)
2nd qtr.	10,000	17,600	(7,600)
			$ (13,200)

The only calculation remaining applies to the third quarter tax benefit pertaining to the operating loss and the loss on reclassification of the assets of the discontinued component. The calculation of this amount is made based on the revised estimate of annual ordinary income both including and excluding the effects of the Division X losses. This is shown below.

	Loss from operations of Division X	*Asset reclassification*
Estimated annual income from continuing operations	$195,000	$195,000
Net permanent differences	(10,000)	(10,000)
Loss from Division X operations	(45,000)	--
Provision for loss on reclassification of Division X assets	--	(75,000)
Total	$140,000	$110,000
Tax at the statutory rate of 50%	$ 70,000	$ 55,000
Anticipated credits (from continuing operations)	(6,700)	(6,700)
Recapture of previously recognized tax credits as a result of disposal	--	2,000
Taxes after effect of Division X losses	63,300	50,300
Taxes computed on estimated income before the effect of Division X losses	85,800	85,800
Tax benefit applicable to Division X	(22,500)	(35,500)
Amounts allocable to quarters one and two ($5,600 + $7,600)	(13,200)	--
Tax benefit to be recognized in the third quarter	$ (9,300)	$(35,500)

The quarterly tax provisions can be summarized as follows:

	Pretax income (loss)			*Tax (benefit) applicable to*		
Reporting period	*Continuing operations*	*Operations of Division X*	*Loss on asset reclassification*	*Continuing operations*	*Operations of Division X*	*Loss on asset reclassification*
1st qtr.	$ 40,000	$(10,000)	$ --	$17,600	$ (5,600)	$ --
2nd qtr.	40,000	(15,000)	--	17,600	(7,600)	--
3rd qtr.	80,000	(20,000)	(75,000)	35,200	(9,300)	(35,500)
4th qtr.	35,000	--	--	15,400	--	--
Fiscal year	$195,000	$(45,000)	$(75,000)	$85,800	$(22,500)	$(35,500)

The following income statement shows the proper financial statement presentation of these discontinued operations. The notes to the statement indicate which items are to be included in the calculation of the annual estimated rate.

Income Statement
(ASC 740-270-55)

Net sales*		$xxxx
Other income*		xxx
		xxxx
Costs and expenses		
Cost of sales*	$xxxx	
Selling, general, and administrative expenses*	xxx	
Interest expense*	xx	
Other deductions*	xx

PERSPECTIVE AND ISSUES

This chapter focuses on accounting for postretirement benefits, including single-employer and multiemployer plans, defined benefit pension plans, defined contribution pension plans, and postretirement benefit plans other than pensions, such as those that help fund retiree costs of health care benefits. The accounting for such arrangements has historically been difficult, in large part because the accounting standard setters, influenced by preparers and issuers, have seen fit to include a variety of "smoothing" features that—whatever merits they may have—did necessitate the use of various accruals and deferrals, and the reporting of

certain elements within other comprehensive income. Thus, presentation of benefit plan expense and related items has involved lengthy and complex footnotes, and generally at least some "off the financial statement" measurements. Longstanding dissatisfaction with such accounting practices, coupled with FASB's stated goal of converging its standards with those of IASB, is expected to culminate in a revised standard for pension and other postretirement benefit plan accounting that will fully incorporate benefit plan assets and liabilities into the sponsor's statement of financial position, and that will result in periodic benefit plan expense measurement devoid of any "smoothing" devices.

While elimination of all accounting artifacts is the ultimate goal (and one expected to be realized in the near to intermediate term), an interim solution has been provided by ASC 715, which requires, for the first time, that the full extent of over- or underfunding of defined benefit pension plans, and that a lesser measure of the underfunding of other postretirement benefit plans, be displayed on the face of the statement of financial position. For many plan sponsors, this has had the unwelcome effect of reducing or even eliminating stockholders' equity. This outcome was caused by former GAAP provisions that effectively concealed (in the financial statements proper) the reporting entities' obligation for postretirement promises made to employees, relegating such information to the financial statement footnotes.

The provisions of all extant GAAP for pension and other employee benefit plans are explored in detail in the following materials. The expected future developments will also be noted.

ASC 715-30 specifies the accrual basis of accounting for pension costs. At the time of its narrowly endorsed issuance in 1985, FASB stated that it was not likely to be the final step in the evolution of pension accounting, which it characterized as being in a "transitional stage." FASB acknowledged in the standard that it had made a political compromise when it stated that "recognition in financial statements of [pension assets and liabilities] in their entirety would be too great a change from past practice."

What may have been intended as a transitional stage, however, is now over 23 years old, with the end not yet clearly in sight. Today, decades later, the accounting model remains, in many ways unchanged, although ASC 715 does for the first time require that there be display within the statement of financial position of the funded status of pension and other postretirement benefit plans. The impact of the mandated "smoothing" of gains and losses, the subjective selection of expected asset returns and discount rate, the use of overfunding to affect the entity's reported earnings, and the complexity of information presented in the footnote disclosures, all remain concerns.

ASC 715-30 includes three primary and controversial characteristics, which are

1. Delayed recognition (changes are not recognized immediately but are subsequently recognized in a gradual and systematic way)
2. Reporting net cost (various expense and income items are aggregated and reported as one net amount)
3. Offsetting assets and liabilities (assets and liabilities are sometimes shown net)

Estimates and averages may be used as long as material differences do not result. Explicit assumptions and estimates of future events must be used for each specified variable included in pension costs and disclosed in the notes to the financial statements.

ASC 715-30 focuses directly on the terms of the plan to assist in the recognition of compensation cost over the service period of the employees. Whereas the effect of underfunding of defined benefit pension plans was only reflected in plan sponsors' balance sheets to a limited extent, and only if certain conditions occurred, under ASC 715-30, under recently-imposed ASC 715 the full amount of under- and overfunding of pension plans is to be reported in the statement of financial position. Whereas the underfunding of other defined

benefit postretirement plans was not, under provisions of ASC 715-60, reported in the sponsoring entity's balance sheet, ASC 715 now requires that this be partially or fully reported.

The principal emphasis of ASC 715-30 is the present value of the pension obligation and the fair value of plan assets. Fair value is addressed, most recently and comprehensively, by ASC 820 and is fully discussed in Chapter 6. The main accounting issues revolve around the expense to recognize on the income statement and the liability to be accrued on the balance sheet. As noted above, the periodic expense to be recognized under current GAAP is a modified version of the actual economic consequence of the employer's commitment to pay future benefits, because of the substantial use of smoothing. (Over the full time horizon, which is measured in decades, all expense does of course get recognized in results of operations.)

ASC 715-30 establishes standards to be followed by sponsors of defined benefit pension plans when obligations are settled, plans are curtailed, or benefits are terminated.

Although there are some major differences in terminology and measurement, other postretirement benefits (commonly referred to as OPEB) accounting basically follows the fundamental framework established for defined benefit pension accounting and applies to all forms of postretirement benefits other than pensions. In most cases, the main focus is on postretirement health care benefits, since that is by far the most costly commitment made by employers to retirees. ASC 715-60 considers OPEB to be a form of deferred compensation and requires accrual accounting. The terms of the individual contract govern the accrual of the employer's obligation for deferred compensation and the cost is attributed to employee service periods until full eligibility to receive benefits is attained. The employer's obligation for OPEB is fully accrued when the employee attains full eligibility for all expected benefits.

As stated in ASC 715, some or all of the underfunded postretirement benefit obligations must now be displayed in the statement of financial position.

ASC 715-20, *Compensation—Retirement Benefits, Defined Benefits Plans,* eliminates less useful information, requires some additional data deemed useful by analysts, and allows some aggregation of presentation.

The complex accounting and disclosure requirements under the aforementioned standards have proved to be a source of frustration for even seasoned analysts of financial statements. In addition, dramatic changes in the values of investments held by defined benefit plans—including both the large value increases of the late 1990s and the subsequent drastic declines of the early 2000s—coupled with sometimes aggressive assumptions about expected returns and discount rates, which were slow to be adjusted as market conditions changed, made such information of sometimes doubtful usefulness. While of course deliberate misapplication of any of these standards would be a GAAP departure, the permitted and indeed necessary use of numerous assumptions does create the opportunity for management to deliberately influence the entity's reported earnings.

FASB's thoroughgoing review of accounting for pension and other postretirement benefits began in late 2005. The first phase of this project was intended to make pension and postretirement benefits information more useful and transparent for investors, creditors, employees, retirees, donors, and other users. The changes wrought by ASC 715 became effective on a phased basis, with the final phase-in occurring for years ending after December 15, 2008. While the changes imposed by ASC 715 have brought improvements to the statement of financial position, however, the ASC 715-30 requirements pertaining to income statement recognition of expense remain intact.

In the second, longer-term phase of this project, FASB expects to comprehensively consider a variety of issues related to the accounting for postretirement benefits. These include how the various elements that affect the cost of postretirement benefits (e.g., prior service costs, actuarial gains and losses) are best recognized and displayed in either earnings or other comprehensive income; how to measure the entity's benefit obligations, including whether

more or different guidance should be provided about assumptions used in measuring benefit costs; and whether postretirement benefit trusts should be consolidated by the plan sponsor (i.e., treated as VIEs). Additional improvements to the financial statement disclosures about plan assets are also being considered.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
360	Property, Plant, and Equipment
Liabilities	
450	Contingencies
Expenses	
710	Compensation—General
715	Compensation—Retirement Benefits
715-20	Compensation—Retirement Benefits—Defined Benefit Plans, General
715-30	Compensation—Retirement Benefits—Defined Benefits Plans, Pension
715-60	Compensation—Retirement Benefits—Defined Benefit Plans, Other Postretirement
715-80	Compensation—Retirement Benefits—Multi-Employer Plans
740	Income Taxes
Broad Transactions	
820	Fair Value Measurements and Disclosures
Industry	
958	Not-for-Profit Entities

DEFINITIONS OF TERMS

Accrued pension cost. Cumulative net pension cost accrued in excess of the employer's contributions.

Accumulated benefit obligation. Actuarial present value of benefits (whether vested or nonvested) attributed by the pension benefit formula to employee service rendered before a specified date and based on employee service and compensation (if applicable) prior to that date. The accumulated benefit obligation differs from the projected benefit obligation in that it includes no assumption about future compensation levels. For plans with flat-benefit or no-pay-related pension benefit formulas, the accumulated benefit obligation and the projected benefit obligation are the same.

Accumulated postretirement benefit obligation. The actuarial present value of benefits attributed to employee service rendered to a particular date. Prior to an employee's full eligibility date, the accumulated postretirement benefit obligation as of a particular date for an employee is the portion of the expected postretirement benefit obligation attributed to that employee's service rendered to that date. On and after the full eligibility date, the accumulated and expected postretirement benefit obligations for an employee are the same.

Actual return on plan assets component (of net periodic pension cost). Difference between fair value of plan assets at the end of the period and the fair value at the beginning of the period, adjusted for employer contributions and payments of benefits during the period.

Actuarial present value. Value, as of a specified date, of an amount or series of amounts payable or receivable thereafter, with each amount adjusted to reflect (1) the time value of money (through discounts for interest) and (2) the probability of payment (by means of decrements for events such as death, disability, withdrawal, or retirement) between the specified date and the expected date of payment.

Amortization. Usually refers to the process of reducing a recognized liability systematically by recognizing revenues or reducing a recognized asset systematically by recognizing expenses or costs. In pension accounting, amortization is also used to refer to the

systematic recognition in net pension cost over several periods of previously unrecognized amounts, including unrecognized prior service cost and unrecognized net gain or loss.

Annuity contract. Irrevocable contract in which an insurance company[1] unconditionally undertakes a legal obligation to provide specified benefits to specific individuals in return for a fixed consideration or premium. It involves the transfer of significant risk from the employer to the insurance company. Participating annuity contracts provide that the purchaser (either the plan or the employer) may participate in the experience of the insurance company. The insurance company ordinarily pays dividends to the purchaser. If the substance of a participating annuity contract is such that the employer remains subject to all or most of the risks and rewards associated with the benefit obligation covered or the assets transferred to the insurance company, the purchase of the contract does not constitute a settlement.

Assumptions. Estimates of the occurrence of future events affecting pension costs, such as mortality, withdrawal, disablement and retirement, changes in compensation and national pension benefits, and discount rates to reflect the time value of money.

Attribution. Process of assigning pension benefits or cost to periods of employee service.

Attribution period. The period of an employee's service to which the expected postretirement benefit obligation for that employee is assigned. The beginning of the attribution period is the employee's date of hire unless the plan's benefit formula grants credit only for service from a later date, in which case the beginning of the attribution period is generally the beginning of that credited service period. The end of the attribution period is the full eligibility date. Within the attribution period, an equal amount of the expected postretirement benefit obligation is attributed to each year of service unless the plan's benefit formula attributes a disproportionate share of the expected postretirement benefit obligation to employees' early years of service. In that case, benefits are attributed in accordance with the plan's benefit formula.

Career-average-pay formula. Benefit formula that bases benefits on the employee's compensation over the entire period of service with the employer. A career-average-pay plan is a plan with such a formula.

Contributory plan. Pension plan under which employees contribute part of the cost. In some contributory plans, employees wishing to be covered must contribute. In other contributory plans, employee contributions result in increased benefits.

Curtailment. Event that significantly reduces the expected years of future service of present employees or eliminates for a significant number of employees the accrual of defined benefits for some or all of their future services. Curtailments include (1) termination of employee's services earlier than expected, which may or may not involve closing a facility or discontinuing a segment of a business and (2) termination or suspension of a plan so that employees do not earn additional defined benefits for future services. In the latter situation, future service may be counted toward vesting of benefits accumulated based on past services.

Defined benefit pension plan. Pension plan that defines an amount of pension benefit to be provided, usually as a function of one or more factors such as age, years of service, or compensation. Any pension plan that is not a defined contribution pension plan is, for purposes of ASC 715-30, a defined benefit pension plan.

Defined contribution pension plan. Plan that provides pension benefits in return for services rendered, provides an individual account for each participant, and specifies how

---

[1] *If the insurance company is controlled by the employer or there is any reasonable doubt that the insurance company will meet its obligation under the contract, the purchase of the contract does not constitute a settlement for purposes of ASC 715-30.*

contributions to the individual's account are to be determined instead of specifying the amount of benefits the individual is to receive. Under a defined contribution pension plan, the benefits a participant will receive depend solely on the amount contributed to the participant's account, the returns earned on investments of those contributions, and forfeitures of other participants' benefits that may be allocated to such participant's account.

Expected long-term rate of return on plan assets. Assumption as to the rate of return on plan assets reflecting the average rate of earnings expected on the funds invested or to be invested to provide for the benefits included in the projected benefit obligation.

Expected postretirement benefit obligation. The actuarial present value as of a particular date of the benefits expected to be paid to or for an employee, the employee's beneficiaries, and any covered dependents pursuant to the terms of the postretirement benefit plan.

Expected return on plan assets. Amount calculated as a basis for determining the extent of delayed recognition of the effects of changes in the fair value of assets. The expected return on plan assets is determined based on the expected long-term rate of return on plan assets and the market-related value of plan assets.

Explicit approach to assumptions. Approach under which each significant assumption used reflects the best estimate of the plan's future experience solely with respect to that assumption.

Fair value. Amount that a pension or postretirement plan could reasonably expect to receive for an investment in a current sale between a willing buyer and a willing seller (i.e., in other than a forced or liquidation sale). Fair value of a plan investment is to be measured by its price in an active market, if available. If no active market exists for the investment, an active market price for an investment with similar characteristics may be used. Finally, if neither market exists, ASC 715-30 and ASC 715-60 permit the use of forecasted expected cash flows. ASC 815-10-15 clarifies that because these standards preceded the issuance of CON 7, the term "expected cash flows" as used to estimate fair value in this context does not require the use of the probability weighted expected cash flow model that ASC 915 introduced (although that model is based on sound estimation principles and is permitted to be used).

Final-pay formula. A plan with a benefit formula that bases benefits on the employee's compensation over a specified number of years near the end of the employee's service period or on the employee's highest compensation periods. For example, a plan might provide annual pension benefits equal to 1% of the employee's average salary for the last five years (or the highest consecutive five years) for each year of service.

Flat-benefit formula. A plan with a benefit formula that bases benefits on a fixed amount per year of service, such as $20 of monthly retirement income for each year of credited service.

Full eligibility (for benefits). The status of an employee having reached the employee's full eligibility date. Full eligibility for benefits is achieved by meeting specified age, service, or age and service requirements of the postretirement benefit plan.

Full eligibility date. The date at which an employee has rendered all of the service necessary to have earned the right to receive all of the benefits expected to be received by that employee (including any beneficiaries and dependents expected to receive benefits). Determination of the full eligibility date is affected by plan terms that provide incremental benefits expected to be received by or on behalf of an employee for additional years of service, unless those incremental benefits are trivial. Determination of the full eligibility date is not affected by plan terms that define when benefit payments commence or by an employee's current dependency status.

Fund. Used as a verb, to pay over to a funding agency (as to fund future pension benefits or to fund pension cost). Used as a noun, assets accumulated in the hands of a funding agency for the purpose of meeting pension benefits when they become due.

Funding policy. Program regarding the amounts and timing of contributions by the employer(s), participants, and any other sources (for example, state subsidies or federal grants) to provide the benefits a pension plan specifies.

Gain or loss. Change in the value of either the projected benefit obligation or the plan assets resulting from experience different from that assumed or from a change in an actuarial assumption. See also **Unrecognized net gain or loss**.

Gain or loss component (of net periodic pension cost). Sum of (1) the difference between the actual return on plan assets and the expected return on plan assets and (2) the amortization of the unrecognized net gain or loss from previous periods. The gain or loss component is the net effect of delayed recognition of gains and losses (the net change in the unrecognized net gain or loss) except that it does not include changes in the projected benefit obligation occurring during the period and deferred for later recognition.

Interest cost component (of net periodic pension cost). Increase in the projected benefit obligation due to passage of time.

Market-related value of plan assets. Balance used to calculate the expected return on plan assets. Market-related value can be either fair value or a calculated value that recognizes changes in fair value in a systematic and rational manner over not more than five years. Different ways of calculating market-related value may be used for different classes of assets, but the manner of determining market-related value must be applied consistently from year to year for each asset class.

Measurement date. Date at which plan assets and obligations are measured.

Mortality rate. Proportion of the number of deaths in a specified group to the number living at the beginning of the period in which the deaths occur. Actuaries use mortality tables, which show death rates for each age, in estimating the amount of pension benefits that will become payable.

Net periodic pension cost. Amount recognized in an employer's financial statements as the cost of a pension plan for a period. Components of net periodic pension cost are service cost, interest cost, actual return on plan assets, gain or loss, amortization of unrecognized prior service cost, and amortization of the unrecognized net obligation or asset existing at the date of initial application of ASC 715-30. The term "net periodic pension cost" is used instead of "net pension expense" because part of the cost recognized in a period may be capitalized as part of an asset such as inventory.

Plan amendment. Change in terms of an existing plan or the initiation of a new plan. A plan amendment may increase benefits, including those attributed to years of service already rendered. See also **Retroactive benefits**.

Postemployment benefits. Benefits provided to former and inactive employees after employment but before retirement. Postemployment benefits include, but are not limited to, salary continuation, supplemental unemployment benefits, severance benefits, disability-related benefits (including workers' compensation), job training and counseling, and continuation of benefits such as health care benefits and life insurance coverage.

Postretirement benefits. All forms of benefits, other than retirement income, provided by an employer to retirees. Those benefits may be defined in terms of specified benefits, such as health care, tuition assistance, or legal services, that are provided to retirees as the need for those benefits arises or they may be defined in terms of monetary amounts that become payable on the occurrence of a specified event, such as life insurance benefits.

Prepaid pension cost. Cumulative employer contributions in excess of accrued net pension cost.

Prior service cost. Cost of retroactive benefits granted in a plan amendment. See also **Unrecognized prior service cost**.

Projected benefit obligation. Actuarial present value as of a date of all benefits attributed by the pension benefit formula to employee service rendered prior to that date. The projected benefit obligation is measured using assumptions as to future compensation levels if the pension benefit formula is based on those future compensation levels (pay-related, final-pay, final-average-pay, or career-average-pay plans).

Retroactive benefits. Benefits granted in a plan amendment (or initiation) that are attributed by the pension benefit formula to employee services rendered in periods prior to the amendment. The cost of the retroactive benefits is referred to as prior service cost.

Service. Employment taken into consideration under a pension plan. Years of employment before the inception of a plan constitute an employee's past service. Years thereafter are classified in relation to the particular actuarial valuation being made or discussed. Years of employment (including past service) prior to the date of a particular valuation constitute prior service.

Service cost component (of net periodic pension cost). Actuarial present value of benefits attributed by the pension benefit formula to services rendered by employees during the period. The service cost component is a portion of the projected benefit obligation and is unaffected by the funded status of the plan.

Settlement. Transaction that (1) is an irrevocable action, (2) relieves the employer (or the plan) of primary responsibility for a pension benefit obligation, and (3) eliminates significant risks related to the obligation and the assets used to effect the settlement. Examples include making lump-sum cash payments to plan participants in exchange for their rights to receive specified pension benefits and purchasing nonparticipating annuity contracts to cover vested benefits. A transaction must meet all of the above three criteria to constitute a settlement.

Substantive plan. The terms of the postretirement benefit plan as understood by an employer that provides postretirement benefits and the employees who render services in exchange for those benefits. The substantive plan is the basis for the accounting for that exchange transaction. In some situations an employer's cost-sharing policy, as evidenced by past practice or by communication of intended changes to a plan's cost-sharing provisions, or a past practice of regular increases in certain monetary benefits may indicate that the substantive plan differs from the existing written plan.

Transition obligation. The unrecognized amount, as of the date ASC 715-60 is initially applied, of (1) the accumulated postretirement benefit obligation in excess of (2) the fair value of plan assets plus any recognized accrued postretirement benefit cost or less any recognized prepaid postretirement benefit cost.

Unfunded accumulated benefit obligation. Excess of the accumulated benefit obligation over plan assets.

Unfunded accumulated postretirement benefit obligation. The accumulated postretirement benefit obligation in excess of the fair value of plan assets.

Unrecognized net gain or loss. Cumulative net gain (loss) that has not been recognized as a part of net periodic pension cost. While not yet included in earnings, under requirements established by ASC 715 these will be displayed in the balance sheet once realized. Thus, these will no longer be unrecognized for balance sheet display purposes. See **Gain or loss**.

Unrecognized prior service cost. Portion of prior service cost that has not been recognized as a part of net periodic pension cost. While not yet included in earnings, under re-

quirements established by ASC 715 this will be displayed in the balance sheet once realized (i.e., incurred). Prior service cost will no longer be unrecognized for balance sheet display purposes.

CONCEPTS, RULES, AND EXAMPLES

The principal objective of ASC 715-30 is to measure the compensation cost associated with employees' benefits and to recognize that cost over the employees' service period. This statement is concerned only with the accounting aspects of pension costs. The funding (assets set aside to meet future payment obligations) of the benefits is not covered and is considered to be a financial management matter.

When an entity provides benefits that can be estimated in advance to its retired employees and their beneficiaries, the arrangement is a pension plan. The accounting for most types of retirement plans is covered by ASC 715-30. These plans include unfunded, insured, trust fund, defined contribution and defined benefit plans, and deferred compensation contracts, if equivalent. Independent deferred profit sharing plans and pension payments to selected employees on a case-by-case basis are not considered pension plans. The typical plan is written and the amount of benefits can be determined by reference to the associated documents. The plan and its provisions can also be implied, however, from unwritten but established past practices.

The establishment of a pension plan represents a commitment to employees that is of a long-term nature. Although some companies manage their own plans, this commitment usually takes the form of contributions made to an independent trustee. These contributions are used by the trustee to invest in plan assets of various types (treasury bonds and bills, certificates of deposit, annuities, marketable securities, corporate bonds, etc.). The plan assets are expected to generate a return generally in the form of interest, dividends, and/or appreciation in asset value. The return on the plan assets (and occasionally the proceeds from their liquidation) provides the trustee with cash to pay the benefits to which the employees are entitled. These benefits, in turn, are defined by the plan's benefit formula. The benefit formula incorporates many factors including employee compensation, employee service longevity, employee age, etc. and is considered to provide the best indication of pension obligations and costs. It is used as the basis for determining the pension cost recognized in the financial statements each fiscal year.

Net Periodic Pension Cost

A pension plan creates long-term obligations. It is assumed that a company will continue to provide retirement benefits well into the future. The accounting for the plan's costs is reflected in the financial statements and these amounts are not discretionary. All pension costs incurred are recognized as expenses but, under the smoothing approach taken by ASC 715-30 and ASC 715-60, recognition of some elements of pension and postretirement benefit expense may be partially deferred until later periods.

Because pension obligations are long-term liabilities, there was a consensus of opinion, when ASC 715-30 was being written, that some current period effects should not be fully recognized in earnings as they occurred. Short-term fluctuations in interest rates, market prices of plan investments, and other factors could, if recognized as incurred, cause material swings in the net periodic pension cost and net income to be reported in the financial statements of the employer/sponsor. It was thought that such fluctuations would quite likely be offset by reversals in subsequent periods—for example, market declines in one period would be followed by market upward movements in later periods.

This possibility has traditionally been cited to justify the use of smoothing techniques in order to recognize certain of these changes in a systematic and rational manner (e.g., by amortization) instead of recognizing them immediately. This smoothing aspect has long been the object of criticism, and FASB has been active in its pursuit of a project that could curtail or eliminate that practice. As a first step, ASC 715 does increase on-balance-sheet disclosure of funding status and of the benefit expense elements subject to deferred recognition, but does not eliminate the practice of expense smoothing itself.

The benefits earned and costs recognized over the employees' service periods are computed by reference to the pension plan's benefit formula. Net periodic pension cost consists of the sum of the following six components:

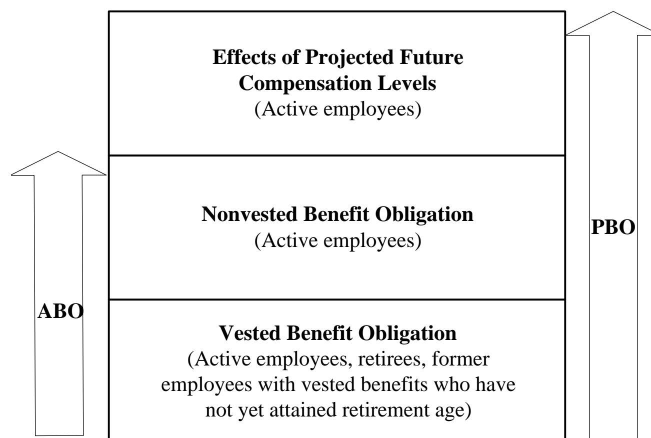
1. Service cost
2. Interest cost on projected benefit obligation
3. Actual return on plan assets
4. Gain or loss
5. Amortization of unrecognized prior service cost
6. Amortization of unrecognized net assets or net obligation existing at date of initial application of ASC 715-30 (this last item is of historical interest only, since implementation of this standard was required in the late 1980s)

Pension plans may or may not be sensitive to future salary progression. The obligation, in present value terms, for future pension payments including the effects of future compensation adjustments is referred to as the *projected* benefit obligation, while the obligation computed without regard to salary progression is called the *accumulated* benefit obligation. For those plans that do not depend on salary progression, the accumulated and the projected benefit obligations are the same.

In order to calculate the net periodic pension cost, the accumulated benefit obligation (ABO) and the projected benefit obligation (PBO) must both be computed. Both of these obligation amounts are actuarially determined using the actuarial present value of benefits earned that are attributable to services rendered by the employee to the date of the computation. Under the provisions of most pension plans, PBO provides a more relevant measure of the estimated cost of the benefits to be paid upon retirement. This is because the benefit formula set forth in the plan normally results in increases in future pension benefits based on increases in the employee's compensation.

Pay-related, final-pay, or career-average-pay plans are examples of plans where future payments are based on future compensation levels. These plans measure benefits based on service performed to date but include assumptions as to future compensation increases, staff turnover rates, etc. In non-pay-related or flat-benefit plans, both obligations (ABO and PBO) are the same.

The following discussion employs a component-by-component analysis, providing a series of examples that cumulatively build to the comprehensive summary of net periodic pension costs and the sample pension disclosures that follow. Key amounts are cross-referenced between examples using parenthesized lowercase letters [(a), (b), etc.]. In accordance with accounting convention, obligations and increases thereto are presented in parentheses.



Example

	January 1, 2008
Accumulated benefit obligation	$(1,500)
Progression of salary and wages	(400)
Projected benefit obligation	$(1,900)

The expected progression of salary and wages is added to the accumulated benefit obligation to arrive at the projected benefit obligation. These amounts are provided by the actuary in a pension plan report.

Computation of the amounts to be presented on the balance sheet requires the determination of plan assets. Plan assets include contributions made by the employer that sponsors the pension plan (sponsor) plus the net earnings on the plan's investments (dividends, interest, and asset appreciation, less asset depreciation), less benefits paid to retired participants.

Example

Plan assets, January 1, 2008	$1,376
Investment earnings during 2008	158
Sponsor's contributions during 2008	145
Benefits paid to retired participants	(160)
Plan assets, December 31, 2008	$1,519

Service costs. This component of net periodic pension cost is the actuarial present value of benefits attributed during the current period. Under ASC 715-30, the plan's benefit formula is the key to attributing benefits to employee service periods. In most cases, this attribution is straightforward.

If the benefit formula is ambiguous, the accounting for pension service costs must be based on the substantive plan. In some cases, this means that if an employer has committed to make future amendments to provide benefits greater than those written in the plan, that commitment is the basis for the accounting. The relevant facts regarding that implicit commitment are disclosed.

Employers use pensions as a compensation tool to aid in the recruitment and long-term retention of employees. In order to provide incentives for employees to continue their employment with the company over time, plan participants' rights to receive present or future pension benefits are often conditioned on continued employment with the employer/plan sponsor for a specified period. As the conditions are satisfied, the employee is said to "vest" in that portion of the future benefits that become unconditional.

Vesting schedules can result in a disproportionate share of plan benefits being attributed to later years of employment. In this situation, instead of applying the benefit formula, proportions or ratios are used to attribute projected benefits to years of service in a manner that more equitably reflects the substance of timing of earning of the employee benefits. Normally, the actuary accomplishes this by attributing plan benefits to completed years of service by multiplying total benefits by the following ratio:

$$\frac{\text{Number of years of service completed by the employee}}{\text{Number of years of service required to be completed for full vesting}}$$

Certain types of benefits are not includable in vested benefits (e.g., death or disability benefit) and, thus, require a different allocation formula to attribute them to years of service. If the plan's benefit formula does not specify how to relate the benefit to years of service, the following formula is used by the actuary to attribute the benefits to years of service:

$$\frac{\text{Number of completed years of service}}{\text{Total projected years of service}}$$

ASC 715-30 actuarial assumptions must reflect plan continuation, must be consistent as to future economic expectations, and must be the best estimate in regard to each individual assumption. It is not acceptable to determine that the aggregate assumptions are reasonable if any of the individual assumptions are unreasonable.

The discount rate used in the calculation of service costs is the rate at which benefits could be settled. Examples include those rates in current annuity contracts, those published by the Pension Benefit Guaranty Corporation (PBGC), and those that reflect returns on high-quality, fixed-income investments.

Future compensation is considered in the calculation of the service cost component to the extent specified by the benefit formula. To the degree considered in the benefit formula, future compensation includes changes due to advancement, longevity, inflation, etc. Indirect effects, such as predictable bonuses based on compensation levels, and automatic increases specified by the plan also need to be considered. The effect of retroactive amendments is included in the calculation when the employer has contractually agreed to them. Service costs attributed during the period increase both the ABO and PBO since they result in additional benefits to be payable in the future.

Example

	January 1, 2008	*2008 Service cost*
Accumulated benefit obligation	$(1,500)	$ (90)
Progression of salary and wages	(400)	(24)
Projected benefit obligation	$(1,900)	$(114) (a)*

* *Component of net periodic pension cost*

The current period service cost component is found in the actuarial report.

Interest on PBO. The PBO is a discounted amount. It represents the discounted actuarial present value, at the date of the valuation, of all benefits attributed under the plan's formula to employee service rendered prior to that date. Each year, when the actuary calculates the end-of-year PBO, it is one year closer to the year in which the benefits attributed in prior years will be paid to participants. Consequently, the present value of those previously attributed benefits will have increased to take into account the time value of money. This annual increase, computed by multiplying the assumed settlement discount rate times the PBO at the beginning of the year, increases net periodic pension cost and PBO.

Since this "interest" cost is accounted for as part of pension cost it is not treated as interest for the purposes of computing capitalized interest under ASC 835-20.

Example

	January 1, 2008	2008 Service cost	2008 Interest cost
Accumulated benefit obligation	$(1,500)	$ (90)	$(120)
Progression of salary and wages	(400)	(24)	(32)
Projected benefit obligation	$(1,900)	$(114) (a)*	$(152) (b)*

* *Component of net periodic pension cost*

The interest cost component is calculated by multiplying the start of the year obligation balances by an assumed 8% settlement rate. This amount is found in the actuarial report.

Benefits paid. Benefits paid to retirees are deducted from the above to arrive at the end of the year balance sheet amounts of the accumulated benefit obligation and the projected benefit obligation.

Example

	January 1, 2008	2008 Service cost	2008 Interest cost	2008 Benefits paid	December 31, 2008
Accumulated benefit obligation	$(1,500)	$ (90)	$(120)	$160	$(1,550)
Progression of salary and wages	(400)	(24)	(32)	--	(456)
Projected benefit obligation	$(1,900)	$(114) (a)	$(152) (b)	$160	$(2,006)

Benefits of $160 were paid to retirees during the current year. This amount is found in the report of the pension plan trustee.

Actual return on plan assets. This component is the difference between the fair value of the plan assets at the end of the period and the fair value of the plan assets at the beginning of the period adjusted for contributions and payments during the period. Another way to express the result is that it is the net (realized and unrealized) appreciation and depreciation of plan assets plus earnings from the plan assets for the period.

Example

	January 1, 2008	2008 Actual return on plan assets	2008 Sponsor funding	2008 Benefits paid	December 31, 2008
Plan assets	$1,376	$158 (c)*	$145	$(160)	$1,519

* *Component of net periodic pension cost*

The actual return on plan assets of $158, cash deposited with the trustee of $145, and benefits paid ($160) are amounts found in the report of the pension plan trustee. These items increase the plan assets to $1,519 at the end of the year. The actual return on plan assets is adjusted, however, to the expected long-term rate (9% assumed) of return on plan assets ($1,376 × 9% = $124). The difference ($158 – $124 = $34) is a return on asset adjustment and is deferred as a gain (loss). The return on asset adjustment is a component of net periodic pension cost and is discussed in detail in the following section.

ASC 715 requires that measurements of defined benefit plan assets and obligations must (with limited exceptions) be as of the balance sheet date of the respective reporting entity.

Gain or loss. Gains (losses) result from (1) changes in plan assumptions, (2) changes in the amount of plan assets, and (3) changes in the amount of the projected benefit obligation. As discussed previously, even though these gains or losses are economic events that impact the sponsor's obligations under the plan, immediately upon their occurrence, their instantaneous recognition in the sponsor's results of operations is not permitted by ASC 715-30. Instead, to provide "smoothing" of the effects of what are viewed as being short-term fluctuations, the net gain (loss) is amortized if it meets certain criteria specified below.

ASC 715 requires that actuarial gains and losses be given recognition in other comprehensive income as they occur, thus affecting balance sheet display in full, even as the

expense recognition is deferred and amortized. If actuarial gains are realized, this will give rise to a pension- or other benefit plan-related asset (or reduction in a pension- or benefit plan-related liability); if actuarial losses are incurred, these will give rise to a benefit plan liability, or reduction in an extant plan asset.

Since actuarial cost methods are based on numerous assumptions (employee compensation, mortality, turnover, earnings of the pension plan, etc.), it is not unusual for one or more of these assumptions to be invalidated by changes over time. Adjustments will invariably be necessary to bring prior estimates back into line with actual events. These adjustments are known as actuarial gains (losses). The accounting issue regarding the recognition of actuarial adjustments is their timing. All pension costs must eventually be recognized as expense. Actuarial gains (losses) are not considered prior period adjustments since they result from a refinement of estimates arising from obtaining subsequent information. These are considered changes in an estimate, and are to be recognized in current and future periods (i.e., prospectively only).

Plan asset gains (losses) result from both realized and unrealized amounts. They represent periodic differences between the actual return on assets and the expected return. The expected return is generated by multiplying the expected long-term rate of return by the market-related value of plan assets. Market-related value is a concept unique to pension accounting. It results from the previously discussed actuarial smoothing techniques under ASC 715-30.

Market-related value consists of two components. The first component is the fair value of the plan assets. The second component is an adjustment for the unrecognized portion of previous years' market gains or losses that are being amortized over a period of five years or less using a consistently applied method. Consistently applied means from year to year for each asset class (i.e., bonds, equities), since different classes of assets may have their market-related value calculated in a different manner (i.e., fair value in one case, moving average in another case). Thus, the market-related value may be fair value, but it also may be other than fair value if all or a portion of it results from calculation.

Plan asset gains (losses) include both (1) changes in the market-related value of assets (regardless of definition) from one period to another and (2) any changes that are not yet reflected in market-related value (i.e., the difference between the actual fair values of assets and the calculated market-related values). Only the former changes are recognized and amortized. The latter changes are recognized over time through the calculated market-related values. Differences between the actual amount of PBO from the assumed amount will also result in gain (loss).

Irrespective of the income smoothing techniques used, if this unrecognized net gain (loss) exceeds a "corridor" of 10% of the greater of the beginning balances of the market-related value of plan assets or the projected benefit obligation, a minimum amount of amortization is required. The excess over 10% is divided by the average remaining service period of active employees and included as a component of net pension costs. Average remaining life expectancies of inactive employees may be used if that is a better measure due to the demographics of the plan participants. ASC 715-30 sets forth a methodology for the deferred recognition of the income statement effects of actuarial changes pertaining to plan assets and obligations.

Net pension costs include only the expected return on plan assets. Any difference between actual and expected returns is deferred through the gain (loss) component of net pension cost. If actual return is greater than expected return, net pension cost is increased to adjust the actual return to the lower expected return. If expected return is greater than actual return, the adjustment results in a decrease to net pension cost to adjust the actual return to the higher expected return. If the unrecognized net gain (loss) is large enough, it is amor-

tized. Conceptually, the expected return represents the best estimate of long-term performance of the plan's investments. In any given year, however, an unusual short-term result may occur given the volatility of financial markets.

The expected long-term rate of return used to calculate the expected return on plan assets is the average rate of return expected to be earned on invested funds to provide for pension benefits included in the PBO. Present rates of return and expected future reinvestment rates of return are considered in arriving at the rate to be used.

The use of estimates and smoothing are hallmarks of ASC 715-30 and may be reduced or eliminated when FASB completes the next phase of its comprehensive review of pension and other postretirement benefit plan accounting. No changes have been imposed by ASC 715, however.

To summarize, net periodic pension cost includes a gain (loss) component consisting of both of the following, if applicable:

1. As a minimum, the portion of the unrecognized net gain (loss) from previous periods that exceeds the greater of 10% of the beginning balances of the market-related value of plan assets *or* the PBO, usually amortized over the average remaining service period of active employees expected to receive benefits.
2. The difference between the expected return and the actual return on plan assets.

An accelerated method of amortization of unrecognized net gain (loss) is acceptable if it is applied consistently to both gains and losses, and if the method is disclosed in the notes to the financial statements. In all cases, at least the minimum amount discussed above must be amortized.

Example

	January 1, 2008	*2008 Return on asset adjustment*	*2008 Amortization*	*December 31, 2008*
Unrecognized actuarial gain (loss)	$(210)	$34 (d)*	$2(d)*	$(174)

* *Components of net periodic pension cost*

The return on asset adjustment of $34 is the difference between the actual return of $158 and the expected return of $124 on plan assets. The actuarial loss at the start of the year ($210 assumed) is amortized if it exceeds a "corridor" of the larger of 10% of the projected benefit obligation at the beginning of the period ($1,900 × 10% = $190) or 10% of the fair value of plan assets ($1,376 × 10% = $138). In this example, $20 ($210 – $190) is amortized by dividing the years of average remaining service (twelve years assumed), with a result rounded to $2. The straight-line method is used, and it is assumed that market-related value is the same as fair value.

Note that the smoothing approach illustrated and discussed above, which is a fundamental defining characteristic of defined benefit plan accounting under ASC 715-30 (pensions) and also of ASC 715-60 (other postretirement benefit plans), continues at this time to represent GAAP. As noted above, as of mid-2008 FASB is continuing its reexamination of accounting for benefit plans, and one likely outcome of this project will be the revision or elimination of the various smoothing procedures incorporated in current standards.

Amortization of unrecognized prior service cost. Prior service costs are incurred when the sponsor adopts plan amendments that increase plan benefits attributable to services rendered by plan participants in the past. These costs are accounted for as a change in estimate. Prior service costs are measured at the amendment date by the increase in the projected benefit obligation. The remaining service period of every active employee expected to receive benefits is estimated, and an equal amount of prior service cost is assigned to each future period. This is called the years-of-service amortization method.

Example of the years-of-service amortization method

The ABC Company amends its pension plan, granting $40,000 of prior service costs to its 100 employees. The employees are expected to retire in accordance with the following schedule:

Group	*Number of employees*	*Expected year of retirement*
A	10	2009
B	15	2010
C	20	2011
D	20	2012
E	35	2013
	100	

The calculation of the service years to be recognized from this group is as follows:

	Service years					
Year	*A*	*B*	*C*	*D*	*E*	*Total*
2009	10	15	20	20	35	100
2010		15	20	20	35	90
2011			20	20	35	75
2012				20	35	55
2013					35	35
	10	30	60	80	175	355

Consequently, there are 355 service years over which the $40,000 prior service cost can be spread, which equates to $112.68 per service year. The following table shows the annual amortization expense based on the standard charge of $112.68 per service year.

Year	*Total service years*	×	*Cost per service year*	=	*Annual amortization*
2009	100		$112.68		$11,268
2010	90		112.68		10,141
2011	75		112.68		8,451
2012	55		112.68		6,197
2013	35		112.68		3,943
	355				$40,000

The foregoing example illustrates the years-of-service amortization method. Consistent use of an accelerated amortization method is also acceptable, and must be disclosed if used.

If most of the plan's participants are inactive, remaining life expectancy is used as a basis for amortization instead of estimated remaining service period. If economic benefits will be realized by plan participants over a shorter period than remaining service period, amortization of costs is accelerated to recognize the costs in the periods that the participants benefit. If an amendment *reduces* the projected benefit obligation, unrecognized prior service costs are reduced to the extent that they exist and any excess is amortized in the manner described above for benefit increases.

Example

	January 1, 2008	*2008 Amortization*	*December 31, 2008*
Unrecognized prior service cost	$320	$(27) (e)*	$293

* *Component of net periodic pension cost*

Unrecognized prior service cost ($320) is amortized over the years of average remaining service (twelve years assumed) at the amendment date with a result rounded to $27. The straight-line method was used. These amounts are found in the actuarial report.

While the vast preponderance of changes to plans increase benefits with credit for prior service, there may be plan amendments that reduce benefits, also with reference to past service. In such instances, under ASC 715, the decreases to the projected benefit obligation are given immediate recognition. The reduction in benefits is to be recognized as a credit (referred to as a prior service credit) to other comprehensive income, which is to be used to offset any remaining prior service cost included in accumulated other comprehensive income

(i.e., from previous plan amendments increasing benefits). Any remaining prior service credit is to be amortized as a component of net periodic pension cost on the same basis as the cost of a benefit increase.

Thus, under requirements established by ASC 715, changes in prior service costs (and in certain other components affecting pension and other postretirement benefit costs) arising in a given reporting period, but not included in current period pension or other benefit costs (e.g., due to the above-described amortization requirements) are fully reported in other comprehensive income. These formerly "off the books" amounts will now be formally displayed in the balance sheet, but the timing of their impact on reported benefit costs and on net income will remain as set forth by ASC 715-30 (for defined benefit pension plans) and ASC 715-60 (for other postretirement benefit plans). It is, however, widely anticipated that pension and other benefit cost recognition will be altered significantly as FASB continues with its ongoing examination of these matters. ASC 715 is addressed in greater detail below.

Amortization of unrecognized amount at date of initial ASC 715-30 application. ASC 715-30 has been GAAP for over twenty years, and few plans likely still remain with unamortized transition amounts. The difference between the PBO and the fair value of plan assets minus recognized prepaid or plus accrued pension cost at the beginning of the fiscal year of the initial ASC 715-30 application was to be amortized using the straight-line method over the average remaining active employee service period. If the average remaining service period was less than fifteen years, the employer could elect to use a fifteen-year period. If all or almost all of a plan's participants were inactive, the employer used the inactive participants' average remaining life expectancy.

NOTE: Solely for purposes of illustrating amortization of an unrecognized amount at transition, implementation of ASC 715-30 is assumed to be currently taking place.

Example

	January 1, 2008	*2008 Amortization*	*December 31, 2008*
Unamortized net obligation (asset) existing at ASC 715-30 application	$(6)	$3 (f)*	$(3)

* *Component of net periodic pension cost*

At initial adoption of ASC 715-30, the "transition amount" was computed as an asset of $48. This transition asset is being amortized using the straight-line method over sixteen years ($3 per year), which represents the average remaining service period of employees expected to receive benefits under the plan at transition. Thus, the unamortized balance at January 1, 2008, was $6 and the amortization for 2008 was $3. These amounts would be found in the actuarial report.

Summary of net periodic pension cost. The components that were identified in the above examples are summed as follows to determine the amount defined as net periodic pension cost:

		2008
Service cost	(a)	$114
Interest cost	(b)	152
Actual return on plan assets	(c)	(158)
Gain (loss)	(d)	36
Amortization of any prior service cost or credit	(e)	27
Amortization of unrecognized net obligation (asset) existing at ASC 715-30 application	(f)	(3)
Total net periodic pension cost		$168

One possible source of confusion is the actual return on plan assets ($158) and the unrecognized gain of $36 that net to $122. The actual return on plan assets reduces pension cost because, to the extent that plan assets generate earnings, those earnings help the plan sponsor subsidize the cost of providing the benefits. Thus, the plan sponsor will not have to

fund benefits as they become due, to the extent that plan earnings provide the plan with cash to pay those benefits. This reduction, however, is adjusted by increasing pension cost by the difference between actual and expected return of $34 and the amortization of the excess actuarial loss of $2, for a total of $36. The net result is to include the expected return of $124 ($158 – $34) less the amortization of the excess of $2 for a total of $122 ($158 – $36). In recognizing the components of net periodic pension costs, ASC 715-20 requires the disclosure of this expected return of $124 and the loss of $2.

Note that, while the components of periodic pension cost nominally remain the same under ASC 715 as under preamendment ASC 715-30, two of the components have changed in substance. Amortization of prior service cost previously meant the income statement recognition of what had in prior periods been an amount not given any financial statement recognition. Now, however, the prior service cost will be included in accumulated other comprehensive income, and then amortized, under the formula set forth by ASC 715-30, to pension cost.

Second, the amortization of gain or loss (which pertains to actuarially driven changes to the projected benefit obligation, as well as to asset valuation adjustments not recognized in current income), which under ASC 715-30 was not given financial statement recognition before the point in time when they were to be included in pension cost, now is associated with an item incorporated in accumulated other comprehensive income.

Thus, under ASC 715 there is *display* of both prior service costs and actuarial gains or losses immediately upon the occurrence or determination of the item, but there is still *deferred recognition in expense* via the ASC 715-30-prescribed amortization process, set forth above.

If any transition amount dating from the adoption of ASC 715-30 still exists, that too must be recorded in accumulated other comprehensive income upon adoption of ASC 715, and amortization over any remaining period as originally determined when ASC 715-30 was adopted will continue as prescribed under that standard.

Under ASC 715, there will be *both* the componentized periodic pension expense *and* changes to the amounts reported in other comprehensive income, although for nonpublic entities the components of pension cost may be omitted. The suggested informative (i.e., footnote) form of disclosure consists of two tables, and is as follows for a publicly-held reporting entity (these amounts, which assume partial funding of other postretirement benefits, are not related to the earlier examples):

Components of Net Periodic Benefit Cost and Other Amounts Recognized in Other Comprehensive Income

	Pension benefits		Other benefits	
	2007	2008	2007	2008
Net periodic benefit cost				
Service cost	$ 95	$102	$49	$57
Interest cost	80	88	58	59
Expected return on plan assets	(70)	(86)	(12)	(14)
Amortization of prior service cost	11	12	(3)	(5)
Amortization of net (gain) loss	14	9	2	2
Net periodic benefit cost	$130	$125	$94	$99
Other changes in plan assets and benefit obligations recognized in other comprehensive income				
Net loss (gain)	$ 86	$102	$27	$(46)
Prior service cost (credit)	60	10	(70)	(47)
Amortization of prior service cost	(11)	(12)	3	5
Total recognized in other comprehensive income	135	100	(40)	(88)
Total recognized in net periodic benefit cost and other comprehensive income	$265	$225	$54	$11

Finally, the assumptions used in computing projected and accumulated benefits and expected return on plan assets must be disclosed. For postretirement health benefits, so-called sensitivity data must also be presented, since the amount of this often significant, and most commonly unfunded future obligation is highly responsive to changes in health care cost levels. The following tables set forth these key parameters:

Assumptions

Weighted-average assumptions used to determine benefit obligations at December 31

	Pension benefits		Other benefits	
	2007	2008	2007	2008
Discount rate	6.75%	7.25%	7.00%	7.50%
Rate of compensation increase	4.25	4.50		

Weighted-average assumptions used to determine net periodic benefit cost for years ended December 31

	Pension 2007	Pension 2008	Other 2007	Other 2008
Discount rate	7.25%	7.50%	7.50%	7.75%
Expected long-term return on plan assets	8.00	8.50	8.10	8.75
Rate of compensation increase	4.50	4.75		

Assumed health care cost trend rates at December 31

	2007	2008
Health care cost trend rate assumed for next year	12%	12.5%
Rate to which the cost trend rate is assumed to decline (the ultimate trend rate)	6%	5%
Year that the rate reaches the ultimate trend rate	2009	2009

Assumed health care cost trend rates have a significant effect on the amounts reported for the health care plans. A one-percentage-point change in assumed health care cost trend rates (not required for nonpublic reporting entities) would have the following effects:

	1-percentage-point increase	*1-percentage-point decrease*
Effect on total of service and interest cost	$ 42	$ (35)
Effect on postretirement benefit obligation	185	(176)

Reconciliation of Beginning and Ending ABO, PBO, and Plan Assets

The following table summarizes the 2008 activity affecting ABO, PBO, and Plan Assets and reconciles the beginning and ending balances per the actuarial report:

	Accumulated benefit obligation	*Progression of salaries and wages*	*Projected benefit obligation*	*Fair value of plan assets**
Balance, January 1, 2008	$ (1,500)	$ (400)	$ (1,900)	$ 1,376
Service cost	(90)	(24)	(114) (a)	
Interest cost	(120)	(32)	(152) (b)	
Benefits paid to retired participants	160		160	(160)
Actual return on plan assets				158 (c)
Sponsor's contributions				145
Balance, December 31, 2008	$ (1,550)	$ (456)	$ (2,006)	$ 1,519

* *Assumed to be the same as market-related value for this illustration.*

Expanded disclosure is now required regarding the portfolio assets maintained to pay future pension and other postretirement benefits. This information should be presented in a tabular format illustrated as follows:

Plan assets. The entity's pension plan weighted-average asset allocations at December 31, 2007, and 2008, by asset category are as follows:

	Pension plan assets at December 31		Other benefit plan assets at December 31	
	2007	2008	2007	2008
Asset category				
Equity securities	50%	48%	60%	52%
Debt securities	30	31	30	27
Real estate	10	12	5	13
Other	10	9	5	8
Total	100%	100%	100%	100%

The foregoing allocation information should be accompanied by an entity-specific narrative description of investment policies and strategies for plan assets, including weighted-average target asset allocations, where such are used as part of those policies and strategies. If the reporting entity holds its own shares in the trusteed assets of the plan(s), this fact, and the amounts held at each reporting date, should also be set forth.

Employer's Liabilities and Assets under ASC 715-30

Accounting for defined benefit plans remains a controversial topic. In particular, the fact that plan assets and liabilities are, with certain exceptions, not considered to be the employers' assets and liabilities, continues to be a contentious issue. When ASC 715-30 was first imposed, the FASB concluded that full imposition of accrual-basis recognition rules would have caused there to be unacceptably large adjustments to the financial statements of companies whose plans were materially underfunded. The adjustments would have been necessary to recognize previously unrecognized assets or liabilities representing the differences between PBO and the fair value of plan assets. To ease the perceived burden on these plan sponsors, FASB developed a compromise *minimum liability* approach for ASC 715-30. This minimum liability was computed by reference to the excess of the ABO (which is a smaller obligation than the PBO, since it does not recognize projected future compensation increases) over the fair value of the plan assets. Note that, for the purpose of this calculation, the fair value of the assets was used, rather than the market-related value that was used to calculate the expected return on plan assets. To the extent that there was a pension liability already recorded, the sponsor needed only to recognize the additional amount necessary to increase the recorded liability to the amount of the minimum liability.

The theory behind using the ABO was the fact that, if the pension plan were terminated at the balance sheet date, the future compensation increases would never occur and the pension obligation could be settled for the smaller amount. Some might argue that this approach conflicted with the underlying going concern assumption that is fundamental to financial accounting theory, of course. ASC 715 has eliminated the minimum liability approach of ASC 715-30, and the full amount of over- or underfunding of pension plans must now be displayed in the balance sheet, as described later in this section.

Fair value is determined as of the financial statement date (prior to the effective date of ASC 715, this could be a date not more than three months prior to year-end, if used consistently). The amount is that which would result from negotiations between a willing buyer and seller not in a liquidation sale. Fair value is measured in preferred order by market price, selling price of similar investments, or discounted cash flows at a rate indicative of the risk involved.

Regarding the additional minimum liability required under ASC 715-30 prior to being amended by ASC 715, there were several important matters impacting upon the actual computation of the amount to be displayed. First, an asset could not be recorded if the fair value of the plan assets exceeded the accumulated benefit obligation. Second, the calculation of the minimum liability required consideration of any already recorded prepaid or accrued pension cost. The net liability had to be equal to at least the unfunded accumulated benefit obligation. An already recorded prepaid pension cost would increase the amount of the recognized additional liability. An already recorded accrued pension cost would decrease it.

Third, the intangible asset was not subject to amortization. Fourth, at the time of the subsequent calculation, the amounts were to be either added to or reversed out with no effect on net income. These balance sheet entries were entirely independent of net income and would not affect the calculatgooion of net pension costs. Fifth, unless a significant event occurred or measures of obligations and assets as of a more current date became available, interim financial statements were to show the year-end additional minimum liability adjusted for subsequent contributions and accruals. In such a case, previous year-end assumptions regarding net pension cost would also carry over to the interim financial statements.

The advent of ASC 715 has made the minimum liability recognition, together with the associated intangible asset, extinct. Under ASC 715 the full amount (measured by projected or accumulated benefit obligations, for pensions and other postretirement benefits, respectively) of over- or underfunding will be given balance sheet recognition, with the offsetting entry being to other comprehensive income. At the date of adoption of ASC 715, any remaining amounts arising from the now-superseded minimum liability rules under ASC 715-30 are eliminated and replaced by the amounts determined in accordance with ASC 715.

A schedule showing the variables of the above example in accordance with ASC 715-20, reconciling the balance sheet amounts with the funded status of the plan, is shown below. Assumed activity for 2007 is provided for comparative purposes. This example is to illustrate the information required for publicly held entities; see comments below for reduced disclosure requirements applicable to nonpublicly held companies. Also, this example combines information about pension plans and other benefit plans, the latter of which are assumed data not detailed in the foregoing discussion.

	Pension benefits		Other benefits	
	2007	2008	2007	2008
Change in benefit obligation				
Benefit obligation at beginning of year	$1,800	$1,900	$612	$662
Service cost	111	114	22	30
Interest cost	144	152	35	43
Plan participant's contributions	--	--	33	13
Amendments	--	--	--	--
Actuarial loss	--	--	--	--
Acquisition	--	--	--	--
Benefits paid	(155)	(160)	(40)	(60)
Benefit obligation at end of year	1,900	2,006	662	688
Change in plan assets				
Fair value of plan assets at beginning of year	1,241	1,376	87	206
Actual return on plan assets	150	158	24	5
Acquisition	--	--	--	25
Employer contribution	140	145	152	137
Plan participants' contributions	--	--	13	20
Benefits paid	(155)	(160)	(70)	(90)
Fair value of plan assets at end of year	1,376	1,519	206	303
Funded status [plan over (under) funded]	$(524)	$(487)	$(456)	$(385)

Nonpublic reporting entities are not required to provide the information in the above tables. Instead, they are only required to disclose the employer's contributions, participants' contributions, benefit payments, and the funded status. Of course, expanded disclosures are not precluded under such circumstances.

Note that since this example disclosure addresses both pension and other postretirement plans, the captions are generically worded, but it is implicit that they refer to projected benefits for pension plans and accumulated benefits for other defined benefit plans.

Under prior GAAP, it was necessary to reconcile the funded status of the plans (the components of which were largely off-balance-sheet) to the amounts reported in the statement of financial position. However, given that ASC 715 requires the funded status of de-

fined benefit plans to be reported in the statement of financial position, this reconciliation has been replaced by a simple table identifying the locations in the balance sheet were the net funded amounts are presented, as follows:

	Pension benefits		*Other benefits*	
	2007	*2008*	*2007*	*2008*
Noncurrent assets	$ 133	$ 18	$ --	$ --
Current liabilities	(225)	(125)	(150)	(99)
Noncurrent liabilities	(432)	(380)	(306)	(286)
Net amount recognized	$(524)	$(487)	$(456)	$(385)

Amounts recognized in accumulated other comprehensive income must also be identified; for this example, these consist of

	Pension benefits		*Other benefits*	
	2007	*2008*	*2007*	*2008*
Net loss (gain)	$ 94	$ 18	$(11)	$(48)
Prior service cost (credit)	210	160	(92)	(22)
	$304	$178	$(103)	$(70)

As set forth above, under the provisions of ASC 715 the *actual* underfunded or—for the first time—overfunded status of defined benefit pension plans will be reported without limitation in the balance sheets of reporting sponsoring entities. Under ASC 715—for defined benefit pension arrangements—under- or overfunding will be defined by the differences between plan assets and the corresponding *projected* benefit obligations. Thus, the measure will now be derived from the (almost inevitably) larger projections of future benefit payments, including the effects of anticipated salary progressions.

Additional ASC 715-30 Guidance

In situations not specifically addressed by ASC 715-30, ASC 715-30-35 states that the vested benefit obligation can be either (1) the actuarial present value of the vested benefits that the employee is entitled to if the employee separates immediately, or (2) the actuarial present value of the vested benefits to which the employee is currently entitled but based on the employee's expected date of separation or retirement. EITF's SEC observer indicated that the alternative selected is to be disclosed. This issue is most commonly applicable to foreign defined benefit pension plans.

Pension plans sometimes are coupled with life insurance plans with the employer as beneficiary. According to ASC 325-30-35, it is not appropriate for the purchaser of life insurance to recognize income from death benefits on an actuarially expected basis.

In recent years a trend has emerged for employers to terminate classic defined benefit pension plans and replace them with "cash balance" plans, the accounting for which has not been well understood. These hybrid plans typically describe the pension benefit by reference to an account balance rather than a monthly annuity at retirement. ASC 715-30-15 considers plans that are characterized by defined principal-crediting rates as percentages of salary, and offer defined, noncontingent interest-crediting rates that entitle participants to future interest credits at stated, fixed rates until retirement. The standard states that "cash balance" plans with the foregoing attributes are to be deemed defined benefit plans, consistent with definitions set forth in ASC 715-30. This is true because an employer's contributions to a cash balance plan trust and the earnings on the invested plan assets may be unrelated to the principal and interest credits to participants' hypothetical accounts.

The standard also determined that the benefit promise in the cash balance arrangement is not pay-related and, accordingly, use of a projected unit credit method is neither required nor appropriate for purposes of measuring the benefit obligation and annual cost of benefits earned under ASC 715-30. The appropriate cost attribution approach, therefore, is the traditional unit credit method.

Transitioning to the accounting required under ASC 715-30-15 depended on how the plan had previously been dealt with by the sponsor. If a reporting entity had been accounting for a cash balance pension plan as a defined contribution plan, the effect of applying the consensuses (i.e., the difference between the funded status as a defined benefit plan and any existing prepaid or accrued pension cost) was to have been reported as the effect of adopting a new accounting principle (in a manner similar to a cumulative-effect-type adjustment) as of the beginning of the year containing the next reporting period beginning after May 28, 2003.

On the other hand, if an entity had been accounting for such a plan as a defined benefit plan, the effect of remeasuring the pension obligation using the guidance in this consensus was to have been calculated as of the above-mentioned measurement date. Any difference in the measurement of the obligation as a result of applying the standard was to be reported as a component of actuarial gains and losses under ASC 715-30. For an entity that has an accounting policy of immediate recognition of all gains and losses, or all gains and losses outside the 10% corridor described in ASC 715-30, the component of such gain or loss that could be attributed to the adoption of the guidance in Issue 03-4, applying a with-and-without calculation, was to have been reported as the effect of adopting the standard (in a manner similar to a cumulative-effect-type adjustment) as of the measurement date.

Reporting Funded Status: Requirements under ASC 715

As suggested earlier in this chapter, the deferred recognition aspect of ASC 715-30 and ASC 715-60 have long been subject to harsh criticism, since real economic events (e.g., changes in fair values of plan assets) were being disguised and distorted in the financial statements, and the deviation from amounts reported and actual underlying facts could often be material in amount. For various reasons, the direct solution to this problem—using a pure fair value approach to measuring changes in plan assets and obligations, with changes being reported currently in operating income—is still not seen as feasible. ASC 715 is a compromise solution.

ASC 715 has two major implications. First, it requires business entities having defined benefit plans (*other than* multiemployer plans) to display the funded status of those plans on the face of their balance sheets, instead of being reported, to greater or lesser degree, only in the informative disclosures. And second, it requires that actuarial gains and losses and prior service costs and credits arising in the reporting period, but not (under provisions of ASC 715-30 and ASC 715-60) reported in the current period's reported benefit cost, be included as items of other comprehensive income. These matters will be addressed in the following paragraphs.

Additionally, ASC 715 imposes a definitive requirement that the measurement date for plan assets and obligations be the end of the annual reporting period (that is, the balance sheet date). Previously, the measurement date could be either year-end or a date not more than three months prior to that date, if used consistently. This flexibility is no longer available.

Finally, the standard requires that additional information be presented in the notes to financial statements about certain effects on net periodic benefit cost for the upcoming fiscal year that arise as a consequence of the delayed recognition of actuarial gains or losses, prior service costs or credits, and transition asset or obligation.

ASC 715 does not change the accounting by employers participating in multiemployer defined benefit plans. For essentially practical reasons, ASC 715-30 provides that contributions made to such plans for the reporting period be recognized as net pension cost, and that any contributions due and unpaid be recognized as a liability. Thus, most of the complexities arising from smoothing were avoided in accounting for sponsors participating in multiemployer plans.

Display of funded status. The most important change wrought by ASC 715 is to move disclosure of the plan's funded status to the face of the balance sheet proper. By requiring that the amounts of net overfunding and underfunding of benefit plans be included in assets and liabilities, respectively, there will be a very substantial improvement in financial statement users' comprehension of the implications of the defined benefit plans under which the reporting entity is obligated. Previously, this was only revealed in the benefit plan footnotes, where the funded status was reconciled to the amount presented in the balance sheet proper.

Determination of funded status varies as between defined benefit pension plans and all other defined benefit arrangements (that is, those addressed by ASC 715-60). For the former, ASC 715 states that funded status is measured by the difference between the fair value of plan assets and the *projected* benefit obligation (explained earlier in this chapter). For the latter, it is the spread between the fair value of plan assets and the *accumulated* benefit obligation that measures funded status.

ASC 715 requires that the difference between plan assets and the *projected* benefit obligation—be used to gauge the liability to be reported. Projected benefit obligation takes into account expected salary progression, while accumulated benefit obligation does not. For all defined benefit plans, other than those that do not take salary progression into account, a larger liability will now be recognized.

ASC 715-60 did not include a requirement that a measure analogous to minimum liability, as defined under ASC 715-30, be recognized by sponsors, in part because obligations under pension arrangements are subject to statutory enforcement whereas those under other promised postretirement benefits have been held not to be contractual commitments, and thus subject to revision or cancellation by the employer on a unilateral basis. For example, postretirement health care cost plans can be modified by employers without limitation.

More important, perhaps, was the fact that when ASC 715-60 was being deliberated, virtually all such arrangements were "pay as you go," with no assets whatsoever being set aside to satisfy these commitments. If ASC 715-60 had incorporated the same minimum liability reporting concept as did ASC 715-30, recognition of the underfunding would have required very substantial adjustments to sponsors' balance sheets—even to the extent of sharply reducing or eliminating reporting entities' net worth. The strongly voiced opposition to the FASB proposal (which did originally include a minimum liability provision) persuaded FASB to delete this requirement.

ASC 715, however, puts an end to this exemption. The net obligations associated with underfunded plans (which will likely describe virtually all postretirement benefit plans other than pensions, as well as some pension plans) will have to be displayed in the balance sheet. In contrast with the requirement for defined benefit pension plans, for these arrangements the measure is based on the *accumulated* postretirement benefit obligation, which is the actuarial present value of benefits attributed to employees as of the balance sheet date, which until full eligibility is achieved, will be a lesser amount than the *projected* benefit obligation. While it is likely that lower amounts of liability will be computed for other postretirement obligations than will be the case for otherwise similar defined benefit pension plans, it will nonetheless be a very substantial change from past practice under ASC 715-60, and could materially affect the financial statements of reporting entities offering such arrangements for their employees.

Reporting when there are multiple plans. When the reporting entity has multiple plans, it will not be acceptable to display one single net amount of over- or underfunding. Rather, all overfunded plans will have to be separately aggregated, as will all underfunded plans. The amount of overfunding is included in noncurrent assets, with no portion of the overfunding permitted to be displayed as a current asset. On the other hand, total underfunding is to be allocated between current and noncurrent liabilities, with the current portion

being computed (on a plan-by-plan basis) as the sum of the actuarial present value of benefits included in the benefit obligation payable over the ensuing twelve months' time, to the extent that it exceeds the fair value of plan assets.

Conceivably, an employer may have the right to use the assets of an overfunded plan to pay the obligations of another, underfunded plan. Only in such circumstances would it be acceptable to offset the overfunding asset and the underfunding liability. Such a situation would be highly unlikely to occur, however.

To illustrate, if the reporting entity has three postretirement benefit plans, one of which is overfunded and two of which are underfunded, the amount of overfunding must be included in noncurrent assets. The amount of underfunding of the two other plans must be reported in liabilities, but a portion of this total might have to be included in current liabilities. This is illustrated in the following table:

	Overfunded plan	*Underfunded plan #1*	*Underfunded plan #2*	*Balance sheet totals*
FV of plan assets	$400,000	$700,000	$ 20,000	
PV of benefit obligation (total)	340,000	874,000	240,000	
PV of benefit obligation (due in next twelve months)	28,000	32,000	31,000	
Overfunding asset (noncurrent)	60,000			$ 60,000
Underfunding liability (noncurrent)		174,000	209,000	383,000
Underfunding liability (current)			11,000	11,000

In the table above, note that the overfunded plan results in the reporting of a noncurrent asset, and this is not mitigated by the simultaneous existence of underfunded plans. Also note that underfunded plan #1 has sufficient assets to satisfy the amounts due within one year, and therefore the sponsoring entity's balance sheet will not report any current liability with respect to this plan. However, plan #2, which is also underfunded, has benefit payments due over the twelve months following the balance sheet date that exceed the amount of plan assets, and thus the sponsor will have to provide additional funding in the current period. That amount must be reported as a current liability. Finally, observe that the noncurrent obligations pertaining to both underfunded plans are combined into a single balance sheet amount.

Reporting of benefit plan transactions and events in comprehensive income. ASC 715 requires an employer to recognize all transactions and events affecting the overfunded or underfunded status of a defined benefit postretirement plan in comprehensive income (or changes in unrestricted net assets, if the entity is a not-for-profit enterprise) in the year in which they occur. Previously, many delayed-recognition elements of pension and other postretirement benefit plan expense were "off-the-books," albeit subject to disclosure in the financial statement notes.

Under ASC 715, the reporting entity must recognize as a component of other comprehensive income the gains or losses and prior service costs or credits arising during that reporting period that are not recognized as components of net periodic benefit cost of the period pursuant to ASC 715-30 and ASC 715-60. For example, if a plan amendment is adopted which credits employees with prior service, this is not reflected immediately in benefit costs, but rather is subject to amortization (i.e., it is to be recognized as part of pension or other postretirement benefit plan cost over an extended period of time). The requirements established by ASC 715 do not alter the piecemeal recognition of expense (that is, smoothing) under current GAAP, but they do make it necessary to record in other comprehensive income, in the year the amendment is effected, the full amount of the prior service cost less what is recognized in pension cost in that period.

In other words, the methodology of expense measurement has not been affected by the issuance of ASC 715, but disclosure *on the face of the balance sheet* is now achieved. The

effect of recording this debit in comprehensive income will be balanced by recording an additional underfunding liability. In accordance with ASC 740, this is to be treated as a temporary difference, since the liability has a different basis (carrying value) for financial reporting purposes than it does for tax purposes. Hence, it must be tax effected within accumulated other comprehensive income, and a deferred tax asset (in the normal circumstances) will be recorded. The tax asset, in turn, will be subject to the "more likely than not" test for realizability, in order to determine whether it needs to be reduced or offset fully by an allowance. (See Chapter 17 for full discussion of accounting for income taxes.)

Example

If Varga Corp., which is in the 30% tax bracket, grants its workers an amendment to a defined benefit pension plan which increases its obligation by $60,000, to be reflected in pension expense over fifteen years (i.e., amortized at $4,000 per year), under ASC 715 the following entry would be made (assuming the amendment is granted at year-end, and thus amortization will begin in the next period):

Accumulated other comprehensive income	42,000	
Deferred tax asset	18,000	
Pension liability		60,000

As noted earlier, the elements that will be reported in accumulated other comprehensive income, until taken into benefit expense as directed under ASC 715-30 or ASC 715-60, include gains and losses (i.e., those due to differences between expected and actual returns on plan assets, and those arising from actuarially determined adjustments), prior service cost or credits from plan amendments, and any remaining transition amounts deferred when ASC 715-30 was adopted. For new amounts (e.g., actuarial adjustment in the current period), there will be an entry similar to the above, whereby accumulated other comprehensive income is adjusted to reflect the full amount of the item, as well as the (offsetting) deferred tax effect thereof.

In subsequent periods, there will be opposite direction adjustments to the amount provided in other comprehensive income, as the normal, ASC 715-30-driven amortization occurs. For example, if the prior service cost recognized by Varga Corp. above is to be amortized based on average remaining service lives of current employees and the amount so determined for 2009, the first period after the amendment, is $5,000, the following entry would be recorded:

Pension cost	5,000	
Deferred tax asset		1,500
Accumulated other comprehensive income		3,500

For each annual statement of income presented, these amounts are to be recognized in accumulated other comprehensive income, showing *separately* the amounts ascribed to net gain or loss and net prior service cost or credit. Those amounts are to be separated into amounts arising during the period and reclassification adjustments of other comprehensive income as a result of being recognized as components of net periodic benefit cost for the period.

Measurement date for year-end financial statements. ASC 715 requires that valuations be as of the balance sheet date.

The only exceptions to the foregoing general statement occur in the instance of plans sponsored by consolidated subsidiaries or equity-method investees. This is a practical concession, but given that under US GAAP subsidiaries and investees are permitted to report financial results using year-ends different than the parent's or investor's, the exception is a reasonable and logical one. In those situations, the determinations of the fair values of plan assets and obligations must be as of the subsidiaries' or investees' respective balance sheet dates.

Measurement date for interim financial statements. Publicly held entities must report quarterly, and private companies may choose to issue interim financial statements that are represented as being in accordance with GAAP. ASC 715 does not impose a requirement to evaluate plan assets and obligations more frequently than on an annual basis. Therefore,

unless there has been an interim revaluation conducted—for example, because a plan amendment was adopted, or there had been a settlement or curtailment of a plan—it is prescribed that the funded status as of the most recent year-end be used in interim period reporting, with certain adjustments. The adjustments to be made are for subsequent accruals of service cost, interest, and return on plan assets included in current earnings (excluding, however, any amortization of amounts first recognized in other comprehensive income), subsequent contributions to the plan, and subsequent benefit payments from the plan. However, if there had been a revaluation subsequent to the prior year-end, the most recent valuation data would be used, again updated as just described, for any postvaluation accruals, contributions, and benefit payments.

ASC 715 transition considerations. Adjustments are necessary in order to initially place the underfunding or overfunding liability or asset onto the balance sheet, since these amounts formerly were disclosed only in the notes to the financial statements and reconciled by means of reference to various "off the books" amounts, such as unamortized prior service cost arising from plan amendments. ASC 715 provides different transition instructions relative to its recognition provisions for business entities and for not-for-profit organizations, which is made necessary by the fact that not-for-profits do not report other comprehensive income amounts.

FASB rejected retrospective revision of prior periods' financial statements upon adoption of ASC 715 due to concerns about cost. Thus, the adjustments necessary to recognize, in other comprehensive income, the elements previously not given formal financial statement recognition, are first recorded at the end of the year the standard is adopted.

Business entities must apply the recognition provisions of ASC 715 as of the *end* of the fiscal year of initial application. Retrospective application is not permitted. The amounts recognized in an employer's statement of financial position as of the end of the fiscal year before applying ASC 715, including amounts required to recognize any additional minimum pension liability, are to be adjusted so that gains or losses, prior service costs or credits, and transition assets or obligations that have not yet been included in net periodic benefit cost as of the end of the fiscal year in which ASC 715 is initially applied are recognized as components of the ending balance of accumulated other comprehensive income, net of tax. Any required adjustment shall be reported as an adjustment of the ending balance of accumulated other comprehensive income.

For not-for-profit enterprises, gains or losses, prior service costs or credits, and transition assets or obligations that have not yet been included in net periodic benefit cost as of the end of the fiscal year in which ASC 715 is initially applied are included in the ending balance of unrestricted net assets, net of tax, if any. Any required adjustment is to be reported in the statement of activities, in a separate line item or items within changes in unrestricted net assets, apart from expenses and outside a performance indicator or other intermediate measure of operations, if one is presented.

ASC 715 also specifies the transition methodology for its measurement date provisions. In fact, the standard offers two approaches for an employer to transition to a fiscal year-end measurement date, if an earlier date had previously been employed. In the first of these, the reporting entity remeasures plan assets and benefit obligations as of the beginning of the fiscal year that the measurement date provisions are applied. It then uses those new measurements to determine the effects of the measurement date change as of the *beginning* of the fiscal year that the measurement date provisions are applied.

Under this approach, for business entities, the net periodic benefit cost for the period between the measurement date that is used for the immediately preceding fiscal year-end and the beginning of the fiscal year that the measurement date provisions are applied, exclusive of any curtailment or settlement gain or loss, must be recognized, net of tax, as a separate

adjustment of the opening balance of retained earnings. For example, assuming a calendar year and an actuarial valuation done three months before year-end, a catch-up adjustment will be needed for pension cost for the months of October, November, and December for the year prior to implementation of ASC 715's measurement provisions.

Put another way, this means that the pretax amount recognized as an adjustment to retained earnings is the net periodic benefit cost that without a change in measurement date otherwise would have been recognized on a delayed basis during the first interim period for the fiscal year that the measurement date provisions are applied.

Any gain or loss arising from a curtailment or settlement between the measurement date that is used for the immediately preceding fiscal year-end and the beginning of the fiscal year that the measurement date provisions are applied is to be recognized in earnings in that period and not as an adjustment to retained earnings. This provision is intended to prohibit a reporting entity from early application of the measurement date provisions (see discussion below) when the employer has issued financial statements for the prior year without recognition of such a settlement or curtailment.

For example, assume an entity with a June 30 year-end that used a March 31 measurement date curtailed its benefit plan on May 31, 2006, resulting in a curtailment loss. That employer would be able to apply early the measurement date provisions in fiscal year 2007 if it recognizes the May 31, 2006 curtailment loss in its financial statements for the year ending June 30, 2006. That would not be the case if its 2006 financial statements had been issued before it wished to early adopt for fiscal year 2007.

Other changes in the fair value of plan assets and the benefit obligations (for example, gains or losses) for the period between the measurement date that was used for the immediately preceding fiscal year-end and the beginning of the fiscal year that the measurement date provisions are first applied must be recognized, net of tax, as a separate adjustment of the *opening* balance of accumulated other comprehensive income for the fiscal year that the measurement date provisions are applied. Thus actuarial gains or losses, determined (for illustration purposes) as of October 31 for purposes of preparing the prior calendar year's financial statements, must be updated to December 31, with any computed differences used to adjust other comprehensive income as of January 1, beginning of the fiscal year when the ASC 715 measurement date requirements are first being applied.

For not-for-profit enterprises, the foregoing guidance also applies, except that the adjustments that would be made to the opening balances of retained earnings and accumulated other comprehensive income are instead to be recognized as a change in unrestricted net assets in the statement of activities, net of tax if applicable. Those amounts are to be reported in a separate line item or items apart from expenses and outside a performance indicator or other intermediate measure of operations, if one is optionally reported.

As an alternative to the foregoing methodology, to avoid the need to remeasure plan assets and obligations at year-end when an optional, earlier date had formerly been employed by the reporting entity, ASC 715 allows for the use of another approach. Under this second approach, the reporting entity continues to use the measurements determined for the prior fiscal year-end reporting as the basis for estimating the effects of the change.

The net periodic benefit cost for the period between the earlier measurement date and the end of the fiscal year that the measurement date provisions are applied, exclusive of any curtailment or settlement gain or loss, is to be allocated proportionately between amounts to be recognized as an adjustment of retained earnings and net periodic benefit cost for the fiscal year that the measurement date provisions are applied.

For purpose of illustrating this approach, consider a calendar-year entity that formerly employed a September 30 measurement date, and has no settlement or curtailment during the period. Note that the change in asset and obligation values determined as of December 31,

2008, would actually gauge changes over fifteen months (since the immediately preceding determination date, which was September 30, 2007, was that long ago), and this must be proportionately assigned per ASC 715 guidance. Therefore, the entity would allocate, as an adjustment of retained earnings, three fifteenths of net periodic benefit cost determined for the period from September 30, 2007, to December 31, 2008. The remaining twelve-fifteenths would be recognized as net period benefit cost for the fiscal year that the measurement date provisions first are applied, which is the year ended December 31, 2008.

As under the first available method, explained above, any gain or loss arising from a curtailment or settlement between the measurement date that is used for the immediately preceding fiscal year-end and the beginning of the fiscal year that the measurement date provisions are applied is to be recognized in earnings in that period and not as an adjustment to retained earnings.

Any other changes in the fair value of plan assets and the benefit obligations (e.g., actuarial gains or losses) for the period between the earlier measurement date and the *end* of the fiscal year that the measurement date provisions are applied is to be recognized as other comprehensive income for the fiscal year that the measurement date provisions are applied.

Effective dates. The requirements set forth under ASC 715 were to be phased in, with different effective dates for the measurement and the recognition and disclosure provisions.

For the measurement provisions, the requirement to measure plan assets and benefit obligations as of the date of the employer's fiscal year-end balance sheet is to be effective for fiscal years ending after December 15, 2008 (e.g., for 2008 calendar years), and may not be applied retrospectively. Earlier application is encouraged, but only if effected for all of an employer's benefit plans. The requirement to disclose the measurement date is eliminated, effective in the year the employer initially adopts the measurement date provisions of ASC 715, since it will be universally understood that year-end measurement is being applied.

The mandatory effective date for the standard's recognition and disclosure provisions depends on whether the reporting entity is publicly held or not. For a plan sponsor with publicly traded equity securities, initial application of the requirements to recognize the funded status of a benefit plan and the disclosure requirements was required as of the end of the fiscal year ending after December 15, 2006. Application as of the end of an earlier fiscal year had been encouraged, provided that it was applied to all of that entity's benefit plans.

For employers without publicly traded equity securities, application of the requirements pertaining to recognition of the funded status of a benefit plan and to the disclosure requirements was as of the end of the first fiscal year ending after June 15, 2007. Again, application as of the end of an earlier fiscal year was encouraged, but only if applied to all of that reporting entity's benefit plans.

ASC 715 provided that an employer without publicly traded equity securities was to disclose the following information in the notes to the financial statements for a fiscal year ending after December 15, 2006, but before June 16, 2007, unless it applied the recognition provisions of that standard in preparing those financial statements:

a. A brief description of the provisions of ASC 715
b. The date that adoption is required
c. The date the employer planned to adopt the recognition provisions of the standard, if earlier

In the year that the *recognition provisions* of ASC 715 were initially to be applied, the reporting entity was required to disclose, in the notes to the annual financial statements, the incremental effect of applying the standard on individual line items in the year-end statement of financial position. In the year that the *measurement date provisions* of ASC 715 were initially applied, a reporting entity that is a business was to disclose the separate adjustments

made to retained earnings and accumulated other comprehensive income. If the reporting entity was a not-for-profit, it was to disclose the separate adjustment made to unrestricted net assets.

Disclosure Requirements

Disclosure requirements for defined benefit pension and other postretirement plans have, of necessity, always been rather voluminous and complex. In part, this has been caused by the "smoothing" (what FASB calls the "delayed recognition" of pension expense), and the resultant "off the balance sheet" nature of plan assets and obligations. What would have otherwise been distortions of the sponsor's (reporting entity's) financial position was arguably moderated via the footnote disclosures required under ASC 715-20.

Under the provisions of ASC 715, a business entity that sponsors one or more defined benefit plans is required to disclose—separately for pension plans and for other postretirement benefit plans—the following information in the notes to its annual financial statements:

a. For each *annual* statement of income presented, the amounts recognized in other comprehensive income, showing separately the net gain or loss and net prior service cost or credit. Those amounts are to be segregated into those amounts arising during the period and reclassification adjustments of other comprehensive income as a result of being recognized as components of net periodic benefit cost for the period.
b. For each *annual* statement of income presented, the net transition asset or obligation recognized as a reclassification adjustment of other comprehensive income as a result of being recognized as a component of net periodic benefit cost for the period.
c. For each *annual* statement of financial position presented, the amounts in accumulated other comprehensive income that have not yet been recognized as components of net periodic benefit cost, showing separately the net gain or loss, net prior service cost or credit, and net transition asset or obligation.
d. The amounts in accumulated other comprehensive income expected to be recognized as components of net periodic benefit cost over the fiscal year that follows the most recent annual statement of financial position presented, showing separately the net gain or loss, net prior service cost or credit, and net transition asset or obligation.
e. The amount and timing of any plan assets expected to be returned to the business entity during the 12-month period, or operating cycle if longer, that follows the most recent annual statement of financial position presented.

A significant change from the previously imposed disclosure requirements, which were set forth by ASC 715-20, is that these requirements apply consistently to both publicly held and nonpublicly held entities sponsoring defined benefit plans. Under prior practice, privately held companies were substantially exempted from many disclosure requirements.

While immediate income statement recognition of changes in defined benefit plan assets and obligations had been strongly opposed by reporting entities when it was being developed in the mid-1980s, over the intervening years the severe deficiencies of GAAP have become well known, and this has been underlined in certain industries (e.g., airlines) as numerous entities have sought bankruptcy protection in part because of pension obligations that had been largely hidden from financial statement users, and perhaps underappreciated by entity management, as well. These defects include the use of an expected long-term rate of return on plan assets (rather than actual observed periodic returns), the deferral of actuarial gain and loss recognition, subject to the 10% corridor and amortization (instead of immediate recognition of actuarially-determined changes), and the delayed recognition of prior service cost associated with plan amendments (versus immediate recognition of the effects of plan amendments made by management). Criticism has also been directed at the combined re-

porting of service, interest, and other components of pension expense, although this is somewhat less of a concern than the previously noted matters. The latitude granted to preparers regarding the key assumptions affecting the computed pension obligation (salary progression, expected returns, discount rate) has been yet another area of concern.

FASB had for some time been contemplating, and slowly moving toward, a different model for accounting for pension and other postretirement benefit plan costs, which would reduce or eliminate the "smoothing" approach, but adoption of a full accrual approach remains controversial, particularly among critics citing the volatility introduced into measures of periodic performance as a result of the increasing usage of fair value measures. A big step was taken in 2006, with the promulgation of ASC 715, which requires that sponsors of such plans display in their balance sheets the funded status of the plans, effectively relocating certain former footnote disclosures to the body of the statement of financial position itself, as discussed above. This standard achieves a presentation and disclosure objective but does not, alas, ameliorate the fundamental recognition and measurement problems inherent in current GAAP for defined benefit plans.

ASC 715-20 establishes differential requirements for nonpublic companies, and also significantly expands requirements to interim period financial statements, bowing to concerns unique to public company financial reporting.

ASC 715-20 continues the practice of exempting nonpublic reporting entities from significant portions of the following disclosure requirements. The specific exemptions are explicitly set forth in the next paragraphs.

Reconciliation of plan benefit obligation. This reconciliation must report, if applicable, the separate effects for the period of the service cost, interest cost, contributions by plan participants, actuarial gains and losses, foreign currency exchange rate changes, benefits paid, plan amendments, business combinations, divestitures, plan curtailments, settlements, and special termination benefits. In preparing this reconciliation for defined benefit pension plans, the plan benefit obligation equals the projected benefit obligation; for defined benefit postretirement plans, it equals the accumulated postemployment benefit obligation. *Nonpublic reporting entities remain exempt from this disclosure requirement.*

Reconciliation of fair value of plan assets. This reconciliation must report, if applicable, the separate effects for the period of the actual return on plan assets, foreign currency exchange rate changes, contributions made by the employer, contributions by the plan participants, benefits paid, business combinations, divestitures, and settlements. *Nonpublic reporting entities remain exempt from this disclosure requirement.*

Funded status of the plan and the amounts recognized in the balance sheet. This must separately report, as applicable, the assets and the current and noncurrent liabilities recognized. Other information formerly found in the notes to the financial statements (e.g., the amount of unamortized prior service cost) will now, under the requirements of ASC 715, be included in the balance sheet proper (e.g. in accumulated other comprehensive income), and are no longer footnote disclosure issues. *Nonpublic reporting entities remain exempt from this disclosure requirement.*

Information about plan assets. For each major category of plan assets, such as equities, debt instruments, and real estate, disclosure is required of the percentage of the fair value of total plan assets held as of the measurement date used for each balance sheet presented. A narrative description of investment policies and strategies employed is now required, which should address target allocations for major asset classes, presented on a weighted-average basis as of the measurement date, as well as other factors that are pertinent to an understanding, such as information about investment goals, risk management practices, permitted and prohibited investments (e.g., use of derivatives, diversification, and relationships between plan assets and benefit obligations). Also required is a narrative explanation

of the basis upon which the expected long-term return on assets has been ascertained (e.g., the extent to which historical performance has been used to extrapolate from, what adjustments were made to anticipate future trends, etc.). The standard encourages expanded discussion and the use of greater asset categorization.

Accumulated benefit obligation. For defined benefit pension plans, disclosure is required of the accumulated benefit obligation, in addition to the aforementioned disclosures of the projected benefit obligation.

Benefits to be paid. The benefits expected to be paid in each of the next five fiscal years plus the aggregate of the five years thereafter. These estimated amounts are developed using the same assumptions that are used to measure the employer's benefit obligation, and should include benefits that will be attributable to estimated future employee service.

Contributions to be received. The amount of contributions expected to be paid into the plan during the next fiscal year; the aggregate of the amounts required by funding regulations or laws, discretionary amounts, and noncash contributions may be reported.

Periodic benefit cost. This must display separately the service cost component, interest cost component, expected return on plan assets, the gain or loss component, the prior service cost or credit component, the transition asset or obligation component, and the gain or loss recognized due to settlements or curtailments. *Nonpublic reporting entities remain exempt from this disclosure requirement.*

Amounts reported in other comprehensive income. Separately, the net gain or loss and net prior service cost or credit recognized in other comprehensive income for the period, and reclassification adjustments of other comprehensive income for the period, as those amounts, including amortization of the net transition asset or obligation, are recognized as components of net periodic benefit cost. Also required to be disclosed are the amounts in accumulated other comprehensive income that have not yet been recognized as components of net periodic benefit cost, showing separately the net gain or loss, the net prior service cost or credit, and the net transition asset or obligation.

Assumptions. There must be disclosure of various assumptions used in the accounting for plans: assumed discount rates, rates of compensation increase (for pay-related plans), and expected long-term rate of return on plan assets. These must be reported in a tabular format, identifying assumptions pertaining to the reported benefit obligation and to determine net benefit cost.

Assumed health care cost trends. For relevant plans, disclosure is required of the assumed health care cost trend rates for the following year used to measure the expected cost of benefits, as well as a general description of the direction and pattern of change in the assumed trend rates thereafter, together with the ultimate rate and when that terminal rate is expected to be achieved.

Sensitivity data. Disclosure of the effects of a one-percentage-point increase and decrease in the assumed health care cost trend rate on the aggregate service and interest cost components of the net periodic postretirement health care benefit cost, and on the accumulated postretirement benefit obligation for health care benefits. In computing these amounts all other assumptions must be held constant. *Nonpublic reporting entities remain exempt from this disclosure requirement.*

Other information. As applicable, other disclosures are also required. These include the amounts and types of securities of the employer and its related entities included in plan assets, the approximate amount of future annual benefits of plan participants covered by insurance contracts issued by the employer or its related entities, and any significant transactions between the employer or related entities and the plan, all of which are equally required for public and nonpublic reporting entities. Any commitment to future benefit increases used as a basis for computing the obligation, the cost of providing special or contractual termina-

tion benefits during the reporting period, and information about any changes not otherwise apparent, are also required disclosures, but only for publicly held reporting entities.

ASC 715 includes a requirement to disclose the amounts in accumulated other comprehensive income expected to be recognized as components of net periodic benefit cost over the fiscal year that follows the most recent annual statement of financial position presented, showing separately the net gain or loss, net prior service cost or credit, and net transition asset or obligation. It further requires identification of the amount and timing of any plan assets expected to be returned to the employer during the 12-month period, or operating cycle if longer, that follows the most recent annual statement of financial position presented. These new disclosure requirements apply to all reporting entities.

Under ASC 715-20, nonpublic reporting entities must report (in lieu of disclosure items cited above as being exempted for such entities) as of each balance sheet date, benefit obligations, fair value of plan assets, and the funded status of the plan. For each period for which an income statement is presented, these entities must disclose employer contributions, participant contributions, and benefits paid. Regarding the composition of assets held by the plan, for each balance sheet the nonpublic reporting entity must reveal the percentage allocation across the major asset categories (e.g., equity securities, real estate, etc.), as well as narration about investment policies and strategies for each major investment category. A narration is also required of the basis for determining the assumed expected long-term rate of return on assets, including the reasons for any adjustments made to actual long-term historicalbased expectations. Additional disclosures—if deemed useful in providing insights regarding risks attendant to various asset categories and to the long-term rates of return expected—are also encouraged.

Additionally, for defined benefit pension plans, the accumulated benefit obligation must be disclosed, as must the benefits expected to be paid in each of the following five fiscal years and over the aggregate for the next five years. The expected plan contributions to be received during the next fiscal year—inclusive of those required by statute or regulation, those that are discretionary, and those made as noncash contributions—are to be stated.

Furthermore the amounts in the financial statements, distinguishing benefit plan assets from current and from noncurrent benefit plan liabilities—must be identified, along with the amounts of net gain or loss and net prior service cost or credit recognized in other comprehensive income, and the related amounts as these elements are then recognized as components of periodic benefit expense. The amounts that are in accumulated other comprehensive income, not yet included in benefit expense, must be disclosed, classified into net gain or loss, net prior service cost or credit, and net transition asset or obligation.

The reporting entities must further disclose the weighted-average assumed discount rates, rate of assumed compensation cost increase (for pay-related plans), expected long-term returns on plan assets—the latter in a tabular format that identifies assumptions used to compute the benefit obligation and to determine benefit cost.

For postretirement health care plans, the assumed cost trend rate must be stated as it pertains to the following fiscal year, and a narrative discussion given regarding the pattern and direction of anticipated future changes, including the so-called ultimate trend rate (i.e., when all short-term perturbations affecting health care inflation have been resolved) that is expected, together with the timing of its achievement. (Cost trend assumptions are obviously of enormous importance in evaluating the adequacy of provisions made to accrue future benefit costs, but in practice it has proven to be extremely difficult to estimate even short-term cost changes in health care, let alone longer-term changes and the time until those changes might be expected to plateau.)

Postretirement benefit plan disclosures by private entities also must include information about the nature and impact of significant nonroutine events, such as plan amendments, cur-

tailments, settlements, and the effects of any mergers or divestitures of parts of the reporting entity. Disclosure must be made of amounts included in accumulated other comprehensive income that are expected to flow into periodic pension benefit cost over the next fiscal year, with the portions attributable to net gain or loss, net prior service cost or credit, and the net transition asset or obligation. Similarly, the amount of plan assets expected to be returned to the sponsoring employer over the following fiscal year is to be identified.

For entities having multiple plans, the information required under ASC 715-20 is to be aggregated so that all defined benefit retirement plans are combined, and all other postretirement benefit plans are likewise combined. Disclosure of amounts recognized in the balance sheet must distinguish prepaid benefit costs from accrued benefit liabilities. However, disclosures about pension plans with assets in excess of the accumulated benefit obligation generally may be aggregated with disclosures about pension plans with accumulated benefit obligations in excess of assets. When aggregation is utilized, the financial statements must disclose separately the aggregate benefit obligations and aggregate fair value of plan assets for each of the pension plans and other benefit plans with accumulated obligations in excess of assets. The reporting entity may also combine disclosures about pension plans or other postretirement benefit plans outside the US with those for US plans unless the obligations of the plans outside the US are significant relative to the entity's total benefit obligation and the non-US plans use significantly different assumptions.

The simplified disclosures permitted for nonpublic entities are illustrated by the following tabulation of comparative data:

	2007	*2008*
Funded status		
Projected benefit obligation at December 31	$ 1,900	$ 2,006
Fair value of Plan assets at December 31	1,376	1,519
Funded status	$ (524)	$ (487)
Amounts recognized on the balance sheet		
Prepaid (accrued) benefit cost	$ --	$ (23)
Weighted-average assumptions		
Discount rate	7.5%	7.5%
Expected return on plan assets	9.0%	9.0%
Rate of compensation increase	4.0%	4.0%
Additional pension data		
Net periodic pension cost	$ 163	$ 168
Employer contribution	140	145
Benefits paid	155	160

ASC 715 requires that plans' under- or overfunded status and the "deferred recognition" gains and losses be formally recorded in the financial statements (the balance sheet, specifically). While ASC 715 does not alter the deferred recognition (i.e., smoothing) aspects of prior GAAP, it does mandate that essentially all the formerly off-balance-sheet defined benefit cost elements be included in the reporting entity's balance sheet.

Interim Financial Reporting Requirements

ASC 715-20 imposed new requirements affecting both public and nonpublic company interim financial reporting. Publicly traded entities must disclose, in interim financial statements that include a statement of income, details regarding both benefit cost and contributions paid. The amount of net periodic benefit cost recognized must be set forth, showing separately the service cost component, the interest cost component, the expected return on plan assets for the period, the amortization of the unrecognized transition obligation or transition asset, the amount of recognized gains or losses, the amount of prior service cost recognized, and the amount of gain or loss recognized due to a settlement or curtailment. Addi-

tionally, the total amount of the employer's contributions paid, and expected to be paid, during the current fiscal year, must be presented, if significantly different from amounts previously disclosed pursuant to the annual reporting requirements of the standard. It is permissible to present estimated contributions in the aggregate, combining contributions required by funding regulations or laws, discretionary contributions, and noncash contributions. ASC 715 has conformed these requirements to the newly imposed regime whereby the balance sheet fully discloses (in accumulated other comprehensive income) the deferred recognition items that formerly were "off-balance-sheet."

For nonpublic entities, disclosure is required—in interim periods when a complete set of GAAP-basis financial statements is being presented—of the total amount of the employer's contributions paid, and expected to be paid, during the current fiscal year, if significantly different from amounts previously disclosed pursuant to the annual reporting requirements of the standard. Estimated contributions may be presented in the aggregate combining contributions required by funding regulations or laws, discretionary contributions, and noncash contributions.

In developing ASC 715, FASB considered whether full or partial interim date remeasurement of pension and benefit plan assets and obligations should be mandated. It decided not to require this because of the additional costs that would be incurred by reporting entities to implement that change. Furthermore, doing so would have represented a fundamental change in the measurement of net periodic benefit cost, and measurement issues were defined as being beyond the scope and objectives of this standard. Accordingly, remeasurement on an interim basis is neither required nor permitted under ASC 715.

Reporting and Disclosure by Not-for-Profit Entities

Not-for-profit entities sponsoring single-employer defined benefit plans are subject to ASC 715, but special rules are necessary to accommodate the fact that such entities do not report other comprehensive income as prescribed under ASC 220 for all other private sector entities. It is therefore necessary to analogize from the requirements of ASC 715. Rather than include the realized but as-yet-unrecognized net gains and losses, the unrecognized prior service cost or credit, and the unamortized transition amounts in accumulated other comprehensive income, these are to be reflected in changes in unrestricted net assets arising from a defined benefit plan. These changes will flow through the current period's statement of activities, since GAAP for not-for-profit organizations (ASC 958—see discussion in Chapter 25) does not provide for an analogue to other comprehensive income, where nonstockholder changes in net worth are reported outside the income statement (statement of activities).

Other Pension Considerations

Annuity and insurance contracts. If annuity contracts and other insurance contracts that are equivalent in substance are valid and irrevocable, if they transfer significant risks to an unrelated insurance company (not a captive insurer), and if there is no reasonable doubt as to their payment, they are excluded from plan assets and their benefits are excluded from the accumulated benefit obligation and from the projected benefit obligation. Most other contracts are not considered annuities for ASC 715-30 purposes. If a plan's benefit formula specifies coverage by nonparticipating annuity contracts, the service component of net pension costs is the cost of those contracts. In the case of a participating annuity contract, the cost of the participation right is recognized as an asset and measured annually at its fair value. If fair value is inestimable, the cost is systematically amortized and carried at amortized cost (not to exceed net realizable value). Benefits provided by the formula beyond those provided by annuities are accounted for in the usual ASC 715-30 manner. All other insurance contracts are considered investments and are usually measured at cash surrender value, conversion value, contract value, or some equivalent.

In certain circumstances, annuity benefits are paid by employers after the insurer fails to make required payments. According to ASC 715-30-35, a loss is recognized by an employer at the time the employer assumes the benefit obligation payments to retirees for an insolvent insurance company that held these pension obligations. The loss recognized is the lesser of any gain recognized in the original contract with the insurance company or the amount of benefit obligation payments assumed by the company. Any additional loss not recognized is accounted for as a plan amendment in accordance with ASC 715-30.

Defined contribution plans. In the typical defined contribution plan, the contribution is either discretionary or derived from a formula, and that amount is the expense to be reported in the sponsor's financial statements for the year. Benefits are generally paid from the pool of accumulated contributions and are limited to the plan assets available to pay them. If, however, the defined contribution plan has defined benefits, the provision is calculated as required under ASC 715-30.

Multiemployer pension plans. Participation in a multiemployer plan (two or more unrelated employers contribute such as in collectively bargained union-sponsored plans) requires that the contribution for the period be recognized as net pension cost and that any contributions due and unpaid be recognized as a liability. Assets of all the employers sponsoring this type of plan are usually commingled and not segregated or restricted. A Board of Trustees usually administers these plans. If there is a withdrawal of an employer from this type of plan and if an obligation to make up any funding deficiency is either probable or reasonably possible, ASC 450 applies.

Some plans are, in substance, a pooling or aggregation of single employer plans and are ordinarily without collective-bargaining agreements. Contributions are usually based on a specified benefit formula. These plans are not considered multiemployer, and the accounting is based on each employer's respective interest in the plan.

Per ASC 715-80-55-2, the existence of an executed agreement does not require recognition by an employer of a liability beyond currently due and unpaid contributions.

Non-US pension arrangements. The terms and conditions that define the amount of benefits and the nature of the obligation determine the substance of a non-US pension arrangement. If they are, in substance, similar to pension plans, ASC 715-30 applies.

Business combinations. When an entity that sponsors a single-employer defined benefit pension plan is purchased, the purchaser must assign part of the purchase price to an asset if plan assets exceed the projected benefit obligation, or to a liability if the projected benefit obligation exceeds plan assets. The projected benefit obligation includes the effect of any expected plan curtailment or termination as a result of the change in ownership of the sponsor. This assignment eliminates any existing unrecognized components, and any future differences between contributions and net pension cost will affect the asset or liability recognized when the purchase was initially recorded.

ASC 715-30

ASC 715-30 describes the accounting to be followed by obligors when all or part of defined benefit pension plans have been settled or curtailed. It establishes employer accounting procedures for benefits offered when employment is terminated.

Settlements include both the purchase of nonparticipating annuity contracts and lump-sum cash payments. The following three criteria must all be met in order to constitute a pension obligation settlement:

1. It must be irrevocable
2. It must relieve the obligor of primary responsibility for the obligation
3. It must eliminate significant risks associated with the obligation and the assets used to effect it

Transactions that do not meet these three criteria do not qualify for treatment as a settlement under ASC 715-30. For example, an obligor could invest in a portfolio of high-quality fixed-income securities that would provide cash flows of interest and return-of-principal payments on dates that approximate the dates on which settlement payments are expected to become due. This would not meet the above criteria, however, because the employer is still primarily liable for the pension obligation and the investment is not irrevocable. Such a defeasance strategy does not constitute a settlement.

Under an annuity contract settlement, an unrelated insurance company unconditionally accepts an obligation to provide the required benefits. The following criteria must be met for this type of settlement:

1. It must be irrevocable
2. It must involve a transfer of material risk to the insurance company

There can be no reasonable doubt as to the ability of the insurance company to meet its contractual obligation. The substance of any participating annuity contract must relieve the employer of most of the risks and rewards or it does not meet the criteria.

Curtailments include early discontinuance of employee services or cessation or suspension of a plan. Additional benefits may not be earned, although future service time may be counted towards vesting. Curtailments must meet the following criteria:

1. It must materially diminish present employees' future service or
2. It must stop or materially diminish the accumulation of benefits by a significant number of employees

A curtailment and a settlement can occur separately or together.

Settlements. If the entire projected benefit obligation is settled, any ASC 715-30 unrecognized net gain (loss) plus any remaining unrecognized net asset existing when ASC 715-30 was initially applied are immediately recognized. A pro rata portion is recognized in the case of partial settlement. If the obligation is settled by purchasing participating annuities, the cost of the right of participation is deducted from the gain (but not from the loss) before recognition.

If the total of the interest cost and service cost components of the ASC 715-30 periodic pension cost is greater than or equal to the settlement costs during a given year, the recognition of the above gain (loss) is not required, but is permitted. However, a consistent policy must be followed in this regard. The settlement cost is generally the cash paid, or the cost of nonparticipating annuities purchased, or the cost of participating annuities reduced by the cost of the right of participation.

Example of a settlement

To use information from the previous baseline example, the company's pension plan settles the $1,150 vested benefit portion of its projected benefit obligation by using plan assets to purchase a nonparticipating annuity contract for $1,150. As a result of this settlement, nonvested benefits and the effects of projected future compensation levels remain in the plan. Also, a pro rata amount of the unrecognized net actuarial loss on assets, unrecognized prior service cost, and unamortized net asset at ASC 715-30 adoption are recognized due to settlement. Because the projected benefit obligation is reduced from $1,550 to $400, a drop of 74%, the pro rata amount used for recognition purposes is 74%. These changes are noted in the following table:

	Before settlement	*Effect of settlement*	*After settlement*
Assets and obligations:			
Vested benefit obligation	$(1,150)	$1,150	$0
Nonvested benefits	(400)	____	(400)
Accumulated benefit obligation	(1,550)	1,150	(400)
Effects of projected future compensation levels	(456)	____	(456)
Projected benefit obligation	(2,006)	1,150	(856)
Plan assets at fair value	1,519	(1,150)	369

	Before settlement	*Effect of settlement*	*After settlement*
Items not yet recognized in earnings:			
Funded status	(487)	0	(487)
Unrecognized net actuarial loss on assets	174	(129)	45
Unrecognized prior service cost	293	(217)	76
Unamortized net asset at ASC 715-30 adoption	(3)	2	(1)
Prepaid (accrued) benefit cost	$(23)	$(344)	$(367)

The entry used by the company to record this transaction does not include the purchase of the annuity contract since the pension plan acquires the contract with existing funds. The recognition of the pro rata amount of the unrecognized net actuarial loss on assets, unrecognized prior service cost, and unamortized net asset at ASC 715-30 adoption is recorded with the following entry:

Loss from settlement of pension obligation	344	
Accrued/prepaid pension cost		344

The foregoing provisions have been amended by ASC 715, necessarily, to state that the maximum gain or loss subject to recognition in earnings when an obligation is settled is the net gain or loss that is remaining in accumulated other comprehensive income, plus any transition asset remaining in accumulated other comprehensive income from the original application of ASC 715-30. The maximum gain or loss, first determined at the date of settlement, is fully reported in earnings only if the entire projected benefit obligation is settled; if it is only partially settled, only a pro rata portion of the maximum gain or loss can be recognized.

Curtailments. A curtailment results in the elimination of future years of service. The pro rata portions of any (1) unrecognized cost of retroactive plan amendments and (2) remaining unrecognized net obligation existing when ASC 715-30 was initially applied that is associated with the eliminated years of service are immediately recognized as a loss.

If curtailment results in a decrease in the projected benefit obligation, a gain is indicated. An increase in the projected benefit obligation (excluding termination benefits) indicates a loss. This indicated gain (loss) is then netted against the loss from unrecognized prior service cost recognized in accordance with the preceding paragraph. The net result is the curtailment gain or curtailment loss. This gain (loss) is accounted for as provided in ASC 450. A gain is recognized upon actual employee termination or plan suspension. A loss is recognized when both the curtailment is probable and the effects are reasonably estimable.

After the curtailment gain (loss) is calculated, any remaining unrecognized net asset existing when ASC 715-30 was initially applied is transferred from that category and combined with the gain (loss) arising after ASC 715-30 application. It is subsequently treated as a component of the new gain (loss) category.

Example of a curtailment

To use information from the previous baseline example, the company shuts down one of its factories, which terminated the employment of a number of its staff. The terminated employees have nonvested benefits of $120 and projected benefit obligation of $261. As a result of this curtailment, 19% of the projected benefit obligation has been eliminated ($381 PBO reduction resulting from the curtailment, divided by the beginning $2,006 PBO). Accordingly, 19% of the unrecognized prior service cost and unamortized net asset at ASC 715-30 adoption are recognized due to the curtailment. In addition, the total projected benefit reduction of $381 is first netted against the unrecognized net actuarial loss on assets of $174, leaving $207 to be recognized as a gain. These changes are noted in the following table:

	Before curtailment	*Effect of curtailment*	*After curtailment*
Assets and obligations:			
Vested benefit obligation	$(1,150)		$(1,150)
Nonvested benefits	(400)	$120	(280)
Accumulated benefit obligation	(1,550)	120	(1,430)
Effects of projected future compensation levels	(456)	261	(195)
Projected benefit obligation	(2,006)	381	(1,625)
Plan assets at fair value	1,519	0	1,519

	Before curtailment	*Effect of curtailment*	*After curtailment*
Items not yet recognized in earnings:			
Funded status	(487)	381	(106)
Unrecognized net actuarial loss on assets	174	(174)	0
Unrecognized prior service cost	293	(56)	237
Unamortized net asset at ASC 715-30 adoption	(3)	1	(2)
Prepaid (accrued) benefit cost	$(23)	$152	$129

The company records the recognition of the pro rata amount of the unrecognized prior service cost and unamortized net asset at ASC 715-30 adoption with the following entry, which is offset against the net gain of $207 resulting from the reduction in the planned benefit obligation:

Accrued/prepaid pension cost	152	
Gain from curtailment of pension obligation		152

ASC 715 has also revised the guidance on accounting for curtailments of defined benefit plans. To the extent that prior service costs are included in accumulated other comprehensive income under the new mandates, and this is associated with service years no longer expected to be rendered, this must be recognized currently as a loss. This would occur if prior service cost is being amortized over a term that no longer accurately reflects expected future service by the post-curtailment workforce. Prior service cost, in this context, includes that resulting from plan amendments and also any transition obligation remaining from the initial adoption of ASC 715-30.

Under ASC 715, curtailment gain or loss alters the projected benefit obligation. If such a gain exceeds any net loss included in accumulated other comprehensive income, or the entire gain if a net gain exists, it is reported as a curtailment gain. On the other hand, to the extent that such a loss exceeds any net *gain* included in accumulated other comprehensive income, or the entire loss if a net loss exists, this will be reported as a curtailment loss. Any transition asset remaining in accumulated other comprehensive income is to be treated as a net gain and combined with the net gain or loss arising subsequent to the ASC 715-30 transition.

Termination benefits. Termination benefits are accounted for in accordance with ASC 450. Special short time period benefits require that a loss and a liability be recognized when the offer is accepted and the amount can be reasonably estimated. Contractual termination benefits require that a loss and a liability be recognized when it is probable that employees will receive the benefits and the amount can be reasonably estimated. The cost of these benefits is the cash paid at termination and the present value of future payments. Termination benefits and curtailments can occur together.

Example of termination benefits

Again using the information from the previous baseline example, the company offers a one-time early retirement bonus payment, which is in addition to existing pension benefits. As a result of the offer, the company directly pays $200 in termination benefits. As a result of the employee retirements, the liability associated with projected future compensation levels drops by $60, while the pro rata portion of the unrecognized prior service cost associated with the retiring employees is $39. These changes are noted in the following table:

	Before termination benefit	*Effect of termination benefit*	*After termination benefit*
Assets and obligations:			
Vested benefit obligation	$(1,150)		$(1,150)
Nonvested benefits	(400)		(400)
Accumulated benefit obligation	(1,550)		(1,550)
Effects of projected future compensation levels	(456)	$60	(396)
Projected benefit obligation	(2,006)	$60	(1,946)
Plan assets at fair value	1,519	0	1,519

	Before termination benefit	*Effect of termination benefit*	*After termination benefit*
Items not yet recognized in earnings:			
Funded status	(487)		(427)
Unrecognized net actuarial loss on assets	174	(60)	114
Unrecognized prior service cost	293	(39)	254
Unamortized net asset at ASC 715-30 adoption	(3)		(3)
Prepaid (accrued) benefit cost	$(23)	(39)	$(62)
Cost of termination benefits		(200)	
Total loss on terminations		$(239)	

The company nets the $60 gain on reduction of projected future compensation levels against the existing unrecognized net actuarial loss on assets. It then records the $39 loss caused by the increased amortization of the unrecognized prior service cost and the $200 cost of the termination benefits with the following entry:

Loss on employee terminations	239	
Accrued/prepaid pension cost		39
Cash		200

Component disposal. Gains (losses), as calculated above, that result because of a disposal of a component of the entity are recognized according to the provisions of ASC 360.

Postretirement Benefits other than Pensions

ASC 715-60 established the standard for employers' accounting for other (than pension) postretirement employee benefits (commonly, if misleadingly, called OPEB). This standard prescribes a single method for measuring and recognizing an employer's accumulated postretirement benefit obligation (APBO). It applies to all forms of postretirement benefits, although the most material such benefit is usually postretirement health care coverage. It uses the fundamental framework established by ASC 715-30. To the extent that the promised benefits are similar, the accounting provisions are similar. Only when there is a compelling reason, is the accounting different.

ASC 715-60 requires accrual accounting and adopts the three primary characteristics of pension accounting as follows:

1. Delayed recognition (changes are not recognized immediately but are subsequently recognized in a gradual and systematic way)
2. Reporting net cost (aggregates of various items are reported as one net amount)
3. Offsetting assets and liabilities (assets and liabilities are sometimes shown net)

ASC 715-60 distinguishes between the substantive plan and the written plan. Although generally the same, the substantive plan (the one understood as evidenced by past practice or by communication of intended changes) is the basis for the accounting if it differs from the written plan.

ASC 715-60 focuses on accounting for a single-employer plan that defines the postretirement benefits to be provided. A defined benefit postretirement plan defines benefits in terms of (1) monetary amounts or (2) benefit coverage to be provided. Postretirement benefits can include tuition assistance, legal services, day care, housing subsidies, health insurance coverage (probably the most significant), and other benefits. The amount of benefits usually depends on a benefit formula. OPEB may be provided to current employees, former employees, beneficiaries and covered dependents. This standard applies to settlement of the APBO and to curtailment of a plan as part of a special termination benefit offer. It also applies to deferred compensation contracts with individuals. Taken together, these contracts are equivalent to an OPEB plan. ASC 715-60 does not apply to benefits provided through a pension plan. If part of a larger plan with active employees, the OPEB is segregated and ac-

counted for in accordance with this standard. If not materially different, estimates, averages, and computational shortcuts may be used.

The basic tenet of ASC 715-60 is that accrual accounting is better than cash basis accounting. Recognition and measurement of the obligation to provide OPEB is required in order to provide relevant information to financial statement users. Although funding and cash flow information is incorporated into the statement, the overall liability is the primary focus.

The standard attempts, in accordance with the terms of the substantive plan, to account for the exchange transaction that takes place between the employer, who is ultimately responsible for providing OPEB, and the employee who provides services, in part at least, to obtain the OPEB. ASC 715-60 accounting requires that the liability for OPEB be fully accrued when the employee is fully eligible for all of the expected benefits. The fact that the employee may continue to work beyond this date is not relevant since the employee has already provided the services required to earn the OPEB.

OPEB are considered to be deferred compensation earned in an exchange transaction during the time periods that the employee provides services. The expected cost generally is attributed in equal amounts (unless the plan attributes a disproportionate share of benefits to early years) over the periods from the employee's hiring date (unless credit for the service is only granted from a later plan eligibility or entry date) to the date that the employee attains full eligibility for all benefits expected to be received. This accrual is followed even if the employee provides service beyond the date of full eligibility.

Accounting for postretirement benefits. The expected postretirement benefit obligation (EPBO) is the actuarial present value (APV) as of a specific date of the benefits expected to be paid to the employee, beneficiaries and covered dependents. Measurement of the EPBO is based on the following:

1. Expected amount and timing of future benefits
2. Expected future costs
3. Extent of cost sharing (contributions, deductibles, coinsurance provisions, etc.) between employer, employee and others (i.e., the government). The APV of employee contributions reduces the APV of the EPBO. Obligations to return employee contributions, plus interest if applicable, are recognized as a component of EPBO.

The EPBO includes an assumed salary progression for a pay-related plan. Future compensation levels represent the best estimate after considering the individual employees involved, general price levels, seniority, productivity, promotions, indirect effects, etc.

The APBO is the APV as of a specific date of all future benefits attributable to service by an employee to that date. It represents the portion of the EPBO earned to date. After full eligibility is attained, the APBO equals the EPBO.

The APBO also includes an assumed salary progression for a pay-related plan. Thus, this term is more comparable to the projected benefit obligation (PBO) under ASC 715-30. The accumulated benefit obligation in ASC 715-30 has no counterpart in ASC 715-60.

Net periodic postretirement benefit costs include the following components:

1. Service cost—APV of benefits attributable to the current period (i.e., the portion of the EPBO earned this period)
2. Interest cost—Interest on the APBO
3. Actual return on plan assets
4. Gain or loss
5. Amortization of unrecognized prior service cost
6. Amortization of the transition asset or obligation

Note that return on plan assets is included in the periodic expense determination, consistent with accounting for defined benefit pension plans. However, in virtually all cases, OPEB plans are unfunded, and thus there will be no asset return. If a trust has been established to fund these benefits, it does not necessarily have to be "bankruptcy proof," or insulated completely from the claims of general creditors, in order to qualify as plan assets in accordance with ASC 715-60-55. On the other hand, assets held in a trust that explicitly makes them available to the general creditors in bankruptcy do not qualify as plan assets under ASC 715-60. The funded status of other postretirement defined benefit plans will, under provisions of ASC 715, now be formally reported in the balance sheet, as described above.

The transition obligation was the unrecognized and unfunded APBO for all of the participants in the plan at the date of adoption of ASC 715-60. This obligation was either (1) recognized immediately as the effect of an accounting change, subject to certain limitations, or (2) elected to be recognized on a delayed basis over future service periods with disclosure of the unrecognized amount. The delayed recognition must have resulted in, at least, as rapid a recognition as would have been recognized on a pay-as-you-go (cash) basis. Under ASC 715 the transition obligation that was to be given deferred recognition will be included in accumulated other comprehensive income, with a corresponding liability.

Service costs and interest costs are defined and measured in the same manner by both ASC 715-60 and ASC 715-30. However, under ASC 715-60, interest increases the APBO while under ASC 715-30, interest increases the PBO.

Under ASC 715-60, a single method is required to be followed in measuring and recognizing the net periodic cost and the liability involved. That method attributes the EPBO to employee service rendered to the full eligibility date.

Assumptions. ASC 715-60 requires the use of explicit assumptions using the best estimates available of the plan's future experience, solely with regard to the individual assumption under consideration. Plan continuity is to be presumed, unless there is evidence to the contrary. Principal actuarial assumptions include: discount rates, present value factors, retirement age, participation rates (contributory plans), salary progression (pay-related plans) and probability of payment (turnover, dependency status, mortality). Present value factors for health care OPEB include cost trend rates, Medicare reimbursement rates and per capita claims cost by age.

Current interest rates, as of the measurement date, are used for discount rates in present value calculations. Examples include high-quality, fixed-income investments with similar amounts and timing and interest rates at which the postretirement benefit obligations could be settled. The EPBO, APBO, service cost and interest cost components use assumed discount rates.

The expected long-term rate of return on plan assets is an assumption about the average rate of return expected on contributions during the period and on existing plan assets. Current returns on plan assets and reinvestment returns are considered in arriving at the rate to be used. Related income taxes, if applicable, reduce the rate. Expected return on plan assets and the market-related value of plan assets use this rate in their calculation. Since ERISA does not require OPEB plans to be funded via the separate trust vehicles used for pension plans, OPEB plans are often unfunded. Thus, there are no "plan assets." Instead, the sponsor pays benefits directly, as they become due, from general corporate assets.

Example

A sample illustration of the basic accounting for OPEB as established by ASC 715-60 follows. Kinetic Corporation established a new OPEB plan as of January 1, 2008. Although the plan was new, it retroactively credited employees for their years of service to Kinetic prior to the establishment of the plan.

All employees had been hired at age 30 and become fully eligible for benefits at age 60. The plan is unfunded and, thus, there are no plan assets. The first calculation is the determination of the unrecognized transition obligation (UTO).

Kinetic Corporation
December 31, 2007

Employee	*Age*	*Years of service*	*Total years when fully eligible*	*Expected retirement age*	*Remaining service to retirement*	*EPBO*	*APBO*
A	35	5	30	60	25	$ 14,000	$ 2,333
B	40	10	30	60	20	22,000	7,333
C	45	15	30	60	15	30,000	15,000
D	50	20	30	60	10	38,000	25,333
E	55	25	30	65	10	46,000	38,333
F	60	30	30	65	5	54,000	54,000
G	65	RET	--		--	46,000	46,000
H	70	RET	--		--	38,000	38,000
					85	$288,000	$226,332

Explanations

1. EPBO (expected postretirement benefit obligation) is usually determined by an actuary, although it can be calculated if complete data is available.
2. APBO is calculated using the EPBO. Specifically, it is EPBO × (Years of service/Total years when fully eligible)
3. The unrecognized transition obligation (UTO) is the APBO at 12/31/07 since there are no plan assets to be deducted. The $226,332 can be amortized over the average remaining service to retirement of 14.17 (85/6) years or an optional period of 20 years, if longer. Kinetic selected the 20-year period of amortization.
4. Note that Employee F has attained full eligibility for benefits and yet plans to continue working.
5. Note that the above 2007 table is used in the calculation of the 2008 components of OPEB cost that follows.

After the establishment of the UTO, the next step is to determine the benefit cost for the year ended December 31, 2008. This calculation follows the framework established by ASC 715-30. The discount rate is assumed to be 10%.

Kinetic Corporation
OPEB Cost
December 31, 2008

1.	Service cost	$ 5,500
2.	Interest cost	22,633
3.	Actual return on plan assets	--
4.	Gain or loss	--
5.	Amortization of unrecognized prior service cost	--
6.	Amortization of UTO	11,317
	Total OPEB Cost	$39,450

Explanations

1. Service cost calculation uses only employees not yet fully eligible for benefits.

Employee	*[a] 12/31/07 EPBO*	*[b] Total years when fully eligible*	*[a ÷ b] Service cost*
A	$14,000	30	$ 467
B	22,000	30	733
C	30,000	30	1,000
D	38,000	30	1,267
E	46,000	30	1,533
			$5,000
	Interest for 2006 ($5,000 × 10%)		500
	Total service cost		$5,500

2. Interest cost is the 12/31/07 APBO of $226,332 × 10% = $22,633.
3. There are no plan assets so there is no return.
4. There is no gain (loss) since there are no changes yet.
5. There is no unrecognized prior service cost initially.
6. Amortization of UTO is the 12/31/07 UTO of $226,332/20-year optional election = $11,317.

After calculation of the 2008 benefit cost, the next step is to project the EPBO and APBO for December 31, 2008. Assuming no changes, it is based on the December 31, 2007 actuarial measurement and it is calculated as shown earlier in the determination of the UTO.

Kinetic Corporation
December 31, 2008

Employee	*Age*	*Years of service*	*Total years when fully eligible*	*EPBO*	*APBO*
A	36	6	30	$ 15,400	$ 3,080
B	41	11	30	24,200	8,873
C	46	16	30	33,000	17,600
D	51	21	30	41,800	29,260
E	56	26	30	50,600	43,853
F	61	31	--	59,400	59,400
G	66	RET	--	44,620	44,620
H	71	RET	--	36,860	36,860
				$305,880	$243,546

Changes in experience or assumptions will result in gains (losses). The gain (loss) is measured by the difference resulting in the APBO or the plan assets from that projected. However, except for the effects of a decision to temporarily deviate from the substantive plan, these gains or losses have no impact in the year of occurrence. They are deferred and amortized as in ASC 715-30. Amortization of unrecognized net gain (loss) is included as a component of net postretirement cost for a year if, as of the beginning of the year, it exceeds 10% of the greater of the APBO or the market-related value of plan assets. The minimum amortization is the excess divided by the remaining average service period of active plan participants. A systematic method of amortization that amortizes a greater amount, is applied consistently to both gains and losses and is disclosed may also be used. If gains (losses) are recognized immediately, special rules of offsetting may be required.

Effect of the prescription drug benefit on OPEB computations. The Medicare Prescription Drug, Improvement and Modernization Act of 2003 introduced a prescription drug benefit under Medicare (Medicare Part D), as well as a federal subsidy to sponsors of retiree health care benefit plans that provide a benefit that is at least actuarially equivalent to Medicare Part D. Under ASC 715-60, the effects of the Act on current period measurements of postretirement benefit costs and the APBO must be accounted for, if defined criteria are met.

The guidance regarding accounting for the subsidiary set forth in ASC 715-60 applies only to sponsors of a single-employer defined benefit postretirement health care plan for which (1) the employers have concluded that prescription drug benefits available under the plan to some or all participants for some or all future years are "actuarially equivalent" to Medicare Part D and thus qualify for the subsidy under the Act and (2) the expected subsidiaries will offset or reduce the employers' shares of the cost of the underlying postretirement prescription drug coverage on which the subsidies are based. ASC 715-60 also provides guidance for disclosures about the effects of the subsidy for employers that sponsor postretirement health care benefit plans that provide prescription drug coverage but for which the employers have not yet been able to determine actuarial equivalency.

The central question raised has been whether a subsidy is substantively similar to other Medicare benefits that existed when ASC 715-60 was issued—and therefore to be accounted for as a reduction of the APBO and net periodic postretirement benefit cost—or whether the subsidy represents a payment to the employer that is determined by reference to its plan's benefit payments but is not, in and of itself, a direct reduction of postretirement benefit costs. A secondary issue pertains to the timing of accounting recognition of the subsidy.

FASB concluded that the former interpretation is the correct one. That is, measures of the APBO and net periodic postretirement benefit cost on or after the date of enactment are to reflect the effects of the Act. When an employer initially accounts for the subsidy, its effect on the APBO is to be accounted for as an actuarial experience gain. Additionally, the subsidy reduces service cost when it is recognized as a component of net periodic postretirement benefit cost. If the estimated expected subsidy changes, the effect is to be treated as an actuarial experience gain or loss.

Plan amendments will also affect the reporting of OPEB cost and the APBO. If prescription drug benefits currently available under an existing plan are deemed not actuarially equivalent as of the date of enactment of the Act, but the plan is later amended to provide actuarially equivalent benefits, the direct effect of the amendment on the APBO and the effect on the APBO from any resulting subsidy to which the employer is expected to be entitled as a result of the amendment are to be combined, and deemed to be an actuarial experience gain if it reduces APBO. On the other hand, if the combined effect increases the APBO, it is deemed to be prior service cost that is to be accounted for consistent with ASC 715-60.

Additionally, according to ASC 715-60, if a plan that provides prescription drug benefits that previously were deemed actuarially equivalent under the Act is subsequently amended to reduce its prescription drug coverage such that the coverage is not considered actuarially equivalent, any actuarial experience gain related to the subsidy previously recognized is unaffected. The combined net effect on the APBO of (1) the subsequent plan amendment that reduces benefits under the plan and thus disqualifies the benefits as actuarially equivalent and (2) the elimination of the subsidy is to be accounted for as prior service cost (credit) as of the date the amendment is adopted.

In the periods in which the subsidy affects the employer's accounting for the plan, this will have no effect on any plan-related temporary difference accounted for under ASC 740, because the subsidy is exempt from federal taxation.

There may be a time lag before the employer is able to determine whether the benefits provided by its plan are actuarially equivalent. During the interim period, it is required to disclose: the existence of the Act and the fact that measures of the APBO or net periodic postretirement benefit cost do not reflect any amount associated with the subsidy because the employer is unable to conclude whether the benefits provided by the plan are actuarially equivalent to Medicare Part D under the Act.

In interim and annual financial statements for the first period in which an employer includes the effects of the subsidy in measuring the APBO and the first period in which an employer includes the effects of the subsidy in measuring net periodic postretirement benefit cost, it is required to disclose the following:

a. The reduction in the APBO for the subsidy related to benefits attributed to past service.
b. The effect of the subsidy on the measurement of net periodic postretirement benefit cost for the current period. That effect includes (1) any amortization of the actuarial experience gain in (a) as a component of the net amortization called for by ASC 715-60, (2) the reduction in current period service cost due to the subsidy, and (3) the resulting reduction in interest cost on the APBO as a result of the subsidy.
c. Any other disclosures required by ASC 715-20, specifically disclosure of an explanation of any significant change in the benefit obligation or plan assets not otherwise apparent in the other disclosures required by that standard.

When ASC 715-60 is initially adopted, a remeasurement of the plan's assets and APBO, including the effects of the subsidy, if applicable, as well as the other effects of the Act, is to

be made as of the earlier of (1) the plan's measurement date that normally would have followed enactment of the Act or (2) the end of the employer's interim or annual period that includes the date of the Act's enactment. Alternatively, employers are permitted, but not required, to perform that remeasurement as of the date of enactment. The measurement of the APBO is to be based on the plan provisions in place on the measurement date (i.e., later amendments are not to be anticipated in the computation).

Other Postemployment Benefits

ASC 712 applies the criteria set forth by ASC 710 to accrue an obligation for postemployment benefits other than pensions if services have been performed by employees, employees' rights accumulate or vest, payment is probable, and the amount can be reasonably estimable. If these benefits do not vest or accumulate, ASC 450 applies. If neither ASC 710 nor ASC 450 is applicable because the amount is not reasonably estimable, this fact must be disclosed.

Deferred Compensation Contracts

If the aggregate deferred compensation contracts with individual employees are equivalent to a pension plan, the contracts are accounted for according to ASC 715-30 and ASC 715-30. All other deferred compensation contracts are accounted for according to ASC 710.

ASC 715-60 states that the terms of the individual contract will govern the accrual of the employee's obligation for deferred compensation and the cost is to be attributed over the employee service period until full eligibility is attained.

Per ASC 710, the amount to be accrued is not to be less than the present value of the estimated payments to be made. This estimated amount is accrued in a systematic and rational manner. When elements of both current and future employment are present, only the portion attributable to the current services is accrued. All requirements of the contract, such as continued employment for a specified period, availability for consulting services, and agreements not to compete after retirement, need to be met in order for the employee to receive future payments. Finally, the total amount is amortized to expense over the period from the date the contract is signed to the point when the employee is fully eligible to receive the deferred payments.

One benefit that may be found in a deferred compensation contract is for periodic payments to employees or their beneficiaries for life, with provisions for a minimum lump-sum settlement in the event of early death of one or all of the beneficiaries. The estimated amount to be accrued is based on the life expectancy of each individual concerned or on the estimated cost of an annuity contract, not on the minimum amount payable in the event of early death.

Example of a deferred compensation contract

The Clear Eye Corporation enters into a deferred compensation contract with its president, Dr. Smith. Under the terms of the agreement, Clear Eye will pay Dr. Smith an amount equal to twice his annual salary in a lump sum on the date of his mandatory retirement from Clear Eye, which is four years in the future. His salary is currently $120,000. In addition, Clear Eye will pay Dr. Smith an annual pension of $45,000 beginning on his mandatory retirement date, or a minimum $200,000 lump-sum payment in the event of his early death. However, these payments are contingent upon his working the remaining four years prior to his mandatory retirement. The actuarial present value of a lifetime annuity of $45,000 that begins at Dr. Smith's expected retirement date is $392,000.

Clear Eye makes the following entry each year to record its annual expense under the lump-sum payment agreement, which is based on a lump-sum payment of $240,000:

Deferred compensation expense	60,000	
Deferred compensation liability		60,000

After two years, Dr. Smith receives a pay raise to $140,000, which increases the amount of his guaranteed lump-sum payment to $280,000. Since Clear Eye has thus far recognized a deferred compensation expense of $120,000, it must now increase its annual expense recognition to $80,000 in order to recognize additional expense totaling $160,000 over the remaining two years prior to the payment date. It makes the following entry to record the actual cash payment to Dr. Smith:

Deferred compensation liability	280,000	
Cash		280,000

Clear Eye must also record the $392,000 present value of the lifetime annuity over the remaining four years of Dr, Smith's employment rather than the smaller $200,000 early death payment, which it does with the following annual entry:

Deferred compensation expense	98,000	
Deferred compensation liability		98,000

Note that all of the foregoing entries assume that Clear Eye Corporation chooses to record the full (i.e., nondiscounted) amount of the estimated future liability pro rata each year. It would also have been acceptable under ASC 710 to record the discounted present value amounts. In that case, while the charge for deferred compensation would have been lower in the earlier years, the accrued amounts would have to be further accreted to reflect interest on the obligation, so the overall charge over the four-year accrual for the lump-sum payment would have still equaled $280,000. The charge for the lifetime annuity over the four years until the payments commence would have been less than the estimated $392,000 obligation, since the amount recorded as of the inception of the annuity (i.e., retirement date) would be the present value of the future estimated payments.

Employee Retirement Income Security Act of 1974

Congress passed the Employee Retirement Income Security Act (ERISA) in 1974. The principal objectives of ERISA were to provide statutory law for pension plan requirements, to strengthen the financial soundness of private pension plans, to safeguard employees' pension rights, and to create the Pension Benefit Guaranty Corporation (PBGC).

Prior to ERISA, the Internal Revenue Code was the principal source of law for governing and managing pension plans. Unfortunately, the thrust of the Code emphasizes tax considerations, and the important nontax aspects of pension plans, such as vesting, funding, and employee participation, were not addressed. ERISA filled the void by mandating minimum vesting, funding, employee participation, and other requirements. Virtually every private pension plan in the United States is affected by the provisions of ERISA.

ERISA, as subsequently amended by Congress and interpreted by regulations issued by the Internal Revenue Service (IRS), provides minimum vesting periods for participants. Amounts contributed by employees must, at all times, be 100% vested. Benefits derived from employer contributions must become nonforfeitable when the employee reaches normal retirement age. Normal retirement age is the earlier of the time a participant attains normal retirement age under the plan or the later of: (1) attainment of age sixty-five, or (2) the fifth anniversary of the individual's participation in the plan.

Plans must meet one of two alternative minimum vesting standards for benefits to be derived from employer contributions prior to normal retirement age.

1. A five-year cliff schedule requiring full vesting after five years of service
2. A three-to-seven-year graded schedule requiring 20% vesting after three years of service and 20% additional vesting in each of the following years (IRC § 1.411(a)-3T)

These vesting standards were liberalized by the Economic Growth and Tax Relief Reconciliation Act of 2001 (EGTRRA). EGTRRA provides accelerated vesting for participants with accrued benefits derived from employer matching contributions that complete an hour

of service under the plan in a plan year beginning after December 31, 2001. Vesting of employer matching contributions under EGTRRA is under one of three alternative vesting schedules.

1. Full and immediate vesting
2. A three-year cliff schedule requiring full vesting after three years of service
3. A six-year graded schedule requiring 20% vesting per year starting after completion of the second year of service

For plans that are determined, under a formula to provide a disproportionate share of benefits to highly compensated individuals (top-heavy plans), the minimum vesting is required to be even faster.

In addition, ERISA requires minimum funding, in accordance with an acceptable actuarial method, for private pension plans. ERISA also established standards for employee participation and has made defined contribution plans more popular.

All of the above requirements strengthen the financial soundness of employee pension funds. To further ensure the ability of a plan to pay pension obligations and to safeguard employee rights, ERISA amended the Internal Revenue Code to allow for the assessment of fines and the denial of tax deductions. The Act also requires that pension plans submit annual reports, provide a description of the plan, and make a full disclosure through the submission of various statements and schedules.

Prior to the enactment of ERISA, some employees lost pension benefits when plans were terminated because of bankruptcy or other reasons. In order to protect employee rights under these circumstances, ERISA created PBGC. The function of this agency is to guarantee employees, if the employer cannot pay, at least a minimum amount of benefits for their years of service. This guarantee is financed by an insurance premium charge that is levied on all employers with defined benefit plans. PBGC also has the right to administer terminated plans, to file liens on employers' assets, and to take over employers' assets under certain specified circumstances.

Reporting by Limited Liability Companies and Partnerships 1048
Appendix A: Financial Statement Presentation **1050**

PERSPECTIVE AND ISSUES

CON 6 defines stockholders' equity as the residual interest in the assets of an entity after deducting its liabilities. Stockholders' equity is comprised of all capital contributed to the entity plus its accumulated earnings less any distributions that have been made. There are three major categories within the equity section: paid-in capital, retained earnings, and other comprehensive income. Paid-in capital represents equity contributed by owners. Retained earnings represents the sum of all earnings less that not retained in the business (i.e., what has been paid out as dividends). Other comprehensive income represents changes in net assets, other than by means of transactions with owners, which have not been reported in earnings under applicable GAAP rules (e.g., accumulated translation gains or losses). Accounting for paid-in capital and retained earnings are addressed in this chapter; comprehensive income was discussed in Chapter 3 and is not discussed here.

It is generally quite clear that liabilities differ from equity interests, since liabilities are claims against the assets of the reporting entity, while equity represents only residual claims to net assets, after all liabilities have been fully satisfied. While this conceptual distinction is straightforward enough, the evolution of complex financial instruments, some of which exhibit attributes of both liabilities and equity, has made it necessary that a formalized approach to distinguishing between these be developed. This has been receiving much attention for the past fifteen years, in fact, but a resolution is still not at hand.

FASB has been attempting to deal with this issue for years; a discussion memorandum, *Distinguishing between Liability and Equity Instruments and Accounting for Instruments with Characteristics of Both*, was issued in 1990, and an Exposure Draft, *Accounting for Financial Instruments with Characteristics of Liabilities, Equity, or Both,* was published in 2000. It was only in late 2001 that the FASB committed to the completion of this project, but to date multiple topics remain to be addressed, as does a promised revision to the definition of liabilities presented in CON 6, to facilitate and justify the newly mandated treatment for these instruments. This ongoing project is discussed later in this chapter.

Earnings are not generated by transactions in an entity's own equity (e.g., by the issuance, reacquisition, or reissuance of its common or preferred shares). Depending on the laws of the jurisdiction of incorporation, distributions to shareholders may be subject to various limitations, such as to the amount of retained (accounting basis) earnings.

A major objective of the accounting for stockholders' equity is the adequate disclosure of the sources from which the capital was derived. For this reason, a number of different paid-in capital accounts may be presented in the balance sheet. The rights of each class of shareholder must also be disclosed. Where shares are reserved for future issuance, such as under the terms of stock option plans, this fact must also be made known.

The long-standing controversy over accounting for stock-based compensation (e.g., employee stock options) heated up substantially in the wake of the financial reporting scandals of the late 1990s and early 2000s and the subsequent passage of the Sarbanes-Oxley Act. In the mid-1990s the FASB concluded that the economic substance of such plans was to provide compensation, and that resulted in an expense that should logically be reported by the entity (the fair value method of accounting); this view appears in ASC 718, which finally imposed fair value accounting on almost all share-based payment plans.

ASC 718 states the accounting for employers' contributions to employee stock ownership plans (ESOP). This relates to the measurement of compensation cost and to the accounting for dividends paid on unallocated shares.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Liabilities	
480	Distinguishing Liabilities from Equity
Equity	
505	Equity
Expenses	
718	Compensation—Stock Compensation
Broad Transactions	
805	Business Combinations
815-40	Derivatives and Hedging—Contracts in Entity's Own Equity
825-20	Registration Payment Arrangements
852	Reorganizations
Industry	
956	Limited Liability Entities

DEFINITIONS OF TERMS

Additional paid-in capital. Amounts received at issuance in excess of the par or stated value of capital stock and amounts received from other transactions involving the entity's stock and/or stockholders. It is classified by source.

Allocated shares. ESOP shares assigned to individual participants. These shares are usually based on length of service, compensation or a combination of both.

Appropriation (of retained earnings). A segregation of retained earnings to communicate the unavailability of a portion for dividend distributions.

Authorized shares. The maximum number of shares permitted to be issued by a corporation's charter and bylaws.

Blackout period. A period of time during which exercise of an equity share option is contractually or legally prohibited.

Broker-assisted cashless exercise. The simultaneous exercise by an employee of a share option and sale of the shares through a broker.

Calculated value. A measure of the value of a share option or similar instrument determined by substituting the historical volatility of an appropriate industry sector index for the expected volatility of a nonpublic entity's share price in an option-pricing model.

Callable. An optional characteristic of preferred stock allowing the corporation to redeem the stock at specified future dates and at specific prices. The call price is usually at or above the original issuance price.

Cliff vesting. A condition of an option or other stock award plan which provides that the employee becomes fully vested at a single point in time.

Closed-form model. A valuation model that uses an equation to produce an estimated fair value. The Black-Scholes-Merton formula is a closed-form model.

Combination plans. Awards consisting of two or more separate components, such as options and stock appreciation rights, each of which can be exercised. Each component is actually a separate plan and is accounted for as such.

Committed-to-be-released shares. ESOP shares that will be allocated to employees for service performed currently. They are usually released by payment of debt service.

Compensatory plan. A stock option or similar plan including elements of compensation which are recognized over the service period.

Comprehensive income. The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period, except those resulting from investments by and distributions to owners.

Constructive retirement method. Method of accounting for treasury shares which treats the shares as having been retired. The shares revert to authorized but unissued status. The stock and additional paid-in capital accounts are reduced, with a debit to retained earnings or a credit to a paid-in capital account for the excess or deficiency of the purchase cost over or under the original issuance proceeds.

Contributed capital. The amount of equity contributed by the corporation's shareholders. It consists of capital stock plus additional paid-in capital.

Convertible. An optional characteristic of preferred stock allowing the stockholders to exchange their preferred shares for common shares at a specified ratio.

Cost method. Method of accounting for treasury shares which presents aggregate cost of reacquired shares as a deduction from the total of paid-in capital and retained earnings.

Cross-volatility. A measure of the relationship between the volatilities of the prices of two assets taking into account the correlation between movements in the prices of the assets. (Refer to the definition of **volatility**.)

Cumulative. An optional characteristic of preferred stock. Any dividends of prior years not paid to the preferred shareholders must be paid before any dividends can be distributed to the common shareholders.

Date of declaration. The date on which the board of directors votes that a dividend shall be paid. A legal liability (usually current) is created on this date in the case of cash, property, and scrip dividends.

Date of grant. The date on which the board of directors awards the stock to the employees in stock option plans.

Date of payment. The date on which the shareholders are paid the declared dividends.

Date of record. The date on which ownership of the shares is determined. Those owning stock on this date will be paid the declared dividends.

Deficit. A debit balance in the retained earnings account. Dividends may not generally be paid when this condition exists. Formally known as accumulated deficit.

Derived service period. A service period for an award with a market condition that is inferred from the application of certain valuation techniques used to estimate fair value. For example, the derived service period for an award of share options that the employee can exercise only if the share price increases by 10% at any time during a 4-year period can be inferred from certain valuation techniques. If the derived service period is three years, the estimated requisite service period is three years and all compensation cost would be recognized over that period, unless the market condition was satisfied at an earlier date. Also, an award of fully vested, deep out-of-the money share options has a derived service period that must be determined from the valuation techniques used to estimate fair value. (See also **explicit service period**, **implicit service period** and **requisite service period**.)

Discount on capital stock. Occurs when the stock of a corporation is originally issued at a price below par value. The original purchasers become contingently liable to creditors for this difference.

Economic interest in an entity. Any type or form of pecuniary interest or arrangement that an entity could issue or be a party to, including equity securities; financial instruments with characteristics of equity, liabilities, or both; long-term debt and other debt-financing arrangements; leases; and contractual arrangements such as management contracts, service contracts, or intellectual property licenses.

Employee. An individual over whom the grantor of a share-based compensation award exercises or has the right to exercise sufficient control to establish an employer-employee relationship based on common law as illustrated in case law and currently under US Internal Revenue Service Revenue Ruling 87-41.171. A grantee meets the definition of an employee if the grantor consistently represents that individual to be an employee under common law.

The definition of an employee for payroll tax purposes under the US Internal Revenue Code includes common law employees. Accordingly, a grantor that classifies a grantee potentially subject to US payroll taxes as an employee for purposes of applying ASC 718 also must represent that individual as an employee for payroll tax purposes (unless the grantee is a leased employee). A leased individual is deemed to be an employee of the lessee for purposes of ASC 718 if all of a series of requirements are met, as defined in the ASC Master Glossary. For purposes of ASC 718, and only for awards granted for service as directors, nonemployee directors acting in their role as members of a board of directors are treated as employees if those directors were (a) elected by the employer's shareholders or (b) appointed to a board position that will be filled by shareholder election when the existing term expires.

Employee stock ownership plan (ESOP). A form of defined contribution employee benefit plan, whereby the employer facilitates the purchase of shares of stock in the company for the benefit of the employees, generally by a trust established by the company. The plan may be leveraged by borrowings either from the employer-sponsor or from third-party lenders.

Equity restructuring. A nonreciprocal transaction between an entity and its shareholders—such as a stock dividend, stock split, spin-off, rights offering, or recapitalization through a large, nonrecurring cash dividend—that causes the per-share fair value of the shares underlying an option or similar award to change.

Excess tax benefit. The realized tax benefit related to the amount (caused by changes in the fair value of the entity's shares after the measurement date for financial reporting) of deductible compensation cost reported on an employer's tax return for equity instruments in excess of the compensation cost for those instruments recognized for financial reporting purposes.

Explicit service period. A service period that is explicitly stated in the terms of a share-based payment award. An award that vest after three years of continuous employee service from the grant date has an explicit service period of three years. (See also **derived service period**, **implicit service period**, and **requisite service period**.)

Fair value. The amount at which an asset (or liability) could be bought (or incurred) or sold (or settled) in a current transaction between willing parties, that is, other than in a forced or liquidation sale.

Fixed options. Options that grant the holder the rights to a specified numbers of shares at fixed prices. They are not dependent upon achievement of performance targets.

Freestanding financial instrument. A financial instrument that is entered into separately and apart from any of the entity's other financial instruments or equity transactions or that is entered into in conjunction with some other transaction and is legally detachable and separately exercisable.

Graded vesting. A vesting process whereby the employee becomes entitled to a stock-based award fractionally over a period of years.

Grant date. The date at which employer and employee reach a mutual understanding of the key terms and conditions of a share-based payment award. The employer becomes contingently obligated on the grant date to issue equity instruments or transfer assets to an employee who renders the requisite service. Awards made under an arrangement that is subject to shareholder approval are not deemed to be granted until that approval is obtained, unless approval is essentially perfunctory. Individual awards that are subject to approval by the board of directors, management, or both are not deemed to be granted until all such approvals are obtained. The grant date for an award of equity instruments is the date that an employee begins to benefit from, or be adversely affected by, subsequent changes in the price of the employer's equity shares. (See also **service inception date**.)

Implicit service period. A service period that is not explicitly stated in the terms of a share-based payment award but that may be inferred from an analysis of those terms and other facts and circumstances. For instance, if an award of share options vests upon the completion of a new product design, which is deemed probable in 18 months, then the implicit service period is 18 months. (See also **derived service period**, **explicit service period**, and **requisite service period**.)

Intrinsic value. The amount by which the fair value of the underlying stock exceeds the option exercise price. A nonvested share may be described as an option on that share with an exercise price of zero. Thus, the fair value of a share is the same as the intrinsic value of such an option on that share.

Issuance costs. The costs incurred in underwriting an equity offering, to be reported as reductions of paid-in capital.

Issuance of equity instrument. An equity instrument is issued when the issuing entity receives the agreed-upon consideration, which may be cash, an enforceable right to receive cash or another financial instrument, goods or services. An entity may conditionally transfer an equity instrument to another party under an arrangement that permits that party to choose at a later date or for a specified time whether to deliver the consideration or to forfeit the right to the conditionally transferred instrument with no further obligation. In that situation, the equity instrument is not issued until the issuing entity has received the consideration. ASC 718 does not use the term issued for the grant of stock options or other equity instruments subject to vesting conditions.

Issued stock. The number of shares issued by the firm and owned by the shareholders and the corporation. It is the sum of outstanding shares plus treasury shares.

Junior stock. Shares with certain limitations, often as to voting rights, which are granted to employees pursuant to a performance compensation program. Such shares are generally convertible to ordinary shares upon achievement of defined goals.

Lattice model. A multiperiod model that produces an estimated fair value based on the assumed changes in prices of a financial instrument over successive periods. The binomial model is a lattice model. In each time period, the model assumes that at least two price movements are possible. The lattice represents the evolution of the value of either a financial instrument or a market variable for the purpose of valuing a financial instrument. In this context, a lattice model is based on risk-neutral valuation and a contingent claims framework. (Refer to closed form model for an explanation of the terms risk-neutral valuation and contingent claims framework.)

Legal capital. The aggregate par or stated value of stock. It represents the amount of owners' equity that cannot be distributed to shareholders. It serves to protect the claims of the creditors.

Liquidating dividend. A dividend distribution that is not based on earnings. It represents a return of contributed capital.

Market condition. A condition affecting the exercise price, exercisability, or other factors used in determining the fair value of an award under a share-based payment arrangement that relates to the achievement of either (a) a specified price of the issuer's shares or a specified amount of intrinsic value indexed solely to the issuer's shares, or (b) a specified price of the issuer's shares in terms of a similar (or index of similar) equity security (securities).

Measurement date. The date at which the equity share price and other factors (e.g., expected volatility) that enter into measurement of the total recognized amount of compensation cost for an award of share-based payment become fixed.

Modification. A change in any of the terms or conditions of a share-based payment award.

Noncompensatory stock options. Options which do not include an element of compensation. Under ASC 718 most stock plans include an element of compensation to be measured and allocated over the service periods of the employees or to be disclosed as such in the notes to the financial statements.

Nonpublic entity. Any entity other than one (1) whose equity securities trade in a public market either on a stock exchange or in the over-the-counter market, including securities quoted only locally or regionally, (2) that makes a filing with a regulatory agency in preparation for the sale of any class of equity securities in a public market, or (3) that is controlled by an entity covered by (1) or (2). An entity that has only debt securities trading in a public market (or that has made a filing with a regulatory agency in preparation to trade only debt securities) is a nonpublic entity for purposes of ASC 718.

Nonvested shares. Shares that an entity has not yet issued because the agreed-upon consideration, such as employee services, has not yet been received.

No-par stock. Stock that has no par value. Sometimes a stated value is determined by the board of directors. In this case, the stated value is accorded the same treatment as par value stock.

Outstanding stock. Stock issued by a corporation and held by shareholders (i.e., issued shares that are not held in the treasury).

Par value method. A method of accounting for treasury shares which charges the treasury stock account for the aggregate par or stated value of the shares acquired and charges the excess of the purchase cost over the par value to paid-in capital and/or retained earnings. A deficiency of purchase cost is credited to paid-in capital.

Participating. An optional characteristic of preferred stock whereby preferred shareholders may share ratably with the common shareholders in any profit distributions in excess of a predetermined rate. Participation may be limited to a maximum rate or may be unlimited (full).

Performance-based options. Options that are granted to employees conditional on the achievement of defined goals, such as market price of the underlying stock or earnings of the entity.

Performance condition. A condition affecting the vesting, exercisability, exercise price, or other pertinent factors used in determining the fair value of an award that relates to both (1) an employee's rendering service for a specified (either explicitly or implicitly) period of time, and (2) achieving a specified performance target that is defined solely by reference to the employer's own operations (or activities). Attaining a specified growth rate in return on assets, obtaining regulatory approval to market a specified product, selling shares in an initial public offering or other financing event, and a change in control are examples of performance conditions for purposes of ASC 718. A performance target also may be defined by reference to the same performance measure of another entity or group of entities.

Phantom stock plan. A type of stock compensation arrangement that gives employees the right to participate in the increase in value of the company's shares (book value or market value, as stipulated in the plan), without being required to actually purchase the shares initially.

Public entity. An entity (1) with equity securities that trade in a public market, which may be either a stock exchange or an over-the-counter market, including securities quoted only locally or regionally, (2) that makes a filing with a regulatory agency in preparation for the sale of any class of equity securities in a public market, or (3) that is controlled by an entity covered by (1) or (2).

Quasi reorganization. A procedure that reclassifies amounts from contributed capital to retained earnings to eliminate a deficit in that account. All the assets and liabilities are

first revalued to their current values. It represents an alternative to a legal reorganization in bankruptcy proceedings.

Related party. As defined by the ASC Master Glossary.

Reload feature and reload option. A reload feature provides for automatic grants of additional options whenever an employee exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. At the time of exercise using shares, the employee is automatically granted a new option, called a reload option, for the shares used to exercise the previous option.

Replacement award. An award of share-based compensation that is granted (or offered to grant) concurrently with the cancellation of another award.

Requisite service period. The period or periods during which an employee is required to provide service in exchange for an award under a share-based payment arrangement. The requisite service period for an award that has only a service condition is presumed to be the vesting period, unless there is clear evidence to the contrary. If an award requires future service for vesting, the entity cannot define a prior period as the requisite service period. Requisite service periods may be explicit, implicit, or derived, depending on the terms of the share-based payment award.

Restricted share. A share for which sale is contractually or governmentally prohibited for a specified period of time. Most grants of shares to employees are better termed nonvested shares because the limitation on sale stems solely from the forfeitability of the shares before employees have satisfied the necessary service or performance condition(s) to earn the rights to the shares. Restricted shares issued for consideration other than employee services, on the other hand, are fully paid immediately. For those shares, there is no period analogous to a requisite service period during which the issuer is unilaterally obligated to issue shares when the purchaser pays for those shares, but the purchaser is not obligated to buy the shares. ASC 718 uses the term restricted shares to refer only to fully vested and outstanding shares whose sale is contractually or governmentally prohibited for a specified period of time. (See also **nonvested shares**.)

Restriction. A contractual or governmental provision that prohibits sale (or substantive sale by using derivatives or other means to effectively terminate the risk of future changes in the share price) of an equity instrument for a specified period of time.

Retained earnings. The undistributed earnings of a firm.

Service condition. A condition affecting the vesting, exercisability, exercise price, or other pertinent factors used in determining the fair value of an award that depends solely on an employee rendering service to the employer for the requisite service period. A condition that results in the acceleration of vesting in the event of an employee's death, disability, or termination without cause is a service condition.

Service inception date. The date at which the requisite service period begins. The service inception date usually is the grant date, but the service inception date may differ from the grant date.

Service period. The period over which a stock-based compensation award is earned by the recipient. If not otherwise defined in the plan, it is the vesting period. Under ASC 718, if performance conditions affect either exercise price or date, then the service period must be consistent with the related assumption used in estimating fair value.

Settlement of an award. An action or event that irrevocably extinguishes the issuing entity's obligation under a share-based payment award. Transactions and events that constitute settlements include (1) exercise of a share option or lapse of an option at the end of its contractual term, (2) vesting of shares, (3) forfeiture of shares or share options due to failure to satisfy a vesting condition, and (4) an entity's repurchase of instruments in exchange for

assets or for fully vested and transferable equity instruments. The vesting of a share option is not a settlement as that term is used in ASC 718 because the entity remains obligated to issue shares upon exercise of the option.

Share option. A contract that gives the holder the right, but not the obligation, either to purchase (or call) or to sell (to put) a certain number of shares at a predetermined price for a specified period of time. Most share options granted to employees under share-based compensation arrangements are call options, but some may be put options.

Share unit. A contract under which the holder has the right to convert each unit into a specified number of shares of the issuing entity.

Share-based payment (or compensation) arrangement. An arrangement under which (a) one or more suppliers of goods or services (including employees) receive awards of equity shares, equity share options, or other equity instruments, or (b) the entity incurs liabilities to suppliers (1) in amounts based, at least in part, on the price of the entity's shares or other equity instruments, or (2) that require or may require settlement by issuance of the entity's shares. For purposes of ASC 718, the term shares includes various forms of ownership interest that may not take the legal form of securities (for example, partnership interests), as well as other interests, including those that are liabilities in substance but not in form. Equity shares refers only to shares that are accounted for as equity.

Share-based payment (or compensation) transaction. A transaction under a share-based payment arrangement, including a transaction in which an entity acquires goods or services because related parties or other holders of economic interest in that entity awards a share-based payment to an employee or other supplier of goods or services for the entity's benefit.

Short-term inducement. An offer by the entity that would result in modification or settlement of an award to which an award holder may subscribe for a limited period of time.

Small business issuer. A public entity that is an SEC registrant that files as a small business issuer under the Securities Act of 1933 or the Securities Exchange Act of 1934.

Stock-based compensation. Compensation arrangements under which employees receive shares of stock, stock options, or other equity instruments, or under which the employer incurs obligations to the employees based on the price of the company's shares.

Stock options. Enable officers and employees of a corporation to purchase shares in the corporation at a predetermined price for a defined period of time.

Stock rights. Enables present shareholders to purchase additional shares of stock of the corporation. They are commonly used if a preemptive right is granted to common shareholders by some state corporation laws.

Suspense shares. ESOP shares that usually collateralize ESOP debt. They have not been allocated or committed to be released.

Tandem plans. Compensation plans under which employees receive two or more components, such as options and stock appreciation rights, whereby the exercise of one component cancels the other(s).

Terms of a share-based payment award. The contractual provisions that determine the nature and scope of a share-based payment award. For example, the exercise price of share options is one of the terms of an award of share options. The written terms of a share-based payment award and its related arrangement, if any, usually provide the best evidence of its terms, but an entity's past practice or other factors may indicate that some aspects of the substantive terms differ from the written terms. The substantive terms of a share-based payment award as those terms are mutually understood by the entity and a party (either an employee or a nonemployee) who receives the award provide the basis for determining the rights conveyed to a party and the obligations imposed on the issuer, regardless of how the award and related arrangement, if any, are structured.

Time value of an option. The portion of the fair value of an option that exceeds its intrinsic value.

Treasury stock. Shares of a corporation that have been repurchased by the corporation. This stock has no voting rights and receives no cash dividends. Some states do not recognize treasury stock. In such cases, reacquired shares are treated as having been retired.

Vesting. Literally, to earn the rights to certain benefits. A share-based payment award becomes vested at the date that the employee's right to receive or retain shares, other instruments, or cash under the award is no longer contingent on satisfaction of either a service condition or a performance condition. Market conditions are not vesting conditions for purposes of ASC 718. The stated vesting provisions of an award often establish the requisite service period, and an award that has reached the end of the requisite service period is vested. However, the stated vesting period may differ from the requisite service period in certain circumstances.

Volatility. A measure of the amount by which a financial variable such as a share price has historically fluctuated or is expected to fluctuate during a period. Volatility also may be defined as a probability-weighted measure of the dispersion of returns about the mean. The volatility of a share price is the standard deviation of the continuously compounded rates of return on the share over a specified period. That is the same as the standard deviation of the differences in the natural logarithms of the stock prices plus dividends, if any, over the period. The higher the volatility, the more the returns on the shares can be expected to vary—up or down. Volatility is typically expressed in annualized terms.

CONCEPTS, RULES, AND EXAMPLES

Legal Capital and Capital Stock

Legal capital typically refers to that portion of the stockholders' investment in a corporation that is permanent in nature and represents assets that will continue to be available for the satisfaction of creditor's claims. Traditionally, legal capital was comprised of the aggregate par or stated value of common and preferred shares issued. In recent years, however, many states have eliminated the requirement that corporate shares have a designated par or stated value. States which have adopted provisions of the Model Business Corporation Act have eliminated the distinction between par value and the amount contributed in excess of par.

The specific requirements regarding the preservation of legal capital are a function of the business corporation laws in the state in which a particular entity is incorporated. Accordingly, any action by the corporation that could affect the amount of legal capital (e.g., the payment of dividends in excess of retained earnings) must be considered in the context of the relevant laws of the state where the company is chartered.

Ownership interest in a corporation is made up of common, and optionally, preferred shares. The common shares represent the residual risk-taking ownership of the corporation after the satisfaction of all claims of creditors and senior classes of equity.

Preferred stock. Preferred shareholders are owners who have certain rights superior to those of common shareholders. Preferences as to earnings exist when the preferred shareholders have a stipulated dividend rate (expressed either as a dollar amount or as a percentage of the preferred stock's par or stated value). Preferences as to assets exist when the preferred shares have a stipulated liquidation value. If a corporation were to liquidate, these preferred holders would be paid a specific amount before the common shareholders would have a right to participate in any of the proceeds.

In practice, preferred shares are more likely to have preferences as to earnings than as to assets. Although unusual, preferred shares may have both preferential rights. Preferred

shares may also have the following optional features: participation in earnings beyond the stipulated dividend rate; the cumulative feature, ensuring that dividends in arrears, if any, will be fully satisfied before the common shareholders participate in any earnings distribution; and convertibility or callability by the corporation. Preferences must be disclosed adequately in the financial statements, either on the face of the balance sheet or in the notes thereto.

In exchange for the preferences, the preferred shareholders' other rights or privileges are often limited. For instance, the right to vote may be restricted to common shareholders. The most important right denied to the preferred shareholders, however, is the right to participate without limitation in the earnings of the corporation. Thus, if the corporation has exceedingly large earnings for a particular period, most of these earnings would accrue to the benefit of the common shareholders. This statement is true even if the preferred stock is participating (a fairly uncommon feature) because participating preferred stock usually has some upper limitation placed upon the extent of participation.

Occasionally, several classes of stock will be categorized as common (e.g., Class A common, Class B common, etc.). Since there can be only one class of shares that represents the true residual risk-taking ownership in a corporation, it is clear that the other classes, even though described as common shareholders, must in fact have some preferential status. Typically, these preferences relate to voting rights. An example of this situation arises when a formerly closely held corporation sells shares to the public but gives the publicly held shares a disproportionately small capacity to exercise influence over the entity, thereby keeping control in the hands of the former majority owners even as they are reduced to the status of minority owners. The rights and responsibilities of each class of shareholder, even if described as common, must be fully disclosed in the financial statements.

Issuance of shares. The accounting for the sale of shares by a corporation depends upon whether the stock has a par or stated value. If there is a par or stated value, the amount of the proceeds representing the aggregate par or stated value is credited to the common or preferred stock account. The aggregate par or stated value is generally defined as legal capital not subject to distribution to shareholders. Proceeds in excess of par or stated value are credited to an additional paid-in capital account. The additional paid-in capital represents the amount in excess of the legal capital that may, under certain defined conditions, be distributed to shareholders.

A corporation selling stock below par value credits the capital stock account for the par value and debits an offsetting discount account for the difference between par value and the amount actually received. If the discount is on original issue capital stock, it serves to notify the actual and potential creditors of the contingent liability of those investors. As a practical matter, corporations avoided this problem by reducing par values to an arbitrarily low amount. This reduction in par eliminated the chance that shares would be sold for amounts below par.

Where the Model Business Corporation Act has been adopted or where corporation laws have been conformed to the guidelines of that Act, there is often no distinction made between par value and amounts in excess of par. In those jurisdictions, the entire proceeds from the sale of stock may be credited to the common stock account without distinction between the stock and the additional paid-in capital accounts. The following entries illustrate these concepts:

Facts: A corporation sells 100,000 shares of \$5 par common stock for \$8 per share cash.

Cash	800,000	
Common stock		500,000
Additional paid-in capital		300,000

Facts: A corporation sells 100,000 shares of no-par common stock for $8 per share cash.

Cash	800,000	
Common stock		800,000

Preferred stock will often be assigned a par value because in many cases the preferential dividend rate is defined as a percentage of par value (e.g., 10%, $25 par value preferred stock will have a required annual dividend of $2.50).

If the shares in a corporation are issued in exchange for services or property rather than for cash, the transaction should be reflected at the fair value of the property or services received. If this information is not readily available, then the transaction should be recorded at the fair value of the shares that were issued. Where necessary, appraisals should be obtained in order to properly reflect the transaction. As a final resort, a valuation of the stock issued can be made by the board of directors. Stock issued to employees as compensation for services rendered should be accounted for at the fair value of the services performed, if determinable, or the value of the shares issued. If shares are given by a major shareholder directly to an employee for services performed for the entity, this exchange should be accounted for as a capital contribution to the company by the major shareholder and as compensation expense incurred by the company. Only when accounted for in this manner will there be conformity with the general principle that all costs incurred by an entity, including compensation, should be reflected in its financial statements.

In certain instances, common and preferred shares may be issued to investors as a unit (e.g., one share of preferred and two shares of common sold as a package). Where both of the classes of stock are publicly traded, the proceeds from a unit offering should be allocated in proportion to the relative market values of the securities. If only one of the securities is publicly traded, then the proceeds should be allocated to the one that is publicly traded based on its known market value. Any excess is allocated to the other. Where the market value of neither security is known, appraisal information may be used. The imputed fair value of one class of security, particularly the preferred shares, can be based upon the stipulated dividend rate. In this case, the amount of proceeds remaining after the imputing of a value of the preferred shares would be allocated to the common stock.

The foregoing procedures would also apply if a unit offering were made of an equity and a nonequity security such as convertible debentures. Under proposed FASB guidelines, proceeds would be apportioned on the basis of relative fair values. (See the detailed discussion later in this chapter.)

Equity offerings generally involve the incurrence of various costs, such as legal and accounting fees and underwriting commissions. These are offset against the proceeds of the offering, generally reducing paid-in capital, which is thus reported net of costs. If a unit offering involves debt and equity, the offering costs should be allocated proportionally against equity and debt, possibly creating a discount on the debt issuance that will be amortized as additional interest expense in the usual manner. (See Chapter 15 for full discussion of accounting for premium or discount on debt.)

In certain situations, equity (or debt) is issued with a promise by the reporting entity to effect registration of the instruments by a defined date after issuance, or upon the occurrence of a contingent event. Per ASC 825-20, such obligations are recognized and measured consistent with the requirements of ASC 450, which does not alter the accounting for the associated financial instrument itself.

Stock Subscriptions

Occasionally, particularly in the case of a newly organized corporation, a contract is entered into between the corporation and prospective investors, whereby the latter agree to pur-

chase specified numbers of shares to be paid for over some installment period. These stock subscriptions are not the same as actual stock issuances and the accounting differs.

The amount of stock subscriptions receivable by a corporation is occasionally accounted for as an asset on the balance sheet and is categorized as current or noncurrent in accordance with the terms of payment. However, in accordance with SEC requirements, most subscriptions receivable are shown as a reduction of stockholders' equity in the same manner as treasury stock. Since subscribed shares do not have the rights and responsibilities of actual outstanding stock, the credit is made to a stock subscribed account instead of to the capital stock accounts.

ASC 310-10-45-14 states that a contribution to a company's equity made in the form of a note receivable should generally not be reported as an asset unless circumstances indicate both the ability and intent to pay in a short period of time. EITF noted that the most widespread practice is to report these notes as a reduction of equity. However, if the cash is received prior to the issuance of the financial statements, the note may be reported as an asset.

If the common stock has par or stated value, the common stock subscribed account is credited for the aggregate par or stated value of the shares subscribed. The excess over this amount is credited to additional paid-in capital. No distinction is made between additional paid-in capital relating to shares already issued and shares subscribed for. This treatment follows from the distinction between legal capital and additional paid-in capital. Where there is no par or stated value, the entire amount of the common stock subscribed is credited to the stock subscribed account.

As the amount due from the prospective shareholders is collected, the stock subscriptions receivable account is credited and the proceeds are debited to the cash account. Actual issuance of the shares, however, must await the complete payment of the stock subscription. Accordingly, the debit to common stock subscribed is not made until the subscribed shares are fully paid for and the stock is issued.

The following journal entries illustrate these concepts:

1. 10,000 shares of $50 par preferred are subscribed at a price of $65 each; a 10% down payment is received.

Cash	65,000	
Stock subscriptions receivable	585,000	
Preferred stock subscribed		500,000
Additional paid-in capital		150,000

2. 2,000 shares of no-par common shares are subscribed at a price of $85 each, with one-half received in cash.

Cash	85,000	
Stock subscriptions receivable	85,000	
Common stock subscribed		170,000

3. All preferred subscriptions are paid and subscribed preferred shares are issued, and one-half of the remaining common subscriptions are collected in full.

Cash [$585,000 + ($85,000 × .50)]	627,500	
Stock subscriptions receivable		627,500
Preferred stock subscribed	500,000	
Preferred stock		500,000

4. The remaining common subscriptions are collected in full.

Cash ($85,000 × .50)	42,500	
Stock subscriptions receivable		42,500
Common stock subscribed	170,000	
Common stock		170,000

When a subscriber defaults on an obligation under a stock subscription agreement, the accounting will follow the provisions of the state in which the corporation is chartered. In

some jurisdictions, the subscriber is entitled to a proportionate number of shares based upon the amount already paid on the subscriptions, sometimes reduced by the cost incurred by the corporation in selling the remaining defaulted shares to other stockholders. In other jurisdictions, the subscriber forfeits the entire investment upon default. In this case, the amount already received is credited to an additional paid-in capital account that describes its source.

Additional Paid-in Capital

Additional paid-in capital represents all capital contributed to a corporation other than that defined as par, stated value, no-par stock, or donated capital. Additional paid-in capital can arise from proceeds received from the sale of common and preferred shares in excess of their par or stated values. It can also arise from transactions related to the following:

1. Sale of shares previously issued and subsequently reacquired by the corporation (treasury stock)
2. Retirement of previously outstanding shares
3. Payment of stock dividends in a manner that justifies the dividend being recorded at the market value of the shares distributed
4. Lapse of stock purchase warrants or the forfeiture of stock subscriptions, if these result in the retaining by the corporation of any partial proceeds received prior to forfeiture
5. Warrants which are detachable from bonds
6. Conversion of convertible bonds
7. Other "gains" on the company's own stock, such as that which results from certain stock option plans

When the amounts are material, the sources of additional paid-in capital should be described in the financial statements.

Examples of additional paid-in capital transactions

ABC Company issues 2,000 shares of common stock having a par value of $1, of a total price of $8,000. The following entry records the transaction:

Cash	8,000	
Common stock		2,000
Additional paid-in capital		6,000

ABC Company buys back 2,000 shares of its own common stock for $10,000 and then sells these shares to investors for $15,000. The following entries record the buyback and sale transactions, respectively, assuming the use of the cost method of accounting for treasury stock:

Treasury stock	10,000	
Cash		10,000

Cash	15,000	
Treasury stock		10,000
Additional paid-in capital		5,000

ABC Company buys back 2,000 shares of its own $1 par value common stock (which it had originally sold for $8,000) for $9,000 and retires the stock, which it records with the following entry:

Common stock	2,000	
Additional paid-in capital	6,000	
Retained earnings	1,000	
Cash		9,000

ABC Company issues a small stock dividend of 5,000 common shares at the market price of $8 per share. Each share has a par value of $1. The following entry records the transaction:

Retained earnings	40,000	
Common stock		5,000
Additional paid-in capital		35,000

ABC Company previously has recorded $1,000 of stock options outstanding as part of a compensation agreement. The options expire a year later, resulting in the following entry:

Stock options outstanding	1,000	
Additional paid-in capital		1,000

ABC Company sells 2,000 of par $1,000 bonds, as well as 2,000 attached warrants having a market value of $15 each. Pro rata apportionment of the $2,000,000 cash received between the bonds and warrants results in the following entry:

Cash	2,000,000	
Discount on bonds payable	29,557	
Bonds payable		2,000,000
Additional paid-in capital—warrants		29,557

ABC's bondholders convert a $1,000 bond with an unamortized premium of $40 and a market value of $1,016 into 127 shares of $1 par common stock whose market value is $8 per share. This results in the following entry:

Bonds payable	1,000	
Premium on bonds payable	40	
Common stock		913
Additional paid-in capital		127

When the amounts are material, the sources of additional paid-in capital should be described in the financial statements.

Donated Capital

Donated capital can result from an outright gift to the corporation (e.g., a major shareholder donates land or other assets to the company in a nonreciprocal transfer) or may result when services are provided to the corporation. Under ASC 958-605-25-2 such nonreciprocal transactions are recognized as revenue in the period the contribution is received. Donated capital should be adequately disclosed in the financial statements.

It is now required that donations be reflected in the income statement, which means that, after the fiscal period has ended and the books have been closed, the effect of donations will be incorporated in the reporting entity's retained earnings.

In the case of donations, historical cost is not adequate to properly reflect the substance of the transaction, since the historical cost to the corporation would be zero. Accordingly, these events should be reflected at fair market value (ASC 845-10-30-1). If long-lived assets are donated to the corporation, they should be recorded at their fair value at the date of donation, and the amount so recorded should be depreciated over the normal useful economic life of such assets. If donations are conditional in nature, they should not be reflected formally in the accounts until the appropriate conditions have been satisfied. However, disclosure might still be required in the financial statements of both the assets donated and the conditions required to be met.

Example of donated capital

A board member of the for-profit Adirondack Boys' Club (ABC) donates land to the organization that has a fair market value of $1 million. ABC records the donation with the following entry:

Land	1,000,000	
Revenue—donations		1,000,000

The same board member donates one year of accounting labor to ABC. The fair value of services rendered is $75,000. ABC records the donation with the following entry:

Salaries—accounting department	75,000	
Revenue—donations		75,000

The board member also donates one year of free rent of a local building to ABC. The annual rent in similar facilities is $45,000. ABC records the donation with the following entry:

Rent expense	45,000	
Revenue—donations		45,000

Finally, the board member pays off a $100,000 debt owed by ABC. ABC records the donation with the following entry:

Notes payable	100,000	
Revenue—donations		100,000

Following the closing of the fiscal period, the effect of all the foregoing donations will be reflected in Adirondack's retained earnings account.

Retained Earnings

Legal capital, additional paid-in capital, and donated capital collectively represent the contributed capital of the corporation. The other major source of capital is retained earnings, which represents the accumulated amount of earnings of the corporation from the date of inception (or from the date of reorganization) less the cumulative amount of distributions made to shareholders and other charges to retained earnings (e.g., from treasury stock transactions). The distributions to shareholders generally take the form of dividend payments but may take other forms as well, such as the reacquisition of shares for amounts in excess of the original issuance proceeds. The key events impacting retained earnings are as follows:

- Dividends
- Certain treasury stock resales at amounts below acquisition cost
- Certain stock retirements at amounts in excess of book value
- Prior period adjustments
- Recapitalizations and reorganizations

Examples of retained earnings transactions

Merrimack Corporation declares a dividend of $84,000, which it records with the following entry:

Retained earnings	84,000	
Dividends payable		84,000

Merrimack acquires 3,000 shares of its own $1 par value common stock for $15,000, and then resells it for $12,000. The following entries record the buyback and sale transactions respectively, assuming the use of the cost method of accounting for treasury stock:

Treasury stock	15,000	
Cash		15,000
Cash	12,000	
Retained earnings	3,000	
Treasury stock		15,000

Merrimack buys back 12,000 shares of its own $1 par value common stock (which it had originally sold for $60,000) for $70,000 and retires the stock, which it records with the following entry:

Common stock	12,000	
Additional paid-in capital	48,000	
Retained earnings	10,000	
Cash		70,000

Merrimack's accountant makes a mathematical mistake in calculating depreciation, requiring a prior period reduction of $30,000 to the accumulated depreciation account, and corresponding

increases in its income tax payable and retained earnings accounts. Merrimack's income tax rate is 35%. It records this transaction with the following entry:

Accumulated depreciation	30,000	
Income taxes payable		10,500
Retained earnings		19,500

Retained earnings are also affected by action taken by the corporation's board of directors. Appropriation serves disclosure purposes and restricts dividend payments, but does nothing to provide any resources for the satisfaction of the contingent loss or other underlying purpose for which the appropriation has been made. Any appropriation made from retained earnings must eventually be returned to the retained earnings account. It is not permissible to charge losses against the appropriation account nor is it to credit any realized gain to that account. The use of appropriated retained earnings has diminished significantly over the years.

It is axiomatic that transactions in a corporation's own stock can result in a reduction of retained earnings (i.e., a deficiency on such transactions can be charged to retained earnings) but cannot result in an increase in retained earnings (any excesses on such transactions are credited to paid-in capital, never to retained earnings).

If a series of operating losses have been incurred or distributions to shareholders in excess of accumulated earnings have been made, and if there is a debit balance in retained earnings, the account is generally referred to as accumulated deficit.

Dividends

Dividends are the pro rata distribution of earnings to the owners of the corporation. The amount and the allocation between the preferred and common shareholders is a function of the stipulated preferential dividend rate; the presence or absence of (1) a participation feature, (2) a cumulative feature, and (3) arrearages on the preferred stock; and the wishes of the board of directors. Dividends, even preferred stock dividends, where a cumulative feature exists, do not accrue. Dividends only become a liability of the corporation when they are declared by the board of directors.

Traditionally, corporations were not allowed to declare dividends in excess of the amount of retained earnings. Alternatively, a corporation could pay dividends out of retained earnings and additional paid-in capital but could not exceed the total of these categories (i.e., they could not impair legal capital by the payment of dividends). States that have adopted the Model Business Corporation Act grant more latitude to the directors. Corporations can now, in certain jurisdictions, declare and pay dividends in excess of the book amount of retained earnings if the directors conclude that, after the payment of such dividends, the fair value of the corporation's net assets will still be a positive amount. Thus, directors can declare dividends out of unrealized appreciation that, in certain industries, can be a significant source of dividends beyond the realized and recognized accumulated earnings of the corporation. This action, however, represents a major departure from traditional practice and demands both careful consideration and adequate disclosure.

Three important dividend dates are

1. The declaration date
2. The record date
3. The payment date

The declaration date governs the incurrence of a legal liability by the corporation. The record date refers to that point in time when a determination is made as to which specific registered stockholders will receive dividends and in what amounts. Finally, the payment date relates to the date when the distribution of the dividend takes place. These concepts are illustrated in the following example:

On May 1, 2008, the directors of River Corp. declared a $.75 per share quarterly dividend on River Corp.'s 650,000 outstanding common shares. The dividend is payable May 25 to holders of record May 15.

May 1	Retained earnings (or dividends)	487,500	
	Dividends payable		487,500
May 15	No entry		
May 25	Dividends payable	487,500	
	Cash		487,500

If a dividends account is used, it is closed to retained earnings at year-end.

Dividends may be made in the form of cash, property, or scrip. Cash dividends are either a given dollar amount per share or a percentage of par or stated value. Property dividends consist of the distribution of any assets other than cash (e.g., inventory or equipment). Finally, scrip dividends are promissory notes due at some time in the future, sometimes bearing interest until final payment is made.

Occasionally, what appear to be disproportionate dividend distributions are paid to some, but not all, of the owners of closely held corporations. Such transactions need to be carefully analyzed. In some cases these may actually represent compensation paid to the recipients. In other instances, these may be a true dividend paid to all shareholders on a pro rata basis, to which certain shareholders have waived their rights. If the former, the distribution should not be accounted for as a dividend, but rather as compensation or some other expense category and included on the income statement. If the latter, the dividend should be "grossed up" to reflect payment on a proportional basis to all the shareholders, with an offsetting capital contribution to the company recognized as having been effectively made by those to whom payments were not made.

Property dividends. If property dividends are declared, the paying corporation may incur a gain or loss. Since the dividend should be reflected at the fair value of the assets distributed, the difference between fair value and book value is recorded at the time the dividend is declared and charged or credited to a loss or gain account.

Scrip dividends. If a corporation declares a dividend payable in scrip that is interest bearing, the interest is accrued over time as a periodic expense. The interest is not a part of the dividend itself.

Liquidating dividends. Liquidating dividends are not distributions of earnings, but rather a return of capital to the investing shareholders. A liquidating dividend is normally recorded by the declarer through charging additional paid-in capital rather than retained earnings. The exact accounting for a liquidating dividend is affected by the laws where the business is incorporated, and these laws vary from state to state.

Stock dividends. Stock dividends represent neither an actual distribution of the assets of the corporation nor a promise to distribute those assets. For this reason, a stock dividend is not considered a legal liability or a taxable transaction.

Despite the recognition that a stock dividend is not a distribution of earnings, the accounting treatment of relatively insignificant stock dividends (defined as being less than 20% to 25% of the outstanding shares prior to declaration) is consistent with it being a real dividend. Accordingly, retained earnings are debited for the fair market value of the shares to be paid as a dividend, and the capital stock and additional paid-in capital accounts are credited for the appropriate amounts based upon the par or stated value of the shares, if any. A stock dividend declared but not yet paid is classified as such in the stockholders' equity section of the balance sheet. Since such a dividend never reduces assets, it cannot be a liability.

The selection of 20% to 25% as the threshold for recognizing a stock dividend as an earnings distribution is arbitrary, but it is based somewhat on the empirical evidence that small stock dividends tend not to result in a reduced market price per share for outstanding

shares. The aggregate value of the outstanding shares should not change, but the greater number of shares outstanding after the stock dividend should necessitate a lower per share price. As noted, however, the declaration of small stock dividends tends not to have this impact, and this phenomenon supports the accounting treatment.

On the other hand, when stock dividends are larger in magnitude, it is observed that per share market value declines after the declaration of the dividend. In such situations, it would not be valid to treat the stock dividend as an earnings distribution. Rather, it should be accounted for as a split. The precise treatment depends upon the legal requirements of the state of incorporation and upon whether the existing par value or stated value is reduced concurrent with the stock split.

If the par value is not reduced for a large stock dividend and if state law requires that earnings be capitalized in an amount equal to the aggregate of the par value of the stock dividend declared, the event should be described as a stock split effected in the form of a dividend, with a charge to retained earnings and a credit to the common stock account for the aggregate par or stated value. When the par or stated value is reduced in recognition of the split and state laws do not require treatment as a dividend, there is no formal entry to record the split but merely a notation that the number of shares outstanding has increased and the per share par or stated value has decreased accordingly. It should be noted that many companies account for stock splits as if they were a large stock dividend. By doing this, par value per share remains unchanged. The concepts of small versus large stock dividends are illustrated in the following examples:

Assume that stockholders' equity for the Wasatch Corp. on November 1, 2008, is as follows:

Common stock, $1 par, 100,000 shares outstanding	$ 100,000
Paid-in capital in excess of par	1,100,000
Retained earnings	750,000

Small Stock Dividend: On November 10, 2008, the directors of Wasatch Corp. declared a 15% stock dividend, or a dividend of 1.5 shares of common stock for every 10 shares held. Before the stock dividend, the stock is selling for $23 per share. After the 15% stock dividend, each original share worth $23 will become 1.15 shares, each with a value of $20 ($23/1.15). The stock dividend is to be recorded at the market value of the new shares issued, or $300,000 (15,000 new shares at the postdividend price of $20). The entries to record the declaration of the dividend and the issuance of stock (on November 30) by Wasatch Corp. are as follows:

Nov. 10	Retained earnings	300,000	
	Stock dividends distributable		15,000
	Paid-in capital in excess of par		285,000
Nov. 30	Stock dividends distributable	15,000	
	Common stock, $1 par		15,000

Large Stock Dividend: Because the focus of the Committee on Accounting Procedure was on reducing the number of small stock dividends, the accounting requirements for governing large stock dividends are less specific than those for small stock dividends. In practice, ASC 505-20-30-3 results in the par or stated value of the newly issued shares being transferred to the capital stock account from either retained earnings or paid-in capital in excess of par. To illustrate, assume that on November 10, 2008, Wasatch Corp. declares a 50% large stock dividend, a dividend of one share for every two held. Legal requirements call for the transfer to capital stock of an amount equal to the par value of the shares issued. Entries for the declaration on November 10 and the issuance of 50,000 new shares (100,000 × .50) on November 30 are as follows:

Nov. 10	Retained earnings	50,000	
	Stock dividends distributable		50,000
	or		
	Paid-in capital in excess of par	50,000	
	Stock dividends distributable		50,000
Nov. 30	Stock dividends distributable	50,000	
	Common stock, $1 par		50,000

Treasury Stock

Treasury stock consists of a corporation's own stock which has been issued, subsequently reacquired by the firm, and not yet reissued or canceled. Treasury stock does not reduce the number of shares issued but does reduce the number of shares outstanding, as well as total stockholders' equity. These shares are not eligible to receive cash dividends. Treasury stock is not an asset although, in some very limited circumstances, it may be presented as an asset if adequately disclosed (ASC 505-30-30). Reacquired stock that is awaiting delivery to satisfy a liability created by the firm's compensation plan or reacquired stock held in a profit-sharing trust is still considered outstanding and would not be considered treasury stock. In each case, the stock would be presented as an asset with the accompanying footnote disclosure. Accounting for excesses and deficiencies on treasury stock transactions is governed by ASC 505-30-30.

Three approaches exist for the treatment of treasury stock: the cost, par value, and constructive retirement methods.

Cost method. Under the cost method, the gross cost of the shares reacquired is charged to a contra equity account (treasury stock). The equity accounts that were credited for the original share issuance (common stock, paid-in capital in excess of par, etc.) remain intact. When the treasury shares are reissued, proceeds in excess of cost are credited to a paid-in capital account. Any deficiency is charged to retained earnings (unless paid-in capital from previous treasury share transactions exists, in which case the deficiency is charged to that account, with any excess charged to retained earnings). If many treasury stock purchases are made, a cost flow assumption (e.g., FIFO or specific identification) should be adopted to compute excesses and deficiencies upon subsequent share reissuances. The advantage of the cost method is that it avoids identifying and accounting for amounts related to the original issuance of the shares and is, therefore, the simpler, more frequently used method.

The cost method is most consistent with the one-transaction concept. This concept takes the view that the classification of stockholders' equity should not be affected simply because the corporation was the middle "person" in an exchange of shares from one stockholder to another. In substance, there is only a transfer of shares between two stockholders. Since the original balances in the equity accounts are left undisturbed, its use is most acceptable when the firm acquires its stock for reasons other than its retirement, or when its ultimate disposition has not yet been decided.

Par value method. Under the par value method, the treasury stock account is charged only for the aggregate par (or stated) value of the shares reacquired. Other paid-in capital accounts (excess over par value, etc.) are relieved in proportion to the amounts recognized upon the original issuance of the shares. The treasury share acquisition is treated almost as a retirement. However, the common (or preferred) stock account continues at the original amount, thereby preserving the distinction between an actual retirement and a treasury share transaction.

When the treasury shares accounted for by the par value method are subsequently resold, the excess of the sale price over par value is credited to paid-in capital. A reissuance for a price below par value does not create a contingent liability for the purchaser. It is only the original purchaser who risks this obligation to the entity's creditors.

Constructive retirement method. The constructive retirement method is similar to the par value method, except that the aggregate par (or stated) value of the reacquired shares is charged to the stock account rather than to the treasury stock account. This method is superior when (1) it is management's intention not to reissue the shares within a reasonable time period or (2) the state of incorporation defines reacquired shares as having been retired. In the latter case, the constructive retirement method is probably the only method of accounting

for treasury shares that is not inconsistent with the state Business Corporation Act, although the state law does not necessarily dictate such accounting. Certain states require that treasury stock be accounted for by this method.

The two-transaction concept is most consistent with the par value and constructive retirement methods. First, the reacquisition of the firm's shares is viewed as constituting a contraction of its capital structure. Second, the reissuance of the shares is the same as issuing new shares. There is little difference between the purchase and subsequent reissuance of treasury shares and the acquisition and retirement of previously issued shares and the issuance of new shares.

Treasury shares originally accounted for by the cost method can subsequently be restated to conform to the constructive retirement method. If shares were acquired with the intention that they would be reissued and it is later determined that such reissuance is unlikely (due, for example, to the expiration of stock options without their exercise), then it is proper to restate the transaction.

Example of accounting for treasury stock

1. 100 shares ($50 par value) that were originally sold for $60 per share are later reacquired for $70 each.
2. All 100 shares are subsequently resold for a total of $7,500.

To record the acquisition, the entry is

Cost method			*Par value method*			*Constructive retirement method*		
Treasury stock	7,000		Treasury stock	5,000		Common stock	5,000	
Cash		7,000	Additional paid-in capital—common stock	1,000		Additional paid-in capital—common stock	1,000	
			Retained earnings	1,000		Retained earnings	1,000	
			Cash		7,000	Cash		7,000

To record the resale, the entry is

Cost method			*Par value method*			*Constructive retirement method*		
Cash	7,500		Cash	7,500		Cash	7,500	
Treasury stock		7,000	Treasury stock		5,000	Common stock		5,000
Additional paid-in capital—treasury stock		500	Additional paid-in capital—common stock		2,500	Additional paid-in capital—common stock		2,500

If the shares had been resold for $6,500, the entry is

Cost method			*Par value method*			*Constructive retirement method*		
Cash	6,500		Cash	6,500		Cash	6,500	
Retained earnings*	500		Treasury stock		5,000	Common stock		5,000
Treasury stock		7,000	Additional paid-in capital—common stock		1,500	Additional paid-in capital—common stock		1,500

* *"Additional paid-in capital—treasury stock" or "Additional paid-in capital—retired stock" of that issue would be debited first to the extent it exists.*

Alternatively, under the par or constructive retirement methods, any portion of or the entire deficiency on the treasury stock acquisition may be debited to retained earnings without allocation to paid-in capital. Any excesses will always be credited to an "Additional paid-in capital—retired stock" account.

The laws of some states govern the circumstances under which a corporation may acquire treasury stock and may prescribe the accounting for the stock. For example, a charge to retained earnings may be required in an amount equal to the treasury stock's total cost. In such cases, the accounting per the state law prevails. Also, some states (including those that have adopted the Model Business Corporation Act) define excess purchase cost of reacquired

(i.e., treasury) shares as being "distributions" to shareholders that are no different in nature than dividends. In such cases, the financial statement presentation should adequately disclose the substance of these transactions (e.g., by presenting both dividends and excess reacquisition costs together in the retained earnings statement).

When a firm decides to formally retire the treasury stock, the journal entry is dependent on the method used to account for the stock. Using the original sale and reacquisition data from the illustration above, the following entries would be made if the cost and par value methods, respectively, were employed:

Cost method			*Par value method*		
Common stock	5,000		Common stock	5,000	
Additional paid-in capital—common stock	1,000		Treasury stock		5,000
Retained earnings	1,000				
Treasury stock		7,000			

* *"Additional paid-in capital—treasury stock" may be debited to the extent it exists.*

If the constructive retirement method were used to record the treasury stock purchase, no additional entry would be necessary upon the formal retirement of the shares.

After the entry is made, the pro rata portion of all paid-in capital existing for that issue (i.e., capital stock and additional paid-in capital) will have been eliminated. If stock is purchased for immediate retirement (i.e., not put into the treasury) the entry to record the retirement is the same as that made under the constructive retirement method.

In some circumstances, shares held by current stockholders may be donated back to the enterprise, possibly to facilitate a resale to new owners who will infuse needed capital into the business. In accounting for donated treasury stock, the intentions of management regarding these reacquired shares is key; if these are to simply be retired, the common stock account should be debited for the par or stated value (if par or stated value stock) or the original proceeds received (if no-par, no-stated-value stock). The current fair value of the shares should be credited to the "donated capital" account, and the difference should be debited or credited to a suitably titled paid-in capital account, such as "additional paid-in capital from share donations."

If the donated shares are to be sold (the normal scenario), variations on the par and cost methods of treasury stock accounting can be employed, with "donated capital" being debited and credited, respectively, when shares are received and later reissued, instead of the "treasury stock" account employed in the above illustrations. Note, however, that if the cost method is used, the debit to the donated capital account should be for the fair value of the shares, not the cost (a seeming contradiction). If the constructive retirement method is utilized instead, only a memorandum entry will be recorded when the shares are received; when reissued, the entire proceeds should be credited to "donated capital."

Other Paid-in Capital Issues

Takeover defense as cost of treasury stock. In certain instances an entity may incur costs to defend against an unwelcome or hostile attempted takeover. In some cases, in fact, putative acquirers will threaten a takeover struggle in order to extract so-called "greenmail" from the target entity, often effected through a buyback of shares held by the acquirer at a premium over market value. ASC 505-30-30 states that the excess purchase price of treasury shares should not be attributed to the shares, but rather should be attributed to the other elements of the transaction and accounted for according to their substance, which could include the receipt of stated or unstated rights, privileges, or agreements. The SEC's position is that such excess is anything over the quoted market price of the treasury shares.

Accelerated share repurchase programs. ASC 505-30-25 pertains to accelerated share repurchase programs, which are combinations of transactions that permit an entity to purchase a targeted number of shares immediately, with the final purchase price determined by an average market price over fixed periods of time. Such programs are intended to combine the immediate share retirement benefits (boosting earnings per share, etc.) of tender offers with the market impacts and pricing benefits of disciplined open market stock repurchase programs. At issue were the implications of accelerated share repurchase programs on EPS calculations and entities' abilities to account for business combinations as (now obsolete) poolings of interests.

The ASC states that an entity should account for an accelerated share repurchase program as two separate transactions: first, as shares of common stock acquired in a treasury stock transaction recorded on the acquisition date, and second, as a forward contract indexed to its own common stock. An entity would classify the forward contract in the above example as an equity instrument because the entity will receive cash when the contract is in a gain position but pay cash or stock when the contract is in a loss position. Changes in the fair value of the forward contract would not be recorded, and the settlement of the forward contract would be recorded in equity.

The treasury stock transaction would result in an immediate reduction of the outstanding shares used to calculate the weighted-average common shares outstanding for both basic and diluted EPS. The effect of the forward contract on diluted EPS would be calculated in accordance with ASC 260.

Freestanding derivatives indexed to, and potentially settled in, stock of a consolidated subsidiary. ASC 815-40 establishes a framework for accounting for freestanding derivative instruments that are indexed to, and potentially settled in, a company's own stock. That consensus did not, however, provide guidance on how to account for freestanding derivative instruments that are indexed to, and potentially settled in, a subsidiary's stock. ASC 810-10 deals with how such contracts should be classified and measured in the consolidated financial statements.

Stock of a subsidiary is not equity of the parent; therefore, derivatives indexed to and to be settled in stock of a subsidiary do not meet ASC 815-10-15's exclusion criteria. If derivatives meet the criteria (e.g., for net settlement, etc.), they must be accounted for under the provisions of ASC 815-25 through 815-35, and not of ASC 815-40. The ASC also discusses a number of exceptions based on the criteria set forth in ASC 815.

Option or forward strike prices and premiums could be indicative of impairments of the parent's investment in subsidiaries. A parent's contract to purchase a subsidiary's (minority held) common stock should not be recorded until settled; during the period of the contract, income should continue to be allocated to the minority interest. A contract to sell shares in a subsidiary, likewise, should be recorded when settled; until that time, income would not be allocated to outside interests (counterparties to the derivative).

ASC 815-40 applies to freestanding derivatives only—similar embedded derivatives are not covered. Also not covered are derivatives which are issued to compensate employees or to acquire goods and services from nonemployees, when performance has yet to occur. It does apply, however, to derivatives issued to acquire goods and services from nonemployees, when performance has occurred.

ASC 815-40 reached a number of conclusions. These are summarized as follows.

1. Initial balance sheet classification is to be guided by the principle that contracts which require net cash settlements are assets or liabilities, and those that require settlement in shares are equity instruments. If the reporting entity has the choice of settlement modes, settlement in shares is to be assumed; if the counterparty has the

option, net cash settlement is presumed. An exception occurs if the two settlement alternatives are not of equal value, in which case the economic substance should govern.

2. Initial measurement should be at fair value. Contracts classed as equity are accounted for in permanent equity, with value changes being ignored, unless settlement expectations change. For publicly held companies, under defined circumstances, guidance is provided by analogy from ASR 268. All other contracts would be classified as assets or liabilities, to be measured continuously at fair value. If settlement in shares ultimately occurs, already recognized gains or losses are left in earnings, not reclassified or reversed.
3. Events may necessitate reclassification of contracts from assets/liabilities to equity. If a contract first classed as equity is later reclassed to assets/liabilities, any value change to the date of reclassification will be included in equity, not earnings. Thereafter, value changes will be reported in earnings. If partial net share settlement is permitted, the portion that can be so settled remains in equity. Appropriate disclosure under ASC 235 may be required, if more than one contract exists and different methods are applied to them.
4. All the following conditions must be satisfied in order to classify a contract in equity:
   a. The contract permits settlement in unregistered shares (the assumption being that the issuer cannot effectively control the conditions for registration, making cash settlement likely unless unregistered shares can be delivered);
   b. There are sufficient authorized, unissued shares to settle the contact, after considering all other outstanding commitments;
   c. The contract contains an explicit limit on the number of shares to be issued;
   d. There are no required cash payments to the counterparty based on the issuer's failure to make timely SEC filings;
   e. There are no "make whole" provisions to compensate the holder after he sells the shares issued in the market at a price below some defined threshold value;
   f. Requirements for net cash settlement are accompanied by similar requirements for existing shareholders;
   g. There are no provisions that indicate that the counterparties have rights greater than those of the actual shareholders; and
   h. There is no requirement for any collateral posting for any reason.
5. Contracts that are subject to this consensus cannot qualify for hedge accounting (this is based on the SEC's position on this matter).
6. Contracts offering multiple settlement alternatives that require the company to receive cash when the contract is in a gain position but pay either stock or cash at the company's option when in a loss position are to be accounted for as equity. Also, such contracts requiring payment of cash when in a loss position but receipt of either cash or stock at the company's option when in a gain position must be accounted for as assets/liabilities.
7. For EPS computation purposes, for those contracts that provide the company with a choice of settlement methods, settlement in shares is to be assumed, although this can be overcome based on past experience or stated policy. If the counterparty controls the choice, however, the more dilutive assumption must be made, irrespective of past experience or policy.

ASC 718 holds that freestanding financial instruments issued to employees in exchange for past or future employee services will continue to be subject to the recognition and mea-

surement provisions of ASC 718 throughout the life of the instruments, unless their terms are modified when the holder is no longer an employee. ASC 718 also holds that, for instruments originally issued as employee compensation and then modified, and where that modification to the terms of the instrument is made *solely* to reflect an equity restructuring that occurs when the holders are no longer employees, no change in the recognition or the measurement (due to a change in classification) of those instruments will result if *both* of the following conditions are met:

1. There is no increase in the fair value of the award (or the ratio of intrinsic value to the exercise price of the award is preserved—i.e., the holder is made whole), or the antidilution provision is not added to the terms of the award in contemplation of an equity restructuring; *and*
2. All holders of the same class of equity instruments (for example, stock options) are treated in the same manner.

Other modifications of the instrument (that is, any modification that fails to meet the dual tests above) that take place when the holder is no longer an employee, is subject to the modification accounting guidance set forth by ASC 718, as addressed above. Following modification, the accounting for such instruments, no longer held by employees, must follow GAAP, including ASC 480 if applicable.

The definition of short-term inducement in the glossary of terms included the phrase *or settlement of an award*. This reference raised a question about possible interaction between different provisions of the standard. FASB did not intend for a short-term inducement deemed to be a settlement to affect the classification of the award for the period it remains outstanding (for example, change the award from an equity instrument to a liability instrument). Therefore, an offer (for a limited time period) to repurchase an award should be excluded from the definition of a short-term inducement, and not be accounted for as a modification. However, if an entity has a history of settling its awards for cash, the entity should consider whether at the inception of the awards it has a substantive liability.

Accounting for freestanding warrants and other instruments on shares that are redeemable. Instruments having both liability-like and equity-like attributes have often been difficult to classify in the balance sheet. ASC 480 (see Chapter 15) requires liability categorization of many instruments which heretofore had been included in equity, or in some cases in a "mezzanine" capital section (which is countenanced by SEC rules although there is no such concept under GAAP). ASC 480 holds that warrants for shares that are puttable are liabilities, because the warrants embody obligations to repurchase the issuer's shares and may require a transfer of assets, and likewise warrants for mandatorily redeemable shares are liabilities because they embody obligations to repurchase the issuer's shares that, if exercised, will require a transfer of assets.

ASC 480-10-55 holds that both warrants on shares that are redeemable immediately after exercise of the warrants and also those that are redeemable at some date in the future are liabilities. The number of conditions that must be met before the warrants become exercisable is deemed to be irrelevant to the question, so that warrants to obtain either puttable or mandatorily redeemable shares are liabilities in all cases.

Other Equity Accounts

In principle, modern financial reporting in conformity with GAAP subscribes to what was once known as the "all inclusive" or "clean surplus" concept, which means that all items of income, expense, gain or loss (other than transactions with owners) should flow through the income statement. In fact, however, a number of important exceptions have been imposed including translation gains or losses (ASC 830), certain adjustments for minimum

pension obligations (ASC 715), and unrealized gains and losses on available-for-sale portfolios of debt or equity investments (ASC 320) to the litany of recognized economic events which escaped reporting in the income statement. Most recently, hedging gains and losses qualifying under ASC 815 are also deferred for income measurement purposes. As explained in Chapter 3, the FASB concepts project had foreseen the need for a flow statement analogous to the income statement to report all such changes for the reporting period, and this was finally mandated under ASC 220, which established the concept of comprehensive income (the term which now denotes normal earnings plus the change in these other equity accounts). Comprehensive income must now be reported either in a combined statement with the income statement, as a stand-alone statement, or in an expanded statement of changes in stockholders' equity.

In the balance sheet, the various elements of other comprehensive income (i.e., the current balances of such items as translation gains and losses and unrealized gains and losses from available-for-sale securities holdings) can be aggregated into a single caption, with details reserved to the notes, or the separate items can be grouped into a subsection of the equity section. Since items of other comprehensive income are neither paid-in capital nor retained earnings, this constitutes a third major classification within the equity section of the balance sheet. Many entities will have only minor amounts of such items or none at all.

Refer to Chapter 3 for a complete discussion of other comprehensive income.

Accounting for Share-Based Payments

Explicit recognition of the imputed cost of compensation paid to executives and other employees via stock option and similar programs has been an objective of accounting standard setters for over a decade. While a few theorists argue that no cost is incurred when a company issues mere paper to employees, the mainstream recognizes that when employees accept lower cash compensation in exchange for stock-based compensation, which forms the basis for measuring compensation cost. Additionally, the issuance of shares to employees in lieu of some cash compensation (which is inevitably what is occurring, even though the employees are not given the choice of cash or stock) is no different than first paying cash compensation (which would be recognized as an operating expense) and then having the recipients use that cash to purchase company stock.

This simple point has been definitively settled under ASC 718. Under ASC 718, one must use fair value to measure the cost of all share-based payment plans. There is still an optional exception available for nonpublic companies, where measures of stock price volatility required to apply the normal fair value approach simply do not exist, but under such circumstances a modified fair value model is prescribed, where an industry group-based surrogate for the entity's stock price volatility is employed. Thus, all stock-based compensation arrangements, where equity instruments are issued to employees, will result in compensation cost that is measured using a variant of the fair value model.

There are several ways to calculate the fair value of stock-based compensation arrangements. Lattice models provide greater flexibility than the Black-Scholes-Merton model for including or excluding variables, or changing variable parameters, from one period to the other. ASC 718 does not require the use of lattice-type models, of which the binomial model is the most widely employed, but the advantages of such approaches are worthwhile.

In determining the fair value of share options, all the features and attributes of the options must be taken into consideration, including the expected volatility of the underlying equity instrument.

In addition, ASC 718 requires that excess tax benefits be reported as a financing cash inflow rather than as a reduction of taxes paid. This is more consistent with the view that the

issuance of employee stock option shares is part of the capital raising process, and the tax advantages attendant to this are equivalently part of that same process.

The formerly employed term, stock-based compensation, has been replaced by the term share-based payment, partly to conform to IFRS usage, and partly to communicate the fact that ASC 718 is applicable to all such payments, whether to employees or to others for purchase of goods or services. For purpose of the discussion in this chapter, however, these will be taken as synonymous.

The business combinations codification, ASC 805, reinforces ASC 718 by requiring that an acquiring entity use ASC 718 to measure the liability associated with the replacement of an acquiree's share-based payment awards with its own share-based payment awards.

ASC 718: Detailed Explanation

ASC 718 broadly addresses share-based payments. It covers plans for employees that convey shares of the employer's stock, derivatives (such as options) related to the employer's shares, or cash in amounts tied to the value of the employer's shares. All share-based plans are considered compensatory unless the benefit to employees is no greater than that which is available to shareholders generally. The benefit to recipients is assessed based both on the discount from market price and the number of shares they are eligible to buy. Consequently, virtually all plans will be considered compensatory for accounting purposes, including employee stock purchase plans that are noncompensatory under the federal tax laws.

Additionally, ASC 718 describes (1) the prescribed pattern of compensation cost recognition, (2) the accounting for employee stock purchase plans, and (3) accounting for the income tax effects of share-based transactions. It also requires that excess tax benefits be reported in the cash flow statement as a financing activity, rather than as an operating activity (these are currently reported as a reduction of income taxes paid).

Scope. ASC 718 applies to

1. Public and nonpublic companies, and the
2. Accounting for all share-based awards to employees, including employee stock purchase plans

ASC 718 does not apply to

1. Accounting for employee stock ownership plan transactions (ESOP), or
2. Awards to nonemployees, with an exception made in the case of awards to nonemployee members of the board of directors in their capacity as directors.

These exclusions will reportedly be taken up in a later phase of FASB's project on equity-based compensation arrangements.

Measurement of compensation cost from share-based payment arrangements with employees. The objective is to estimate, as of the grant date, the fair value of the award that an employee earns as a result of requisite service and satisfying vesting requirements. The estimate of fair value would reflect transferability and other restrictions if they are in effect when the award vests. Compensation cost is to be recognized only for those awards that vest (which obviously demands that estimates be made).

- **Classifying awards as liabilities or equity.** ASC 718 requires that the classification criteria of ASC 480 be applied in determining whether an instrument granted to an employee is a liability or equity. In particular, some stock-based compensation awards that call for settlement by issuing an entity's own equity instruments may be classified as liabilities if they meet the criteria of ASC 480.

- **Valuation models.** In the absence of an observable market price for an award—often the reality for employee share options—reporting entities are now required to use a valuation method that takes into account the factors set forth in the standard.

  While ASC 718 does not dictate a valuation model, reportedly FASB believes and prefers that most companies will use the binomial, or other so-called *lattice* models of value, rather than a *closed-form* model such as the BSM. The binomial model is favored, however, because it accommodates more potential postvesting behaviors than the closed-form models.

  Binomial or other lattice models value options by constructing lattices or trees that represent different possible stock prices at different future points in time. The value of the option is determined at each node or branch of the tree. To determine these values, companies need to develop information about expected volatility, dividends, and risk-free rates that will apply at each of the possible branches or nodes of the model. In addition, information about employee postvesting behavior is needed to determine likely exercise dates. Note that under ASC 718 it is necessary to use *expected volatility* of share prices.
- **Liability-classified awards.** The provisions dealing with share-based payments that involve liabilities, rather than equity, are affected by the issuance of ASC 480. Certain share-based payments create liabilities under ASC 480, (e.g., awards which result in the issuance of mandatorily redeemable shares, or those which require cash settlements or give the holders the right to demand cash, as do some stock appreciation rights). Liability-classified awards are to be remeasured at fair value each reporting period. Prior to vesting, the cumulative compensation costs would equal the proportionate amount of the award earned to date, and thus the periodic compensation cost would reflect both the passage of time (service period) and change in the fair value of the ultimate award. Subsequent to vesting, any further change in fair value would be recorded as a charge against earnings.

  The use of grant date to fix the value of equity-based awards, and settlement date to fix the value of liability-based awards, may seem inconsistent and/or confusing. FASB presents a rather detailed explanation for its decisions in the new standard, but essentially the logic is that to recognize changes in compensation based on post-grant-date changes to the value of the underlying equity would be equivalent to recognizing changes in the value of the entity's own equity shares in earnings, which is prohibited under GAAP. Also, grant date is when the parties (the entity and its employees) have fixed the terms of their arrangement, which provides a meaningful measure of the cost to be incurred by the entity. This differs importantly from the situation with equity-based compensation that is classified as a liability because it is to be settled for cash (e.g., cash SARs). In that scenario, the entity is obligated to distribute assets, and the relevant measure of compensation cost, ultimately, is the amount of assets disbursed.
- **Equity-classified awards.** Equity-classified awards that are publicly traded and have observable market prices are to be valued using the market price. Few, if any, employee stock compensation awards (i.e., employee stock options) would have this characteristic, however. If not publicly traded, equity-classified awards are valued using a model such as the binomial or the Black-Scholes-Merton.
- **Valuation for graded-vesting awards.** Companies that grant awards with graded vesting are to elect whether to measure the awards as if it were a cliff-vested award, or alternatively whether they are to be treated as several separate awards. If the former is chosen, the amount expensed each year would be the pro rata portion of compensation cost determined with reference to the entire package. If the latter approach is selected,

each separately vesting portion will be valued and the associated compensation cost will be accrued over the term until that portion vests.

- **Measurement alternatives for nonpublic companies.** Nonpublic companies must now choose to use either continually updated intrinsic values or fair values to measure share-option or liability-classified awards. Note that no such choice would be available for nonvested or vested stock awards, which are to be measured using grant-date fair values.

  If a nonpublic reporting entity chooses to use the intrinsic value alternative, the intrinsic value of an equity-classified award will have to be reestimated each reporting period. However, if a company uses the fair value alternative no reestimation is required, which could reduce fluctuations in reported earnings. If nonpublic companies choose the fair value approach, they will not later be able to return to the use of intrinsic value, because fair value is deemed preferable for purposes of applying ASC 250 (accounting changes).

While fair value is to be determined as of grant date, in practice there has been some ambiguity regarding the precise definition of this term. ASC 718 does set forth criteria for determining that a share-based payment award has been granted. One of the criteria is a mutual understanding by the employer and employee of the key terms and conditions of a share-based payment award. However, the "mutual" aspect may not occur until some time after the formal grant, when actual communications between employer and employee are held, sometimes not until, for example, a regularly scheduled performance review that might not occur for weeks or months thereafter. To address these practical concerns, ASC 718-10-25-5 holds that, assuming all other criteria in the grant date definition have been met, a mutual understanding of the key terms and conditions of an award to an individual employee is presumed to exist at the date the award is approved in accordance with the relevant corporate governance requirements (that is, by the board or management with the relevant authority), if both the following conditions are met:

1. The award is a unilateral grant and, therefore, the recipient does not have the ability to negotiate the key terms and conditions of the award with the employer, and
2. The key terms and conditions of the award are expected to be communicated to an individual recipient within a relatively short time period from the date of approval.

Recognizing compensation. Vesting can be based on a service condition, performance condition, or a combination of both.

- Service conditions are requirements to achieve a specified duration of employment (e.g., number of years' continuous full-time service).
- Performance conditions are requirements to achieve company-specific operating or financial goals (e.g., net income over $3 million).

Compensation cost is to be recognized based on the actual number of awards that eventually vest. Estimates are used to make accruals each period and adjustments are made based on current estimates of expected future vesting until the actual number of awards that vest are known.

Under provisions of ASC 718, compensation cost for equity-based awards is to be measured at the grant date, and not subsequently revised (apart from recognizing changed likelihood of forfeitures).

Market conditions affect the exercisability of an award, but not its vesting. ASC 718 defines a market condition as an exercisability requirement based on achieving a specified share price (e.g., reaching a market price of $22 per share before exercise is allowed). Market conditions can affect the grant-date fair value, and hence the compensation expense to be

recognized by the reporting entity. If an employee forfeits an award because a market condition is not satisfied, compensation previously accrued is not reversed, unlike what is done in the event of ordinary forfeitures, which necessitate reversal of previously accrued compensation cost (or, equivalently, adjustment of compensation cost prospectively until the vesting date).

Under provisions of ASC 718, compensation cost for liability-based awards will be measured at the exercise or settlement date, but compensation is estimated at each reporting date from grant date to exercise or settlement date.

Modified awards. The incremental compensation cost resulting from a modification of an award will be measured as the excess of the fair value of the modified award over the fair value of the original award measured immediately prior to the modification. Modifications can occur because of repricing, extending the life, or changing the vesting condition of the award. Cancellations of existing awards and concurrent replacement with new ones have to be accounted for as modifications. In practice, modifications will rarely result in recognized compensation costs less than the fair value of the award at the grant date, but this could conceivably result if the original service or performance vesting conditions were not expected to be satisfied at the modification date.

Accounting for Employee Stock Options under ASC 718

Under ASC 718, fair value accounting must be applied in measuring compensation expense. Ideally, fair value would be market-observed. An observable market price, if available for an option with similar features, should be used as the estimate of fair value of the employee option. However, in most cases, due to the nature of employee stock options (which lack exchangeability, etc.), observable market prices will not be available. Therefore, the reporting entity will have to estimate the fair value of the employee share option using a valuation model that meets the requirements of ASC 718. The valuation model takes into account the following factors, at a minimum:

1. Exercise price of the option
2. Expected term of the option, taking into account several things including the contractual term of the option, vesting requirements, and postvesting employee termination behaviors
3. Current price of the underlying share
4. Expected volatility of the price of the underlying share
5. Expected dividends on the underlying share
6. Risk-free interest rate(s) for the expected term of the option

In practice, there are likely to be ranges of reasonable estimates for expected volatility, dividends, and option term. The closed-form models, of which Black-Scholes (now BSM) is the most widely regarded, are predicated on a set of deterministic assumptions, which remain invariate over the full term of the option. In the real world, of course, this condition is almost always not met. For this reason, current thinking is that a lattice model, of which the binomial model is an example, would be preferred. Lattice models explicitly identify nodes, such as the anniversaries of the grant date, at each of which new parameter values can be specified (e.g., expected dividends can be independently defined each period).

If a reporting entity changes from the BSM model to a binomial model, the change will be deemed a change in accounting estimate, not a change in accounting principle. A change from a binomial model back to a less desirable BSM model is to be discouraged, but apparently not prohibited if use of BSM or a similar closed-form model is supportable. The presumption is that moving from a binomial model to the BSM model would not be well received.

Other features that may affect the value of the option include changes in the issuer's credit risk, if the value of the awards contains cash settlement features (i.e., if they are liability instruments). Also, contingent features that could cause either a loss of equity shares earned or reduce realized gains from sale of equity instruments earned, such as a clawback feature (for example, where an employee who terminates the employment relationship and begins to work for a competitor is required to transfer to the issuing enterprise shares granted and earned under a share-based payment arrangement—see the illustrations in ASC 718) would be factors affecting the valuation model.

Market, performance, or service conditions may affect vesting. An award becomes vested at the date the employee's right to receive or retain shares no longer has any of these conditions. Vesting may be conditional on satisfying two or more conditions. Regardless of the conditions that must be satisfied, the existence of a market condition requires recognition of compensation cost if service has been rendered, even if the market condition is never satisfied.

The definition of an employee used in ASC 718 is that given by Internal Revenue Service Ruling 87-41. In addition, ASC 718 requires that nonemployee directors, acting in their role as members of the company's board of directors, be treated as employees if they were elected by the shareholders or appointed to the board and will be subject to election at the next shareholder election. Any awards granted to these individuals for their service as directors would be considered to be employee compensation.

The grant date is defined as the date when the employer and employee have a mutual understanding of the key terms and conditions of the share-based compensation arrangement and all necessary authorizations of those conditions have occurred. The service inception date is the first day of the requisite service period. Compensation cost is attributed over the service period.

If a given option plan involves the payment of compensation to the employees, such compensation cost should be recognized in the period(s) in which the services being compensated are performed. If the grant is unconditional, which means it effectively is in recognition of past services rendered by the employees and does not depend on the rendering of further service, then compensation is reported in full in the period of the grant. If the stock options are granted before the service inception date, compensation cost should be recognized over the periods in which the performance is scheduled to occur. Whether compensation cost is recognized ratably over the periods or not is a function of the vesting provisions of the plan. If the plan provides for cliff vesting, compensation will be accrued on an essentially straight-line basis, while if it provides for graded vesting, the pattern of recognition is subject to election and may be more complex. The accounting for graded vesting plans under ASC 718 represents a change from current practice.

Before presenting specific examples of accounting for stock options, simple examples of calculating the fair value of options using both the Black-Scholes-Merton and the binomial/lattice methods are provided. First, an example of the BSM, closed-form model is provided.

BSM actually computes the theoretical value of a so-called "European" call option, where exercise can occur only on the expiration date. "American" options, which include most employee stock options, can be exercised at any time until expiration. The value of an American-style option on dividend paying stocks is generally greater than a European-style option since preexercise the holder does not have a right to receive dividends that are paid on the stock. (For non-dividend-paying stocks, the value of American and European options will tend to converge.) BSM ignores dividends but this is readily dealt with, as shown below, by deducting from the computed option value the present value of expected dividend stream over the option holding period.

BSM also is predicated on constant volatility over the option term, which available evidence suggests may not be a wholly accurate description of stock price behavior. On the other hand, the reporting entity would find it very difficult, if not impossible, to compute differing volatilities for each node in the lattice model described later in this section, lacking a factual basis for presuming that volatility would increase or decrease in specific future periods.

The BSM model:

C	=	$SN(d_1) - Ke^{(-rt)}N(d_2)$
C	=	Theoretical call premium
S	=	Current stock price
t	=	time until option expiration
K	=	option striking price
r	=	risk-free interest rate
N	=	Cumulative standard normal distribution
e	=	exponential term (2.7183)
d_1	=	$\frac{\ln(S/K) + (r + s^2/2)^t}{s\surd t}$
d_2	=	$d_1 - s$
s	=	standard deviation of stock returns
ln	=	natural logarithm

The BSM valuation is illustrated with the following assumed facts; note that dividends are ignored in the initial calculation but will be addressed once the theoretical value is computed. Also note that volatility is defined in terms of the variability of the entity's stock price, measured by the standard deviation of prices over, say, the past three years, which is used as a surrogate for expected volatility over the next twelve months.

Example—Determining the fair value of options using the Black-Scholes model

Black-Scholes-Merton is a closed-form model, meaning that it solves for an option price from an equation. It computes a theoretical call price based on five parameters—the current stock price, the option exercise price, the expected volatility of the stock price, the time until option expiration, and the short-term risk-free interest rate. Of these, expected volatility is the most difficult to ascertain. Volatility is generally computed as the standard deviation of recent historical returns on the stock. In the following example, the stock is currently selling at $40 and the standard deviation of prices (daily closing prices can be used, among other possible choices) over the past several years was $6.50, thus yielding an estimated volatility of $6.50/$40 = 16.25%.

Assume the following facts:

S	=	$40
t	=	2 years
K	=	$45
r	=	3% annual rate
s	=	standard deviation of percentage returns = 16.25% (based on $6.50 standard deviation of stock price compared to current $40 price)

From the foregoing data, all of which is known information (the volatility, s, is computed or assumed, as discussed above) the factors d_1 and d_2 can be computed. The cumulative standard normal variates (N) of these values must then be determined (using a table or formula), following which the BSM option value is calculated, *before the effect of dividends*. In this example, the computed amounts are

$N(d_1)$ = 0.2758
$N(d_2)$ = 0.2048

With these assumptions the value of the stock options is approximately $2.35. This is derived from the BSM as follows:

$$
\begin{aligned}
C &= SN(d_1) - Ke^{(-rt)}N(d_2) \\
&= 40(.2758) - 45(.942)(.2048) \\
&= 11.032 - 8.679 \\
&= 2.35
\end{aligned}
$$

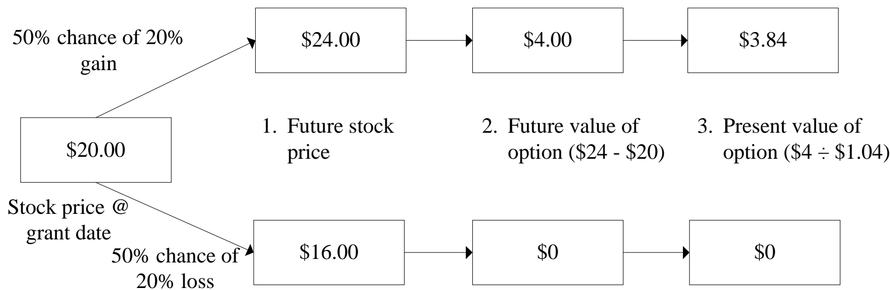
The foregone two-year stream of dividends, which in this example are projected to be $0.50 annually, have a present value of $0.96. Therefore, the net value of this option is $1.39 ($2.35 – .96).

Example—Determining the fair value of options using the binomial/lattice model

In contrast to the BSM, the binomial/lattice model is an open form, inductive model. It allows for multiple (theoretically, unlimited) branches of possible outcomes on a "tree" of possible price movements and induces the option's price. As compared to the BSM approach, this relaxes the constraint on exercise timing. It can be assumed that exercise occurs at any point in the option period, and past experience may guide the reporting entity to make certain such assumptions (e.g., that one-half the options will be exercised when the market price of the stock reaches 150% of the strike price, etc.). It also allows for varying dividends from period to period.

It is assumed that the common (Cox, Ross, and Rubinstein) binomial model will be used in practice. To keep this preliminary example relatively simple in order to focus on the concepts involved, a single-step binomial model is provided here for illustrative purposes. Assume an option is granted on a $20 stock that will expire in one year. The option exercise price equals the stock price of $20. Also, assume there is a 50% chance that the price will jump 20% over the year and a 50% chance the stock will drop 20%, and that no other outcomes are possible. The risk-free interest rate is 4%. With these assumptions there are three basic calculations.

1. Plot the two possible future stock prices.
2. Translate these stock prices into future options values.
3. Discount these future values into a single present value.



In this case, the option will only have value if the stock price increases, and otherwise the option would expire worthless and unexercised. In this simplistic example, there is only a 50% chance of the option having a value of $3.84, and therefore the option is worth $1.92 at grant date.

The foregoing was a simplistic single-period, two-outcome model. A more complicated and realistic binomial model extends this single-period model into a randomized walk of many steps or intervals. In theory, the time to expiration can be broken into a large number of ever-smaller time intervals, such as months, weeks, or days. The advantage is that the parameter values (volatility, etc) can then be varied with greater precision from one period to the next (assuming, of course, that there is a factual basis upon which to base these estimates). Calculating the binomial model then involves the same three calculation steps. First, the possible future stock prices are determined for each branch, using the volatility input and time to expiration (which grows shorter with each successive node in the model). This permits computation of terminal values for each branch of the tree. Second, future stock prices

are translated into option values at each node of the tree. Third, these future option values are discounted and added to produce a single present value of the option, taking into account the probabilities of each series of price moves in the model.

Example—Multiperiod option valuation using binomial model

Consider the following example of a 2-period binomial model. Again, certain simplifying assumptions will be made so that a manual calculation can be illustrated (in general, computer programs will be necessary to compute option values). Eager Corp. grants 10,000 options to its employees at a time when the market price of shares is $40. The options expire in 2 years; expected dividends on the stock will be $0.50 per year; and the risk-free rate is currently 3%, which is not expected to change over the 2-year horizon. The option exercise price is $43.

The entity's past experience suggests that, after 1 year (of the 2-year term) elapses, if the market price of the stock exceeds the option exercise price, one-half of the options will be exercised by the holders. The other holders will wait another year to decide. If at the end of the second year—without regard to what the stock value was at the end of the first year—the market value exceeds the exercise price, all the remaining options will be exercised. The workforce has been unusually stable and it is not anticipated that option holders will cease employment before the end the option period.

The stock price moves randomly from period to period. Based on recent experience, it is anticipated that in each period the stock may increase by $5, stay the same, or decrease by $5, with equal probability, versus the price at the period year-end. Thus, since the price is $40 at grant date, 1 year hence it might be either $45, $40, or $35. The price at the end of the second year will follow the same pattern, based on the price when the first year ends.

Logically, holders will rather exercise their options than see them expire, as long as there is gain to be realized. Since dividends are not paid on options, holders have a motive to exercise earlier than the expiration date, which explains why historically one-half the options are exercised after one year elapses, as long as the market price exceeds the exercise price at that date, even though the exercising holders risk future market declines.

The binomial model formulation requires that each sequence of events and actions be explicated. This gives rise to the commonly seen decision tree representation. In this simple example, following the grant of the options 1 of 3 possible events occur; either the stock price rises $5 over the next year, or it remains constant, or it falls by $5. Since these outcomes have equal *a priori* probabilities, p=1/3 is assigned to each outcome of this first year event. If the price does rise, one half the option holders will exercise at the end of the first year, to reap the economic gain and capture the second year's dividend. The other holders will forego this immediate gain and wait to see what the stock price does in the second year before making an exercise decision.

If the stock price in the first year either remains flat or falls by $5, no option holders are expected to exercise. However, there remains the opportunity to exercise after the second year elapses, if the stock price recovers. Of course, holding the options for the second year means that no dividends will be received.

The cost of the options granted by Eager Corp., measured by fair value using the binomial model approach, is computed by the sum of the probability-weighted outcomes, discounted to present value using the risk-free rate. In this example, the rate is expected to remain at 3% per year throughout the option period, but it could be independently specified for each period—another advantage the binomial model has over the more rigid BSM. The sum of these present value computations measures the cost of compensation incorporated in the option grant, regardless of what pattern of exercise ultimately is revealed, since at the grant date, using the available information about stock price volatility, expected dividends, exercise behavior and the risk-free rate, this best measures the value of what was promised to the employees.

The following graphic offers a visual representation of the model, although in practice it is not necessary to prepare such a document. The actual calculations can be made by computer pro-

gram, but to illustrate the application of the binomial model, the computation will be presented explicitly here. There are four possible scenarios under which, in this example, holders will exercise the options, and thus the options will have value. All other scenarios (combinations of stock price movements over the 2-year horizon) will cause the holders to allow the options to expire unexercised.

First, if the stock price goes to $45 in the first year, one-half the holders will exercise at that point, paying the exercise price of $43 per share. This results in a gain of $2 ($45 – $43) per share. However, having waited until the first year-end, they lost the opportunity to receive the $0.50 per share dividend, so the net economic gain is only $1.50 ($2.00 – $0.50) per share. As this occurs after 1 year, the present value is only $\$1.50 \times 1.03^{-1} = \$1.46$ per share. When this is weighted by the probability of this outcome obtaining (given that the stock price rise to $45 in the first year has only a 1/3 probability of happening, and given further that only one-half the option holders would elect to exercise under such conditions), the actual expected value of this outcome is [(1/3)(1/2)($1.46)] = $0.24. More formally,

$[(1/3)(1/2)(\$2.00 - \$0.50)] \times 1.03^{-1} = \$0.2427$

The second potentially favorable outcome to holders would be if the stock price rises to $45 the first year and then either rises another $5 the second year or holds steady at $45 during the second year. In either event, the option holders who did not exercise after the first year's stock price rise will all exercise at the end of the second year, before the options expire. If the price goes to $50 the second year, the holders will reap a gross gain of $7 ($50 – $43) per share; if it remains constant at $45, the gross gain is only $2 per share. In either case, dividends in both years 1 and 2 will have been foregone. To calculate the compensation cost associated with these branches of the model, the first-year dividend lost must be discounted for 1 year, and the gross gain and second-year dividend must be discounted for 2 years. Also, the probabilities of the entire sequence of events must be used, taking into account the likelihood of the first year's stock price rise, the proclivity of holders to wait for a second year to elapse, and the likelihood of a second-year price rise or price stability. These computations are shown below.

For the outcome if the stock price rises again

$[(1/3)(1/2)(1/3)]\{[(\$7.00) \times 1.03^{-2}] - [(\$0.50) \times 1.03^{-1}] - [\$0.50 \times 1.03^{-2}]\} = [0.05544]\{\$6.59 - \$0.48 - \$0.47\} = \$0.31276$

For the outcome if the stock price remains stable

$[(1/3)(1/2)(1/3)]\{[(\$2.00) \times 1.03^{-2}] - [(\$0.50) \times 1.03^{-1}] - [(\$0.50) \times 1.03^{-2}]\} = [0.05544]\{\$1.88 - \$0.48 - \$0.47\} = \$0.05147$

The final, favorable outcome for holders would occur if the stock price holds constant at $40 the first year but rises to $45 the second year, making exercise the right decision. Note that none of the holders would exercise after the first year given that the price, $40, was below exercise price. The calculation for this sequence of events is as follows:

$[(1/3)(1/3)]\{[(\$2.00) \times 1.03^{-2}] - [(\$0.50) \times 1.03^{-1}] - [(\$0.50) \times 1.03^{-2}]\} = [0.1111]\{\$1.88 - \$0.48 - \$0.47\} = \$0.10295$

Summing these values yields $0.709879 ($0.2427 + $0.31276 + $0.05147 + $0.10295), which is the expected value per option granted. When this per-unit value is then multiplied by the number of options granted, 10,000, the total compensation cost to be recognized, $7,098.79, is derived. This would be attributed over the required service period, which is illustrated later in this section. (In the facts of this example, no vesting requirements were specified; in such cases, the employees would not have to provide future service in order to earn the right to the options, and the entire cost would be recognized upon grant.)

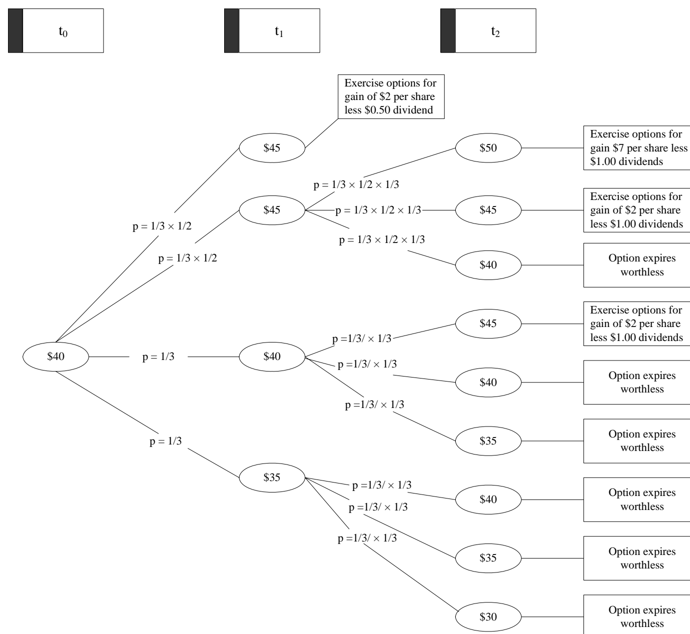
A big advantage of the binomial model is that it can value an option that is exercisable before the end of its term (an American-style option). This is the style that employee share-based compensation arrangements normally take. FASB prefers the binomial model because it can incorporate the unique features of employee stock options. Two key features that FASB recommends that companies incorporate into the binomial model are vesting restric-

tions and early exercise. Doing so, however, requires that the reporting entity had previous experience with employee behaviors (e.g., gained with past employee option programs) that would provide it with a basis for making estimates of future behavior. In some instances, there will be no obvious bases upon which such assumptions can be developed.

The binomial model permits the specification of more assumptions than does the BSM, which has generated the perception that the binomial will more readily be manipulated so as to result in lower option values, and hence lower compensation costs, than the BSM. But, this is not necessarily the case: switching from BSM to the binomial model can increase, maintain, or decrease the option's value. Having the ability to specify additional parameters, however, does probably give management greater flexibility and, accordingly, will present additional challenges for the auditors who must attest to the financial statement effects of management's specification of these variables.

To calculate option values using either the BSM or binomial models without the aid of computer software would be very difficult, but hardly impossible. Fortunately, reasonably priced software is now widely available to perform these calculations. What managers must do is determine the assumptions that should be used to create an unbiased, representative value of the options. We now turn to specific examples of accounting for share-based compensation as required under ASC 718.

NOTE: All examples ignore deferred tax effects for simplicity.



Example—Accounting for stock options for a publicly held entity

Options are granted to corporate officers to purchase 10,000 shares of $1 par stock at a price of $50 per share, which is equal to the current market price. The options may not be exercised until 3 years from the grant date (that is, they vest in three years). ASC 718 provides that public companies must use the fair value method to measure compensation cost associated with share-based equity programs. This means that it will be necessary to determine the expected volatility of the share price over the service period. Assume that either a lattice model or BSM has been used and that the fair value per option has been determined to be $7. Past experience suggests that forfeitures will be 4% per year, so that compensation cost under ASC 718 will be based on the net

number of shares expected to vest, given as (.96 × .96 × .96 =).885. Total share-based compensation will be ($7 × .885 × 10,000 =) $61,932. The annual entries would be

Compensation cost	20,644	
Additional paid-in capital		20,644

If all the options are subsequently exercised, the derived proceeds of the stock issuance will be $566,000. The entry would be

Cash	500,000 (option price)	
Additional paid-in capital	61,932	
Common stock		10,000 (par)
Additional paid-in capital		551,932 (excess)

Example—Accounting for stock options for a nonpublic entity that is not an SEC registrant and elects the calculated value method

Options are granted to corporate officers to purchase 10,000 shares of $1 par stock at a price of $50 per share, which is the current market price. The options may not be exercised until 3 years from the grant date (that is, they vest in three years). ASC 718 provides that nonpublic companies may use a surrogate measure of fair value, called calculated fair value, when it is not possible to determine the expected volatility of the share price over the service period. Essentially, this requires that a relevant industry sector-specific index be identified for use in place of the volatility factor in the normal BSM or lattice models.

In this case, the reporting entity identifies such an index and proceeds to compute a value of $6.60 per option. The total compensation cost thereby calculated, $66,000, is accrued over the three year period ratably. The annual entries would be

Compensation cost	22,000	
Additional paid-in capital		22,000

If all the options are subsequently exercised, the derived proceeds of the stock issuance will be $566,000. The entry would be

Cash	500,000 (option price)	
Additional paid-in capital	66,000	
Common stock		10,000 (par)
Additional paid-in capital		556,000 (excess)

Example—Accounting for stock options for a nonpublic entity that is not an SEC registrant and elects the intrinsic value method

As discussed above, nonpublic companies are permitted to elect the intrinsic value method of accounting for the cost of share-based compensation plans. Using this method, the intrinsic value must be measured at each reporting date, and used to accrue compensation cost for the period.

Assume again that options are granted to corporate officers to purchase 10,000 shares of $1 par stock at a price of $50 per share, which is the current market price. The options may not be exercised until 3 years from the grant date. These options have no intrinsic value ($50 – $50 = 0) at the grant date. The intrinsic value method and fair value method require the same measurement date (grant date) for shares and similar instruments whose fair value does not differ from their intrinsic value (and instruments with no time value). This example assumes there is no forfeiture before vesting occurs. Because of the company's decision to use the intrinsic value method, its share options are recognized at intrinsic value at each reporting date through the date of settlement, and the periodic adjustment in intrinsic value, prorated over the service period, is included in compensation cost for that period. Consequently, the compensation cost recognized each year of the 3-year requisite service period will vary based on changes in the share option's intrinsic value. For example, assume that at the end of year 1 stock is valued at $55 per share, resulting in a ($55 – $50) $5 intrinsic value per share—thus, a total value of $50,000 for the award. In year 1 the compensation cost would be 1/3 of $50,000. This entry would be

Compensation cost	16,667	
Additional paid-in capital		16,667

Assume now that at the end of year 2 the stock is valued at $53 per share, and thus the intrinsic value is ($53 – $50 =) $3 per share option, for an intrinsic value of the award of $30,000 at that date. The intrinsic value of the award has declined by ($50,000 – $30,000 =) $20,000. Because services for 2 of the 3 years of service have now been rendered, the company must recognize *cumulative* compensation cost for two-thirds of the intrinsic value of the award, or ($30,000 × 2/3 =) $20,000. Because the company already recognized $16,667 in the first year, only $3,333 in further compensation cost is to be recognized in year 2.

Compensation cost	3,333	
Additional paid-in capital		3,333

Note that, depending on the change in intrinsic value from the prior reporting date, the current period could be credited with *negative* compensation expense. To illustrate, assume instead that at the end of year 2 the stock is valued at $52 per share, for an intrinsic value of $20,000. Since 2 of the 3 year service period has elapsed, the cumulative compensation cost to be recognized is ($20,000 × 2/3 =) $13,333. Because the company already recognized $16,667 in the first year, *negative* $3,333 compensation cost is to be recognized in year 2.

Additional paid-in capital	3,333	
Compensation cost		3,333

Example of fair value accounting for stock options with cliff vesting—measurement and grant date the same

Options are granted to corporate officers to purchase 10,000 shares of $1 par stock at a price of $50 per share, which is also the market price on the grant date. The options may not be exercised until 3 years from the grant date, and only if the employees remain employed through that date. The company has no reason to expect that any of the options will be forfeited by the employees to whom they are granted (i.e., after the completion of the service period). The company uses the following assumptions to apply the binomial model:

Share options granted	10,000
Employees granted options	100
Expected forfeitures per year	3.0%
Share price at the grant date	$50
Exercise price	$50
Par value per share	$1
Number of years to vest	3 years
Contractual term (CT) of options	10 years
Risk-free interest rate over CT	2 to 5%
Expected volatility over CT	40 to 700%
Expected dividend yield	1.0%
Suboptimal exercise factor	2

Given these assumptions needed to construct a binomial model to value the options, a fair value estimate of approximately $6 per option is determined (details not presented). It is estimated that 3% of employees will turn over each year during the service period. The number of share options expected to vest is estimated at the grant date of (10,000 × .97 × .97 × .97 =) $9,127. The estimated fair value of the award on the grant date would be (9,127 × $6 =) $54,762. The entry to record the compensation cost [($54,762 ÷ 3) = $18,254] in each of the years 1, 2, and 3 is

Compensation cost	18,254	
Additional paid-in capital		18,254

If in year 1, the actual forfeiture rate is 6% instead of the 3% expected rate, and management determines that the forfeiture rate should change to 6%, then in year 2 an adjustment would be needed. The revised estimate of the number of options expected to vest is (10,000 × .94 × .94 × .94 =) 8,306. The revised cumulative compensation cost would be (8,306 × $6 =) $49,836. The cumulative adjustment to reflect adjustment of the forfeiture rate is the difference between two-thirds of the revised cost of the award and the cost already recognized in year 1. The related entries and computations are

Revised total compensation cost	$49,836
Revised cumulative cost as of the end of year 1	$16,112
Cost already recognized in year 1	$18,254
Adjustment to cost at the end of year 1	$(2,142)

The related journal entries are

Compensation cost	2,142	
Additional paid-in capital		2,142

Entries in years 2 and 3

Compensation cost	16,112	
Additional paid-in capital		16,112

At the end of the third year, the company would examine actual forfeitures and make any necessary adjustments to reflect compensation cost for the number of shares actually vested. Assuming vesting equals expected, the journal entry at exercise of the options would be

Cash	500,000 (option price)	
Additional paid-in capital	49,836	
Common stock		10,000 (par)
Additional paid-in capital		539,836 (excess)

The difference between the market price of the shares and the exercise price at the date of exercise is deductible for tax purposes because the share options do not qualify as incentive stock options. The realized tax benefits result in a credit to additional paid-in capital and a reduction in the deferred tax asset.

The statement of cash flows, as amended by ASC 718, requires that the cash flow benefit that results from the tax benefit be classified as a cash inflow from financing activities and a cash outflow from operating activities.

Example of accounting for stock options with graded vesting—measurement and grant date the same

In a shift from the position espoused in the exposure draft, ASC 718 requires each reporting entity to make a policy decision about whether to recognize compensation cost for an award with only service conditions that has a graded vesting schedule either (1) on a straight-line basis over the requisite service period for each separately vesting portion of the award as if the award was, in-substance, multiple awards, or (2) on a straight-line basis over the requisite service period for the entire award (that is, over the requisite service period of the last separately vesting portion of the award). However, ASC 718 requires that the amount of compensation cost recognized at any date must at least equal the portion of the grant-date value of the award that is vested at that date.

For this example, assume the basic facts from the prior example, but now the 10,000 options vest according to a graded schedule of 25% for the first and second years of service and 50% for the third year. Using the 3% annual employee turnover forfeiture rate, 300 options are expected to never vest, leaving 9,700 options expected to vest at 25% of the award—or 2,425 options vested. In the second year, another 3% are expected to be forfeited, leaving 9,409 to vest at 25% of the award—or 2,352 options vested. In the final year another 3% are forfeited and vesting occurs at 50% of the remaining—or 4,563 vested options. (Data upon which value per option amounts are derived are not presented in this example.)

Year	*Vested option*	*Value per option*	*Compensation cost*
1	2,425	$5.00	$12,125
2	2,352	$5.50	12,936
3	4,563	$6.00	27,378
	9,340		$52,439

The value of the option is determined separately for different vesting periods after which exercise might occur. Thus, the compensation cost associated with the options is less in the earlier years, as reflected in the table above. Compensation cost is recognized over the periods of requisite service during which each group of share options is earned. In year 1, therefore, compensation cost is [$12,125 + ($12,936 ÷ 2) + ($27,378 ÷ 3) =] $27,719. The journal entry for year 1 would be

Compensation cost	27,719	
Additional paid-in capital		27,719

Accounting for Stock Appreciation Rights and Tandem Plans

Background. The accounting for variable stock plans is addressed by ASC 718. Under this standard, share-based compensation arrangements which provide for cash payments, or which give to grantees the choice of receiving stock or cash in settlement, are accounted for as liabilities, not equity, as compensation is accrued over the requisite service period. Publicly held entities are required to measure liabilities incurred to employees in share-based payment transactions at fair value. Nonpublic entities, on the other hand, may elect to measure their liabilities to employees incurred in share-based payment transactions at their intrinsic value.

Whether measured at fair value (using an option-pricing model such as BSM or binomial) or at intrinsic value (measured simply as the excess of market or other defined value over reference value as of the balance sheet date), these amounts are updated as of each financial reporting date. Thus, when share-based compensation plans give rise to liabilities, these are continually updated as to value, whereas under the fair value measurement approach to equity instruments arising from such compensation plans, value is assessed as of the grant date in most instances, never later to be revised.

Determining whether a share-based payment should be categorized as a liability requires close attention to the guidance of ASC 718, which invokes the requirements of ASC 480. It states that, for example, a puttable share (giving the grantee the right to demand the issuer to redeem it) awarded to an employee as compensation is to be classified as a liability if either (1) the repurchase feature permits the employee to avoid bearing the risks and rewards normally associated with equity share ownership for a reasonable period of time from the date the requisite service is rendered and the share is issued, or (2) it is probable that the employer would prevent the employee from bearing those risks and rewards for a reasonable period of time from the date the share is issued. For this purpose, a period of six months or more is defined as a reasonable period of time.

Note that a share that is mandatorily or optionally redeemable upon the occurrence of a defined contingency, such as an initial public offering by the grantor entity, would not make this share-based payment a liability, unless the contingency were deemed probable of occurrence within a reasonable period of time. For example, if the entity had begun the regulatory approval and registration process, this might trigger liability classification.

ASC 718 stipulates that options or similar instruments on shares are to be categorized as liabilities if the underlying shares are classified as liabilities (which is logical) or if the reporting entity is subject to a requirement to transfer cash or other assets under any circumstances in order to settle the option. However, ASC 718-10-35-15 holds that a cash settlement feature that can be exercised only upon the occurrence of a contingent event that is outside the employee's control does not meet the condition set forth by ASC 718.

Furthermore, an option or similar instrument that is first classified as equity, but subsequently becomes a liability because the contingent cash settlement event becomes probable of occurring, is to be accounted for similar to a modification from an equity to liability award. Accordingly, on the date the contingent event becomes *probable* of occurring (thus triggering reclassification of the award as a liability) the entity recognizes a share-based liability equal to the portion of the award attributed to past service (reflecting any provision for acceleration of vesting) multiplied by the award's fair value on that date. To the extent the liability equals or is less than the amount previously recognized in equity, that is the amount transferred from equity to the liability. To the extent that the liability exceeds the amount previously recognized in equity, the excess is recognized as additional compensation

cost in that period. The total recognized compensation cost for an award with a contingent cash settlement feature must at least equal the fair value of the award at the grant date.

A puttable share that does not meet either of the foregoing conditions is to be classified as equity. Options or similar instruments on shares is to be classified as liabilities if (1) the underlying shares are classified as liabilities, or (2) the reporting entity can be required under any circumstances to settle the option or similar instrument by transferring cash or other assets. If the entity grants an option to an employee that, upon exercise, would be settled by issuing a mandatorily redeemable share, the option must be classified as a liability.

According to ASC 718, a freestanding financial instrument ceases to be subject to this standard, and becomes subject to the recognition and measurement requirements of ASC 480 or other applicable GAAP when the rights conveyed by the instrument to the holder are no longer dependent on the holder being an employee of the entity. Thus, once the requisite service has been provided and the grantee has, say, elected to receive stock or another instrument, guidance on the appropriate accounting would be given by ASC 480. For example, a mandatorily redeemable share becomes subject to ASC 480 or other applicable GAAP when an employee (1) has rendered the requisite service in exchange for the instrument and (2) could terminate the employment relationship and receive that share. Similarly, a share option or similar instrument that is not transferable and whose contractual term is shortened upon employment termination continues to be subject to ASC 718 until the rights conveyed by the instrument to the holder are no longer dependent on the holder being an employee of the entity (generally, when the instrument is exercised).

An award may be indexed to a factor beyond the entity's share price. ASC 718 holds that, if that additional factor is not a market, performance, or service condition, the award is to be classified as a liability. In such a case, the additional factor is to be reflected in estimating the fair value of the award. An example of such a circumstance would be an award of options whose exercise price is indexed to the market price of the commodity (e.g., wheat or gold). Another example: a share award that will vest based on the appreciation in the price of that commodity; such an award is indexed to both the value of that commodity and the issuing entity's shares. If an award is so indexed, the relevant factors (expected commodity price change) should be included in the fair value estimate of the award. ASC 718 states that the award would be classified as a liability even if the entity granting the share-based payment instrument is a producer of the commodity whose price changes are part or all of the conditions that affect an award's vesting conditions or fair value.

Stock appreciation rights (SARs) and similar instruments. SARs are a popular means of providing share-based compensation awards to employees. Essentially, the bonus arrangement is to pay employees the amount by which the share price at a defined date (say, three years hence) exceeds what it was at the measurement date. Depending on the plan, the award may be payable in the entity's shares, in cash, or in either at the option of the grantee. If the optionee has the right to demand cash or the SAR is payable in cash only, the grantor entity recognizes a liability for the accrued compensation.

If the entity is publicly held, measurement at fair value is required, with revaluation at each reporting date through final settlement. For nonpublicly held entities, an election must be made to use fair value or intrinsic value—but again, in either case, remeasurement at each reporting date until final settlement is required.

Example of accounting for SAR—Share-based liabilities

The company grants SAR with the same terms and conditions used in the examples above. Each SAR entitles the holder to receive an amount in cash equal to the increase in value of one share of company stock over $50. Using the same assumptions and option-pricing model the fair value of the share options is computed to be $6 per SAR (details not presented). The awards cliff-

vest at the end of 3 years. The forfeitures are expected to be 3% a year: thus, SAR expected to vest are (10,000 × .97 × .97 × .97 =) 9,127, and the fair value of the award at the beginning of year 1 is (9,127 × $6 =) $54,762. It is assumed that expected and actual forfeitures are the same. The share-based compensation liability at the end of year 1 is ($54,762 ÷ 3 =) $18,254. The journal entry for year 1 is

Compensation cost	18,254	
Share-based compensation SAR liability		18,254

Under ASC 718, compensation arising in connection with share-based liabilities must be valued at fair value at each reporting date. At the end of year 2, the estimated fair value is assumed to be $10 per SAR. Therefore, the award's fair value is (9,270 × $10 =) $91,270, and the corresponding liability at that date is ($91,270 × 2/3 =) $60,847 because service has now been provided for 2 of the 3 years required. Compensation cost recognized for the award in year 2 is ($60,847 – $18,254 =) $42,593. The journal entry for year 2 is

Compensation cost	42,593	
Share-based compensation SAR liability		42,593

At the end of year 3 the estimated fair value is assumed to be $9 per SAR. Therefore, the award's fair value is (9,270 × $9 =) $83,430 and the corresponding liability at that date is the same because the award is fully vested. Compensation cost for year 3 is ($83,430 – $42,593 – $18,254 =) $22,583. The journal entry for year 3 is

Compensation cost	22,583	
Share-based compensation SAR liability		22,583

Stock SARs. If the SAR were to be redeemed (only) in common stock of the entity, "Stock rights outstanding" (a paid-in capital account) would replace the liability account in the above entries. Fair value would be assessed at the grant date (measurement date), and then not altered over the time to final settlement, consistent with how other equity compensation awards are measured under ASC 718.

Tandem plans. Often stock option plans and SAR are joined in tandem plans, under the terms of which the exercise of one automatically cancels the other. In the absence of evidence to the contrary, however, the presumption is that the SAR, not the options, will be exercised. If the SAR portion of the tandem plan is such that classification as a liability is required, as described above, then remeasurement through the settlement date is required.

Modifications of Awards of Equity Instruments

In some instances awards previously issued but not yet settled are later modified in ways that may or may not change the classification (e.g., liability to equity). ASC 718 requires that modification of the terms or conditions of an equity award is to be treated as an exchange of the original award for a new award. In substance, the event is accounted for as if the entity repurchases the original instrument by issuing a new instrument of equal or greater value, incurring additional compensation cost for any incremental value.

Incremental compensation cost in such circumstances is to be measured as the excess, if any, of the fair value of the modified award—determined in accordance with the provisions of ASC 718—over the fair value of the original award immediately before its terms are modified. These measures are to be based on the share price and other pertinent factors at the modification date. Any effect of the modification on the number of instruments expected to vest is also to be reflected in determining incremental compensation cost. The estimate at the modification date of the portion of the award expected to vest may also be subsequently adjusted, if necessary, as estimates or experience may dictate prior to final settlement.

The total recognized compensation cost for an equity award will at least equal the fair value of the award at the grant date, except for those instances when, at the date of the modification, the performance or service conditions of the original award are not expected to be

satisfied. Accordingly, the total compensation cost measured at the date of a modification will be (1) the portion of the grant-date fair value of the original award for which the requisite service is expected to be rendered (or has already been rendered) at that date, plus (2) the incremental cost resulting from the modification.

The change in compensation cost for an equity award measured at intrinsic value (if elected for nonpublicly held companies) is to be measured by comparing the intrinsic value of the modified award, if any, with the intrinsic value of the original award, if any, immediately before the modification.

If a modification results in what had been a liability award becoming an equity award, the amount of the fair value (or implicit value, if such were elected as a measurement strategy by a nonpublic company), the amount becomes "fixed" as of the modification date, and this will differ from the amount that would have been recognized had the award been classified as equity at inception. On the other hand, if an award was originally equity and after modification becomes a liability, to the extent that the liability equals or is less than the amount recognized in equity for the original award, the offsetting debit is a charge to equity. To the extent that the liability exceeds the amount recognized in equity for the original award, the excess is recognized as compensation cost.

Example of a liability to equity modification

Assume that a cash payment SAR plan is created, with features similar to earlier examples (10,000 SARs granted, with three-year term, 3% forfeiture per year expectation). The share-based compensation liability is (9,127 × \$10 ÷ 3 =) \$30,423, based on reporting date fair value measurement. On January 1 of year 2, the company modifies the SAR by replacing the cash-settlement feature with a net-share settlement feature, which converts the award from a liability award to an equity award, because there is no longer an obligation to settle for cash, or an obligation classified as a liability per ASC 480. For the equity award, fair value is to be measured at grant date only. Per ASC 718, when no other terms are altered by the modification, the fair value at the modification date is used to measure the amount of the total compensation to be awarded in equity instruments.

The journal entry to reclassify the liability to equity would be

Share based compensation SAR liability	30,423	
Additional paid-in capital—SAR		30,423

Since no further remeasurement would be permitted, additional compensation cost of \$30,423 per year will be recorded at the end of years 2 and 3, with credits to the additional paid-in capital account. In this example, total compensation cost was greater because the effective measurement date was the end of year 1, but it could also have happened that compensation cost was reduced for the same reason.

Example of an equity to liability modification

Assume that a SAR plan, payable in shares, is created, with features similar to earlier examples (10,000 SARs granted, with three-year term, 3% forfeiture per year expectation). Using a valuation model, the amount of compensation is determined to be \$40,000 in total, computed at grant date. At the end of the first year, compensation expense and additional paid-in capital of \$13,333 is recorded, based on completion of 1 of the 3 years required service. At that date the fair value of the SARs amount to \$45,000. If the plan is amended at the start of year 2 to offer grantees the right to a cash payout, the equity must be reclassified to liability and the value must be remeasured at each reporting date. At the time of modification, since the fair value exceeds what had been accrued, additional compensation cost must be recognized. The entry would be

Additional paid-in capital—SAR	13,333	
Compensation cost	1,667	
Share-based compensation—SAR liability		15,000

On the other hand, if the fair value of the liability for the SAR at the modification date had been only $30,000, the difference between the amount accrued in year 1 and the modified value would have been left in the additional paid-in capital account. The entry follows:

Additional paid-in capital—SAR	10,000	
Share-based compensation—SAR liability		10,000

A share-based payment award may also be modified as a result of an acquisition. ASC 805 describes the accounting for several instances where an acquirer exchanges its share-based payment awards for rewards held by the employees of an acquiree. If the acquiring entity replaces an acquiree's share-based awards when it is not obligated to do so, then all of the fair-value replacement cost is to be recognized as postcombination compensation expense. If the acquirer's replacement award requires some additional employee service, a portion of the replacement award's fair-value cost should be attributed to postcombination compensation expense. ASC 805 is covered in detail in Chapter 13.

Accounting for Income Tax Effects of Share-Based Compensation

Under US income tax laws, the amount that is deductible in connection with a share-based compensation arrangement is limited to intrinsic value. This is generally defined by the amount by which the fair (market) value of the compensation exceeds the amount paid, if any, by the recipient. For example, if an option grant is made when the underlying stock is trading at $34, and the option is exercisable at that price, and it is later exercised when the stock is trading at $55, the deductible amount will be $21 per share, based on the *intrinsic value* of the option, which becomes observable only upon actual exercise. However, under ASC 718, compensation expense will have been recognized for the fair value of the option when granted, computed using either the BSM or lattice model as illustrated earlier in this section. Depending on other facts, that option value may have been $5, $10, or some other amount per share; it would not, however, be the same as the intrinsic amount other than by sheer coincidence.

Additionally, the timing of the compensation expense recognition will differ between tax and financial reporting. For financial reporting, expense is recognized over the expected service period, as explained above. For tax, the expense is deductible at the actual exercise date. Options not exercised (i.e., forfeited) thus never give rise to taxable deductions, whereas under GAAP the compensation cost would have been expensed.

It is thus inevitable that both the timing and the amounts of compensation expense related to share-based compensation will differ. To the extent that these are timing differences, interperiod tax allocation (deferred tax accounting) will be appropriate. The cumulative amount of compensation cost that will result in a tax deduction is to be considered a deductible temporary difference. This applies both for instruments classified as equity and for those categorized as liabilities. Any compensation cost recognized in the financial statements for instruments that will not result in a tax deduction should not be considered to result in a deductible temporary difference under ASC 740.

In general, the fair value of stock-based compensation, which is computed at grant date and recognized over the vesting period as compensation cost in the financial statements, will not be tax deductible currently, giving rise to deferred tax benefits measured with reference to the book compensation expense recognized. Ultimately, when the employee's options vest and are exercised, the company is able to deduct the intrinsic value, measured by the spread between fair value on exercise date and exercise price. To the extent this exceeds the fair value of the stock-based compensation recognized as GAAP-basis expense, the tax effect of that excess tax deduction is treated as a contribution to paid-in capital. If (less likely, but quite possible) the tax deduction is lower than the compensation already recognized for fi-

nancial reporting purposes, this shortfall in tax benefits is additional compensation cost—in effect, the employer entity incurred higher compensation cost in connection with the share option program since it received less than the anticipated tax benefits related thereto.

If the exercise results in a tax deduction prior to the actual realization of the related tax benefit—because the entity, for example, has a net operating loss carryforward—then the tax benefit and the credit to additional paid-in capital for the excess deduction would not be recognized until that deduction reduces taxes payable.

However, to the extent that the excess stems from a reason *other* than changes in fair value of the entity's shares between the measurement date for accounting purposes (grant date, generally) and the later measurement date for income tax purposes (exercise date), that portion of the tax effect is to be reported in income (i.e., in the tax provision). For example, a change in the tax rate could result in such a difference.

Differences between the deductible temporary difference that arises and the tax deduction that would have resulted based on the current fair value of the entity's shares should not be considered either in measuring the gross deferred tax asset or in determining the need for a valuation allowance created by the application of ASC 718.

If there should be an excess of cumulative compensation cost recognized for financial reporting purposes over the tax deductible amount (e.g., due to options lapsing unexercised), the write-off of the deferred tax asset (net of valuation allowance, if any) is first to be offset against any remaining additional paid-in capital from previous awards accounted for under the fair value method; any remaining excess should be recognized in income (the tax provision). The additional paid-in capital available to absorb tax effects is referred to as the *APIC pool*.

Consistent with the treatment of excess tax deductions for share-based compensation as being essentially similar to capital contributions, ASC 718 requires that the realized tax benefit applicable to the excess of the deductible amount over the compensation cost recognized under GAAP be reported in the cash flow statement as both a cash inflow from financing activities and a cash outflow from operating activities. This is required whether the cash flow statement is being presented under the direct method or the indirect method.

It is possible that an entity has issued dividends to employees holding nonvested shares, nonvested share units, or outstanding options. If so, it should recognize the income tax benefit as an increase to additional paid-in-capital, but only if the deduction reduces income taxes payable.

Other ASC 718 Matters

The most common share-based compensation arrangements have been presented. Other more complicated awards have been and will continue to be developed. Some of these are presented below. For a further discussion with examples refer to ASC 718.

Share options with performance conditions and/or market conditions. Some option arrangements provide grants of share options with a performance condition. These types of plans permit employees to vest in differing numbers of options depending on the increase in market value of one of the company's products (or other condition) over a vesting period. These performance conditions can include factors such as market share increases, passing clinical trials, and other performance goals.

In addition to performance conditions, market conditions may also affect the option arrangements. These would include such things as indexing share prices to an industry group and the exercise price of options tied to this index. Therefore, the exercise price could go up or down depending on how the index performs. Arrangements exist for share units to have both performance and market conditions. These are accounted for in the same way as other

options. The difficulty is in determining the fair values, as there are more factors contributing to uncertainty. These factors can, however, be modeled in a binomial valuation model.

Other modifications of share option awards. A company may modify the vesting conditions of an award. The accounting treatment for these modifications depends on the probability of vesting under the original conditions or the modified conditions. Other modifications are whether SAR will be settled in cash or equity or some combination, different from the original plan assumptions. A modification of vesting conditions is accounted for based on the principles set forth in ASC 718. Illustrations of different potential modifications are illustrated in ASC 718-10-55.

Other types of share-based compensation awards covered in ASC 718. Other share awards that ASC 718 addresses are outlined below.

- Share award with a clawback feature: These are restrictions on the employee's subsequent employment with a direct competitor, which if violated cause the ex-employee to return the value of the share award to the company.
- Tandem plan—share options or cash SAR: Employees are granted awards with two separate components, in which exercise of one component cancels the other.
- Tandem plan—phantom shares or share options: Similar to the plan above, but the employee's choice of which component to exercise depends on the relative value of the components when the award is exercised.
- Look-back share options: Share options awarded under Section 423 of the Internal Revenue Code, which provides that employees will not be immediately taxed on the difference between the market price of the stock and a discounted purchase price if certain requirements are met.
- Employee share purchase plans: Employee share purchase plans are not compensatory if their terms are no more favorable than those available to all holders of the same class of shares and if all employees that meet limited employment qualifications may participate in the plan on an equitable basis.
- Book value share purchase plans (nonpublic companies only): Companies with two classes of stock—one of which is available to all employees and the price is based on book value.
- Voluntary (or involuntary) change to fair-value-based method (nonpublic companies only): A nonpublic company elects as accounting policy the intrinsic value method and grants share awards to employees. Subsequently, the accounting for the value of these awards is changed to fair value because it is preferable under GAAP. Estimating grant date values is very difficult in hindsight. Therefore, these companies do not have to retrospectively apply fair value methods to unvested awards at the date of change.
- Certain instruments become subject to ASC 480: Certain instruments will become subject to ASC 480 when an employee could terminate service and receive or retain the fair value of the instrument for the remaining contractual term of that instrument.

Reload feature and reload option. A reload feature provides for automatic grants of additional options whenever an employee exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. At the time of exercise using shares, the employee is automatically granted a new option, called a reload option, for the shares used to exercise the previous option.

Example of reload options

Mr. Jones has 6,000 shares of ABC Company's $1 par value common stock, as well as options to purchase an additional 8,000 shares at an exercise price of $12. It will cost Jones $96,000

to exercise the options. The current market price of ABC stock is $16, so he trades in his existing 6,000 shares, which have a market value of $96,000, to purchase 8,000 shares with his options. The option plan has a reload feature, so ABC issues 6,000 replacement options (matching the number of shares traded in), for which the exercise price is set at the current market value of $16. ABC records the stock sale with the following entry:

Treasury stock	96,000	
Common stock		8,000
Additional paid-in capital		88,000

Jones elects to exercise his options when the market value of ABC Company's stock reaches $24. At an exercise price of $16, it will again cost Jones $96,000 to purchase shares. At the current market price of $24, Jones can trade in 4,000 of his existing shares to acquire new shares. However, he chooses to trade in only 3,000 shares and pay for the remaining options with cash. ABC records the stock sale with the following entry:

Cash	24,000	
Treasury stock	72,000	
Common stock		6,000
Additional paid-in capital		90,000

The reload feature still applies, but now ABC only issues 3,000 replacement options, which matches the number of shares Jones traded in to acquire new shares. The new options are assigned at an exercise price of $24, to match the market value on the grant date.

Effect of employer payroll taxes. ASC 718-10-25-22 discusses (1) when a liability for employer payroll taxes on employee stock compensation should be recognized in the employer's financial statements and (2) how that liability should be measured. The consensus was that a liability for employee payroll taxes on stock compensation should be recognized and measured on the date of the event triggering the measurement and payment of the tax to the taxing authority (which would generally be the exercise date).

Payments in lieu of dividends on options. Normally dividends are not paid on shares that have not been issued; thus, unexercised options do not gain the benefit of any dividends declared on the underlying stock. However, an entity can choose to pay dividend equivalents on options.

ASC 718 is silent on this. Since the codification requires, effectively, that forfeitures be estimated and accounted for over the service period, in the authors' view it would be consistent to likewise charge retained earnings only for the estimated number of options to be exercised (changing from period to period, if a lattice model is used), with the remainder of any payments in lieu of dividends charged currently to compensation expense.

Example of payments in lieu of dividends on options

Gary Ironworks declares dividends of $2 per share of common stock. Its president, Mr. Jones, has 5,000 unvested options. Gary's board of directors chooses to pay Mr. Jones dividends on the 5,000 shares represented by the unvested options, on the assumption that all the options will vest. The resulting entry follows:

Retained earnings	10,000	
Dividends payable		10,000

There are several other employees who have 20,000 unvested options. The board also declares dividends for these options, with the provision that dividends paid can be retained even if the associated options do not vest. The controller expects that only 70% of the options will vest, so she creates the following entry to charge the other 30% of the dividends to compensation expense:

Retained earnings	28,000	
Compensation expense	12,000	
Dividends payable		40,000

Disclosure requirements under ASC 718. For a company to achieve the objectives of ASC 718, the minimum information needed to achieve disclosure objectives are set forth below.

- A description of the share-based payment arrangements, including the terms of the awards. A nonpublic company should disclose its policy for measuring compensation cost.
- The most recent income statement should provide the number and weighted-average exercise prices of the share options and equity instruments.
- Each year for which an income statement is provided, a company should provide the weighted-average grant-date fair value of equity options and the intrinsic value of options exercised during the year.
- For fully vested share options and those expected to vest at the latest balance sheet date, the company should provide the number, weighted-average exercise price, aggregate intrinsic value, and contractual terms of options outstanding and currently exercisable.
- If more than one share-based plan is in effect, the information should be provided separately for different types of awards.
- For each year for which an income statement is provided, companies should provide the following:
  - Companies that do not use the intrinsic value method should provide a description of the method of determining fair value and a description of the assumptions used.
  - Total compensation cost for share-based payment arrangements, including tax benefits and capitalization of compensation costs should be stated.
  - Descriptions of significant modifications and numbers of employees affected should also be provided.
- On the latest balance sheet date the total compensation cost related to nonvested awards not yet recognized and the period over which they are expected to be recognized.
- The amount of cash received from exercise of share-based compensation and the amount of cash used to settle equity instruments should be disclosed.
- Description of the company's policy for issuing shares upon share options exercise, including the source of the shares.

Accounting for Equity Instruments Issued to other than Employees

ASC 505-50 deals exclusively with those situations in which the fair value of the equity instruments delivered to other than employees is more objectively ascertainable than is the value of goods or services received. ASC 505-50 is the foundation for the discussion that follows in this section.

Measurement date. For purposes of ascertaining the amounts to be assigned for these transactions, the key concern is the determination of the measurement date. Essentially, the amount of expense or the value of the asset acquired through the issuance of equity instruments is fixed as of the measurement date, although, under certain circumstances as explained below, some subsequent adjustments may need to be made.

Per ASC 505-50, the measurement date will be the earlier of the date at which a commitment for performance is made or when the performance is actually completed. Whether or not there has been a "performance commitment" by the party providing the goods or services is a question of fact and must be determined from the surrounding circumstances, but in general will be deemed to exist if there is a "sufficiently large disincentive for nonperfor-

mance" to make performance probable. This disincentive must derive from the relationship between the equity instrument issuer/recipient of the goods or services and its counterparty. Mere risk of forfeiture is not enough to qualify as a disincentive, nor is the risk of being sued for nonperformance. When a sufficiently large disincentive exists, however, the measurement date will precede the completion of performance and, accordingly, when accrual of the related expense or recognition of the asset would otherwise be required under GAAP, it will be necessary to include the value of the equity instruments in such cost.

For example, if the agreed-upon price for the construction of a new power plant includes options on the utility company's stock, subject to a completion date of no longer than three years hence, and the contract also contains substantial financial disincentives to late completion, such as a provision for liquidated damages, then it would be concluded that there was a "performance commitment" within the meaning of ASC 505-50. On the other hand, if the price agreed to were to be fully payable even in the event of late delivery, there would be no "performance commitment" as that term is used.

In many situations in which the compensation includes significant equity instrument components, there will still be no finding of a performance commitment because the payment arrangement provides for phases of work, with payment in full for work as it is completed. For example, if a contractor agrees to build a multiplicity of sales kiosks in various air terminals for a retailing chain, with payment to be made in cash and the retailer's stock upon the completion of each kiosk, the contractor could terminate the arrangement after any intermediate completion date without significant penalty. In such cases, the measurement date would be, for each subproject, the date on which the work is completed.

When to recognize the fair value of the equity instruments. In general, the normal rules of GAAP would apply in circumstances in which stock or other equity instruments were being granted as part, or all, of the consideration for the transaction. Thus, if the services provided represented an expense of the enterprise, the expense should be recognized when incurred, which could well precede the date on which the payment was ultimately to be made.

An expense or asset measurement is made with the best information available at that time, and there is no "look back" based on subsequent events; the value assigned to the option would be credited to an appropriate paid-in capital account (e.g., "capital from expired options") if this becomes necessary.

Accounting prior to measurement date. If, under GAAP, it is necessary for the entity to recognize an expense or an asset related to the transaction involving the issuance of equity for goods or services prior to the measurement date, the then-current fair values of the equity instruments must be utilized to determine these amounts. If fair values change later, these variations are attributed to those later periods. Thus, for a transaction which calls primarily for cash payment but also, to a lesser extent, for the issuance of stock, a decline in the value of the equity portion in a later interim period would reduce the cost (or asset value) to be recognized in that period; if the stock portion is a significant component, a decline could largely eliminate the cost otherwise to be accrued or even, conceivably, cause it to become negative in a later reporting period. Of course, overall, the aggregate cost would be positive upon ultimate completion (at worst it could be zero, if the transaction were predicated only on the issuance of equity instruments, and these became worthless—an obviously unlikely scenario).

Measurement of fair value of the equity instrument portion of the transaction when certain terms are not known at inception. In some circumstances where there is a performance commitment there will also be a material uncertainty regarding the valuation of the equity instruments, either because of some question regarding the number of instruments to

be delivered, the value of such instruments, or some factor dependent upon the performance of the party providing the service. For example, the arrangement may include a guarantee of the value of the instrument extending for some period subsequent to completion of performance that unless the underlying shares maintain a market price of $15 or greater for one year following delivery, or else a defined number of additional shares will be granted. This type of arrangement is referred to as a "market condition." In other circumstances there may be a condition based on the counterparty's performance, for example, when options are granted to a tax accountant structuring a tax shelter, in which the number of options ultimately deliverable depends upon successfully surviving an IRS audit. Situations such as this are denoted "counterparty performance conditions."

Where the arrangement contains market conditions, measurement of the equity instrument portion of the contracted price should be based on two elements: the first is the fair value of the basic equity instrument; the second is the fair value of the contingent commitment, such as the aforementioned promise to grant a specified number of extra shares if the market price falls below $15 during the one-year period. In practice, the valuation of these contingencies might prove to be challenging, but clearly any such promise has some positive value, and the standard requires that this be assessed. Changes in the value of the second (contingent) element subsequent to the performance commitment date would not be recognized since, per ASC 815, a derivative financial instrument to be settled in a company's own shares (as contrasted to a settlement in cash) is not to be remeasured.

Compared to market conditions, measurement when there are counterparty performance conditions is more complicated. At the measurement date, the equity instruments are valued at the lowest of the defined alternative amounts. For example, if the value of the option award to the tax accountant noted above is $20,000 (at the performance commitment date) assuming survival against IRS challenge, but only $5,000 if the IRS ultimately prevails, then the measurement of the value of the service would be based on the $5,000 amount. However, later, when the outcome of the performance condition is known, an additional cost would have to be recognized if a more favorable outcome occurred (in this example, successful defense of the tax shelter). The added cost would be based not on the values as of the performance commitment date, but rather as of the date of resolution of the condition. If the value of the options under the "success" outcome is $28,000 at that date, and the value of the "failure" outcome is $19,000, then an added cost of ($28,000 – 19,000 =) $9,000 would be recognized.

Where a given transaction involves both market and counterparty performance conditions, the accounting specified for situations involving only counterparty performance conditions is to be applied.

Example of equity instruments issued to a third party

Carney Development Enterprises has engaged the services of Alfred Brothers Construction (ABC) to design an office tower. ABC agrees to accept 5,000 shares of Carney $1 par value common stock and 1,000 options on shares in exchange for this service, but it will only receive half the number of shares if it delivers completed drawings after the due date. Thus, there exists a sufficiently large disincentive for nonperformance. Also, if the value of Carney's stock declines below $15/share at any point during the six months subsequent to the issuance of shares to ABC, Carney agrees to issue additional shares to bring ABC's total compensation back up to the $15 level, which is capped at a maximum additional stock issuance of 2,000 shares.

Carney measures the value of its stock and options as of the performance commitment date for the initial 5,000 share payment, the 1,000 option grant, and the potential additional payment of 2,000 shares. At a price on the commitment date of $18/share, the initial share payment costs $90,000, while the additional payment costs $36,000. Carney appropriately values the stock options at $9 each, or $9,000 in total, using an option pricing model. During each of the 18 months

of the design process, Carney recognizes 1/18 of the $90,000 cost of the initial stock grant and of the $9,000 option grant with the following entry:

Construction-in-progress	5,500	
Stock options outstanding		500
Accrued liabilities		5,000

ABC successfully completes the drawings by the designated deadline, triggering a stock grant of 5,000 shares that Carney records with the following entry:

Accrued liabilities	90,000	
Common stock		5,000
Additional paid-in capital		85,000

Carney's stock price drops below $18 immediately after the project is completed, so ABC never exercises the 1,000 stock options. Carney accounts for the stock options with the following entry:

Stock options outstanding	9,000	
Additional paid-in capital—expired options		9,000

The value of Carney stock subsequently declines to $10/share, which represents a shortfall of $25,000 from the guaranteed minimum share price of $15. At the current market price of $10/share, Carney would have to issue an additional 2,500 shares to ABC to make up the shortfall. However, since this liability is capped at 2,000 shares, Carney only issues 2,000 shares, using the valuation of $18 set at the commitment date, and records the transaction with the following entry:

Construction-in-progress	36,000	
Common stock		2,000
Additional paid-in capital		34,000

Reporting prior to the measurement date when certain terms are not known. When market conditions (e.g., the value of the stock underlying the options two years hence) are not known, and expenses must be accrued or assets recorded prior to the measurement date, the then-current fair values of the equity instruments at such dates should be used, with subsequent adjustments as necessary. When there are counterparty performance conditions, either alone or in conjunction with market conditions, then interim measurements should be based on the lowest of the alternative values as of each date, with subsequent changes in this same measure assigned to later periods.

Reporting after the measurement date when certain terms are not known. When market conditions (e.g., the value of the stock underlying the options two years hence) are not known, after the measurement date the principles of ASC 815 are to be applied, which generally would mean that changes in value would not be recognized. On the other hand, when there are counterparty performance conditions, with or without market conditions also being present, "modification accounting" procedures are to be utilized. This results in reporting an adjustment in subsequent periods determined with reference to the difference between the then-current fair value of the revised equity instruments and that of the old instruments immediately prior to the recognition event. In all cases, the "then-current" values are to be determined with reference to the lowest aggregate fair values under the alternative outcomes specified by the contractual arrangement.

Further guidance. Where fully vested, exercisable, nonforfeitable equity instruments are issued at the date the grantor and grantee enter into an agreement, by eliminating any obligation on the part of the counterparty to earn the equity instruments, a measurement date has been reached. The grantor should recognize the equity instruments when they are issued (in most cases, when the agreement is entered into). Whether the corresponding cost is an immediate expense or a prepaid asset (or whether the debit should be characterized as contra equity) depends on the specific facts and circumstances.

If an entity grants fully vested, nonforfeitable equity instruments that are exercisable by the grantee only after a specified period of time and the terms of the agreement provide for earlier exercisability by the grantee only after a specified period of time and the terms of the agreement provide for earlier exercisability if the grantee achieves specified performance conditions, the grantor should measure the fair value of the equity instruments at the date of grant and should recognize that measured cost under the same guidance as the foregoing. If, subsequent to the arrangement date, the grantee performs as specified and exercisability is accelerated, the grantor should measure and account for the increase in the fair value of the equity instruments resulting from the acceleration of exercisability using "modification accounting." Since, generally, option-pricing models are not sensitive to exercisability restrictions, it may be necessary to provide additional guidance on how to measure the discount attributable to the exercisability restriction.

For transactions that include a grantee performance commitment, the grantee should account for the arrangement as an executory contract (that is, generally no accounting before performance) in the same manner as it would if the grantor had agreed to pay cash (upon vesting) for the goods or services. Further consideration will be directed to the accounting in cases in which the fair value at the date the equity instruments are earned is greater than or less than the fair value measured at the performance commitment date (measurement date).

Consideration for future services. ASC 505-50 discusses the appropriate balance sheet presentation of arrangements where unvested, forfeitable equity instruments are issued to an unrelated nonemployee (the counterparty) as consideration for future services. SEC staff has since addressed situations where the grantor is entitled to recover the specific consideration paid, plus a substantial mandatory penalty, as a minimum measure of damages for counterparty nonperformance. Fair value measurement under ASC 718 is required. In practice, however, some reporting entities have made no entries until performance occurs, while others have recorded the fair value of the equity instruments as equity at the measurement date and record the offset either as an asset (future services receivable) or as a reduction of stockholders' equity (contra equity).

The SEC staff believes that if the issuer receives a right to receive future services in exchange for unvested, forfeitable equity instruments, those equity instruments should be treated as unissued for accounting purposes until the future services are received (that is, the instruments are not considered issued until they vest). Consequently, there would be no recognition at the measurement date and no entry should be recorded. This does not apply to similar arrangements in which the issuer exchanges fully vested nonforfeitable equity instruments, as those types of arrangements are addressed in ASC 505-50.

Convertible Preferred Stock

The treatment of convertible preferred stock at its issuance is no different than that of nonconvertible preferred. When it is converted, the book value approach is used to account for the conversion. Use of the market value approach would entail a gain or loss for which there is no theoretical justification since the total amount of contributed capital does not change when the stock is converted. When the preferred stock is converted, the "Preferred stock" and related "Additional paid-in capital—preferred stock" accounts are debited for their original values when purchased, and "Common stock" and "Additional paid-in capital—common stock" (if an excess over par or stated value exists) are credited. If the book value of the preferred stock is less than the total par value of the common stock being issued, retained earnings is charged for the difference. This charge is supported by the rationale that the preferred shareholders are offered an additional return to facilitate their conversion to common stock. Many states require that this excess instead reduce additional paid-in capital from other sources.

Example of convertible preferred stock

Caspian Corporation issues 10,000 shares of $1 par value convertible preferred stock, and receives $1.25 per share. It records the initial sale with the following entry:

Cash	12,500	
Convertible preferred stock		10,000
Additional paid-in capital—preferred stock		2,500

The terms of the convertible preferred stock allow Caspian's shareholders to convert one share of preferred for one share of common stock at any time. The preferred shareholders convert all of their shares to Caspian common stock, which has a par value of $2. This requires the following entry:

Convertible preferred stock	10,000	
Additional paid-in capital—preferred stock	2,500	
Retained earnings	7,500	
Common stock		20,000

Mandatorily Redeemable Common and Preferred Stock

A mandatory redemption clause requires common or preferred stock to be redeemed (retired) at a specific date(s) or upon occurrence of an event which is uncertain as to timing although ultimately certain to occur. This feature is in contrast to callable preferred stock, which is redeemed at the issuing corporation's option. Mandatory redemption features are not uncommon in practice; closely held corporations, for example, have "buy-sell" agreements to redeem the shares of retiring or deceased owners at formula prices, often book value. Historically, the mandatory redemption feature has been ignored in determining balance sheet classification for nonpublic companies. On the other hand, for publicly held companies, mandatorily redeemable shares (which are almost always preferred stock in these situations) had to be displayed as either debt or as a "mezzanine equity" item separate from stockholders' equity.

Under ASC 480, which is discussed in greater detail later in this chapter, financial instruments with mandatory redemption features must be reported as liabilities. This means that "mezzanine" presentation of redeemable preferred stock is no longer appropriate. It also means that some entities, having "buy-sell" agreements with all of their respective shareholders, should report no equity at all and should display all of what formerly was equity within the liabilities caption of the balance sheet. This is a major change from previous GAAP practice.

The only exception to this requirement exists in the circumstance where the redemption is required to occur only upon the liquidation or termination of the reporting entity. Since financial statements are prepared under the assumption of a going concern, it would be inconsistent to classify this type of redeemable stock as a liability.

If the stock subject to mandatory redemption provisions represents the only shares in the reporting entity, it must, under ASC 480, report those instruments in the liabilities section of its balance sheet, and describe them as shares subject to mandatory redemption, so as to distinguish the instruments from other financial statement liabilities. Transition to this standard may create distress, particularly in those cases where there will be a need to modify loan agreements, restrictive covenants, and so forth, since these entities' debt/equity ratios and other financial indicators will change dramatically and in many instances immediately violate existing covenants. The use of the special caption above will serve to educate financial statements users regarding the substantive meaning of this new mode of financial statement presentation.

In some cases stock is issued which is not subject to mandatory redemption provisions currently, but which is contingently subject to such requirements once defined events occur.

An assessment must be made each reporting period to ascertain whether the triggering event has yet occurred. If it has, reclassification of the conditionally mandatorily redeemable stock to liabilities must be effected.

ASC 480 offers two such examples. First, if shares are to become mandatorily redeemable upon a change in control of the issuing corporation, these remain classified within equity until that event occurs, if ever. When it does occur, the equity is reclassified to liabilities, measured at the fair value at that date, with no gain or loss recognized. Any disparity between the carrying value of the equity and the amount transferred to liabilities would therefore remain in equity, as additional paid-in capital or as a reduction to paid-in capital or to retained earnings.

Another example of conditional mandatory redemption would occur when preferred stock is issued with a mandatory redemption at a date certain, say ten years hence, conditioned on the failure of the preferred stockholders to exercise the right to convert to common stock before another defined date, say five years from issuance. For the first five years, the preferred stock would be displayed as equity, since the mandatory redemption feature has yet to become activated. If the shareholders elect to exchange the preferred stock to common stock, the usual accounting for such conversions would apply. If the five-year period elapses and the preferred shares are not exchanged, the mandatory redemption provision becomes effective, and the preferred stock is to be reclassified to liabilities, measured at fair value.

Accounting for mandatorily redeemable financial instruments of a nonpublic reporting entity must be conformed to the requirements outlined above, effective for existing or new contracts for fiscal periods beginning after December 15, 2004. For all other mandatorily redeemable financial instruments issued by nonpublic entities that are not SEC registrants, the classification, measurement, and disclosure provisions are deferred indefinitely. For mandatorily redeemable noncontrolling interests that would not be classified by the subsidiary as liabilities (because they are redeemable only upon liquidation) but would be classified by the parent as liabilities on the consolidated statements, the classification and measurement provisions of ASC 480 are deferred indefinitely. For other mandatorily redeemable noncontrolling interests, the measurement provisions of ASC 480 were deferred indefinitely, but the classifications provisions are not deferred. For financial instruments created before issuance date of ASC 480 and still existing at the beginning of the interim period of adoption, transition is to be achieved by reporting the cumulative effect of a change in an accounting principle by initially measuring the financial instruments at fair value or other measurement attribute required by the statement.

In addition to the requirement of ASC 480, expanded disclosure of mandatorily redeemable common or preferred stock is required by ASC 505-10-50. Specifically, the redemption requirements for each of the next five years must be set forth in the notes to the financial statements prepared in accordance with GAAP, if the amounts are either fixed or determinable on fixed or determinable dates. Thus, readers can interpret the cash requirements on the reporting entity in a manner similar to the drawing of inferences about other fixed commitments, such as maturities of long-term debt and lease obligations.

Example of mandatorily redeemable stock

A major shareholder of the Atlantic Corporation swaps the company two tracts of prime real estate (Tract A and Tract B) in exchange for 10,000 shares and 5,000 shares, respectively, of $1 par value preferred stock. Each block of stock is mandatorily redeemable within one year if Atlantic ever sells the related tract of real estate. Tract A has a fair value of $400,000 and Tract B has a fair value of $200,000 on the initial transaction date. Since the shares are only conditionally redeemable at this time, Atlantic records a credit to equity accounts with the following entry:

Land	600,000	
Preferred stock		15,000
Additional paid-in capital		585,000

Five years later, Atlantic sells Tract A for $550,000, which is the fair value of the land. Because the status of the shares has now changed to mandatorily redeemable, Atlantic reclassifies the related 10,000 shares as a liability, measured at their fair value on the reclassification date. Since the fair value has increased by $150,000, Atlantic shifts an additional $150,000 from the additional paid-in capital account to the liability account. It uses the following entry to do so:

Preferred stock	10,000	
Additional paid-in capital	540,000	
Liabilities—shares subject to mandatory redemption		550,000

Two years later, Atlantic sells Tract B for $125,000, which is the fair value of the land. The status of these shares has also now changed to mandatorily redeemable, so Atlantic reclassifies the related 5,000 shares as a liability, measured at their fair value on the reclassification date. Since the fair value has decreased by $75,000, Atlantic retains $75,000 in the additional paid-in capital account. It uses the following entry to do so:

Preferred stock	5,000	
Additional paid-in capital	120,000	
Liabilities—shares subject to mandatory redemption		125,000

Put Warrant

A detachable put warrant can either be put back to the debt issuer for cash or can be exercised to acquire common stock. These instruments should be accounted for in the same manner as a mezzanine security. The proceeds applicable to the put warrant ordinarily are to be classified as equity and should be presented between the liability and equity sections in accordance with SEC ASR 268.

In the case of a warrant with a put price substantially higher than the value assigned to the warrant at issuance, however, the proceeds should be classified as a liability since it is likely that the warrant will be put back to the company.

Example of a put warrant

Caspian Corporation issues 100 bonds with detachable put warrants, each of which allow holders, after two years have elapsed, to purchase one share of Caspian's $1 par value common stock from the company for $20 per share, and which are puttable for a cash payment of $5. Caspian apportions $5 of the bond sale price to the warrants. Caspian's share price on the issuance date is $23. At this price, warrant holders can purchase shares from Caspian for $20 and resell them for $23, yielding a net gain of $3. Since this is less than the $5 to be gained from the put feature of the warrants, this is classified as a liability, and is recorded as such with the following entry (the remaining entries for the issuance of the bond are not given here):

Cash	500	
Liabilities—puttable warrants		500

After two years, Caspian's stock price has declined to $20, so the warrant stock purchase feature clearly has no value. Instead, a warrant holder puts 30 warrants back to the company, which requires a cash payment of $5 for each warrant, and results in the following entry:

Liabilities—puttable warrants	150	
Cash		150

Caspian's stock price then increases to $30, which allows warrant holders to achieve a $10 gain if they acquire shares with their warrants for $20. Accordingly, another warrant holder acquires shares with 50 warrants, resulting in the following entry:

Cash	1,000	
Liabilities—puttable warrants	250	
Common stock		50
Additional paid-in capital		1,200

In a separate bond issuance, Caspian again issues put warrants under the same terms, but now its stock price is $35 at the time of bond issuance, making the warrant feature more likely to be exercised than the put feature. Accordingly, Caspian records the proceeds in equity with the following entry (again, the remaining entries recording the bond issuance are omitted):

Cash	500	
Additional paid-in capital—warrants		500

Investors use all 100 warrants to acquire shares at the $20 exercise price. The entry follows:

Cash	2,000	
Paid-in capital—warrants	500	
Common stock		100
Additional paid-in capital		2,400

The original classification should not be changed because of subsequent economic changes in the value of the put. The value assigned to the put warrant at issuance, however, should be adjusted to its highest redemption price, starting with the date of issuance until the earliest date of the warrants. Changes in the redemption price before the earliest put dates are changes in accounting estimates and changes after the earliest put dates should be recognized in income. If the put is classified as equity, the adjustment should be reported as a charge to retained earnings, and if the put is classified as a liability the adjustment is reported as interest expense.

Regardless of how the put is classified on the balance sheet, the primary and fully diluted EPS should be calculated on both an equity basis (warrants will be exercised) and on a debt basis (put will be exercised) and the more dilutive of the two methods should be used.

Accounting for Stock Issued to Employee Stock Ownership Plans

For over thirty years, it has been a government policy to encourage employee ownership of corporations. To that end, tax laws have been adopted which make this prospect attractive to employer entities. Thus, there has been a steady increase in the number of corporations which are entirely or partially employee-owned under terms of employee stock ownership plans (ESOP). The accounting for ESOP is governed by ASC 718-40.

Depending on what motivated the creation of the ESOP (e.g., estate planning by the controlling shareholder, expanding the capital base of the entity, rewarding and motivating the work force), the sponsor's shares may be contributed to the plan in annual installments in a block of shares from the sponsor, or shares from an existing shareholder may be purchased by the plan.

Employee stock ownership plans are defined contribution plans in which shares of the sponsoring entity are awarded to employees as additional compensation. Briefly, ESOP are created by a sponsoring corporation which either funds the plan directly (unleveraged ESOP) or, more commonly, facilitates the borrowing of money either directly from an outside lender (directly leveraged ESOP) or from the employer, which in turn will borrow from an outside lender (indirectly leveraged ESOP).

Borrowings from outside lenders may or may not be guaranteed by the sponsor. However, since effectively the only source of funds for debt repayment are future contributions by the sponsor, GAAP requires that the ESOP's debt be considered debt of the sponsor even absent a guarantee.

When recording the direct or indirect borrowings by the ESOP as debt in the sponsor's balance sheet, a debit to a contra equity account, not to an asset, is also reported. This is necessary since the borrowings represent a commitment (morally if not always legally) to make future contributions to the plan and this is certainly not a claim to resources. Significantly, this results in a "double hit" to the sponsor's balance sheet (i.e., the recording of a liability and the reduction of net stockholders' equity) which is often an unanticipated and unpleasant

surprise to plan sponsors. This contra equity account is referred to as "unearned ESOP shares" in accordance with provisions of ASC 718-40. If the sponsor itself lends funds to the ESOP without a "mirror loan" from an outside lender, this loan should not be reported in the employer's balance sheet as debt, although the debit should still be reported as a contra equity account.

As the ESOP services the debt, using contributions made by the sponsor and/or dividends received on sponsor shares held by the plan, it reflects the reduction of the obligation by reducing both the debt and the contra equity account on its balance sheet. Simultaneously, income and thus retained earnings will be impacted as the contributions to the plan are reported in the sponsor's current statement of earnings. Thus, the "double hit" is eliminated, but net worth continues to reflect the economic fact that compensation costs have been incurred.

The interest cost component of debt service must be separated from the remaining compensation expense. That is, the sponsor's income statement should reflect the true character of the expenses being incurred, rather than aggregating the entire amount into a category which might have been denoted as "ESOP contribution."

In a leveraged ESOP, shares held serve as collateral for the debt and are not allocated to employees until the debt is retired. In general, shares must be allocated by the end of the year in which the debt is repaid. However, in order to satisfy the tax laws, the allocation of shares may take place at a faster pace than the retirement of the principal portion of the debt.

Under ASC 718-40, the cost of ESOP shares allocated is measured based upon the fair value on the release date for purposes of reporting compensation expense in the sponsor's income statements. This is in contradistinction to the actual historical cost of the shares to the plan.

Furthermore, dividends paid on unallocated shares (i.e., shares held by the ESOP) are not treated as dividends, but rather must be reported in the sponsor's income statement as compensation cost and/or as interest expense. Of less significance to nonpublic companies is the fact that under the new rules only common shares released and committed to be released are treated as being outstanding, with the resultant need to be considered in calculating both basic and diluted EPS.

Example of accounting for ESOP transactions

Assume that Intrepid Corp. establishes an ESOP, which then borrows $500,000 from Second Interstate Bank. The ESOP then purchases 50,000 shares of Intrepid no-par shares from the company; none of these shares are allocated to individual participants. The entries would be

Cash	500,000	
Bank loan payable		500,000
Unearned ESOP shares (contra equity)	500,000	
Common stock		500,000

The ESOP then borrows an additional $250,000 from the sponsor, Intrepid, and uses the cash to purchase a further 25,000 shares, all of which are allocated to participants.

Compensation	250,000	
Common stock		250,000

Intrepid Corp. contributes $50,000 to the plan, which the plan uses to service its bank debt, consisting of $40,000 principal reduction and $10,000 interest cost. The debt reduction causes 4,000 shares to be allocated to participants at a time when the average market value had been $12 per share.

Interest expense	10,000	
Bank loan payable	40,000	
Cash		50,000
Compensation	48,000	
Additional paid-in capital		8,000
Unearned ESOP shares		40,000

Dividends of $.10 per share are declared (only the ESOP shares are represented in the following entry, but dividends are paid equally on all outstanding shares)

Retained earnings (on 29,000 shares)	2,900	
Compensation (on 46,000 shares)	4,600	
Dividends payable		7,500

Note that in all the foregoing illustrations the effect of income taxes is ignored. Since the difference between the cost and fair values of shares committed to be released is analogous to differences in the expense recognized for tax and accounting purposes with regard to stock options, the same treatment should be applied. That is, the tax effect should be reported directly in stockholders' equity, rather than in earnings.

Financial Instruments with Characteristics of Both Liabilities and Equity

Standard setters have been struggling with the proper reporting for hybrid instruments—having characteristics of both liabilities and equity. Two needs had been perceived: first, to establish criteria for classification for certain instruments (e.g., mandatorily redeemable stock) that nominally are equity but have key characteristics of debt, but which will severely impact corporate balance sheets if a "substance over form" approach is strictly enforced; and second, to develop the methodology for disaggregating the constituent parts of compound instruments so that they may be accounted for as debt and as equity, respectively.

A discussion memorandum was issued in 1990; ten years later, FASB issued an Exposure Draft, *Accounting for Financial Instruments with Characteristics of Liabilities*, *Equity, or Both*, as well as a concomitant proposed amendment to CON 6 to revise the definition of liabilities. Later, FASB decided to restructure its efforts to engage in a multiphase project, the first part of which has been included in ASC 480. This addresses only financial instruments issued in the form of shares that are mandatorily redeemable (i.e., that embody unconditional obligations requiring the issuer to redeem them by transferring its assets at a specified or determinable date or dates or upon an event that is certain to occur.)

According to ASC 480, the affected instruments include those, other than an outstanding share, that, at inception, embody an obligation to repurchase the issuer's equity shares, or are indexed to such an obligation, and that require or may require the issuer to settle the obligations by transferring assets (for example, a forward purchase contract or written put option on the issuer's equity shares that is to be physically settled or net cash settled). It also includes financial instruments that embody unconditional obligations, or financial instruments other than outstanding shares that embody conditional obligations, that the issuers must or may settle by issuing a variable number of equity shares, if, at inception, the monetary values of the obligations are based solely or predominantly on any of the following:

1. A fixed monetary amount known at inception, for example, a payable settleable with a variable number of the issuer's equity shares;
2. Variations in something other than the fair value of the issuer's equity shares, for example, a financial instrument indexed to the S&P 500 and settleable with a variable number of the issuer's equity shares; or
3. Variations inversely related to changes in the fair value of the issuer's equity shares, for example, a written put option that could be net share settled.

The requirements of ASC 480 apply to issuers' classification and measurement of freestanding financial instruments, including those that comprise more than one option or forward contract. It does not apply, however, to features that are embedded in financial instruments that are not derivatives in their entirety. For example, it does not alter the accounting treatment of conversion features (as found in convertible debentures), conditional redemption features, or other features embedded in financial instruments that are not derivatives in their entirety. It also does not affect the classification or measurement of convertible bonds, puttable stock, or other outstanding shares that are conditionally redeemable. ASC 480 also does not address certain financial instruments indexed partly to the issuer's equity shares and partly, but not predominantly, to another referent.

ASC 480 establishes requirements for only a limited range of financial instruments having characteristics of both liabilities and equity. FASB is now pursuing a second phase of its project and will address the accounting for various financial instruments with characteristics of both liabilities and equity not addressed in ASC 480. Guidance currently in effect under GAAP for those instruments remains in effect in the interim.

Terminology of ASC 480. Key terminology referenced in ASC 480 include the following:

Freestanding financial instrument—A financial instrument that is entered into separately and apart from any of the entity's other financial instruments or equity transactions, or that is entered into in conjunction with some other transaction and is legally detachable and separately exercisable.

Issuer—The entity that issued a financial instrument or may be required under the terms of a financial instrument to issue its equity shares.

Mandatorily redeemable financial instrument—Any of various financial instruments issued in the form of shares that embody an unconditional obligation requiring the issuer to redeem the instrument by transferring its assets at a specified or determinable date (or dates) or upon an event that is certain to occur.

Monetary value—What the fair value of the cash, shares, or other instruments that a financial instrument obligates the issuer to convey to the holder would be at the settlement date under specified market conditions.

Net cash settlement—A form of settling a financial instrument under which the party with a loss delivers to the party with a gain cash equal to the gain.

Net share settlement—A form of settling a financial instrument under which the party with a loss delivers to the party with a gain shares of stock with a current fair value equal to the gain.

Nonpublic entity—Any entity other than one (a) whose equity securities trade in a public market either on a stock exchange (domestic or foreign) or in the over-the-counter market, including securities quoted only locally or regionally; (b) that makes a filing with a regulatory agency in preparation for the sale of equity securities in a public market; or (c) that is controlled by an entity covered by (a) or (b).

Obligation—A conditional or unconditional duty or responsibility to transfer assets or to issue equity shares.

Physical settlement—A form of settling a financial instrument under which (a) the party designated in the contract as the buyer delivers the full stated amount of cash or other financial instruments to the seller and (b) the seller delivers the full stated number of shares of stock or other financial instruments or nonfinancial instruments to the buyer.

In addition to the foregoing, the terms fair value and financial instrument are used as defined in other recent FASB standards.

Applicability of ASC 480. This standard only applies to three types of freestanding financial instruments: mandatorily redeemable financial instruments; obligations to repurchase the issuer's shares by transferring assets; and certain obligations to issue a variable number of shares. Mandatorily redeemable shares were addressed earlier in this chapter; the other classes of instruments affected by ASC 480 are discussed in the following paragraphs.

Obligations to repurchase the issuer's equity shares by transferring assets include financial instruments, other than outstanding shares, that, at inception, (a) embody obligations to repurchase the issuers' equity shares, or are indexed to such obligations, and (b) require or may require the issuers to settle the obligations by transferring assets. These must be classified as liabilities (or, rarely, as assets). Such obligations could include forward purchase contracts or written put options on an issuer's equity shares that are to be physically settled or net cash settled.

Certain obligations to issue a variable number of shares are financial instruments that embody unconditional obligations, or financial instruments other than outstanding shares that embody conditional obligations, that the issuers must or may settle by issuing variable numbers of equity shares. These obligations also must be classified as liabilities (or, rarely, as assets) if, at inception, the monetary values of the obligations are based solely or predominantly on any one of the following:

1. A fixed monetary amount known at inception (e.g., a payable settleable with a variable number of the issuer's equity shares);
2. Variations in something other than the fair value of the issuer's equity shares (e.g., a financial instrument indexed to the S&P 500 and settleable with a variable number of the issuer's equity shares); or
3. Variations inversely related to changes in the fair value of the issuer's equity shares (e.g., a written put option that could be net share settled).

ASC 480 only applies to freestanding instruments, which could include those that comprise more than one option or forward contract, as, for example, an instrument that consists of a written put option for an issuer's equity shares and a purchased call option. The standard does not apply to features embedded in another financial instrument, such as an option on the issuer's equity shares that is embedded in a nonderivative host contract.

If a freestanding instrument is composed of more than one option or forward contract and one of those contracts embodies an obligation to repurchase the issuer's shares that require or may require settlement by a transfer of assets, the financial instrument is a liability. In addition, if a freestanding instrument composed of more than one option or forward contract includes an obligation to issue shares, the various component obligations must be analyzed to determine if any of them would be obligations under ASC 480. If one or more would be obligations under this standard, then judgment must be used to determine if the monetary value of the obligations that would be liabilities is collectively predominant over the other component liabilities. If so, the instrument is a liability. If not, the instrument is outside the scope of ASC 480. Following is a list of examples of these types of financial instruments:

- Puttable warrants
- Warrant for shares that can be put by the holder immediately after exercise
- Warrant that allows the holder to exercise the warrant or put the warrant back to the issuer on the exercise date for a variable number of shares with a fixed monetary value
- Forward contract in which the number of shares to be issued depends on the issuer's share price on the settlement date
- Warrant with a "liquidity make-whole" put to issue additional shares to the holder if the sales price of the shares when later sold is less than the share price when the warrant is exercised
- Warrant that allows the holder to exercise the warrant or, if contingent event does not occur, put the warrant back to the issuer on the exercise date for a variable number of shares with a fixed monetary value

The standard does not apply to or affect the timing of recognition of financial instruments issued as contingent consideration in a business combination, nor the measurement guidance for contingent consideration, as set forth in ASC 805. It also does not affect accounting for stock-based compensation or ESOP plans (ASC 718), which were addressed earlier in this chapter.

Initial and subsequent measurements. As noted, mandatorily redeemable financial instruments, which are now to be reported as liabilities, are initially recognized at fair value. Mandatorily redeemable financial instruments are subsequently remeasured using fair value, with any adjustments to be included in the periodic determination of income. In general, the value of mandatorily redeemable financial instruments will be accreted over time and the accretion will be treated as interest expense. The method of determining subsequent fair values corresponds to that set forth in the following paragraph.

Forward contracts that require physical settlement by repurchase of a fixed number of the issuer's equity shares in exchange for cash are to be measured initially at the fair value of the shares, as adjusted for any consideration or unstated rights or privileges. Equity is reduced by this same amount. Fair value in this context may be determined by reference to the amount of cash that would be paid under the conditions specified in the contract if the shares were repurchased immediately. Alternatively, the settlement amount can be discounted at the rate implicit at inception after taking into account any consideration or unstated rights or privileges that may have affected the terms of the transaction.

Subsequent measurement can be effected by either accretion (which is feasible only if the amount to be paid and the settlement date are both fixed), or by determining the amount of cash that would be paid under the conditions specified in the contract if settlement occurred at the reporting date (useful when either the amount to be paid or the settlement date vary based on defined conditions and terms). In either case, the change from the amount reported in the prior period is interest expense. If accretion is appropriate, the instruments are to be measured subsequently at the present value of the amount to be paid at settlement, accruing interest cost using the rate implicit at inception.

Conditionally redeemable instruments, first classified as equity and transferred to liabilities when the condition is satisfied, are measured at fair value at that date, with no gain or loss being recognized from the reclassification. For earnings per share computation purposes, the amount of common shares that are to be redeemed or repurchased are excluded for both basic and diluted calculations.

Gain or loss on retirement of redeemable instruments. If mandatorily redeemable preferred or common stock is acquired prior to the mandatory redemption date, the financial statement implications are the same as when debt is retired. Since the mandatorily redeemable shares are categorized, for financial reporting purposes, as liabilities, not equity, the usual prohibition against reporting gain or loss on capital transactions (such as retirement of treasury stock) would not be applicable. Rather the guidance under GAAP (ASC 470-50) governing debt retirement would be pertinent. Specifically, if the price paid to redeem the shares differs from the carrying value of the shares, the difference would be a gain or loss to be reported in the current period's earnings.

Disclosure requirements. The nature and terms of the financial instruments to which ASC 480 applies, and the rights and obligations embodied in those instruments, must be disclosed. That would include information about settlement alternatives, if any, in the contract, and would furthermore identify the entity that controls the settlement alternatives.

Additionally, for all outstanding financial instruments within the scope of ASC 480, and for each settlement alternative, issuers are required to disclose

1. The amount that would be paid, or the number of shares that would be issued and their fair value, determined under the conditions specified in the contract if the settlement were to occur at the reporting date;
2. How changes in the fair value of the issuer's equity shares would affect those settlement amounts;
3. The maximum amount that the issuer could be required to pay to redeem the instrument by physical settlement, if applicable;
4. The maximum number of shares that could be required to be issued, if applicable;
5. The fact that a contract does not limit the amount that the issuer could be required to pay or the number of shares that the issuer could be required to issue, if applicable; and
6. For a forward contract or an option indexed to the issuer's equity shares, the forward price or option strike price, the number of issuer's shares to which the contract is indexed, and the settlement date or dates of the contract, as applicable.

The definition of liabilities, set forth in CON 6 (see Chapter 1), was to have been revised in conjunction with the promulgation of new standards of accounting for instruments having characteristics of both liabilities and equity. That change will not be made at this time, however, but will be addressed in a subsequent phase of this FASB project. FASB also decided against imposing new requirements to bifurcate embedded derivatives. Furthermore, to prevent the provisions of the new standard from being circumvented by the insertion for nonsubstantive or minimal features into financial instruments, any such features are to be disregarded in applying ASC 480's classification provisions.

Application of ASC 480

Example 1: Obligations that require net share settlement—monetary value changes in the same direction as the fair value of the issuer's equity shares

Tyler Corp. grants 10,000 stock appreciation rights that entitle the holder to receive a number of equity shares to be determined based on the change in the fair value of Tyler's equity shares. At the date of the grant, the fair value of Tyler's equity shares is $25 per share. Subsequently, the fair value of Tyler's equity shares increases to $28 per share. Tyler is thus required to issue shares worth $30,000 [($28 – $25) × 10,000], or 1,072 shares.

This financial instrument contains an obligation to issue a number of equity shares with a value equal to the appreciation of 10,000 equity shares. The number of shares to be issued, therefore, is not fixed. Classification will depend on whether the monetary value changes in the same direction as changes in the fair value of the equity shares. In this example, the monetary value changes in the same direction as changes in the fair value of the equity shares.

The increase in fair value of the equity shares from $25 to $28 resulted in an increase in the monetary value of the obligation from $0 to $30,000. If the fair value of the equity shares increases further, for example to $30 per share, the monetary value of the obligation increases as well to $50,000 [($30 – $25) × 10,000]. If the fair value of the equity shares then decreases, for example from $30 to $27, the monetary value of the obligation decreases to $20,000 [($27 –$25) × 10,000]. Because the monetary value of the obligation changes in the same direction as the change in fair value of the issuer's equity shares, this obligation does not qualify as a liability and the equity classification is prescribed. (Accounting for stock appreciation rights is discussed earlier in this chapter.)

Example 2: Obligations that require net share settlement—monetary value changes in opposite direction as the fair value of the issuer's equity shares

Harrison Corp. issues equity shares to Middleboro Co. for $5 million (1 million shares at $5 each). Simultaneously, Harrison enters into a financial instrument with Middleboro, under the terms of which, if the per share value of Harrison' shares is greater than $5 on a specified date, Middleboro will transfer shares of Harrison with a value of [(share price – $5) × 1,000,000] to

Harrison. If the per share is less than $5 on a specified date, Harrison transfers shares of its own equity with a value of [($5 – share price) × 1,000,000] to Middleboro.

The 1,000,000 shares issued to Middleboro do not embody an obligation. They also do not convey to the issuer the right to receive cash or another financial instrument from the holder, or to exchange other financial instruments on potentially favorable terms with the holder. Therefore, the equity classification criteria are met and the component is classified as equity.

The financial instrument issued to Middleboro contains an obligation to issue a variable number of equity shares if the fair value of Harrison' equity shares is less than $5 on a certain date. As a result, the classification will depend upon whether the monetary value is equal to the change in fair value of a fixed number of equity shares, and whether the changes are in the same direction as the fair value of the equity shares.

The first criterion is met because the monetary value of the obligation is equal to the appreciation of a fixed number (1,000,000) of the issuer's equity shares. However, the monetary value of the obligation changes in a direction opposite to the changes in the fair value of the issuer's equity shares. If the fair value of the equity shares increases, the monetary value of the obligation decreases (and may in fact be reduced to zero or result in a receivable from the counterparty). If the fair value of the equity shares decreases, the monetary value of the obligation increases. Because the monetary value of the obligation does not change in the same direction as the fair value of the equity shares, criterion (b) is not met; therefore, the obligation is not classified as equity.

Example 3: Written put options that require physical settlement

Carlyle Corp. writes a put option that allows a holder, Yetta Co., to put 200 shares of Carlyle stock to Carlyle for $33 per share on a specified date. The put option requires physical settlement (delivery of the shares and payment therefore). Because the put option requires Carlyle to transfer assets (cash) to settle the obligation, the component is classified as a liability.

Example 3a: Forward purchase contract that requires physical or net cash settlement

In a fact pattern slightly at variance with the preceding example, Carlyle Corp. enters into a freestanding forward purchase arrangement with Yetta Co., under which Yetta is to transfer 200 shares of Carlyle stock to Carlyle for $33 per share on a specified date. The forward purchase agreement requires physical settlement (delivery of the shares and payment therefore). Because the forward purchase arrangement requires Carlyle to transfer assets (cash) to settle the obligation, the component is classified as a liability. The same result would hold if the contract called for a net cash settlement. While a put option (the preceding example) requires that the liability be initially recorded, and subsequently remeasured, at fair value, the forward purchase arrangement is to be recorded at fair value, and then accreted to the present value of the forward purchase price at each balance sheet date, using the implicit interest rate given by the initial fair value.

Example 4: Written put option that require net share settlement

Dragoon Corp. writes a put option that allows the holder, Zitti Corp., to put 200 shares of Dragoon stock to Dragoon for $44 a share on a specified date. The put requires net share settlement (i.e., shares having a value equal to the spread between the option price and fair value must be delivered in settlement). Assume the fair value of the shares at the date the put is issued is $44. The monetary value of the obligation at that time is therefore zero.

Subsequently, the fair value of Dragoon's equity shares decreases to $36 and the put option is exercised. At this point, the monetary value of the obligation is $1,600 [200 shares × ($44 – $36)]. Dragoon would be required to issue about 45 shares ($1,600 divided by $36). The monetary value of the obligation increased because of a decrease in the fair value of Dragoon's equity shares. Because changes in the monetary value of the obligation are not in the same direction as changes in the fair value of Dragoon's equity shares, the component is not classified as equity, but rather as a liability. The contract is measured initially and subsequently at fair value, with changes in fair value recognized in current earnings.

Example 5: Unconditional obligation that must be either redeemed for cash or settled by issuing shares

If the reporting entity issues financial instruments which do not require the transfer of assets to settle the obligation, but instead, unconditionally require the issuer to settle the obligation either by transferring assets or by issuing a variable number of its equity shares, this may or may not create a liability. Because such instruments do not require the issuer to settle by transfer of assets, they are not automatically classified as liabilities under ASC 480. However, those instruments may still be classified as liabilities, if other stipulated conditions are met.

Assume that Zylog Corp. issues one million shares of cumulative preferred stock for cash equal to the stock's liquidation preference of $25 per share. Under the terms, Zylog is required either to redeem the shares on the third anniversary of the issuance, for the issuance price plus any accrued but unpaid dividends, either in cash or by issuing sufficient shares of its common stock to be worth $25 per share. This does not represent an unconditional obligation to transfer assets, and therefore the preferred stock is not a mandatorily redeemable financial instrument as that term is defined in ASC 480. However, the stock is still a liability, because the preferred shares represent an unconditional obligation that the issuer may settle by issuing a variable number of its equity shares with monetary value that is fixed and known at inception. Because the preferred shares are liabilities, payments to holders are reported as interest cost, and accrued but not-yet-paid payments are part of the liability for the shares.

If the redemption price of mandatorily redeemable shares is greater than the book value of those shares, the company should report the excess as a deficit (equity), even though the mandatorily redeemable shares are reported as a liability.

Disclosure Requirements

Under ASC 505-10-50, certain disclosures of an entity's capital structure are required. Under the codification, the financial statements will be required to explain, in summary form, the pertinent rights and privileges of the various equity securities outstanding, including dividend and liquidation preferences, participation rights, call prices and dates, conversion and exercise prices or rates along with pertinent dates, sinking fund requirements, unusual voting rights, and significant terms of any contractual obligations to issue additional shares.

Furthermore, the number of shares issued upon conversion, exercise, or satisfaction of required conditions, during at least the most recent annual reporting period and any subsequent interim period that is presented, must be disclosed. If preference shares have a liquidation preference considerably in excess of par or stated value in the event of involuntary liquidation, the aggregate amount must be disclosed. The amount that would be paid upon exercise of call privileges applicable to preferred shares must be disclosed also, but in this case either per share or aggregate data can be given. Any dividend arrearages on cumulative preferred shares must be stated, on both per share and aggregate bases. Finally, if redeemable preferred shares are outstanding, the amount of redemption requirements for each of the subsequent five years must be given, if fixed or determinable on fixed or determinable dates; if there are several series of such shares, this can be given in the aggregate.

ASC 505-10-50 also applies to all contingently convertible securities, including those containing requirements that are yet to be met, where the convertible shares are not otherwise required to be included in the computation of diluted EPS in accordance with ASC 260 (see Chapter 20). To comply, the significant terms of the conversion features of such security should be disclosed, in order for users of financial statements to be able to understand the circumstances of the contingency and the potential impact of conversion. The codification identifies the following quantitative and qualitative terms as potentially being helpful in understanding both the nature of the contingency and the potential impact of conversion:

1. Events or changes in circumstances that would cause the contingency to be met, and significant features necessary to understand the conversion rights and the timing of those rights;
2. The conversion price and the number of shares into which the security is potentially convertible;
3. Events or changes in circumstances, if any, that could adjust or change the contingency, conversion price, or number of shares, including significant terms of those changes; and
4. The manner of settlement upon conversion and any alternative settlement methods (for example, cash, shares, or a combination).

In some instances the reporting entity may enter into derivatives transactions to hedge the impact of the written call option that implicitly is incorporated into contingently convertible instruments. ASC 505-10-50 states that disclosures of information about such derivative transactions may be useful in terms of fully explaining the potential impact of the contingently convertible securities. Such disclosure could include the terms of those derivative transactions (including the terms of settlement), how those transactions relate to the contingently convertible securities, and the number of shares underlying the derivatives. Of course, all the usual requirements for disclosures of derivatives and hedging activities also would apply.

Corporate Bankruptcy and Reorganizations

Entities operating under and emerging from protection of the bankruptcy laws. The going concern assumption is one of the basic postulates underlying generally accepted accounting principles and is responsible for, among other things, the historical cost convention in financial reporting. For entities that have entered bankruptcy proceedings, however, the going concern assumption will no longer be of central importance.

Traditionally, the basic financial statements (balance sheet, income statement, and statement of cash flows) presented by going concerns were seen as less useful for entities undergoing reorganization. Instead, the statement of affairs, reporting assets at estimated realizable values and liabilities at estimated liquidation amounts, was recommended for use by such organizations. In more recent years, this is less frequently encountered in practice.

ASC 852 sets forth certain financial reporting standards for entities undergoing and emerging from reorganization under the bankruptcy laws. Under its provisions, assets are presented at estimated realizable values. Liabilities are set forth at the estimated amounts to be allowed in the balance sheet and liabilities subject to compromise are to be distinguished from those that are not. Furthermore, the codification requires that in both the statements of income and cash flows, normal transactions be differentiated from those which have occurred as a consequence of the entity's being in reorganization. While certain allocations to the latter category are rather obvious, such as legal and accounting fees incurred, others are less clear. For example, the codification suggests that if the entity in reorganization earns interest income on funds that would normally have been used to settle obligations owed to creditors, such income will be deemed to be income arising as a consequence of the bankruptcy action.

Another interesting aspect of ASC 852 is the accounting to be made for the emergence from reorganization (known as confirmation of the plan of reorganization). The ASC provides for "fresh start" financial reporting in such instances. This accounting is similar to that applied to purchase business combinations, with the total confirmed value of the entity upon its emergence from reorganization being analogous to the purchase price in an acquisition. In both cases, this total value is to be allocated to the identifiable assets and liabilities of the entity, with any excess being allocated to goodwill. In the case of entities emerging from

bankruptcy, goodwill (reorganization value in excess of amounts allocable to identifiable assets) is measured as the excess of liabilities existing at the plan confirmation date, computed at present value of future amounts to be paid, over the reorganization value of assets. Reorganization value is calculated with reference to a number of factors, including forecasted operating results and cash flows of the new entity.

ASC 852 applies only to entities undergoing formal reorganization under the Bankruptcy Code. Less formal procedures may still be accounted for under preexisting quasi reorganization accounting procedures.

Quasi reorganizations. Generally, this procedure is applicable during a period of declining price levels. It is termed "quasi" since the accumulated deficit is eliminated at a lower cost and with less difficulty than a legal reorganization.

Per ASC 852-20, the procedures in a quasi reorganization involve the

1. Proper authorization from stockholders and creditors where required
2. Revaluation of assets to their current values. All losses are charged to retained earnings, thus increasing any deficit.
3. Elimination of any deficit by charging paid-in capital
   a. First, additional paid-in capital to the extent it exists
   b. Second, capital stock when additional paid-in capital is insufficient. The par value of the stock is reduced, creating the extra additional paid-in capital to which the remaining deficit is charged.

No retained earnings may be created by a reorganization. Any excess created by the reduction of par value is credited to "Paid-in capital from quasi reorganization."

ASC 852-20 requires that retained earnings be dated for ten years (less than ten years may be justified under exceptional circumstances) after a quasi reorganization takes place. Disclosure similar to "since quasi reorganization of June 30, 20XX" is appropriate.

Reporting by Limited Liability Companies and Partnerships

Accounting theory and practice have overwhelmingly developed within the context of businesses organized as normal corporations. Accordingly, there is little official guidance to entities organized as partnerships or other forms of business, which is generally not a serious concern given that most transactions entered into by such entities do not differ generically from those conducted by corporations. The primary differences relate to equity transactions and to the display of the equity section of the balance sheet.

ASC 956 addresses certain issues pertaining to accounting and reporting by limited liability companies and partnerships. This pronouncement establishes that, when an entity restructures itself as a limited liability company or a limited liability partnership, the basis of all assets and liabilities from its predecessor entity are carried forward. Also, as suggested by ASC 740, if the new entity is not a taxable one, any deferred tax assets or liabilities existing previously are to be written off at the time the change in tax status becomes effective; with the elimination of any debit or credit balance being effected by a charge or credit to current period tax expense.

With regard to financial statement display issues, the practice bulletin establishes that the headings of each statement identify the entity as being a limited liability company or a limited liability partnership, similar to the common practice of identifying partnership entities. The apparent logic is that this alerts the user to certain anomalies, such as (most commonly) an absence of income tax expense and a related liability, and the use of somewhat distinctive captions in the equity section of the balance sheet. In the case of limited liability companies and partnerships, the term "members' equity" has been prescribed, and the changes in mem-

bers' equity is to be communicated either in a separate financial statement, in a combined statement of operations and changes in members' equity, or in the notes to the financial statements.

The bulletin recommends that, where there are several classes of members' equity, these be set forth separately in the equity section of the balance sheet, although this is not a firm requirement. If not set forth in the balance sheet, however, the notes must provide adequate disclosure about the different classes of equity outstanding. This is entirely analogous to the existing GAAP requirements concerning disclosure about common and preferred stock of typical corporations, which has been analogized further to apply to classes of partnership equity in limited partnerships.

A deficit, if one exists, should be reported in the members' equity account(s), even if there is limited liability for the members. This is consistent with the "going concern" assumption that underlies GAAP. It is not required to disaggregate members' equity into separate components (undistributed earnings, unallocated capital, etc.) on the face of the balance sheet or in the notes, although this is of course permissible.

Amounts due from members for capital contributions, if any remain unpaid at the balance sheet date, should be shown as deductions from members' equity. This is entirely consistent with practice for unpaid stock subscriptions receivable.

GAAP presumes that comparative financial statements are more useful than those for a single period, and accordingly that comparative statements should normally be presented. However, for such financial statements to be meaningful, the information for the earlier period must be truly comparable to that of the more recent period. If the formation of the limited liability company or the limited liability partnership results in a new reporting entity being created, the guidance of ASC 250 dealing with changes in accounting entities should be consulted.

ASC 956 sets forth certain disclosures to be made in the financial statements of limited liability companies or limited liability partnerships. There should be a description of any limitations on members' equity and of the different classes of members' interests and the respective rights, preferences, and privileges of each class and amounts thereof. If the entity will cease to exist at a stipulated date, this must be disclosed. As suggested above, any change in tax status, and the impact of eliminating any tax liability or benefit from the entity's balance sheet, must be adequately explained in the notes to the financial statements in the period the change in status occurs.

APPENDIX A

FINANCIAL STATEMENT PRESENTATION

This appendix provides an illustration of the various financial statements that may be required to be presented and are related to the stockholders' equity section of the balance sheet.

Stockholders' Equity Section of a Balance Sheet

Capital stock:		
Preferred stock, $100 par, 7% cumulative, 30,000 shares authorized, issued, and outstanding		$ 3,000,000
Common stock, no par, stated value $10 per share, 500,000 shares authorized, 415,000 shares issued		4,150,000
Total capital stock		$ 7,150,000
Additional paid-in capital:		
Issued price in excess of par value—preferred	$ 150,000	
Issued price in excess of stated value—common	845,000	995,000
Total paid-in capital		$ 8,145,000
Donated capital		100,000
Retained earnings:		
Appropriated for plant expansion	$2,100,000	
Unappropriated	2,110,000	4,210,000
Accumulated other comprehensive income		165,000
Total capital, retained earnings, and accumulated other comprehensive income		$12,620,000
Less 10,000 common shares held in treasury, at cost		(120,000)
Total stockholders' equity		$12,500,000

Retained Earnings Statement

Balance at beginning of year, as reported	$ 3,800,000
Prior period adjustment—correction of an error in method of depreciation (less tax effect of $77,000)	115,000
Balance at beginning of year, restated	$ 3,915,000
Net income for the year	583,000
Cash dividends declared during the year	
Preferred stock	(210,000)
Common stock	(78,000)
Balance at end of year	$ 4,210,000

Statement of Changes in Stockholders' Equity

	Preferred stock		Common stock		Additional paid-in capital	Donated capital	Retained earnings	Accumulated other comprehensive income*	Treasury stock (common)	Total stockholders' equity
	Shares	Amount	Shares	Amount						
Balance, 12/31/07, as reported	--	--	400,000	$4,000,000	$840,000	$100,000	$3,800,000	$ 56,000	$(120,000)	$ 8,676,000
Correction of an error in method of depr.	--	--	--	--	--	--	115,000		--	115,000
Balance, 12/31/07, restated	--	--	400,000	$4,000,000	$840,000	$100,000	$3,915,000		$(120,000)	$ 8,791,000
Preferred stock issued in public offering	30,000	$3,000,000	--	--	150,000	--	--		--	3,150,000

PERSPECTIVE AND ISSUES

Earnings per share (EPS) is an indicator widely used by both actual and prospective investors to gauge the profitability of a corporation. Its purpose is to indicate how effective an enterprise has been in using the resources provided by its common stockholders. In its simplest form, EPS is net income (loss) divided by the number of shares of outstanding common stock. The EPS computation becomes more complex with the existence of securities that are not common stock but have the potential of causing additional shares of common stock to be issued (e.g., convertible preferred stock, convertible debt, options, and warrants). Omission of an EPS number that takes into account the potential dilutive effects of such securities would be misleading. In addition, a lack of standardization in the way in which these securities are included in such an EPS computation would make comparisons among corporations extremely difficult.

Publicly traded corporations with a complex capital structure are obligated to report basic EPS and diluted EPS. The dual presentation is required on the face of the corporation's income statement even if both of these computations result in the same EPS amount. In ad-

dition, a reconciliation of the numerator and the denominator of the basic EPS computation to the numerator and denominator of the diluted EPS computation is required.

Basic EPS, which includes no dilution, is computed by dividing income available to common stockholders by the weighted-average number of shares outstanding for the period. In contrast, diluted EPS considers the potential dilution that could occur from other financial instruments that would increase the total number of outstanding shares of common stock.

An amendment to ASC 260 is currently under deliberation, the stated purpose for which is to provide for convergence with the corresponding international standard, IAS 33, thereby improving comparability of EPS data on a global basis. In particular, provisions of this draft standard, if enacted, will do the following:

- Amend ASC 260 for calculating the number of incremental shares included in diluted shares when applying the treasury stock method.
- Eliminate the provisions of ASC 260 that allow an entity to rebut the presumption that contracts with the option of settling either in cash or stock will be settled in stock.
- Require that shares that would be issued as a result of conversion of mandatorily convertible securities would be included in the weighted-average number of ordinary shares outstanding used in computing basic earnings per share from the date that the conversion becomes mandatory.
- Contingently issuable shares would be included in diluted EPS from the beginning of the period during which the contingency has been satisfied.
- Retrospective application would be prohibited for contracts that were either settled in cash prior to adoption or modified prior to adoption to require cash settlement.
- Shares issuable upon conversion of a mandatorily convertible instrument would have to be included in the calculation of basic EPS, whether the effect is dilutive or antidilutive.
- Options and warrants with nominal exercise prices should be included in the computation of basic EPS if they are currently exercisable at minimal cost.
- A contract that may be settled in cash or shares would not be treated as being paid in shares if the share settlement only occurs under the legal bankruptcy of the issuer.
- When applying the treasury stock method to an instrument classified as a liability but potentially settled in shares, extinguishment of the liability upon share issuance would be included in proceeds in the computation of incremental shares.

The draft states that after the effective date, all prior period EPS data presented would be adjusted retrospectively. This retrospective adjustment would include interim financial statements, summaries of earnings, and selected financial statements, as well as the annual financial statements. The FASB expects to issue a third exposure draft on this topic during early 2008.

DEFINITIONS OF TERMS

There are a number of terms used in the discussion of earnings per share that have special meanings in that context. When used, they are intended to have the meanings given in the following definitions.

Antidilution (antidilutive). An increase in earnings per share or reduction in net loss per share resulting from the conversion, exercise, or contingent issuance of certain securities.

Basic earnings per share (basic EPS). The portion of net income available to each share of common stock outstanding during the reporting period.

Call option. A contract that allows the holder to buy a specified quantity of stock from the writer of the contract at a fixed price for a given period. Refer to **option** and **purchased call option**.

Common stock. A stock that is subordinate to all other stock of the issuer.

Contingent issuance. A possible issuance of shares of common stock that is dependent upon the exercise of conversion rights, options or warrants, the satisfaction of certain conditions, or similar arrangements.

Contingent stock agreement. An agreement to issue common stock (usually in connection with a business combination) that is dependent on the satisfaction of certain conditions.

Contingently issuable shares (contingently issuable stock). Shares issuable for little or no cash consideration upon the satisfaction of certain conditions pursuant to a contingent stock agreement.

Conversion price. The price that determines the number of shares of common stock into which a security is convertible. For example, $100 face value of debt convertible into five shares of common stock has a conversion price of $20 per share.

Conversion rate. The ratio of (1) the number of common shares issuable upon conversion to (2) a unit of convertible security. For example, a class of preferred stock may be convertible at the rate of three shares of common stock for each share of preferred stock.

Convertible security. A security that is exchangeable for another security based on a stated rate; for example, convertible preferred stock that is convertible into common stock on a two-for-one basis (two shares of common stock for each share of preferred stock).

Conversion value. The current market value of the common shares obtainable upon conversion of a convertible security, after deducting any cash payment required upon conversion.

Diluted earnings per share (diluted EPS or DEPS) . The portion of net income available to each share of common stock outstanding during the reporting period and to each share that would have been outstanding assuming the issuance of common shares for all dilutive potential common shares outstanding during the reporting period.

Dilution (dilutive). A reduction in earnings per share or an increase in net loss per share resulting from assuming that convertible securities have been converted or that options and warrants have been exercised or other shares have been issued upon the fulfillment of certain conditions.

Dual presentation. The presentation with equal prominence of two types of earnings per share amounts on the face of the income statement: one is basic earnings per share (EPS), the other is diluted earnings per share (DEPS).

Earnings per (common) share (EPS). The amount of net income attributable to each outstanding share of common stock. For convenience, the term is used in ASC 260 to refer to either net income (earnings) per share or net loss per share. The term is only permitted to

be used without qualifying language when no potentially dilutive convertible securities, options, warrants, or other agreements providing for contingent issuances of common stock are outstanding during the period.

Exercise price. The amount that must be paid for a share of common stock upon exercise of a stock option or warrant.

If-converted method. A method of computing earnings per share that assumes conversion of convertible securities as of the beginning of the earliest period reported (or at the actual time of issuance, if later).

Income available to common stockholders. Income (or loss) from continuing operations or net income (or net loss) adjusted by subtracting preferred stock dividends.

Mandatorily redeemable instrument. A financial instrument, often issued in the form of a share, that requires the issuer to transfer assets to the holder in exchange for canceling the instrument on either a specified date (or dates), or upon occurrence of an event that is certain to occur. In accordance with ASC 480, such instruments are considered liabilities and are not classified as equity in the issuer's balance sheet.

Option. Unless otherwise stated in ASC 260, a call option that gives the holder the right to purchase shares of common stock in accordance with an agreement upon payment of a specified amount, including, but not limited to, options granted to and stock purchase agreements entered into with employees. Options are considered "securities" in ASC 260. Refer to **Call option**.

Potential common stock. A security or other contract that may entitle its holder to obtain common stock during the reporting period or after the end of the reporting period.

Preferred stock. A class of capital stock, typically nonvoting, whose holders have rights to receive distributions (dividends or liquidating distributions) that have a higher priority than distributions to the common stockholders. Common stockholders are not entitled to receive corporate distributions until all required higher-priority distributions to preferred stockholders have been made.

Purchased call option. A contract that allows the reporting entity to buy a specified quantity of its own stock from the writer of the contract at a fixed price for a given period. Refer to **Call option**.

Put option. A contract that allows the holder to sell a specified quantity of stock to the writer of the contract at a fixed price during a given period.

Redemption price. The amount that the issuer of a security is required to pay to the holder at maturity or under a sinking fund arrangement.

Reverse treasury stock method. A method of recognizing the dilutive effect on earnings per share of satisfying a put obligation. It assumes that the proceeds used to buy back common stock (pursuant to the terms of the put option) will be raised from issuing shares at the average market price during the period. Refer to **put option**.

Rights issue. An offer to existing stockholders to purchase additional shares of common stock in accordance with an agreement for a specified amount (which is generally substantially less than the fair value of the shares) for a given period.

Security. The evidence of a debt or ownership or related right. For purposes of ASC 260, it includes stock options and warrants, as well as debt and stock.

Treasury stock method. A method of recognizing the use of proceeds that would be obtained upon exercise of options and warrants in computing diluted earnings per share. It assumes that any proceeds would be used to repurchase outstanding common stock at average market prices during the period.

Two-class method. A method employed for securities that cannot be accounted for by the if-converted method. This method computes earnings per share by treating participating

securities as though they were common stocks with different dividend rates from that of the other common stock.

Warrant. A security issued by a corporation entitling the holder to purchase a specified number of shares of stock at a stated price, usually above the stock's market price at the time that the warrant is issued. Similar to call options, warrants are effective for a longer period of time. Warrants are often issued in tandem with another class of security (e.g., bonds or preferred stock) in order to provide an incentive to potential investors to purchase the other security.

Weighted-average number of shares. The number of shares outstanding determined by relating (1) the portion of time within a reporting period that a particular number of shares of a certain security has been outstanding to (2) the total time in that period. For example, if 100 shares of a certain security were outstanding during the first quarter of a fiscal year and 300 shares were outstanding during the balance of the year, the weighted-average number of outstanding shares would be 250 [(100 × 1/4) + (300 × 3/4)]. In computing DEPS, equivalent common shares are considered for all dilutive potential common shares.

CONCEPTS, RULES, AND EXAMPLES

Simple Capital Structure

Simple capital structures are those having no potential common shares (options, warrants, etc.). These entities will only have basic EPS. All other entities are considered to have a complex capital structure. Entities with a complex capital structure will have potential common stock in the form of potentially dilutive securities, options, warrants, or other rights that upon conversion or exercise would dilute earnings per common share. Dilutive securities have the potential upon their issuance to reduce earnings per share.

Computational guidelines. The basic EPS calculation is income available to common stockholders (the numerator) divided by the weighted-average number of common shares outstanding (the denominator) during the period. The objective of the basic EPS calculation is to measure the performance of the entity over the reporting period. Complexities arise because net income does not necessarily represent the earnings available to the common stockholder, and a simple weighted-average of common shares outstanding does not necessarily reflect the true nature of the situation.

Numerator. The income available to common stockholders used as the numerator in any of the EPS computations must be reduced by any preferential claims against it by other securities. The justification for this reduction is that the preferential claims of the other securities must be satisfied before any income is available to the common stockholder. These other securities are usually in the form of preferred stock, and the deduction from income is the amount of the dividend declared (whether or not paid) during the year on the preferred stock. If the preferred stock is cumulative, the dividend is deducted from income (added to the loss) whether or not declared. Dividends in arrears do not affect the calculation of EPS in the current period; such dividends have been included in prior periods' EPS computations. However, the amount in arrears is required to be disclosed, as well as the effects on the EPS calculation of the rights given to holders of preferential securities.

If an entity is presenting consolidated financial statements with less than wholly owned subsidiaries, then it should exclude from net income the income attributable to the noncontrolling interest in subsidiaries.

Denominator. The weighted-average number of common stock shares outstanding is "an arithmetical mean average of shares outstanding and assumed to be outstanding for EPS computations" (ASC 260). The difficulty in computing the weighted-average exists because of the effect that various transactions have on the computation of common shares out-

standing. While it is impossible to analyze all the possibilities, ASC 260 provides discussion of some of the more common transactions affecting the number of common shares outstanding. By analogy, the theoretical model set forth in these relatively simple examples can be applied to situations that are not explicitly discussed.

If a company reacquires its stock (treasury stock), the number of shares reacquired is excluded from EPS calculations as of the date of reacquisition. The same theory holds for the issuance of common stock during the period. The number of shares newly issued is included in the computation only for the period after their issuance date. The logic for this treatment is that the proceeds from issuance of the shares were not available to the company to generate earnings until the shares were issued. This same logic applies to the reacquired shares because the cash paid to reacquire those shares was no longer available to generate earnings after the reacquisition date.

A stock dividend or split does not generate additional consideration, but it does increase the number of shares outstanding. ASC 260 states that the increase in shares as a result of a stock split or dividend, or decrease in shares as a result of a reverse split, is to be given retroactive recognition as an appropriate equivalent charge for all periods presented. Thus, even if a stock dividend or split occurs at the end of the period, it is considered outstanding for the entirety of each period presented. The reasoning is that a stock dividend or split has no effect on the ownership percentage of the common stockholder. As such, to show a dilution in the EPS reported would erroneously give the impression of a decline in profitability when in fact it was merely an increase in the shares outstanding due to the stock dividend or split. ASC 260 carries this principle one step further by requiring the retroactive adjustment of outstanding shares for stock dividends or splits occurring after the end of the period, but before the release of the financial statements. The rationale for this adjustment is that the primary interest of the financial statement user is considered to be the company's current capitalization. If this situation occurs, disclosure of both the end-of-year outstanding shares and those used to compute EPS is required.

When shares are issued in connection with a business combination that occurs during the period, they are treated as issued and outstanding as of the date of the acquisition.

Weighted-Average (WA) Computation

Transaction	*Effect on WA computation*
• Common stock outstanding at the beginning of the period	• Included in number of shares outstanding
• Issuance of common stock	• Increase number of shares outstanding by the number of shares issued times the portion of the year outstanding
• Conversion into common stock	• Increase number of shares outstanding by the number of shares converted times the portion of the year outstanding
• Reacquisition of common stock	• Decrease number of shares outstanding by number of shares reacquired times portion of the year since reacquisition
• Stock dividend or split	• Increase number of shares outstanding by number of shares issued for the dividend or resulting from the split retroactively as of the beginning of the earliest period presented
• Reverse split	• Decrease number of shares outstanding by decrease in shares retroactively as of the beginning of the earliest period presented
• Business combination	• Increase number of shares outstanding by number of shares issued times portion of year since acquisition

The table does not provide for all of the possible complexities arising in the EPS computation; however, most of the others occur under a complex capital structure. The complications arising under a complex capital structure are discussed and illustrated in detail later in this chapter and in its Appendix. The illustration below applies some of the foregoing concepts to a simple capital structure.

Example of EPS computation—Simple capital structure

Assume the following information:

	Numerator information			*Denominator information*	
a.	Income from continuing operations before extraordinary items	$130,000	a.	Common shares outstanding 1/1/09	100,000
b.	Extraordinary loss (net of income tax)	(30,000)	b.	Shares issued for cash 4/1/09	20,000
c.	Net income	100,000	c.	Shares issued in 10% stock dividend declared in July 2009	12,000
d.	6% cumulative preferred stock, $100 par, 1,000 shrs. issued and outstanding	100,000	d.	Shares of treasury stock reacquired 10/1/09	10,000

When calculating the numerator, the claims related to the preferred stock are deducted to arrive at the income available to the common stockholders. In this example, the preferred stock is cumulative. Thus, regardless of whether or not the board of directors declares a preferred dividend, holders of the preferred stock have a claim of $6,000 (= 1,000 shares × $100 par × 6%) against 2009 earnings. Therefore, $6,000 must be deducted from the numerator to arrive at the income available to common stockholders. Note that any cumulative preferred dividends in arrears are ignored in computing this period's EPS since they would have been incorporated into previous periods' EPS calculations. Also note that this $6,000 would have been deducted for *non*cumulative preferred stock only if a dividend of this amount had been declared during the period.

The EPS calculations follow:

Earnings per common share

On income from continuing operations before extraordinary item $\frac{\$130,000 - \$6,000}{\text{Common shares outstanding}}$

On net income $\frac{\$100,000 - \$6,000}{\text{Common shares outstanding}}$

The computation of the denominator is based upon the weighted-average number of common shares outstanding. A simple weighted-average is not considered appropriate because of the various complexities. Table 1 illustrates one way of computing the weighted-average number of shares outstanding.

Table 1

Item	*Actual number of shares*	*Retroactive effects of July stock dividend*	*Subtotal number of shares deemed outstanding*	*Fraction of the year deemed outstanding*	*Shares times fraction of the year deemed outstanding*
Number of shares as of beginning of the year 1/1/09	100,000	10,000 [10%(100,000)]	110,000	12/12	110,000
Shares issued 4/1/09	20,000	2,000 [10%(20,000)]	22,000	9/12	16,500
Treasury shares reacquired 10/1/09	(10,000)	--	(10,000)	3/12	(2,500)
Weighted-average number of common shares outstanding					124,000

The stock dividend declared in July is treated as being retroactive to the beginning of the year. Thus, for the period 1/1 through 4/1, 110,000 shares are considered to be outstanding. When shares are issued, they are included in the weighted-average beginning with the date of issuance. The shares issued as a result of the stock dividend applicable to the 20,000 newly issued

shares are also assumed to have been outstanding for the same period as the 20,000 shares. Thus, we can see that of the 12,000-share stock dividend, 10,000 shares relate to the beginning balance and 2,000 shares to the new issuance (10% of 100,000 and 20,000, respectively). The reacquisition of the treasury stock requires that these shares be excluded from the calculation for the remainder of the period after their reacquisition date. This amount is subtracted from the calculation because the shares were reacquired from shares outstanding prior to their reacquisition.

To complete the example, we divide the previously computed numerator by the weighted-average number of common shares outstanding to arrive at EPS.

Earnings per common share:

On income from continuing operations before extraordinary item $\frac{\$130,000 - \$6,000}{124,000 \text{ common shares}} = \$1.00$

On net income $\frac{\$100,000 - \$6,000}{124,000 \text{ common shares}} = \$0.76$

The numbers computed above are required to be presented on the face of the income statement. Reporting a $.24 extraordinary loss per share ($30,000 extraordinary item ÷ 124,000 common shares) is required either on the face of the income statement or in the notes to the financial statements.

Preferred stock dividends payable in common shares. All dividends represent distributions of accumulated earnings, and accordingly, are not reported as expenses on the income statement under GAAP. However, as illustrated above, for purposes of computing earnings per share, preferred dividends must be deducted in order to ascertain how much income is available for common stockholders. In some cases, preferred dividends are not payable in cash, but rather in common shares (based on market value as of the date of declaration, typically). In certain cases, the dividends may be payable in common shares or cash at the issuer's option.

ASC 260 defines income available to common stockholders as "income (or loss) from continuing operations or net income (or net loss) adjusted for preferred stock dividends." Logic suggests that this adjustment be made for all preferred stock dividends, regardless of the form of payment. This adjustment in computing income available to common stockholders is consistent with the treatment of common stock issued for goods or services.

Example of preferred stock dividends payable in common shares

Delta Corporation has three classes of preferred stock outstanding as noted in the following table:

Stock type	*Preferred stock description*	*Total $ issued*
Series A	7% preferred stock, $100 par value, 3,000 shares outstanding, payable in common stock priced at market value on declaration date	$300,000
Series B	5% preferred stock, $100 par value, 2,000 shares outstanding, payable in common stock at fixed price of $2.00/share	200,000
Series C	8% preferred stock, $100 par value, 1,000 shares outstanding, payable in cash or in common stock at market price on declaration date, at Delta's option	100,000

On the dividend declaration date, the price of a share of common stock is $2.50. Delta's Board of Directors approves the payment of the Series C dividend as 50% cash, 50% common stock. The following table shows the types and amounts of dividends due for all types of preferred stock:

Stock type	*Total dividend due*	*Applicable common stock price*	*Number of common shares issued*	*Cash issued*
Series A	$21,000	$2.50	8,400	
Series B	10,000	2.00	5,000	
Series C	8,000	2.50	1,600	$4,000
	$39,000		15,000	$4,000

Delta has net income of $110,000, from which the total dividend due, regardless of the form of payment, must be subtracted. The calculation follows:

$$\frac{\$110{,}000 \text{ net income} - \$39{,}000 \text{ dividend}}{\text{Common shares outstanding}}$$

Delta's fiscal year is the calendar year. Delta had 200,000 shares of common stock outstanding on January 1, issued an additional 30,000 common shares on May 1, and declared the previously described preferred stock dividends on 12/31. Based on this information, the weighted-average number of shares outstanding follows:

Description	*Number of shares*	*Fraction of the year deemed outstanding*	*Weighted-average shares outstanding*
Number of shares as of 1/1	200,000	12/12	200,000
Common stock issuance on 5/1	30,000	8/12	20,000
Common stock issued on 12/31 as part of preferred stock dividend	15,000	12/12	15,000
Weighted-average number of common shares outstanding			235,000

Delta divides the 235,000 common shares outstanding into the adjusted net income to arrive at the following earnings per share calculation:

$$\frac{\$110{,}000 - \$39{,}000}{235{,}000 \text{ common shares}} = \$0.30$$

Effect of preferred stock dividends payable in common shares on computation of EPS. At the option of the issuer, preferred stock dividends are sometimes payable in either cash or common stock. According to ASC 260-10-45, the form of payment is not a determinant in accounting for the effect of the preferred dividend on net income available to common stockholders. Therefore, for the purposes of the numerator in EPS computations, net income or loss is adjusted to compute the portion available to common stockholders.

Complex Capital Structure

The computation of EPS under a complex capital structure involves all of the complexities discussed under the simple structure and many more. A complex capital structure is one that includes securities that grant rights with the potential to be exercised and reduce EPS (dilutive securities). Any antidilutive securities (those that increase EPS) are not included in the computation of EPS. Note that a complex capital structure requires dual presentation of basic EPS and diluted EPS (DEPS). The common stock outstanding and all other dilutive securities are used to compute DEPS.

Diluted earnings per share (DEPS). DEPS represents the earnings attributable to each share of common stock after giving effect to all potentially dilutive securities which were outstanding during the period. The computation of DEPS requires that the following steps be performed:

1. Identify all potentially dilutive securities.
2. Compute dilution, the effects that the other dilutive securities have on net income and common shares outstanding.

Identification of potentially dilutive securities. Dilutive securities are those that have the potential of being exercised and reducing the EPS figure. Some examples of dilutive securities identified by ASC 260 are convertible debt, convertible preferred stock, options, warrants, participating securities, two-class common stocks, and contingent shares.

Convertible securities. A convertible security is one type of potentially dilutive security. A security of this type has an inherent dual nature. Convertibles are comprised of two distinct elements: the right to receive dividends or interest, and the right to potentially participate in earnings by becoming a common stockholder. This security is included in the DEPS computation due to the latter right.

Options and warrants. Options, warrants, and their equivalents generally derive their value from the right to obtain common stock at specified prices over an extended period of time.

Participating securities and two-class common stocks. The capital structure of some entities includes securities that may participate in dividends with common stocks according to a predetermined formula, or a class of common stock with different dividend rates from those of another class of common stock but without prior or senior rights. ASC 260-10-55 nullified the option of using the if-converted method for those securities that are convertible into common stock if the effect is dilutive. For these securities, participating securities and two-class commons stocks, the two-class method of computing EPS, as described below, is used.

Financial instruments with characteristics of both liabilities and equity. ASC 480 specifies that certain freestanding financial instruments (as distinguished from compound financial instruments) that may resemble equity are nevertheless required to be classified as liabilities on the issuer's balance sheet. (See Chapter 19.) Such instruments include mandatorily redeemable financial instruments (including mandatorily redeemable common or preferred stock) and certain forward contracts that require physical settlement by repurchase of a fixed number of the issuer's equity shares. Issuers of these instruments are required to (1) exclude any shares of common stock that are required to be redeemed or repurchased from the denominator of the EPS and DEPS computations, and (2) apply the two-class method described below to deduct from income available to common stockholders (the numerator of EPS and DEPS computations) any amounts that are attributable to shares that are to be redeemed or repurchased, including contractual dividends and participation rights in undistributed earnings. The deduction described in (2) is limited to amounts not recognized in the issuer's financial statements as interest expense.

Contingent issuances of common stock. Another consideration is contingent issuances of common stock (e.g., stock subscriptions). If shares are to be issued in the future with no restrictions on issuance other than the passage of time, they are to be considered issued and treated as outstanding in the computation of DEPS. Other issuances that are dependent upon certain conditions being met are to be evaluated in a different manner. ASC 260 uses as examples the maintenance of current earnings levels and the attainment of specified earnings increases. If the contingency is to merely maintain the earnings levels currently being attained, then the shares are considered outstanding for the entire period and considered in the computation of DEPS if the effect is dilutive. If the requirement is to increase earnings over a period of time, the DEPS computation includes those shares that would be issued based on the assumption that the current amount of earnings will remain unchanged if the effect is dilutive. Previously reported DEPS are not restated to give recognition to shares issued as a result of the earnings level attainment. If a contingent issuance is based upon the lapsing of time *and* the market price of the stock (which generally affects the number of shares issued), both conditions must be met to include the contingently issuable shares in the DEPS computation. FASB prohibits restatement of DEPS data should fluctuations in the market price occur in future periods.

Example of the impact of contingent stock issuances on earnings per share

Arturo Corporation offers its management team the following set of stock-based incentives that apply to the current year of operations:

- A stock grant of 25,000 common shares if the company attains full-year net income of at least $1 million.
- An additional stock grant of 1,000 common shares for every additional $100,000 of net income recorded above $1 million.
- A stock grant of 50,000 common shares if the company is granted ISO 9001 certification, to be issued immediately upon completion of the certification.

Arturo has 500,000 shares of common stock outstanding throughout the calendar year, which is its fiscal year. It obtains the ISO 9001 certification on April 1. Arturo's full-year net income is $1,300,000. It records the following basic EPS:

$$\frac{\$1{,}300{,}000 \text{ net income}}{537{,}500 \text{ common shares}} = \$2.42$$

The denominator incurs 3/4 of the 50,000 stock grant (e.g., 37,500 shares) associated with completion of the ISO 9001 certification, since the grant occurs after 1/4 of the fiscal year had been completed. The stock grant that is contingent on full-year earnings is not included in the basic earnings per share calculation, since the grant cannot occur until the last day of the year, and therefore has a negligible impact on the calculation

For the DEPS calculation, the contingent stock grant of 25,000 shares associated with the $1 million net income goal is included in the full-year weighted-average, as well as the 3,000 shares associated with the incremental increase in net profits above $1 million and the 50,000 shares associated with the ISO 9001 project completion. The calculation of shares to include in the DEPS denominator follows:

Common stock outstanding	$500,000
Stock grant associated with ISO 9001 project completion	50,000
Stock grant associated with attainment of $1 million net income goal	25,000
Stock grant associated with attainment of incremental $300,000 net income goal	3,000
Total DEPS shares	$578,000

By including these shares in the denominator of the DEPS calculation, Arturo arrives at the following diluted earnings per share:

$$\frac{\$1{,}300{,}000 \text{ net income}}{578{,}000 \text{ common shares}} = \$2.25$$

Computation of DEPS. The second step in the process is the actual computation of DEPS. There are basically two methods used to incorporate the effects of other dilutive securities on EPS (excluding participating and two-class common securities for which the two-class method described above is used).

1. The treasury stock method, and
2. The if-converted method

The treasury stock method. The treasury stock method, which is used for the exercise of most warrants or options, requires that DEPS be computed as if the options or warrants were exercised at the beginning of the period (or actual date of issuance, if later), and that the funds obtained from the exercise were used to purchase (reacquire) the company's common stock at the average market price for the period. Note that the proposed amendment to ASC 260, which is outlined at the end of this chapter, would change this computation slightly. It stipulates that the number of incremental shares included in quarterly and year-to-date diluted EPS shall be computed using the average market price of common shares for the quarterly and year-to-date periods. For example, an entity with a calendar year-end would compute the number of incremental shares used for its second quarter DEPS using the

average market price of common shares during the quarter ended June 30, 2009. The number of incremental shares used to calculate year-to-date DEPS at the end of the second quarter would be determined using the average market price of common shares for the year-to-date period ending June 30, 2009. These two average market prices would most likely differ since the one is the average market price for April–June and the other is the average market price for January–June.

An example of the existing requirements under ASC 260 follows. A corporation has warrants outstanding for 1,000 shares of common stock exercisable at $10 per share and the average market price of the common stock is $16 per share, the following would occur: the company would receive $10,000 (1,000 × $10) and issue 1,000 shares from the exercise of the warrants which would enable it to repurchase 625 shares ($10,000 ÷ $16) in the open market. The net increase in the denominator (which effects a dilution in EPS) is 375 shares (1,000 issued less 625 repurchased). If the exercise price is greater than the average market price, the exercise is not assumed since the result would be antidilutive. In that case, DEPS of prior periods presented in comparative form are not restated to reflect the change in market price.

Treasury Stock Method

Denominator must be increased by net dilution, as follows:

Net dilution	= Shares issued – Shares assumed to be repurchased
where	
Shares issued	= Proceeds received ÷ Exercise price per share
Shares assumed to be repurchased	= Proceeds received ÷ Average market price per share

The if-converted method. The if-converted method is used for those securities that are currently sharing in the earnings of the company through the receipt of interest or dividends as preferential securities, but that have the potential for sharing in the earnings as common stock (e.g., convertible bonds or convertible preferred stock). The if-converted method logically recognizes that the convertible security can only share in the earnings of the company as one or the other, not both. Thus, the dividends or interest less income tax effects applicable to the convertible security as a preferential security are not recognized in income available to common stockholders used to compute DEPS, and the weighted-average number of shares is adjusted to reflect the assumed conversion as of the beginning of the year (or actual date of issuance, if later).

If-Converted Method

Numerator

Income available to common stockholders recomputed to reflect assumed and/or actual conversion

- Add back interest expense less income tax effects
- Convertible preferred dividends are no longer subtracted
- Add back other expenses attributable to convertible issues

- -

Denominator

Weighted-average number of shares of common stock outstanding adjusted to reflect the assumed and/or actual conversion of convertible securities at the beginning of the period or actual date of issuance, if later

Exceptions. Generally, the if-converted method is used for convertible securities, while the treasury stock method is used for options and warrants. There are some situations specified by ASC 260 for which this does not hold true.

1. If options or warrants permit or require that debt or other securities of the issuer be tendered for all or a portion of the exercise price, the if-converted method is used.
2. If options or warrants require that the proceeds from the exercise are to be used to retire existing debt, the if-converted method is used.
3. If convertible securities require cash payment upon conversion, and are, therefore, considered equivalent to warrants, the treasury stock method is used.

Dual presentation of earnings per share. DEPS is a pro forma presentation which reflects the dilution of EPS that would have occurred if all contingent issuances of common stock that would individually reduce EPS had taken place at the beginning of the period (or the date actually issued, if later). The presentation of concept of dual earnings per share provides the reader with factually supportable EPS that range from no dilution to the maximum potential dilution. DEPS assumes that all issuances that have the legal right to become common stock exercise that right (unless the exercise would be antidilutive), and therefore anticipates and measures all potential dilution. The dual presentation of EPS and DEPS is prominently displayed on the face of the income statements. The underlying basis for the computation is that of conservatism. The DEPS considers all other potentially dilutive securities but only uses those securities which are dilutive. Thus, in most cases, the DEPS is less than the basic EPS. DEPS can never be greater than the basic EPS, but it could potentially be the same if all of the convertible securities were antidilutive.

NOTE: The FASB concluded that an entity that reports a discontinued operation, an extraordinary item, or the cumulative effect of an accounting change in a period is to use income from continuing operations as the "control number" for determining whether including potential common shares in the diluted EPS computation would be dilutive or antidilutive. Income from continuing operations (or a similar line item above net income if it appears on the income statement) would be adjusted for preferred dividends. If necessary, refer to FAS 128, footnote 8, for an example.

Examples of EPS Computation—Complex Capital Structure

Each of the following independent examples is presented to illustrate the foregoing principles. The procedural guidelines are detailed to enable the reader to understand the computation without referring back to the preceding explanatory text.

Example of the treasury stock method

Assume that net income is $50,000 and the weighted-average number of common shares outstanding has been computed as 10,000. Additional information regarding the capital structure is

1. 4% nonconvertible, cumulative preferred stock, par value of $100 per share, 1,000 shares issued and outstanding the entire year
2. Options and warrants to purchase 1,000 shares of common stock at $8 per share were outstanding all year.
3. The average market price of common stock during the year was $10.

The first step in applying this method is the determination of basic EPS. This calculation appears as follows:

$$\frac{\text{Net income – Preferred dividends}}{\text{Weighted-average number of common shares outstanding}} = \frac{\$50,000 - \$4,000}{10,000 \text{ shares}} = \$4.60$$

The second step is the calculation of DEPS which is based upon outstanding common stock and other dilutive securities. The options and warrants are the only potentially dilutive securities in the example. However, remember that only dilutive options (Market price > Exercise price) are included in the computation. The treasury stock method is used to compute the number of shares to be added to the denominator as illustrated below.

Proceeds from assumed exercise of options and warrants (1,000 shares × $8 per share)	$8,000
Number of shares issued	1,000
Number of shares assumed to be reacquired ($8,000 ÷ $10 average market price per share)	800
Number of shares assumed issued and not reacquired	200*

* *An alternative approach that can be used to calculate this number for DEPS is demonstrated below.*

$$\frac{\text{Average market price} - \text{Exercise price}}{\text{Average market price}} \times \text{Number of shares under options/warrants} = \text{Shares not reacquired}$$

$$\frac{\$10 - \$8}{\$10} \times 1{,}000 \text{ shares} = 200 \text{ shares}$$

DEPS can now be calculated as follows, including the effects of applying the treasury stock method:

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding + Number of shares assumed issued and not reacquired with proceeds from options and warrants}} = \frac{\$50{,}000 - \$4{,}000}{10{,}200 \text{ shares}} = \$4.51$$

Note the dilutive effect of the options and warrants, as EPS of $4.60 is reduced to DEPS of $4.51.

Table 2
Computations of Basic and Diluted Earnings Per Share

	EPS on outstanding common stock (Basic EPS)			*DEPS*		
Items	*Numerator*		*Denominator*	*Numerator*		*Denominator*
Net income	$50,000			$50,000		
Preferred dividends	(4,000)			(4,000)		
Common shs. outstanding			10,000 shs			10,000 shs
Options and warrants						200
Totals	$46,000	÷	10,000 shs	$46,000	÷	10,200 shs
EPS		$4.60			$4.51	

Example of the if-converted method

Assume net income of $50,000 and weighted-average common shares outstanding of 10,000. Additional information regarding capital structure is

1. 7% convertible debt, 200 bonds each convertible into forty common shares. The bonds were outstanding the entire year. The income tax rate is 40%. The bonds were issued at par ($1,000 per bond). No bonds were converted during the year.
2. 4% convertible, cumulative preferred stock, par value of $100 per share, 1,000 shares issued and outstanding. Each preferred share is convertible into two common shares. The preferred stock was issued at par value and was outstanding the entire year. No shares were converted during the year.

The first step is to compute basic EPS. As in the previous example, this is $4.60. The next step is the computation of DEPS assuming conversion of the convertible debt in order to determine whether their conversion would be dilutive. The convertible bonds are assumed to have been converted to common stock at the beginning of the year since no bonds were actually converted during the year. The effects of this assumption are twofold. One, if the bonds are converted, interest expense would be reduced by $14,000 (= 7% × 200 bonds × $1,000 par value per bond); and two, there will be an additional 8,000 shares of common stock outstanding during the year (= 200 bonds × 40 common shares per bond). The effect of avoiding $14,000 of interest expense will increase net income, but it will also increase income tax expense due to the lost income tax deduction. Consequently, the net after-tax effect of avoiding interest expense of $14,000 is $8,400 [= (1 – .40) × $14,000]. DEPS is computed as follows:

$$\frac{\text{Net income} - \text{Preferred dividends} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares issued upon conversion of bonds}} = \frac{\$50{,}000 - \$4{,}000 + \$8{,}400}{10{,}000 + 8{,}000 \text{ shares}} = \$3.02$$

The convertible debt is dilutive because EPS of $4.60 is reduced to DEPS of $3.02.

To determine the dilutive effect of the preferred stock, the preferred stock is assumed to have been converted to common stock at the beginning of the year since no shares of preferred stock were actually converted during the year. The effects of this assumption are twofold. One, if the preferred stock is converted, there will be no preferred dividends of $4,000 for the year; and two, there will be an additional 2,000 shares of common stock outstanding during the year (the conversion rate is 2 for 1 on 1,000 shares of outstanding preferred stock). DEPS considering the preferred stock is computed, as follows, reflecting these two assumptions:

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares issued upon conversion of bonds and conversion of preferred stock}} = \frac{\$50{,}000 + \$8{,}400}{10{,}000 + 8{,}000 + 2{,}000 \text{ shares}} = \$2.92$$

The convertible preferred stock is also dilutive because DEPS of $3.02 is reduced to DEPS of $2.92.

Together, the effect of the convertible bonds and preferred stock reduces EPS of $4.60 to DEPS of $2.92. In this example the convertible bonds must be considered first, prior to the inclusion of the convertible preferred stock in the computation. For a complete explanation of the sequencing process of including multiple dilutive securities in the computations of DEPS, see the comprehensive example in Appendix A. Table 3 summarizes the computations made for this example.

Table 3
Computations of Basic and Diluted Earnings Per Share

	EPS on outstanding common stock (Basic EPS)			*DEPS*		
Items	*Numerator*		*Denominator*	*Numerator*		*Denominator*
Net income	$50,000			$50,000		
Preferred dividend	(4,000)					
Common shs. outstanding			10,000 shs			10,000 shs
Conversion of preferred						2,000
Conversion of bonds				8,400		8,000
Totals	$46,000	÷	10,000 shs	$58,400	÷	20,000 shs
EPS		$4.60			$2.92	

In the preceding example all of the potentially dilutive securities were outstanding the entire year and no conversions or exercises were made during the year. If a potentially dilutive security was not outstanding the entire year, then the numerator and denominator effects would have to be "time-weighted." For instance, suppose the convertible bonds in the above example were issued during the current year on July 1. If all other facts remain unchanged, DEPS would be computed as follows:

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares issued upon conversion of preferred stock and conversion bonds}} = \frac{\$50{,}000 + ½(8{,}400)}{10{,}000 + 2{,}000 + ½(8{,}000)} = \$3.39$$

Since the DEPS of $3.39 is still less than the EPS of $4.60, the convertible debt is dilutive whether or not it is outstanding the entire year.

If actual conversions or exercises take place during a period, the common shares issued upon conversion will be outstanding from their date of issuance, and therefore, will be included in the computation of the weighted-average number of common shares outstanding. These shares are then weighted from their respective dates of issuance. Assume that all the

bonds in the above example are converted on July 1 into 8,000 common shares; the following effects should be noted:

1. For basic EPS, the weighted-average of common shares outstanding will be increased by (8,000 shares)(6 months outstanding/12 months in the period) or 4,000. Income will increase $4,200 net of income tax, because the bonds were only outstanding for the first half of the year.
2. For DEPS, the if-converted method is applied to the period January 1 to June 30 because it was during this period that the bonds were potentially dilutive. The interest expense, net of income tax, of $4,200 is added to the net income in the numerator, and 4,000 shares are added to the denominator.
3. Interestingly, the net effect of items 1. and 2. is the same for the period whether these dilutive bonds were outstanding the entire period or converted during the period.

Participating Securities and the Two-Class Method

Reporting entities that issue securities that are entitled to participate in dividends with common shares will report lower EPS under the provisions of ASC 260-10-55. This issue addresses the computation of EPS by entities that have issued securities, other than common stock, that entitle the holder to participate in dividends when, and if, dividends are declared on common stock. In addition, ASC 260-10-55 provides further guidance on calculating EPS using a two-class method and requires companies to retroactively restate EPS amounts presented.

Participation rights are defined based solely on whether the holder is entitled to receive any dividends if the entity declares them during the period. The codification also requires the use of the two-class method for computing basic EPS when participating convertible securities exist. The use of the two-class method was also expanded by ASC 260-10-55 to encompass other forms of participating securities, including options, warrants, forwards, and other contracts to issue an entity's common shares (except for unvested share-based compensation awards).

Presentation and disclosure. Presentation of participating securities' basic and diluted EPS is not required, but is permitted for other than common stock. What is required by ASC 260-10-55 is adjustment to the earnings that are used to compute EPS for the common stock.

Participating security defined. Determination of participating securities was difficult given the description in ASC 260, so the ASC 260-10-55 formally defined them as any "security that may participate in undistributed earnings with common stock, whether that participation is conditioned upon the occurrence of a specified event or not, regardless of the form of participation."

Allocating earnings and losses. In addition to the amount of dividends declared in the current period, net dividends must be reduced by the contractual amount of dividends or other participation payments that are paid or accumulated for the current period. The allocation of undistributed earnings for a period should be done for a participating security based on the contractual participation rights of the security to share in the current earnings assuming all earnings for the period are distributed. The allocation process is not based on a fair-value analysis, but is based on the term on the securities. For losses, an entity would allocate to the participating securities a portion of the net losses of the entity in accordance with the contractual provisions which may require the security to have an obligation to share in the issuing entity's losses. This occurs when the participating security holder has an obligation to share in the losses of the issuing entity if the holder is obligated to fund the issuing authority's losses or if losses incurred by the issuing entity reduce the security's principal or mandatory redemption amount.

Two-class method. This is an earnings allocation formula for computing EPS. It determines EPS for each class of common stock and participating securities according to dividends declared/accumulated and participation rights in undistributed earnings. The codification requires that the two-class method be applied for participating convertible securities when computing basic EPS. This changes earlier guidance, which permitted reporting entities to make an accounting policy election to use the if-converted method, rather than the two-class method, in the basic EPS calculation, as long as the if-converted method was not less dilutive.

The FASB staff has issued a proposed FASB Staff Position (FSP FAS 128-a) in which it presents computational guidance for computing diluted EPS under the two-class method. The FASB currently expects to integrate this Staff Position into its planned ASC 260 update.

Their three-step process is as follows:

1. Compute the basic EPS using the two-class method.
2. Use the total earnings allocated to common stock in the first step to compute diluted EPS. Then determine the dilutive effect of any potential common shares under two scenarios, and use the more dilutive of the two.
   a. Assume the instrument has been exercised, and that all other dilutive potential common shares have been exercised.
   b. Add back undistributed earnings allocated to the participating security in calculating basic EPS and assume all other dilutive potential common shares have been exercised. Then reallocate undistributed earnings to the common shares and the participating security, including the impact of any additional common shares and income that would result from the exercise of potential common shares.
3. If diluted EPS should be presented, compute it for the second class of common stock by determining the incremental effect of reallocating undistributed earnings to the second class of common stock.

ASC 260-10-55 states that use of the two-class method is dependent upon having no unsatisfied *contingencies* or objectively determinable contingent events. Thus, if preferred shares are entitled to participate in dividends with common shareholders only if management declares the distribution to be "extraordinary," this would not invoke the use of the two-class computation of EPS. However, if classification of dividends as extraordinary is predetermined by a formula, then undistributed earnings would be allocated to common stock and the participating security based on the assumption that all of the earnings for the period are distributed, with application of the defined sharing formula used for the determination of the allocation to the participating security.

If the participating security participates with common stock in earnings for a period in which a specified event occurs, regardless of whether a dividend is actually paid during the period (e.g., achievement of a target market price or achievement of threshold earnings), then undistributed earnings would be allocated to common stock and the participating security based on the assumption that all of the earnings for the period are distributed. Undistributed earnings would be allocated to the participating security if the contingent condition would have been satisfied at the reporting date, even if no actual distribution was made.

Example—Participating convertible preferred stock

Assume that Struthers Corp. had 20,000 shares of common stock and 5,000 shares of preferred stock outstanding during 2009, and reported net income of $65,000 for 2009. Each share of preferred stock is convertible into two shares of common stock. The preferred stock is entitled to a noncumulative annual dividend of $5 per share. After the common has been paid a dividend of

$1 per share, the preferred stock then participates in any additional dividends on a 2:3 per share ratio with the common. For 2009, the common shareholders have been paid $26,000 (or $1.30 per share), and the preferred shareholders have been paid $26,000 (or $5.20 per share). Basic earnings per share under the two-class method for 2009 would be computed as follows:

Net income		65,000
Less dividends paid:		
Common	$26,000	
Preferred stock	26,000	52,000
Undistributed 2008 earnings		$13,000

Allocation of undistributed earnings

To preferred

0.2(5,000) ÷ [0.2(5,000) + 0.3(20,000)] × $13,000 = $1,857

$1,857 ÷ 5,000 shares = $0.37 per share

To common

0.3(20,000) ÷ [0.2(5,000) + 0.3(20,000)] × $13,000 = $11,143

$11,143 ÷ 20,000 shares = $0.56 per share

Basic earnings per share amounts

	Preferred	*Common*
Distributed earnings	$5.20	$1.30
Undistributed earnings	0.37	0.56
Total	$5.57	$1.86

Example—Participating convertible debt instrument

Assume that Wincomp, Inc. had 20,000 shares of common stock outstanding during 2009 and reported net income of $85,000 for the year. On January 1, 2009, Wincomp issues 1,000 30-year, 3% convertible bonds with an aggregate par value of $1,000,000. Each bond is convertible into 8 shares of common stock. After the common has been paid a dividend of $1 per share, the bondholders then participate in any additional dividends on a 2:3 per share ratio with common shareholders. The bondholders receive common stock dividends based on the number of shares of common stock into which the bonds are convertible. The bondholders do not have any voting rights prior to conversion into common stock. For 2009, the Wincomp common shareholders have been paid $20,000 (or $1.00 per share). Basic earnings per share under the two-class method for 2009 would be computed as follows:

Net income		$85,000
Less dividends paid:		
Common	$20,000	20,000
Undistributed 2008 earnings		$65,000

Allocation of undistributed earnings

To convertible bonds

0.2(8,000) ÷ [0.2(8,000) + 0.3(20,000)] × $65,000 = $13,684

$13,684 ÷ 8,000 shares = $1.71 per share

To common

0.3(20,000) ÷ [0.2(8,000) + 0.3(20,000)] × $65,000 = $51,316

$51,316 ÷ 20,000 shares = $2.57 per share

Basic earnings per share amounts

	Convertible bonds	*Common*
Distributed earnings	$ --	$1.00
Undistributed earnings	1.71	2.57
Total	$1.71	$3.57

Example—Participating warrants

Assume that SmithCo. had 15,000 shares of common stock and 1,000 warrants to purchase shares of common stock outstanding during 2009. SmithCo. reported net income of $75,000 for the year. Each warrant entitles the holder to purchase one share of common stock at $10 per share. In addition, the warrant holders receive dividends on the underlying common stock to the extent they are declared. For 2009, common shareholders have been paid $30,000 ($2.00 per share), and the warrant holders have been paid $2,000 (also $2.00 per share). Basic earnings per share under the two-class method for 2009 would be computed as follows:

Net income		$75,000
Less dividends paid:		
Common stock	$30,000	
Warrants	2,000	32,000
Undistributed 2009 earnings		$43,000

Allocation of undistributed earnings

To warrants

0.5(1,000) ÷ [0.5(1,000) + 0.5(15,000)] × $43,000 = $2,687.50

$2,687.50 ÷ 1,000 shares = $2.69 per share

To common

0.5(15,000) ÷ [0.5(1,000) + 0.5(15,000)] × $43,000 = $40,312.50

$40,312.50 ÷ 15,000 shares = $2.69 per share

Basic earnings per share amounts

	Common	*Warrants*
Distributed earnings	$2.00	$2.00
Undistributed earnings	2.69	2.69
Total	$4.69	$4.69

Effect of Contracts That May Be Settled in Stock or Cash on the Computation of DEPS

There is an issue regarding how the option to settle contracts (e.g., written puts on the reporting entity's shares) in stock or cash influences the computation of EPS. FASB staff concluded that in calculating EPS, adjustments should be made to the numerator for contracts that are classified, in accordance with ASC 815-40-15, as equity instruments, but for which the company has a stated policy or for which past experience provides a reasonable basis to believe that such contracts will be paid partially or wholly in cash (in which case there will be no potential common shares included in the denominator). Thus, a contract that is reported as an equity instrument for accounting purposes may require an adjustment to the numerator for any changes in income or loss that would result if the contract had been reported as an asset or liability for accounting purposes during the period.

For purposes of computing diluted earnings per share, the adjustments to the numerator described above are only permitted for instruments for which the effect on net income (the numerator) is different depending on whether the instrument is accounted for as an equity instrument or as an asset or liability (e.g., those that are within the scope of ASC 480 or ASC 815-40-15). The provisions of ASC 260 require that for contracts that provide the company with a choice of settlement methods, the company will assume that the contract will be settled in shares. That presumption may be overcome if past experience or a stated policy provides a reasonable basis to believe that it is probable that the contract will be paid partially or wholly in cash.

ASC 260-10-55 also states that, for contracts in which the holder controls the means of settlement, past experience or a stated policy is not determinative. In those situations, the more dilutive of cash or share settlement should be used.

Adjustment to the numerator in year-to-date diluted EPS calculations may be required in certain circumstances. ASC 260-10-55 cites the example of contracts in which the holder controls the method of settlement and that would have a more dilutive effect if settled in shares, where the numerator adjustment is equal to the earnings effect of the change in the fair value of the asset/liability recorded during the year-to-date period. In that situation, the number of incremental shares included in the denominator is to be determined by calculating the number of shares that would be required to settle the contract using the average share price during the year-to-date period.

ASC 260-10-55 also notes that antidilutive contracts, such as purchased put options and purchased call options, should be excluded from diluted earnings per share.

ASC 480 requires entities that issue mandatorily redeemable financial instruments or that enter into forward purchase contracts that require physical settlement by repurchase of a fixed number of shares in exchange for cash to exclude the common shares that are to be redeemed or repurchased in calculating EPS and DEPS. Amounts attributable to shares that are to be redeemed or repurchased that have not been recognized as interest costs (e.g., amounts associated with participation rights) are deducted in computing the income available to common shareholders (the numerator of the earnings per share calculations) consistently under the "two-class" method. Therefore, ASC 480's requirements for calculating EPS partially nullify ASC 260-10-55 for those financial instruments. For other financial instruments including those that are liabilities under ASC 480, the guidance in ASC 260-10-55 remains applicable.

Inclusions/Exclusions from Computation of DEPS

Certain types of instruments and contracts having characteristics of both liabilities and equity require special treatment using the two-class method described previously, if under ASC 480, they are required to be classified as liabilities on the balance sheet of the issuer. Examples of these instruments include mandatorily redeemable common or preferred stock; and forward purchase contracts or written put options on the issuer's equity shares that require physical settlement or net cash settlement.

The computations of DEPS also does not include contracts such as purchased put options and purchased call options (options held by the entity on its own stock). The inclusion of such contracts would be antidilutive.

Sometimes entities issue contracts that may be settled in common stock or in cash at the election of either the issuing entity or the holder. The determination of whether the contract is reflected in the computation of DEPS is based on the facts available each period. It is presumed that the contract will be settled in common stock and the resulting common shares included in DEPS if the effect is dilutive. This presumption may be overcome if past experience or a stated policy provides a reasonable basis to believe that the contract will be paid partially or wholly in cash. The new standard described in the ED at the end of this chapter would preclude the assumption that the contract would be paid in cash, in whole or part. If during the reporting period the exercise price exceeds the average market price for that period, the potential dilutive effect of the contract on EPS is computed using the reverse treasury stock method. Under this method

1. Issuance of sufficient common shares is assumed to have occurred at the beginning of the period (at the average market price during the period) to raise enough proceeds to satisfy the contract.
2. The proceeds from issuance of the shares are assumed to have been used to satisfy the contract (i.e., to buy back shares).

3. The denominator of the DEPS calculation includes the incremental number of shares (the difference between the number of shares assumed issued and the number of shares assumed received from satisfying the contract).

The Effect of Contingently Convertible Instruments on DEPS

In recent years contingently convertible securities have become more common. ASC 260-10-45 addresses the impact of the existence of such instruments on the computation of earnings per share. Contingently convertible instruments are those that have embedded conversion features that are contingently convertible or exercisable based either on a market price trigger or on multiple contingencies, if one of the contingencies is a market price trigger and the instrument can be converted or share settled based on meeting the specified market condition. A market price trigger is a condition that is based at least in part on the reporting entity's share price. Examples include contingently convertible debt and contingently convertible preferred stock. A typical trigger occurs when the market price exceeds a defined conversion price by a specified percentage (e.g., when the market price first equals or exceeds 20% more than the conversion price of $33 per share). Others have floating market price triggers for which conversion is dependent upon the market price of the reporting entity's stock exceeding the conversion price by a specified percentage(s) at specified times during the term of the debt. Yet other contingently convertible instruments require that the market price of the issuer's stock exceed a specified level for a specified period (for example, 20% above the conversion price for a 30-day period). In addition, these instruments may have additional features such as parity features, issuer call options, and investor put options.

ASC 260-10-45 holds that contingently convertible instruments are to be included in diluted earnings per share, if dilutive, regardless of whether the market price trigger has been met. The reasoning is that there is no substantive economic difference between contingently convertible instruments and conventional convertible instruments with a market price conversion premium. ASC 260-10-45 is to be applied to instruments that have multiple contingencies, if one of these is a market price trigger and the instrument is convertible or settleable in shares based on a market condition being met—that is, the conversion is not dependent on a substantive non-market-based contingency.

Example—Contingently convertible debt with a market price trigger

The holder of the Frye Corp. 4% interest-bearing bonds, amounting to $100,000 face value, may convert the debt into shares of Frye common stock when the share price exceeds the market price trigger; otherwise, the holder is only entitled to the par value of the debt. The conversion ratio is 20 shares per bond, or a total of 2,000 shares of stock. The implicit conversion price, therefore, is $50 per share.

At the time of issuance of the bonds, Frye common stock has a market price of $40. Frye's effective tax rate is 35%. Currently Frye has 20,000 shares of its common shares outstanding. The bonds become convertible when the average share price for the year exceeds $65 (130% of conversion price).

The contingently convertible bonds are issued on January 1, 2009. Income available to common shareholders for the year ended December 31, 2009, is $80,000, and the average share price for the year is $55. The issuer of the contingently convertible debt would apply ASC 260-10-45, which requires the reporting entity to include the dilutive effect of the convertible debt in diluted earnings per share even though the market price trigger of $65 has not been met.

Basic EPS is ($80,000 ÷ 20,000 shares =) $4.00 per share. Applying the if-converted method to the debt instrument dilutes earnings per share to $3.77. (To compute diluted EPS, net income is increased by the after-tax effect of interest, and this is then divided by the total of outstanding plus potential common shares.)

Consolidated DEPS

When computing consolidated DEPS entities with subsidiaries that have issued common stock or potential common shares to parties other than the parent company (minority interests) follow these general guidelines.

1. Securities issued by a subsidiary that enable their holders to obtain the subsidiary's common stock are included in computing the subsidiary's EPS. Per share earnings of the subsidiary are included in the consolidated EPS calculations based on the consolidated group's holding of the subsidiary's securities.
2. For the purpose of computing consolidated DEPS, securities of a subsidiary that are convertible into its parent company's common stock, along with subsidiary's options or warrants to purchase common stock of the parent company, are all considered among the potential common shares of the parent company.

Partially Paid Shares

If an entity has common shares issued in a partially paid form and the shares are entitled to dividends in proportion to the amount paid, the common-share equivalent of those partially paid shares is included in the computation of basic EPS to the extent that they were entitled to participate in dividends. Partially paid stock subscriptions that do not share in dividends until paid in full are considered the equivalent of warrants and are included in the calculation of DEPS using the treasury stock method.

Example of impact of partially paid shares on earnings per share

Orion Corporation has 200,000 shares of common stock outstanding. In addition, under a stock subscription plan, investors have paid $30,000 towards the purchase of 4,000 common shares at the fixed price of $15 per share. Investors purchasing shares under the plan are entitled to dividends in proportion to the amount paid. Thus, there are 2,000 shares in the stock subscription plan for the purpose of calculating basic earnings per share, calculated as follows:

$$\frac{\text{4,000 common shares}}{\text{(4,000 common shares} \times \text{\$15/share) / \$30,000 paid}} = \text{2,000 shares}$$

Orion records net income of $50,000 for the fiscal year. Its calculation of basic earnings per share follows:

$$\frac{\text{\$50,000 net income}}{\text{2,000 existing common shares + 2,000 stock subscription shares}} = \text{\$0.25}$$

Once the stock subscription plan is completed, with all shares paid for and issued under that earlier plan, Orion creates another plan, which is one that does not allow participants to share in dividends until all payments are completed. Again, participants have thus far paid $30,000 to acquire 4,000 common shares at a fixed price of $15 each. Orion has 204,000 shares of common stock outstanding, and its net income for the current fiscal year is $80,000. The average market price of Orion's stock during the period is $20. Orion calculates the number of additional common shares with the following calculation, which is the same approach used to calculate the number of shares associated with warrants:

Proceeds from assumed purchase of shares in subscription plan (4,000 shares × $15/share)	$60,000
Number of shares to be issued	4,000
Number of shares assumed to be reacquired ($60,000 / $20 average market price)	3,000
Number of shares assumed issued and not reacquired	1,000

Orion's DEPS calculation follows:

$$\frac{\text{80,000 net income}}{\text{204,000 existing common shares + 1,000 shares from stock purchase plan}} = \text{\$0.39}$$

Note that Orion's basic EPS is not affected by the shares to be issued under this plan, since no right to dividends exists until the subscription has been fully paid.

Effect of Certain Derivatives on EPS Computations

ASC 260 did not contemplate certain complex situations having EPS computation implications. In ASC 815-40-15, the accounting for derivative financial instruments that are indexed to, and potentially to be settled in, the reporting entity's own shares has been addressed. It establishes a model for categorization of a range of such instruments and deals with, *inter alia*, the EPS effects of each of these. This approach assumes that when the entity can elect to settle these instruments by payment of cash or issuance of shares, the latter will be chosen; if the holder (counterparty) has that choice, payment of cash must be presumed. (Certain exceptions exist when the settlement alternatives are not economically equivalent; in those instances, accounting is to be based on the economic substance of the transactions.) As discussed in Chapter 19, balance sheet classification of such instruments is based on consideration of a number of factors, and classification may change from period to period if there are certain changes in circumstances.

For EPS computation purposes, for those contracts that provide the company with a choice of either cash settlement or settlement in shares, ASC 815-40-15 states that settlement in shares should be assumed, although this can be overcome based on past experience or stated policy. If the counterparty controls the choice, however, the more dilutive assumption must be made, irrespective of past experience or policy.

ASC 260 requires the use of the "reverse treasury stock method" to account for the dilutive impact of written put options and similar derivative contracts, if they are "in the money" during the reporting period. Using this method, an incremental number of shares is determined to be the excess of the number of shares that would have to be sold for cash, at the average market price during the period, to satisfy the put obligation over the number of shares obtained via the put exercise. ASC 815-40-15 states that, for contracts giving the reporting entity a choice of settlement methods (stock or cash), it should assume share settlement, although this can be overcome if past behavior makes it reasonable to presume cash settlement. If the holder controls settlement method, however, the more dilutive method of settlement must be presumed.

Effect on EPS of Redemption or Induced Conversion of Preferred Stock

Companies may redeem shares of their outstanding preferred stock for noncash consideration such as by exchanges for other securities. Sometimes the company induces conversion by offering additional securities or other consideration to the holders. Such offers are sometimes referred to as "sweeteners." The accounting for "sweeteners" offered to convertible debt holders was addressed by ASC 470-20-05, and was explained in Chapter 15. ASC 260-10-S99 deals with the anomalous situation of "sweeteners" offered to induce conversion of convertible preferred shares.

The position of the SEC staff is that any excess of the fair value of consideration given over the book value of the preferred stock represents a return to the preferred stockholder and, consequently, is to be accounted for similar to dividends paid to the preferred stockholders for purposes of computing EPS. This means that the excess should be deducted from earnings to compute earnings available for common stockholders in the calculation of EPS.

If the converse is true, with consideration given being less than carrying value, including when there is an excess of the carrying amount of the preferred stock over the fair value of the consideration transferred, this should be added to net income to derive earnings available for common stockholders in the calculation of EPS.

If the redemption or induced conversion is effected by offering other securities, rather than cash, fair values would be the referent to determine whether an excess was involved.

Furthermore, per ASC 260-10-S99, in computing the carrying amount of preferred stock that has been redeemed or been subject to an induced conversion, the carrying amount of the preferred stock is to be reduced by the related issuance costs irrespective of how those costs were classified in the stockholders' equity section of the balance sheet upon initial issuance.

Since ASC 480 defines mandatorily redeemable preferred stock as a liability, not as equity, the guidance in ASC 260-10-S99 would not apply. Rather, any excess or shortfall offered in an induced conversion situation involving mandatorily redeemable preferred stock would be reported as gain or loss on debt extinguishment, not as a dividend.

In a related matter, ASC 260-10-S99 discusses the accounting required when a reporting entity effects a redemption or induced conversion of only a portion of the outstanding securities of a class of preferred stock. Reflecting an SEC staff position, any excess consideration should be attributed to those shares that are redeemed or converted. Thus, for the purpose of determining whether the "if-converted" method is dilutive for the period, the shares redeemed or converted should be considered separately from those shares that are not redeemed or converted. It would be inappropriate to aggregate securities with differing effective dividend yields when determining whether the "if-converted" method is dilutive, which would be the result if a single, aggregate computation was made for the entire series of preferred stock.

EPS Impact of Tax Effect of Dividends Paid on Unallocated ESOP Shares

Accounting for ESOPs, discussed in Chapter 19, was significantly changed by ASC 718-40. Under the provisions of ASC 718-40, dividends paid on unallocated shares are not charged to retained earnings. Since the employer controls the use of dividends on unallocated shares, these dividends are not considered dividends for financial reporting purposes. Consequently, the dividends do not affect the DEPS computation.

Earnings Per Share Implications of ASC 718

ASC 718 mandates that share-based employee compensation arrangements must, with very few exceptions, be recognized as expenses over the relevant employee service period. ASC 260 requires that employee equity share options, nonvested shares, and similar equity instruments granted to employees be treated as potential common shares in computing diluted earnings per share. DEPS is to be based on the actual number of options or shares granted and not yet forfeited, unless doing so would be antidilutive. If vesting in or the ability to exercise (or retain) an award is contingent on a performance or market condition (e.g., as the level of future earnings), the shares or share options shall be treated as contingently issuable shares. If equity share options or other equity instruments are outstanding for only part of a reporting period, the shares issuable are to be weighted to reflect the portion of the period during which the equity instruments are outstanding.

ASC 260 provides guidance on applying the treasury stock method for equity instruments granted in share-based payment transactions in determining diluted earnings per share.

Presentation

The reason for the differentiation between simple and complex capital structures is that ASC 260 requires different financial statement presentation for each. ASC 260 mandates that EPS be shown on the face of the income statement for each of the following items (when applicable):

1. Income from continuing operations
2. Net income

An entity that reports a discontinued operation, an extraordinary item, or the cumulative effect of a change in accounting principle presents basic and diluted EPS amounts for these

line items either on the face of the income statement or in the notes to the financial statements. These requirements must be fulfilled regardless of whether the capital structure is simple or complex. The difference in the two structures is that a simple capital structure requires presentation of only a single EPS number for each item, while a complex structure requires the dual presentation of basic EPS and DEPS for each item.

Earnings per share data is to be presented for all periods for which an income statement or summary of earnings is presented. If DEPS is reported for at least one period, it is to be reported for all periods presented, regardless of whether or not DEPS differs from basic EPS. However, if basic and diluted EPS are the same amounts for all periods presented, dual presentation may be accomplished in one line on the face of the income statement.

Rights issue. A rights issue whose exercise price at issuance is below the fair value of the stock contains a bonus element. If a rights issue contains a bonus element (somewhat similar to a stock dividend) and is offered to all existing stockholders, basic and diluted EPS are adjusted retroactively for the bonus element for all periods presented. However, if the ability to exercise the rights issue is contingent on some event other than the passage of time, this retroactive adjustment does not apply until the contingency is resolved.

Restated EPS. When a restatement of the results of operations of a prior period is required to be included in the income statement, EPS for the prior period(s) are also restated. The effect of the restatement, expressed in per share terms, is disclosed in the period of restatement. Restated EPS data is computed as if the restated income (loss) had been reported in the prior period(s).

Year-to-date diluted earnings per share. ASC 260-10-45 addresses the matter of how to compute year-to-date diluted earnings per share (1) when a company has a year-to-date loss from continuing operations including one or more quarters with income from continuing operations, and (2) when in-the-money options or warrants were not included in one or more quarterly diluted EPS computations because there was a loss from continuing operations in those quarters.

ASC 260 directs that in applying the treasury stock method in year-to-date computations, the number of incremental shares to be included in the denominator is to be determined by computing a year-to-date weighted-average of the number of incremental shares included in each quarterly diluted EPS computation.

However, ASC 260 includes a prohibition against antidilution, which states that the computation of diluted EPS is not to assume conversion, exercise, or contingent issuance of securities that would have an antidilutive effect on earnings per share. There may be a conflict between these provisions when a period longer than three months has an overall loss but includes quarters with income. For period with year-to-date income (as in quarterly filings on Form 10-Q), in computing year-to-date diluted EPS, SEC staff believes that year-to-date income (or loss) from continuing operations should be the basis for determining whether or not dilutive potential common shares not included in one or more quarterly computations of diluted EPS should be included in the year-to-date computation.

According to ASC 260-10-45, (1) when there is a year-to-date loss potential common shares should never be included in the computation of diluted EPS, because to do so would be antidilutive, and (2) when there is year-to-date income, if in-the-money options or warrants were excluded from one or more quarterly diluted EPS computations because the effect was antidilutive (there was a loss from continuing operations in those periods), then those options or warrants should be included in the diluted EPS denominator (on a weighted-average basis) in the year-to-date computation as long as the effect is not antidilutive. Similarly, contingent shares that were excluded from a quarterly computation solely because there was a loss from continuing operations should be included in the year-to-date computation unless the effect is antidilutive.

Other Disclosure Requirements

The following additional items are required to be disclosed for all periods for which an income statement is presented:

1. A reconciliation of the numerators and the denominators of the basic and diluted EPS computations for income from continuing operations including the effects of all securities that affect EPS.
2. The effect of preferred dividends in arriving at income available for common stockholders in computing basic EPS.
3. Securities which could potentially dilute basic EPS in future periods but which were not included in DEPS for the period(s) presented since the results were antidilutive.

In addition, for the latest period for which an income statement is presented, a description is required for transactions occurring after the balance sheet date that result in a material change in the number of shares that were outstanding at the balance sheet date.

APPENDIX

COMPREHENSIVE EXAMPLE

The examples within the text used a simplified approach for determining whether or not options, warrants, convertible preferred stock, or convertible bonds have a dilutive effect on DEPS. If the DEPS number computed was lower than basic EPS, the security was considered dilutive. This approach is adequate when the company has only *one* potentially dilutive security. If the firm has *more than one* potentially dilutive security, a more complex ranking procedure must be employed (ASC 260).

For example, assume the following facts concerning the capital structure of a company:

1. Income from continuing operations and net income are both $50,000. Income from continuing operations is not displayed on the firm's income statement.
2. The weighted-average number of common shares outstanding is 10,000 shares.
3. The income tax rate is a flat 40%.
4. Options to purchase 1,000 shares of common stock at $8 per share were outstanding all year.
5. Options to purchase 2,000 shares of common stock at $13 per share were outstanding all year.
6. The average market price of common stock during the year was $10.
7. 7% convertible bonds, 200 bonds, each convertible into 40 common shares, were outstanding the entire year. The bonds were issued at par value ($1,000 per bond) and no bonds were converted during the year.
8. 4% convertible, cumulative preferred stock, par value of $100 per share, 1,000 shares issued and outstanding the entire year. Each preferred share is convertible into one common share. The preferred stock was issued at par value and no shares were converted during the year.

Note that reference is made below to some of the tables included in the body of the chapter because the facts above represent a combination of the facts used for the examples in the chapter.

In order to determine both basic EPS and DEPS, the following procedures must be performed:

1. Calculate basic EPS as if the capital structure were simple.
2. Identify other potentially dilutive securities.
3. Calculate the per share effects of assuming issuance or conversion of each potentially dilutive security on an individual basis.
4. Rank the per share effects from smallest to largest.
5. Recalculate EPS (step 1 above) adding the potentially dilutive securities one at a time in order, beginning with the security with the *smallest* per share effect.
6. Continue adding potentially dilutive securities to each successive calculation until all have been added or until the addition of a security increases EPS (antidilution) from its previous level.

Applying these procedures to the facts above

1. Basic EPS

$$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding}} = \frac{\$50{,}000 - \$4{,}000}{10{,}000 \text{ shares}} = \$4.60$$

2. Identification of other potentially dilutive securities
   a. Options (two types)
   b. 7% convertible bonds
   c. 4% convertible cumulative preferred stock

Diluted EPS (DEPS)

3. Per share effects of conversion or issuance of other potentially dilutive securities calculated individually
   a. Options—Only the options to purchase 1,000 shares at $8.00 per share are potentially dilutive. The options to purchase 2,000 shares of common stock are antidilutive because the exercise price is greater than the average market price. Thus, they are not included in the computation.

      Proceeds if options exercised:

      $$1{,}000 \text{ shares} \times \$8 \text{ per share} = \$\underline{8{,}000}$$

      Shares that could be acquired:

      $$\$8{,}000 \div \$10 = \underline{800}$$

      $$\text{Dilutive shares: } 1{,}000 - 800 = \underline{200}$$

      $$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$0}{200 \text{ shares}} = \$0$$

   b. 7% convertible bonds (see Table 3)

      $$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$8{,}400}{8{,}000 \text{ shares}} = \$1.05$$

   c. 4% convertible cumulative preferred stock—The outstanding common shares increase by 1,000 when all shares are converted. This results in total dividends of $4,000 not being paid.

      $$\frac{\text{Increase/decrease in net income}}{\text{Increase in weighted-average number of common shares outstanding}} = \frac{\$4{,}000}{1{,}000 \text{ shares}} = \$4.00$$

4. Rank the per share effects from smallest to largest

a.	Options	$ 0
b.	7% convertible bonds	1.05
c.	4% convertible cumulative preferred stock	4.00

5. Recalculate the EPS in rank order starting from the security with the smallest per share dilution and adding one potentially dilutive security at a time
   a. DEPS—options added

      $$\frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average number of common shares outstanding + Shares not acquired with proceeds of options}} = \frac{\$50{,}000 - \$4{,}000}{10{,}000 + 200 \text{ shares}} = \$4.51$$

b. DEPS—options and 7% convertible bonds added

$$\frac{\text{Net income} - \text{Preferred dividends} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares not acquired with proceeds of options} + \text{Shares issued upon conversion of bonds}} = \frac{\$50,000 - \$4,000 + \$8,400}{10,000 + 200 + 8,000 \text{ shares}} = \$2.99$$

c. DEPS—options, 7% convertible bonds and 4% convertible cumulative preferred stock added

$$\frac{\text{Net income} + \text{Interest expense (net of tax)}}{\text{Weighted-average number of common shares outstanding} + \text{Shares not acquired with proceeds of options} + \text{Shares issued upon conversion of bonds and preferred stock}} = \frac{\$50,000 + \$8,400}{10,000 + 200 + 8,000 + 1,000 \text{ shares}} = \$3.04$$

DEPS = $2.99

Since the addition of the 4% convertible cumulative preferred stock raises DEPS from $2.99 to $3.04, the preferred stock is antidilutive and is therefore excluded from the computation of DEPS.

A dual presentation of basic EPS and DEPS is required. The dual presentation on the face of the income statement would appear as follows:

Net income	$50,000
Earnings per common share* (Note X)	$4.60
Earnings per common share, assuming dilution*(Note X)	$2.99

* *The captions "Basic earnings per share" and "Diluted earnings per share" may be substituted, respectively.*

Note X: Earnings Per Share (illustrative disclosure based on facts from the Appendix)

The following adjustments were made to the numerators and denominators of the basic and diluted earnings per share computations:

	Year Ended December 31, 2009		
	Income (numerator)	*Weighted-average number of outstanding shares (denominator)*	*Amount per share*
Net income	$50,000		
Less: Preferred stock dividends	(4,000)		
Basic EPS			
Income available to common stockholders	46,000	10,000	$4.60
Effects of Dilutive Securities			
Options to purchase common stock		200	
7% convertible bonds	8,400	8,000	
Diluted EPS			
Income available to common stockholders adjusted for the effects of assumed exercise of options and conversion of bonds	$54,400	18,200	$2.99

There were 1,000 shares of $100 par value, 4% convertible, cumulative preferred stock issued and outstanding during the year ended December 31, 2009, that were not included in the above computation because their conversion would not have resulted in a dilution of earnings per share.

PERSPECTIVE AND ISSUES

The term "interim reporting" refers to financial reporting for periods of less than a year. GAAP itself does not mandate interim reporting; however, the SEC requires public companies to file quarterly condensed financial information on Form 10-Q. The information required in those interim reports is substantially less than is specified under GAAP for annual financial statements, but the extent of informational content in interim financial statements is an evolving matter. For example, ASC 715 requires expanded disclosures about the costs of pension and other employee benefit plans and associated information in interim reports of both public and nonpublic companies (See Chapter 18 for details).

The basic objective of interim reporting is to provide current information regarding enterprise performance to existing and prospective investors, lenders, and other financial statement users. This enables these users to act upon relevant information in making informed decisions in a timely manner. The demand for timely information (e.g., SEC filings on Form 10-Q are due in no greater than 45 days after period end, whereas filings on Form 10-K are due, depending on entity size, as long as 90 days after year-end) means that interim data will often be more heavily impacted by estimates and assumptions.

There historically have been two competing views of interim reporting. Under the *integral* view, the interim period is considered to be an integral part of the annual accounting period. It thus follows that annual operating expenses are to be estimated and then allocated to the interim periods based on forecasted annual activity levels such as sales volume. The results of subsequent interim periods must be adjusted to reflect the effect of estimation errors in earlier interim periods of the same fiscal year. The APB indicated a preference for the integral view in APB 28, which remains the principal guidance on this topic.

Under the *discrete* view, the interim period is considered to be a discrete accounting period. Thus, estimations and allocations are to be made using the same methods used for annual reporting. It follows that the same expense recognition rules apply as under annual reporting, and no special interim accruals or deferrals would be necessary or permissible. Annual operating expenses are to be recognized in the interim period incurred, irrespective of the number of interim periods benefited (i.e., there would be no special deferral rules for interim periods).

Proponents of the integral view argue that unique interim expense recognition procedures are necessary to avoid fluctuations in period-to-period results that might be misleading to financial statement users. Using the integral view results in interim earnings which are indicative of annual earnings and, thus, arguably more useful for predictive purposes. Proponents of the discrete view argue that the smoothing of interim results for purposes of forecasting annual earnings has undesirable effects. For example, a turning point during the year in an earnings trend could be obscured if smoothing techniques implied by the integral view approach were to be employed.

In response to inconsistencies in interim reporting practices and problems in implementing GAAP in interim reporting, FASB had issued a Discussion Memorandum, *Interim Financial Accounting and Reporting*. A fundamental objective of this project was to resolve the integral/discrete debate. However, FASB made no recommendations and ultimately removed the project from its agenda. The current convergence efforts of FASB and IASB may result in changes to US GAAP for interim reporting, inasmuch as the ASC 270 requirements lean toward the integral view (while nonetheless mandating certain discrete view procedures), but the corresponding IFRS (IAS 34) proclaims faithfulness to the discrete view (although certain aspects of that standard are closer to the integral view). Thus a "converged" standard could well differ from one or both of these current standards.

The debate between integral and discrete views of interim reporting is more than academic, and can result in very different interim measures of results of operations. This can occur, for example, because certain annual expenses may be concentrated in one interim period, yet benefit the entire year's operations. Examples include advertising expenses and major repairs and maintenance of equipment. Also, in the US (and many other jurisdictions) progressive (graduated) income tax rates are applied to total annual income and various income tax credits may arise, all of which are computed on annual pretax earnings, making the determination of quarterly income tax expense often complex.

Interim reporting is problematic for reasons other than the choice of an underlying measurement philosophy. As reporting periods are shortened, the effects of errors in estimation and allocation are magnified, and randomly occurring events which might not be material in the context of a full fiscal year could create major distortions in short interim period summaries of reporting entity performance. The effects of seasonal fluctuations and temporary market conditions further limit the reliability, comparability, and predictive value of interim reports.

Furthermore, the seemingly insatiable demand for information (particularly when in the consumers' view such information is available free of charge) is also changing how and how soon interim data is to be reported, and what level of assurance is to be provided by both preparers and independent attesting entities. With the advent of modernized accounting procedures such as the "virtual close," users will in the not-too-distant future be demanding to receive information from reporting entities on a real-time basis.

The spate of well-publicized audit failures in the late 1990s and early 2000s pressured the US Congress to pass the Sarbanes-Oxley Act of 2002 (SOX). Among its provisions is its Section 409, entitled "Real Time Issuer Disclosures" which charges the SEC with rule setting that would require issuers of public company financial statements to

> *...Disclose to the public on a rapid and current basis...information concerning material changes in the financial condition or operations of the issuer, in plain English, which may include trend and qualitative information and graphic presentations...*

The issue of independent auditor association with interim financial reports is subject to continuing controversy. The assumption of standard-setting responsibility for audits of "issuers" (i.e., SEC registrants) by the Public Company Accounting Oversight Board (PCAOB), as mandated by SOX, and the "real-time" demands of users described above, will

intensify the pressure on the auditing profession to develop standards to provide real-time continuous assurance to users of financial data regarding its completeness, accuracy and relevance as well as the effectiveness of the design and operation of the reporting entity's internal controls.

Although much of the discussion that follows relates to quarterly reporting, the rules and concepts are equally applicable to reports covering monthly or other interim periods.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Presentation
270 Interim Reporting

DEFINITIONS OF TERMS

Discrete view. A philosophy for measuring interim period results that views each interim period separately without regard to the annual period to which it relates.

Estimated annual effective tax rate. The average annual tax rate which reflects the application of graduated income tax rates to estimates of annual earnings, adjusted for the effects of available tax credits.

Integral view. A philosophy for measuring interim period results that views each interim period as an integral part of the annual period. Expenses are recognized in proportion to revenues earned through the use of special accruals and deferrals.

Interim reporting. Financial reporting for a period of less than a year, (e.g., a month or quarter).

Last-twelve-months reports. Financial reporting that covers the twelve-month period ending on a given interim date.

Liquidation of LIFO inventories. A LIFO liquidation occurs in an interim period when units sold during that period exceed the number of units purchased during that same period. This results in costs associated with one or more previous years' LIFO layers being released into cost of goods sold.

Seasonality. The normal, expected occurrence of a major portion of revenues or costs in the same one or two interim periods (on a consistent basis from year to year).

Year-to-date reports. Financial reporting for the period beginning on the first day of the current fiscal year and ending on a given interim date during the year.

CONCEPTS, RULES, AND EXAMPLES

Revenues

As explained elsewhere in this book, revenue recognition practices have received a great deal of attention in recent years, largely because of aggressive reporting (including financial reporting fraud) that came to light in a number of restatements of previously issued financial statements and in SEC enforcement actions and private litigation. However, the underlying principles established by GAAP have not been altered and have remained essentially unchanged for many decades, notwithstanding the periodic issuance of certain interpretive literature (such as the SEC's Staff Accounting Bulletins 101 and 104).

Interim reporting GAAP follows the discrete view for revenue recognition. Revenues are recognized as earned during an interim period using the same principles followed in annual reports. This rule applies to both product sales and service revenues. For example, product sales cutoff procedures are applied at the end of each interim period in the same manner that they are applied at year-end, and revenue from long-term construction contracts is recognized at interim dates using the same method used at year-end.

With respect to contingent rental income of lessors, contingent rental income is not to be recognized during interim periods, until such time that the achievement of the target that causes the contingent rental income to be earned is probable (ASC 840-10-25-35).

Product Costs and Direct Costs

Product costs (and costs directly associated with service revenues) are treated in interim reports in the same manner as in annual reports. Thus, in general, the discrete view is followed. However, ASC 270 provides for four integral view exceptions, described below.

1. The gross profit method may be used to estimate cost of goods sold and ending inventory for interim periods.
2. When inventory consists of LIFO layers and a portion of the base period layer is liquidated at an interim date, and it is expected that this inventory will be replaced by year-end, the anticipated cost of replacing the liquidated inventory is included in cost of sales of the interim period.
3. An inventory market decline reasonably expected to reverse by year-end (i.e., a decline deemed to be temporary in nature) need not be recognized in the interim period. ASC 330-10-55 states that there must be substantial evidence available to support the contention that the market value will recover before the inventory is sold, which generally limited this interim exception to seasonal price fluctuations. If an inventory loss from a market decline that is recognized in one period is followed by a market price recovery, the reversal is recognized as a gain in the subsequent interim period. Recognition of this gain in the later interim period is limited to the extent of loss previously recognized. This is in marked contrast to lower of cost or market write-downs in annual financial statements, which are not permitted to be restored in a later period.
4. Reporting entities using standard cost accounting systems ordinarily report purchase price, wage rate, and usage or efficiency variances in the same manner as year-end. Planned purchase price and volume variances are deferred if expected to be absorbed by year-end.

The first exception above eliminates the need for a physical inventory count at the interim date. The other three exceptions attempt to synchronize the quarterly financial statements with the annual report. For example, consider the LIFO liquidation exception. Without this exception, interim cost of goods sold could include low earlier year or base-period costs, while annual cost of goods sold would include only current year costs.

Several questions arise when using LIFO for interim reporting.

1. What is the best approach to estimate interim LIFO cost of sales?
2. As noted above, when an interim liquidation occurs that is expected to be replaced by year-end, cost of sales includes the expected cost of replacement. How is this adjustment treated on the interim balance sheet?
3. How is an interim liquidation that is not expected to be replaced by year-end recorded?

These problems are not addressed in ASC 270. The only literature related to these problems is the AICPA Task Force Issues Paper, *Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories.* (See Chapter 9.)

The Issues Paper describes two acceptable approaches to measuring interim LIFO cost of sales. The first approach makes specific quarterly computations of the LIFO effect based on year-to-date amounts. This is accomplished by reviewing quarterly price level changes and inventory levels. The second approach projects the expected annual LIFO effect and

then allocates that projection to the quarters. The allocation can be made equally to each quarter or can be made in relation to certain operating criteria per quarter.

The Issues Paper also describes two acceptable approaches to treating the interim liquidation replacement on the balance sheet. The first approach is to record the adjustment for the effect on pretax income of the replacement as a deferred credit in the current liabilities section. The second approach is to record the adjustment as a credit to an inventory valuation allowance.

When an interim LIFO liquidation occurs that is not expected to be reinstated by year-end, the effect of the liquidation is recognized in the period in which it occurs to the extent that it can be reasonably determined. A reporting entity using dollar-value LIFO may allocate the expected effect of the liquidation to the quarters affected.

Example of interim reporting of product costs

Dakota Corporation encounters the following product cost situations as part of its quarterly reporting:

- It takes physical inventory counts at the end of the second quarter and end of the fiscal year. Its typical gross profit is 30% of sales. The actual gross profit applicable to the first six months of the year is 32%. The actual full-year gross profit is 29%.
- It carries one type of its inventory at LIFO and the remaining inventory at FIFO.
- It suffers a clearly temporary decline of $10,000 in the market value of a specific part of its FIFO inventory in the first quarter, which it recovers in the second quarter.
- It liquidates earlier-period, lower-cost LIFO inventories during the second quarter. The liquidation results in second quarter cost of goods sold being $90,000 less (and, of course, second quarter gross profit being $90,000 more) than it would have been absent the LIFO liquidation. Dakota expects to, and does, restore these inventory levels by year-end.
- It suffers a decline of $65,000 in the market value of its FIFO inventory during the third quarter. The inventory value increases by $75,000 in the fourth quarter.

Dakota computes interim cost of goods sold to reflect the effect of these situations as follows:

	Quarter 1	*Quarter 2*	*First 6 months*	*Quarter 3*	*Quarter 4*	*Full year*
Sales	$10,000,000	$8,500,000	$18,500,000	$7,200,000	$11,800,000	$37,500,000
Complement of normal gross profit percentage	70%			70%		
Cost of goods sold using gross profit method	7,000,000			5,040,000		
Complement of year-to-date gross profit percentage based on actual count			68%			71%
Cost of goods sold based on actual count			12,580,000			26,625,000
Adjustment for effect of temporary LIFO liquidation[3]			90,000			
Decline in inventory value[4]				65,000		
Adjusted cost of goods sold	$7,000,000	$5,670,000[1]	$12,670,000	$5,105,000	$8,850,000[2]	$26,625,000

	Quarter 1	Quarter 2	First 6 months	Quarter 3	Quarter 4	Full year
Proof of 4th quarter cost of goods sold[5]						
Q4 sales × Actual annual gross profit complement					$ 8,378,000	
Difference between 68% complement based on Q2 count and 71% annual complement × 1st 6 mos sales					555,000	
Difference between 70% based on gross profit method used in Q3 and actual annual 71% × Q3 sales					72,000	
Q4 recovery of Q3 temporary decline					(65,000)	
Q4 recovery of Q3 temporary decline					(90,000)	
Reversal of Q2 temporary LIFO liquidation					$ 8,850,000	

[1] *Calculated as adjusted cost of goods sold for first six months – Cost of goods sold recognized during the first quarter.*

[2] *Calculated as (full year cost of goods sold of $26,625,000 – $12,670,000 cost of goods sold for first half of year – $5,105,000 cost of goods sold recognized during the third quarter).*

[3] *Full recognition of replacement of earlier period layer in the period that the temporary liquidation was incurred.*

[4] *No recognition is given to the first quarter temporary decline in value or the subsequent increase because, at the time it occurred, it was expected to be temporary. Full recognition is given to the third quarter market value decline assuming that it was not expected to be temporary. This is followed by recognition of the market value increase, but only to offset the amount of the initial decline.*

[5] *The "proof" of the fourth quarter cost of goods sold illustrates that the fourth quarter reflects adjustments for the effects of applying the interim costing rules in the other quarters.*

Other Costs and Expenses

The integral view is more clearly evident in how current US GAAP treats costs incurred in interim periods. Most other costs and expenses are recognized in interim periods as incurred. However, a cost that clearly benefits more than one interim period (e.g., annual repairs or property taxes) is allocated among the periods benefited. The allocation is based on estimates of time expired, benefit received, or activity related to the specific periods. Allocation procedures are to be consistent with those used at year-end reporting dates. However, if a cost incurred during an interim period cannot be readily associated with other interim periods, it is not arbitrarily assigned to those periods. The following parameters are used to account for certain types of interim expenses:

1. Costs expensed at year-end dates that benefit two or more interim periods (e.g., annual major repairs) are assigned to interim periods through the use of deferrals or accruals.
2. Quantity discounts given customers based on annual sales volume are allocated to interim periods on the basis of sales to customers during the interim period relative to estimated annual sales.
3. Property taxes (and like costs) are deferred or accrued at a year-end date to reflect a full year's charge to operations. Charges to interim periods follow similar procedures.

4. Advertising costs are permitted to be deferred to subsequent interim periods within the same fiscal year if the costs clearly benefit the later interim periods. Advertising costs may be accrued and allocated to interim periods on the basis of sales prior to actually receiving the service if the sales arrangement implicitly includes the advertising program. See Chapter 3 for a discussion of the specialized accounting for direct-response advertising prescribed by ASC 340-20. Those rules apply to both interim and annual reporting periods.
5. Lessees are to recognize contingent rental expense in the period before the end of the fiscal year when the achievement of the target that triggers the contingent rental expense becomes probable (ASC 840-10-25-35). If the assessment of probable target achievement changes during the year, previously recognized rental expense is reversed.
6. Planned major maintenance expenses must be accrued using the same method for both annual and interim financial reporting periods, while the accrue-in-advance method of accounting is prohibited in all periods.

Costs and expenses subject to year-end determination, such as discretionary bonuses and profit-sharing contributions, are assigned to interim periods in a reasonable and consistent manner to the extent they can be reasonably estimated.

Application of interim expense reporting principles is illustrated in the following examples:

Example of interim reporting of other expenses

Dakota Corporation encounters the following expense scenarios as part of its quarterly reporting (for illustrative purposes, all amounts are considered to be material):

- Its largest customer, Floor-Mart, placed firm orders for the year that will result in sales of $1,500,000 in the first quarter, $2,000,000 in the second quarter, $750,000 in the third quarter, and $1,650,000 in the fourth quarter. Dakota gives Floor-Mart a 5% rebate if Floor-Mart buys at least $5 million of goods each year. Floor-Mart exceeded the $5 million goal in the preceding year and is expected to do so again in the current year.
- It incurs $24,000 of trade show fees in the first quarter for a trade show that will occur in the third quarter.
- It pays $64,000 in advance in the second quarter for a series of advertisements that will run during the third and fourth quarters.
- It receives a $32,000 property tax bill in the second quarter that applies to the following twelve-month period (July 1 to June 30).
- It incurs annual air filter replacement costs of $6,000 in the first quarter.
- Its management team is entitled to a year-end cash bonus of $120,000 if it meets an annual sales target of $40 million, prior to any sales rebates, with the bonus dropping by $10,000 for every million dollars of sales not achieved.

Dakota used the following calculations to record these scenarios:

	Quarter 1	*Quarter 2*	*Quarter 3*	*Quarter 4*	*Full year*
Sales	$10,000,000	$8,500,000	$7,200,000	$11,800,000	$37,500,000
Deduction from sales	(75,000)[1]	(100,000)	(37,500)	(82,500)	(295,000)
Marketing expense			24,000[2]		24,000
Advertising expense			32,000[3]	32,000	64,000
Property tax expense			8,000[4]	8,000	16,000
Maintenance expense	1,500[5]	1,500	1,500	1,500	6,000
Bonus expense	30,000[6]	25,500	21,600	17,900	95,000

[1] *The sales rebate is based on 5% of actual sales to the customer in the quarter when the sale is made. The actual payment back to the customer does not occur until the end of the year when the $5 million goal is definitively reached.*

[2] *The $24,000 trade show payment is initially recorded as a prepaid expense and then charged to marketing expense when the trade show occurs in the third quarter.*

[3] *The $64,000 advertising payment is initially recorded as a prepaid expense and then charged to advertising expense when the advertisements run.*

[4] *The $32,000 property tax payment is initially recorded as a prepaid expense and then charged to property tax expense on a straight-line basis over the next four quarters.*

[5] *The $6,000 air filter replacement payment is initially recorded as a prepaid expense and then charged to maintenance expense over the one-year life of the air filters.*

[6] *The management bonus is recognized in proportion to the amount of revenue recognized in each quarter. Once it becomes apparent that the full sales target will not be reached, the bonus accrual is adjusted downward. In this case, the downward adjustment is assumed to be in the fourth quarter, since past history and seasonality factors made achievement of the full goal unlikely until fourth quarter results were known.*

NOTE: With other fact patterns, quarterly accruals may have differed.

Income Taxes

At each interim date, the reporting entity is required to make its best estimate of the effective income tax rate expected to apply to the full fiscal year. This estimate reflects expected federal, state, local, and foreign income tax rates, income tax credits, and the effects of applying income tax planning techniques. However, changes in income tax legislation are reflected in interim periods only after the enactment date of the legislation. This process is necessary to avoid distortions that would result if early interim periods reflected the entire effect of lower income tax brackets, while later periods suffered from having all income taxed at higher bracket rates. Since income taxes apply to annual income, not to interim periods on stand-alone bases, an integral approach is clearly warranted.

The accounting for income taxes in interim periods is discussed extensively in Chapter 17.

Discontinued Operations and Extraordinary Items

Extraordinary items and the effects of the disposal of a component of the entity (as defined by ASC 360) are reported separately in the interim period in which they occur. The same treatment is given to other unusual or infrequently occurring events. No attempt is made to allocate the effects of these items over the entire fiscal year in which they occur.

Materiality is evaluated by relating the item to the expected annual results of operations. Thus, an item to be reported in an early interim period may be judged material but later, when estimated results for the full fiscal year are known with greater precision, be found immaterial; the opposite pattern may also occur, with a presumed immaterial item being later found material to full-year results of operations. Either of such eventualities is inherent in the interim reporting process and would not be deemed an error requiring restatement.

Example of discontinued operations and extraordinary items

Dakota Corporation's Helena, Montana, facility suffers a direct hit from a tornado during the second quarter. Dakota's management believes the loss warrants treatment as an extraordinary item since the state of Montana does not typically experience tornadoes. Dakota's insurance does not cover tornados and the loss resulting from cleanup costs and writing down the net book value of the damaged portion of the building is $620,000, or $403,000 net of applicable income taxes computed at a flat 35% rate. As required by ASC 360-10-35, Dakota's management estimates the expected future cash flows from the use and ultimate disposition of the property and determines that the building does not require any further write-down for impairment.

In the third quarter, before the tornado repairs are completed, this unfortunate facility is subjected to a flood; however, the unreimbursed damage is only $68,000, or $44,200 net of applicable income taxes. The flood damage is considered material in the third quarter, but subsequently, during the fourth quarter, is determined to be immaterial for annual reporting purposes.

Finally, in the fourth quarter, management declares the facility too damaged to repair, and reclassifies it as held-for-sale. The facility meets the criteria of ASC 360-10-35 to be classified as a component of the entity since its operations and cash flows are clearly distinguishable from the rest of Dakota Corporation. Activities conducted at the facility generated income from operations of $82,000 in the first quarter, followed by losses of $102,000, $129,000, and $104,000 in the succeeding quarters, prior to 35% income taxes. Upon classification of the facility as held for sale, the carrying value is written down to its fair value less cost to sell resulting in a further loss of $117,000, which is net of $63,000 in applicable income taxes.

Dakota includes these circumstances in its quarterly and annual financial statement in the following manner:

	Quarter 1	Quarter 2	Quarter 3	Quarter 4	Full year
Income from continuing operations	$814,000	$629,000	$483,000	$505,000	$2,483,650[1]
Discontinued operations:					
Loss from operations of discontinued component, net of applicable income taxes of $36,400				(67,600)[2]	
Loss from operations of discontinued component, net of applicable income taxes of $88,550					(164,450)[3]
Loss from reclassification of Montana facility as held for sale and adjusting the carrying value to fair value less costs to sell, net of applicable income taxes of $63,000				(117,000)	(117,000)
Loss from discontinued operations				(184,600)	(281,450)
Extraordinary items:					
Tornado loss (less applicable income taxes of $217,000)		(403,000)			(403,000)
Flood loss (less applicable income taxes of $23,800)			(44,200)		0[1]
Net income	$814,000	$226,000	$438,800	$320,400	$1,799,200

[1] *The full-year income from continuing operations does not match the total of quarterly income from continuing operations, because the third-quarter classification of flood damage is not considered extraordinary for annual reporting purposes, and so is added back into annual income from continuing operations. Annual income is also reduced by operating losses in the discontinued facility for the full year, which were retained in income from continuing operations for the first three quarters. Full-year income from continuing operations is computed as follows:*

Sum of operating income for four quarters	*$2,431,000*
– Extraordinary loss shifted back to operating income	*(44,200)*
+ After-tax effect of first three quarters of losses on discontinued operations	*96,850*
= Full-year income from continuing operations	*$2,483,650*

[2] *The facility is classified as discontinued in the fourth quarter; there is no requirement to restate prior interim statements to show the loss from operations of the facility in earlier quarters.*

[3] *The full-year financial statement reflects the full-year loss from discontinued operations.*

Note that classification as an extraordinary item is based on facts and circumstances, given the requirement under GAAP that the event be both infrequent in occurrence and unusual in na-

ture. If the plant were located in Kansas, for example, and tornado damage did not qualify under both criteria given its location, then this would not have been presented as an extraordinary item.

Accounting Changes

The following discussion relates to accounting changes made in interim financial statements of privately held companies. The special considerations that apply to public companies are discussed later in this chapter. The treatment of accounting changes in annual reports is covered extensively in Chapter 5.

Change in accounting principle. ASC 270 requires disclosure in interim financial statements of any changes in accounting principles or the methods of applying them from those that were followed in

1. The prior fiscal year;
2. The comparable interim period of the prior fiscal year; and
3. The preceding interim periods of the current fiscal year.

The information to be included in these disclosures is the same as is required to be included in annual financial statements and is to be provided in the interim period in which the change occurs, subsequent interim periods of that same fiscal year, and the annual financial statements that include the interim period of change.

ASC 250 requires changes in accounting principle to be adopted through retrospective application to all prior periods presented. This accounting treatment is the same in both interim and annual financial statements. The impracticability exception provided by ASC 250 is only applicable to annual financial statements and may not be invoked for prechange interim periods occurring in the same fiscal year as the change is made.

Change in accounting estimate. Changes in accounting estimate are required by ASC 250 to be accounted for currently and prospectively. Retroactive restatement and presentation of pro forma amounts are not permitted. This accounting is the same whether the change occurs at the end of a year or during an interim reporting period.

Change in reporting entity. When an accounting change results in the financial statements presenting a different reporting entity than was presented in the past, all prior periods presented in the new financial statements, including all previously issued interim financial information, are to be retroactively restated to present the financial statements of the new reporting entity. In restating the previously issued information, however, interest previously capitalized under ASC 835 with respect to equity method investees that have not yet commenced their planned principal operations, is not to be changed.

Restatements. The term "restatement" is only to be used to describe a correction of an error from a prior period. Under ASC 250, when a restatement is made, the financial statements of each individual prior period presented (whether interim or annual) are to be adjusted to reflect correction of the effects of the error that relate to that period. Full disclosure of the restatement is to be provided in the financial statements of the

1. Interim period in which the restatement was first made;
2. Subsequent interim periods during the same fiscal year that includes the interim period in which the restatement was first made; and
3. Annual period that includes the interim period in which the restatement was first made.

Contingencies

In general, contingencies and uncertainties that exist at an interim date are accrued or disclosed in the same manner required for annual reports. For example, contingent losses that are probable and subject to reasonable estimation are to be accrued. The materiality of

the contingency is evaluated in relation to the expected annual results. Disclosures regarding material contingencies and uncertainties are to be repeated in all interim and annual reports until they have been removed, resolved, or become immaterial.

The following adjustments or settlements are accorded special treatment in interim reports if they relate to prior interim periods of the current fiscal year:

1. Litigation or similar claims
2. Income taxes (except for the effects of retroactive tax legislation enacted during an interim period)
3. Renegotiation proceedings associated with government contracts
4. Utility revenue under rate-making processes

If the item is material, directly related to prior interim periods of the current fiscal year in full or in part, and becomes reasonably estimable in the current interim period, it is reported as follows:

1. The portion directly related to the current interim period is included in that period.
2. Prior interim periods are restated to reflect the portions directly related to those periods.
3. The portion directly related to prior years is recognized in the restated first interim period of the current year.

Example of interim reporting of contingencies

Dakota Corporation is sued over its alleged violation of a patent in one of its products. Dakota settles the litigation in the fourth quarter. Under the settlement terms, Dakota must retroactively pay a 3% royalty on all sales of the product to which the patent applies. Sales of the product are $150,000 in the first quarter, $82,000 in the second quarter, $109,000 in the third quarter, and $57,000 in the fourth quarter. In addition, the cumulative total of all sales of the product in prior years is $1,280,000. Dakota restates its quarterly financial results to include the following royalty expense:

	Quarter 1	*Quarter 2*	*Quarter 3*	*Quarter 4*	*Full year*
Sales related to lawsuit	$150,000	$82,000	$109,000	$57,000	$398,000
Royalty expense	4,500	2,460	3,270	1,710	11,940
Royalty expense related to prior years' sales	38,400				38,400

Seasonality

The operations of many businesses are subject to recurring material seasonal variations. Such businesses are required to disclose the seasonality of their activities to avoid the possibility of misleading interim reports. ASC 270 also recommends that such businesses supplement their disclosures with information for twelve-month periods ending at the interim date of the current and preceding year.

Interim Reporting Considerations for Public Companies

Quarterly reporting. Condensed (summarized) unaudited interim financial statements are required to be filed with the SEC on a quarterly basis on Form 10-Q (Regulation S-X, Rule 10-01) or, for entities qualifying as small businesses, on Form 10-QSB. The minimum captions and disclosures required to be included in these financial statements are summarized in the Disclosure Checklist in Appendix A. Although such financial statements are informational tools used by investors, creditors, and analysts, they are not presented in sufficient detail to constitute a fair presentation of the reporting entity's financial position and results of operations in accordance with GAAP.

Period of adoption disclosures. In the interim period in which a new accounting principle is adopted, the SEC expects registrants to include in the quarterly condensed financial statements a complete set of the disclosures required to be included in annual financial statements. In addition, these complete disclosures are to be repeated in the interim condensed financial statements of the quarters immediately succeeding the quarter of adoption until an annual Form 10-K is filed that reflects the registrant's adoption of the new accounting principle. However, the SEC considers the reporting requirements of FASB Interpretation 48, *Accounting for Uncertainty in Income Taxes*, to be unduly burdensome for interim reporting, and so limits the Interpretation's disclosure requirements to the total amount of unrecognized tax benefits recorded, while excluding the tabular and other disclosures of the Interpretation from interim reporting.

Fourth quarter adjustments. When, as is typical, the fourth quarter results are not reported separately, the annual financial statements of publicly traded companies are required to include note disclosure of the effects on the fourth quarter of accounting changes made during the quarter; disposals of components of the reporting entity; extraordinary, unusual, or infrequently occurring items; and the aggregate effect of year-end adjustments having a material effect on the quarter's results.

Earnings per share. The same procedures used at year-end are used for earnings per share computations and disclosures in interim reports. Note that annual earnings per share generally will not equal the sum of the interim earnings per share amounts, due to such factors as stock issuances during the year and market price changes. No reconciliation requirements exist for such disparities.

Accelerated reporting requirements. In order to provide stakeholders with relevant, actionable information on a more timely basis, the SEC requires certain events that occur between regular quarterly reporting deadlines to be reported on its Form 8-K in accordance with an accelerated timetable. In response to the "real time issuer disclosure" mandate in Section 409 of the Sarbanes-Oxley Act of 2002, eight new items were added to the form and the 8-K filing deadline for most items was shortened to four business days after the occurrence of the triggering event. Events subject to accelerated reporting requirements are set forth below.

Form 8-K *Item number*	*Event requiring disclosure*
1.01	Entry into "material definitive agreement" that provides for rights or obligations material to and enforceable by or against the registrant
1.02	Termination of material definitive agreement
1.03	Bankruptcy or receivership
2.01	Completion of acquisition or disposition of significant amounts of assets (other than in the ordinary course of business)
2.02	Disclosure of material nonpublic information regarding a completed fiscal year or quarter
2.03	Creation of a direct financial obligation or an obligation under an off-balance-sheet arrangement
2.04	Triggering events that accelerate or increase a direct financial obligation or an obligation under an off-balance-sheet arrangement
2.05	Costs associated with exit or disposal activities
2.06	Material impairments
3.01	Notice of delisting or failure to satisfy a continued listing rule or standard; transfer of listing
3.02	Unregistered sales of equity securities
3.03	Material modification to rights of security holders including working capital restrictions and other limitations on the payment of dividends

Form 8-K *Item number*	*Event requiring disclosure*
4.01	Changes in auditor
4.02	Nonreliance on previously issued financial statements or a related audit report or completed interim review
5.01	Changes in control of the registrant
5.02	Departure of directors or principal officers; election of directors; appointment of principal officers
5.03	Amendments to the articles of incorporation or bylaws; change in fiscal year
5.04	Receipt of notice from retirement plan administrator regarding the commencement of a temporary blackout period affecting the issuance of securities of the registrant/employer
5.05	Code of ethics amendments or waivers granted
5.06	Completion of a transaction that causes a shell company to cease being a shell company as defined in Rule 12b-2 under the Exchange Act

Additional accelerated reporting requirements apply to issuers of asset-backed securities under Section 6 of the Form 8-K instructions.

PERSPECTIVE AND ISSUES

With many companies organized as diversified holding companies or conglomerates, the presentation of basic consolidated financial statements on an aggregated basis does not provide users with sufficient information for decision-making purposes. The objective of segment reporting, as set forth in ASC 280, is to

> *…Provide information about the different types of business activities in which an enterprise engages and the different economic environments in which it operates to help users of financial statements:*
>
> a. *Better understand the enterprise's performance*
> b. *Better assess its prospects for future net cash flows [and]*
> c. *Make more informed judgments about the enterprise as a whole.*

The primary benefit of segment reporting is the release of "hidden data" from consolidated financial information. Different segments may possess different levels of profitability, risk, and growth. This important information is merged and thus "averaged out" in the consolidated amounts. Assessing future cash flows and their associated risks can be aided by segment data. For example, knowledge of the level of reporting entity operations in a growing or declining product line can help in the prediction of cash flow, while knowledge of the scope of reporting entity operations in an unstable geographic area can help in the assessment of risk. In general, information about the nature and relative size of an enterprise's various business operations is considered useful by decision makers.

Segment reporting is an important tool in analyzing companies that are diversified in terms of the types of businesses in which they engage or the geographic locations in which they operate. In addition, financial analysts have consistently requested that financial statement data be more disaggregated. Academic research has also demonstrated the value of disaggregated information for economic decision-making purposes.

ASC 280 currently governs the way publicly held businesses are required to report disaggregated information in financial reports to stockholders, including interim reports. The statement defines operating segments as distinct revenue-producing components of the reporting entity about which separate financial information is produced internally, and whose operating results are regularly reviewed by the reporting entity.

The approach used in ASC 280 is a "management approach," meaning it is based on the way management organizes segments internally to make operating decisions and assess performance. The management approach, in general, provides that external financial reporting will closely conform to internal reporting, thus giving financial statement users the ability to view the reporting entity's segments in the same manner as internal decision makers.

Financial information can be segmented in several ways: by types of products or services, by geography, by legal entity, or by type of customer. ASC 280 requires that each reportable segment report, among other items, its profit or loss, certain specific revenues and expenses, and its assets. Management is required to reconcile segment information with its consolidated general-purpose financial statements.

In addition, ASC 280 requires that all public companies report information on a company-wide basis about revenues for each product and service, about countries in which revenues are earned and assets are held, and about its major customers, even if this information is not used by management in making operating decisions.

The codification does not limit segment reporting to purely financial information. It also requires a description of the company's rationale or methods employed in determining the composition of the segments. This description includes the products or services produced by each segment, differences in measurement practices between segments and the consolidated entity, and differences in the segments' measurement practices between periods.

The corresponding international standard, which until recently was IAS 14, differed in some important respects from ASC 280, although as revised effective 1998 it did impose a management perspective to the definition of segments. With the replacement of IAS 14 by newly adopted IFRS 8, however, the IASB has now fully "converged" to the US GAAP approach. IFRS 8, which becomes mandatorily effective in 2009, requires that an entity report financial and descriptive information about its *reportable segments*. Reportable segments are defined as *operating segments* or aggregations thereof that meet certain defined criteria. Operating segments are components of an entity about which separate financial information is available that is evaluated regularly by the chief operating decision maker in deciding how to allocate resources and in assessing performance. Generally, segment financial information is required to be reported on the same basis as is used internally for evaluating operating segment performance and deciding how to allocate resources to operating segments.

Recent Developments

The full convergence of the international standard, IFRS 8, with US GAAP's ASC 280 is the most significant recent development in segment reporting practice. It is furthermore important in demonstrating that, while an overall trend to universal utilization of IFRS is clearly discernible, IASB remains open to making changes to IFRS based on recognition of superior principles promulgated by other standard-setting bodies.

The Accounting Staff of the SEC's Division of Corporation Finance, in its periodically updated document, *Current Accounting and Disclosure Issues in the Division of Corporation Finance,* has as recently as November 2006 identified compliance with segment disclosure requirements as being a "significant focus of staff reviews." The principal concern was that foreign registrants were still making use of a "products and services" typology, rather than the "management approach" mandated by ASC 280. The Staff emphasized certain matters

that had arisen as a result of those reviews and communicated the level of scrutiny that they were going to be applying to registrants' filings.

1. The chief operating decision maker (CODM) is not necessarily a single person. Rather, it is to be considered a function that may be carried out be several persons.
2. The Staff may challenge registrants' exclusion of components of the business from being considered operating segments when the CODM receives reports of that component's operating results on a quarterly or more frequent basis. In some cases, the Staff requested copies of all reports furnished to the CODM and reviewed internal documentation for its consistency with public statements made by members of the management and related press coverage. The Staff pointed out that there may be mitigating circumstances whereby the CODM receives reports on overlapping sets of components that are more representative of the way the reporting entity is managed.
3. As discussed later in this chapter, the Staff believes the aggregation of segments is a "high hurdle" and is appropriate only in situations when the user's understanding of the reporting entity's results and future prospects would not be enhanced by separate reporting.
4. The Staff reminded registrants to identify the products and services from which each reportable segment derives its revenues, and to report the total revenues from external customers for each product or service or each group of similar products and services. The Staff has observed that, based on their reviews of filings, registrants have taken "overly broad views" of what constitutes similar products. The Staff has, in some cases, reviewed public disclosures and marketing materials containing descriptions of the registrants' products.
5. Some registrants manage their segments based on geographic areas of operations and report accordingly. The Staff points out that, even when this is the case, the registrant is still required to provide separate disclosures with respect to each individual country in which revenues are material. This may be accomplished by providing material country disclosures as separate subtotals within each region.
6. Registrants must clearly quantify and explain each material reconciling item between the segment disclosures and the consolidated financial statements, including identification of measurement differences and asymmetrical allocations among segments.
7. The Staff provided interpretive guidance on the requirement that the registrant recast prior information for comparative purposes when changes are made (or are being contemplated) in the structure of the segments.
8. The Staff noted that, since the identification of reporting units can have a significant impact on the determination of goodwill impairment charges, registrants should disclose how goodwill is allocated to reporting units, and whether there have been changes in the manner in which goodwill is allocated.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Presentation	
280	Segment Reporting

DEFINITIONS OF TERMS

Assets test. One of the three 10% tests; used to determine whether operating segments are separately reportable.

Chief operating decision maker (CODM). The person(s) at the reporting entity level whose general function (not specific title) is to allocate resources to, and assess the perfor-

mance of, the segments. Within a reporting entity, this authority does not necessarily need to be vested in a single individual; rather, the responsibilities can be fulfilled by a group of individuals.

Common costs. Operating expenses incurred by the reporting entity for the benefit of more than one segment.

Corporate assets. Assets maintained for general corporate purposes and not used in the operations of any segment.

Expenditures for segment assets. Additions to a segment's long-lived assets; generally, property, plant, and equipment.

Financial report. Includes any aggregation of information that includes one or more complete sets of financial statements, such as an annual report to stockholders or a filing with the Securities and Exchange Commission.

Foreign operations. Operations located outside of the reporting entity's home country that generate either unaffiliated or intersegment revenues.

General corporate expenses. Expenses incurred for the benefit of the corporation as a whole, which cannot be reasonably allocated to any segment.

Geographic area. An individual country (domestic or foreign).

Intersegment sales. Transfers of products or services, similar to those sold to unaffiliated customers, between operating segments.

Major customer. A customer responsible for at least 10% of a reporting entity's revenues.

Management approach. The method chosen by FASB to determine the information to be reported; it is based on the way that management organizes the segments internally for making operating decisions and assessing performance.

Nonpublic company. A company other than one (1) whose debt or equity securities trade in a public market on a foreign or domestic stock exchange, or in the over-the-counter market (including securities quoted only locally or regionally) or (2) that is required to file financial statements with the US Securities and Exchange Commission. A company is no longer considered nonpublic when its financial statements are issued in preparation for the sale of any class of securities in a public market. Nonpublic companies include certain mutual associations, cooperatives, nonbusiness organizations, and partnerships that often make their financial statements available to a broad class, such as insurance policyholders, depositors, members, contributors, or partners.

Operating segment. A component of a reporting entity that earns revenues and incurs expenses, about which separate financial information is available that is evaluated regularly by the CODM in deciding how to allocate resources and in assessing performance.

Profit center. Those components of a reporting entity that sell primarily to outside markets and for which information about revenue and profitability is accumulated. They are the smallest units of activity for which revenue and expense information is accumulated for internal planning and control purposes.

Profit and loss test. One of the three 10% tests; used to determine whether operating segments are separately reportable.

Reportable segments. Segments considered to be significant to the operations of the reporting entity; a segment that has passed any one of the three defined 10% tests (assets, revenues, or profit and loss), or has been identified as being reportable through other criteria (e.g., aggregation, etc.).

Revenues test. One of three 10% tests; used to determine whether operating segments and major customers are reportable.

Segment assets. Those tangible and intangible assets directly owned or used by a segment, including any allocated portion of assets used jointly by more than one segment.

Segment manager. The person(s) accountable to the reporting entity's chief operating decision maker (CODM, as defined above) for one or more operating segment's activities, financial results, budgets, forecasts, and operating plans. The reporting entity's CODM can also serve as segment manager for one or more operating segments.

Segment profit or loss. All of a segment's revenues and gains minus its expenses and losses, including any similar items allocated to it by the reporting entity.

Segment reporting. Disclosure of information about different components of a reporting entity's operations, as well as information related to its products and services, geographic areas of operations, and major customers.

Segment revenue. Revenue from sales to unaffiliated customers and from intersegment sales or transfers.

75% test. A test used to determine whether the reportable segments of a reporting entity represent a sufficient portion of its total operations.

Transfer pricing. The pricing of products or services between segments or geographic locations.

CONCEPTS, RULES, AND EXAMPLES

Applicability of ASC 280

ASC 280 applies to public companies. The statement does not mandatorily apply to not-for-profit organizations or to nonpublic companies—which are, nevertheless, encouraged to voluntarily provide the segment disclosures prescribed by ASC 280.

Operating Segments

In ASC 280, an operating segment is defined as a component of a reporting entity

a. That engages in business activities that may generate revenues and incur expenses from transactions with external parties and/or with other components of the same reporting entity (intersegment transactions),
b. About which discrete financial information is available, and
c. Whose operating results are reviewed regularly by the reporting entity's chief operating decision maker (CODM) in order to assess the segment's performance and make resource allocation decisions.

Operating segments frequently have a segment manager function that communicates on an ongoing basis with the reporting entity's CODM. The segment manager is not necessarily a single individual but rather the segment management responsibility can vest functionally in a committee or group of designated individuals. Additionally, an operating segment is not necessarily revenue generating from its inception, as it may be in a start-up phase.

Not all activities that occur within the reporting entity are allocable to its operating segments. Activities that are non-revenue-producing or that are incidental to the reporting entity are not considered to be operating segments such as corporate headquarters or certain functional departments. ASC 280 specifies that the reporting entity's pension and other postretirement benefit plans are not considered to be operating segments.

This rather general definition means that management's judgment will be relied upon to determine operating segment classifications. However, FASB believes meaningful segment information will be provided in external financial reports because the externally reported segment information must conform with the segment information that is used internally.

Reportable Segments

A segment is considered to be a reportable segment if it is significant to the enterprise as a whole because it satisfies one of the three quantitative 10% tests described below.

Revenues test. Segment revenue (unaffiliated and intersegment) is at least 10% of the combined revenue (unaffiliated and intersegment) of all operating segments.

Profit and loss test. The absolute amount of segment profit or loss is at least 10% of the greater, in absolute amount, of

1. Combined profits of all operating segments reporting a profit
2. Combined losses of all operating segments reporting a loss

ASC 280-10-55 clarifies that, if the CODM uses different measures of profit or loss to evaluate the performance of different segments (e.g. net income versus operating income), the reporting entity is to use a single, consistent measure for the purposes of this profit and loss test. This does not, however, affect the requirement that the reporting entity disclose the measure of profit or loss used by the CODM for the purposes of decision making regarding the segment's performance and resources to be allocated to the segment.

Assets test. Segment assets are at least 10% of the combined assets of all operating segments. Segment assets include those assets used exclusively by the segment and the allocated portion of assets shared by two or more segments. Assets held for general corporate purposes are not assigned to segments.

Interperiod comparability must be considered in conjunction with the results of the 10% tests. If a segment fails to meet the tests in the current reporting period, but has satisfied the tests in the past and is expected to in the future, it is considered as being reportable in the current year for the sake of comparability. Similarly, if a segment which rarely passes the tests does so in the current year as the result of an unusual event, that segment may be excluded to preserve comparability.

After the 10% tests are completed, a 75% test must be performed. The combined unaffiliated revenue of all reportable segments must be at least 75% of the combined unaffiliated revenue of all operating segments. If the 75% test is not satisfied, additional segments must be designated as reportable until the test is satisfied. The purpose of this test is to ensure that reportable segments account for a substantial portion of the entity's operations.

The following example illustrates the three 10% tests and the 75% test.

Operating segment	*Unaffiliated revenue*	*Intersegment revenue*	*Total revenue*	*Segment profit*	*Segment (loss)*	*Assets*
A	$ 90	$ 12	$ 102	$11	$ --	$ 70
B	120	--	120	10	--	50
C	110	20	130	--	(40)	90
D	200	--	200	--	--	140
E	140	300	440	--	(100)	230
F	380	--	380	60	--	260
G	144	--	144	8	--	30
Total	$1,184	$332	$1,516	$89	$(140)	$870

NOTE: Because the $140 total segment losses exceed the $89 total segment profits, the $140 is used for the 10% test.

Summary of Test Results

x = Passed test – Reportable segment

Operating segment	*Total revenues (10% of $1,516 = $152)*	*Segment profit/loss (10% of $140 = $14)*	*Assets (10% of $870 = $87)*	*75% of unaffiliated revenues test*
A				
B				
C		x	x	$110
D	x		x	200
E	x	x	x	140
F	x	x	x	380
G				
				830
			75% of $1,184	888
			Revenue shortfall	$ (58)

Note that the aggregate revenues of the reportable segments that passed the 10% tests are $58 short of providing the required coverage of 75% of unaffiliated revenues. Consequently, an additional operating segment (A, B, or G) will need to be added to the reportable segments in order to obtain sufficient coverage.

Certain other factors must be considered when identifying reportable segments. Management may consider aggregating two or more operating segments if

1. They have similar economic characteristics,
2. Aggregation is consistent with the objective and basic principles of ASC 280, and
3. The segments are similar in all of the following areas:
   a. The nature of the products and services
   b. The nature of the production processes
   c. The type of customer for their products and services
   d. The methods used to distribute their products or provide their services
   e. The nature of the regulatory environment

This aggregation can occur prior to performing the 10% tests if management desires.

In their analyses, financial statement preparers have allegedly often ignored the second factor presented above in making aggregation decisions. The SEC, in particular, was quick to note that the paramount consideration should be the achievement of the financial reporting objectives of ASC 280 (i.e., providing useful information to financial statement users, allowing them to gain an understanding of management's decision making processes regarding operation of the business). With that in mind, the authors emphasize that aggregation decisions should be made carefully, and only after concluding that the information loss due to aggregation would not impede such understanding by financial statement users.

Management may *optionally* combine information on operating segments that do not meet any of the 10% tests to produce a reportable segment, but only if the segments being combined have similar economic characteristics and also share a majority of the five aggregation criteria listed above (ASC 280-10-50).

Note that information about operating segments that do not meet any of the 10% thresholds may still be disclosed separately. By utilizing the aggregation criteria and quantitative thresholds (10% tests) for determining reportable segments, ASC 280 uses what should be considered a modified management approach.

The number of reportable segments should not be so great as to decrease the usefulness of segment reporting. As a rule of thumb, FASB suggests that if the number of reportable segments exceeds ten, segment information may become too detailed. In this situation, the most closely related operating segments should be combined into broader reportable segments, again, however, subject to the objectives inherent in ASC 280's requirements.

Refer to the discussion of alternative balance sheet segmentation and the accompanying diagram in Chapter 2. It provides an example of the different components of a reporting entity used for various accounting and reporting purposes.

Accounting Issues

Since segment revenue as defined by ASC 280 includes intersegment sales, transfer pricing becomes an issue. Rather than establishing a basis for setting transfer prices, FASB requires companies to use the same transfer prices for segment reporting purposes as are used internally. Since most segments are organizational profit centers, internal transfer prices would generally reflect market prices, but even if this is not the case, these same transfer prices must be used for segment disclosures. This is consistent with the management approach adopted by ASC 280.

Another issue in determining profit or loss is the allocation of common costs. Common costs are expenses incurred by the reporting entity for the benefit of more than one operating segment. Again, segment reporting is required to conform to internal management reporting. Accordingly, these costs are only allocated to a segment for external reporting purposes if they are included in the measure of the segment's profit or loss that is used internally by the CODM.

Difficulties can arise in distinguishing common costs from general corporate expenses. General corporate expenses are not direct expenses from the point of view of any operating segment; they are incurred for the benefit of the corporation as a whole and cannot be reasonably attributed to any operating segment. Common costs, on the other hand, benefit two or more segments and can be allocated to those segments in a manner determined by management to support internal decision making by the reporting entity.

Similarly, only those assets that are included internally in the measure of the segment's assets used to make operating decisions are reported as assets of the segment in external financial reports. If management allocates amounts to segment profit or assets internally and those amounts are used by the CODM, then those amounts are to be allocated on a reasonable basis and disclosed.

Segment Disclosures

ASC 280 requires disclosures regarding the reporting entity's reportable segments that include

1. **General information**—An explanation of how management identified the reporting entity's reportable segments, including whether operating segments have been aggregated, is to be presented. Additionally, a description of the types of products and services from which each reportable segment derives its revenues is to be provided.
2. **Certain information about reported segment profit and loss, segment assets and the basis of measurement**—This will include certain revenue and expense items included in segment profit and loss, as well as certain amounts related to the determination of segment assets. Also, the basis of measurement for these items must be disclosed.
3. **Reconciliations**—Management must reconcile the segment amounts disclosed to the corresponding consolidated reporting entity amounts.
4. **Interim period information**—Although the interim disclosures are not as extensive as in the annual financial report, certain segment disclosures are required in interim financial statements.

See the comprehensive illustration of the disclosures required for segment reporting provided later in this chapter. Additionally, ASC 280 provides an illustrative example.

Entity-Wide Disclosures

In addition to segment data, ASC 280 mandates that certain entity-wide disclosures be made. The entity-wide disclosures are required for all reporting entities subject to ASC 280, even those that have only a single reportable segment.

Products and services. Revenue from external customers for each product and service or each group of similar products and services is to be reported by the reporting entity unless impracticable. If deemed to be impracticable, that fact is to be disclosed. If the company's reportable segments have been organized around products and services, then this disclosure will generally not be required.

Geographic areas. A reporting entity separately discloses revenues from external customers and long-lived assets attributable to its domestic operations and foreign operations. If the reportable segments have been organized around geographic areas, then these disclosures will generally not be required because they would be duplicative.

Domestic operations are those operations located in the reporting entity's home country that generate either unaffiliated or intersegment revenues. Foreign operations are similar operations located outside of the home country of the reporting entity. For the purposes of these disclosures, US reporting entities' operations in Puerto Rico are not considered to be foreign operations although management is not precluded from voluntary disclosure regarding Puerto Rican operations (ASC 280-10-55).

If the reporting entity functions in two or more foreign geographic areas, to the extent revenues or assets of an individual foreign geographic area are material, then these amounts are separately disclosed. In addition, disclosure is required of the basis for attributing revenue to different geographic areas. A geographic area is defined as an individual country. If providing this information is impracticable, that fact is to be disclosed.

Major customers. If the reporting entity earns 10% or more of its revenue on sales to a single external customer, that fact and the amount of revenue from each such customer must be disclosed. Also, the segment making these sales must be disclosed. This disclosure provides information on concentrations of risk.

For the purpose of this disclosure, a group of customers under common control, such as subsidiaries of a common parent, is regarded as a single customer. Similarly the various agencies of a government are considered to be a single customer. An insuring entity (such as Blue Cross) is not considered to be the customer unless that entity (rather than the patient) controls the decision as to the doctor, type of service, etc.

Restatement of Previously Reported Segment Information

Segment reporting is required on a comparative basis when the associated financial statements are comparative. Therefore, the information must be restated to preserve comparability whenever the reporting entity has changed the structure of its internal organization in a manner that causes a change to its reportable segments. Management must explicitly disclose that it has restated the segment information of earlier periods.

Comprehensive Illustration

The following illustration is provided for a hypothetical company, Resources Unlimited. The illustration provides segment disclosures by legal entity.

NOTE: ASC 280 provides illustrative segment disclosures by product line.

Description of the types of products and services from which each reportable segment derives its revenues. Resources Unlimited has four reportable segments: Wholesale Corporation, Retail Corporation, Library Corporation, and Software Corporation. Wholesale Corporation buys and resells used elementary and college textbooks. Retail Corporation operates 200 college book stores and a related e-commerce Web site selling both new and used college textbooks, trade books, sports apparel, and other sundries. Library Corporation sells library books primarily to elementary school libraries. Software Corporation develops and sells library systems application software.

Measurement of segment profit or loss and segment assets. The accounting policies of the segments are the same as those described in the summary of significant accounting policies except the first-in-first-out (FIFO) method of inventory valuation is used for segment reporting. In addition, Resources Unlimited allocates interest expense to each segment based on the segment's average borrowings from the corporate office. However, the related debt is not allocated to the segments and remains on the corporate balance sheet. Resources Unlimited evaluates performance based on profit or loss before income taxes not including nonrecurring gains and losses.

Resources Unlimited accounts for intersegment sales and transfers as if the sales or transfers were transacted with third parties (i.e., at current market prices).

Factors management used to identify reportable segments. Resources Unlimited's business is conducted through four separate legal entities that are wholly owned subsidiaries. At the company's inception, each entity was founded and managed by a different Resources Unlimited stockholder/family member. Each corporation is still managed separately, as each business has a distinct customer base and requires different strategic and marketing efforts.

Information about profit and loss and assets. The amounts in the illustration are assumed to be the amounts in reports used by the CODM. Resources Unlimited allocates interest expense to the segments, however it does not allocate income taxes and unusual items to them.

($000 omitted)

	Wholesale Corporation	*Retail Corporation*	*Library Corporation*	*Software Corporation*	*Totals*
Revenues from external customers	$197,500	$263,000	$182,300	$102,200	$745,000
Intersegment revenues	23,000	--	--	--	23,000
Interest revenue	250	150	--	--	400
Interest expense	1,570	2,150	1,390	2,700	7,810
Depreciation and amortization*	8,600	13,100	7,180	6,070	34,950
Segment profit	12,100	13,500	9,900	5,100	40,600
Segment assets	121,200	153,350	100,600	85,000	460,150
Expenditures for segment assets	7,200	12,700	5,600	6,700	32,200

* *Depreciation and amortization are required to be disclosed for each operating segment even if the CODM evaluates segment performance using predepreciation measures such as earnings before income taxes, depreciation, amortization (EBITDA) (ASC 280-10-55)*

Reconciliations. An illustration of reconciliations for revenues, profit and loss, assets, and other significant items is shown below. In general, this illustration assumes that there are no unreported operating segments, but there is a corporate headquarters, thus most reconciling items relate to corporate revenues and expenses.

As discussed previously, the company recognizes and measures inventory based on FIFO valuation for segment reporting. The consolidated financial statements are assumed not to include discontinued operations or the cumulative effect of a change in accounting principle.

	($000 omitted)
Revenue	
Total revenues for reportable segments	$768,000
Elimination of intersegment revenue	(23,000)
Total consolidated revenue	$745,000
Profit and loss	
Total profit for reportable segments	$40,600
Elimination of intersegment profits	(6,100)
Unallocated amounts relating to corporate operations:	
Interest revenue	500
Interest expense	(800)
Depreciation and amortization	(1,900)
Unrealized gain on trading securities	1,865
Income before income taxes and extraordinary items	$34,165
Assets	
Total assets for reportable segments	$460,150
Corporate short-term investments, land and building	25,100
Adjustment for LIFO reserve in consolidation	(9,200)
	$476,050

Other significant items

	Segment totals	*Adjustments*	*Consolidated totals*
Expenditures for segment assets	$32,200	800	$33,000

The reconciling adjustment is the amount of expenditures incurred for additions to the corporate headquarters building, which is not included in the segment information.

Products and services.

Used textbooks	$296,125
New textbooks	72,150
Trade books	45,700
Sports apparel	41,325
Sundries	5,200
Library books	182,300
Library software	102,200
Total consolidated revenue	$745,000

Geographic information.

	*Revenues**	*Long-lived assets*
United States	$687,400	$253,200
Foreign countries	57,600	18,800
Total	$745,000	$272,000

* *Revenues are attributed to countries as follows: For Wholesale Corporation and Library Corporation, the country in which the customer takes delivery. For Retail Corporation, the country in which the retail store is located or, for internet sales, the country to which the merchandise is delivered. For Software Corporation, the country where the host server on which the software is installed is located.*

Major customers. No single customer represents 10% or more of the consolidated revenues. Consequently, management believes that the Companies' sales are appropriately diversified.

PERSPECTIVE AND ISSUES

Over the past half century, international activity by US corporations has increased enormously and the prospects are that this will only accelerate in the coming years. Not only are transactions consummated with independent foreign entities, but also with foreign subsidiaries or branches of US parents. In addition, foreign investment into the US has increased substantially, with acquisition of such venerable US companies as the former Amoco Corporation and Universal Studios.

To facilitate the proper analysis of foreign operations by financial statement users, transactions and financial statements denominated in foreign currencies must be expressed in a common currency (i.e., US dollars). The generally accepted accounting principles governing the translation of foreign currency financial statements and the accounting for foreign currency transactions are found primarily in ASC 830. Additional guidance in this area is provided by ASC 830-30-40. These principles apply to the translation of

1. Foreign currency transactions (e.g., exports, imports, and loans) that are denominated in other than a company's functional currency
2. Foreign currency financial statements of branches, divisions, subsidiaries, and other investees which are incorporated into the financial statements of a company reporting under US GAAP by combination, consolidation, or application of the equity method

The objectives of translation are to provide

1. Information relative to the expected economic effects of rate changes on an enterprise's cash flows and equity
2. Information in consolidated statements relative to the financial results and relationships of each individual foreign consolidated entity as reflected by the functional currency of each reporting entity

Companies sometimes use hedging strategies to attempt to manage their risk and minimize their exposure to fluctuations in the exchange rates of foreign currencies. Hedge accounting under ASC 815 is addressed at the end of this chapter.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Expenses	
740	Income Taxes
Broad Transactions	
815	Derivatives and Hedging
820	Fair Value Measurements and Disclosures
825-10-25	Financial Instruments—Fair Value Option
830	Foreign Currency Matters
830-740	Foreign Currency Matters—Income Taxes

DEFINITIONS OF TERMS

Conversion. The exchange of one currency for another.

Current exchange rate. The rate at which one unit of a currency can be exchanged for (converted into) another currency. For purposes of translation of financial statements in accordance with ASC 830, the current exchange rate is the rate at the end of the period covered by the financial statements or at the dates of recognition in those statements with respect to revenues, expenses, gains, and losses.

Discount or premium on a forward contract. The foreign currency amount of the contract multiplied by the difference between the contracted forward rate and the spot rate at the date of inception of the contract.

Foreign currency. A currency other than the functional currency of the reporting entity being referred to (for example, the US dollar could be a foreign currency for a foreign entity). Composites of currencies, such as the Special Drawing Rights on the International Monetary Fund (SDR), used to set prices or denominate amounts of loans, etc., have the characteristics of foreign currency for purposes of applying ASC 830.

Foreign currency statements. Financial statements that employ as the unit of measure a functional currency that is not the reporting currency of the enterprise.

Foreign currency transactions. Transactions whose terms are denominated in a currency other than the reporting entity's functional currency. Foreign currency transactions arise when an enterprise (1) buys or sells goods or services on credit whose prices are denominated in foreign currency, (2) borrows or lends funds and the amounts payable or receivable are denominated in foreign currency, (3) is a party to an unperformed forward exchange contract, or (4) for other reasons, acquires or disposes of assets or incurs or settles liabilities denominated in foreign currency.

Foreign currency translation. The process of expressing in the enterprise's reporting currency amounts that are denominated or measured in a different currency.

Forward exchange contract. An agreement to exchange at a specified future date currencies of different countries at a specified rate (forward rate).

Functional currency. The currency of the primary economic environment in which the entity operates; normally, the currency of the environment in which the entity primarily generates and expends cash.

Local currency. The currency of a particular country being referred to.

Monetary items. Cash, claims to receive a fixed amount of cash, and obligations to pay a fixed amount of cash.

Nonmonetary items. All balance sheet items other than cash, claims to cash, and cash obligations.

Remeasurement. If an entity's accounting records are not maintained in its functional currency, remeasurement is the process necessary to convert those records into the functional currency, with the objective of reflecting the same results as if the records had been maintained in the functional currency. Monetary balances are translated by using the current exchange rate, and nonmonetary balances are translated by using historical exchange rates. In the event that remeasurement into the functional currency is required, it must be done prior to translation into the reporting currency.

Reporting currency. The currency in which an enterprise prepares its financial statements.

Reporting enterprise. An entity or group of entities whose financial statements are being referred to. For the purposes of this discussion, those financial statements reflect (1) the financial statements of one or more foreign operations by combination, consolidation, or equity method accounting; (2) foreign currency transactions; or (3) both.

Spot rate. The exchange rate for immediate delivery of currencies exchanged.

Transaction date. The date on which a transaction (for example, a sale or purchase of merchandise or services) is recognized in accounting records in conformity with generally accepted accounting principles. A long-term commitment may have more than one transaction date (for example, the due date of each progress payment under a construction contract is an anticipated transaction date).

Transaction gain or loss. Transaction gains or losses result from a change in exchange rates between the functional currency and the currency in which a foreign currency transaction is denominated. They represent an increase or decrease in (1) the actual functional currency cash flows realized upon settlement of foreign currency transactions and (2) the expected functional currency cash flows on unsettled foreign currency transactions.

Translation adjustments. Translation adjustments result from the process of translating financial statements from the entity's functional currency into the reporting currency.

CONCEPTS, RULES, AND EXAMPLES

Translation of Foreign Currency Financial Statements

Selection of the functional currency. Before the financial statements of a foreign branch, division, or subsidiary are translated into US dollars, the management of the US company must make a decision as to which currency is the functional currency of the foreign entity. Once chosen, the functional currency cannot be changed unless economic facts and circumstances have clearly changed. Additionally, previously issued financial statements are not restated for any changes in the functional currency. The functional currency decision is crucial because different translation methods are applied which may have a material effect on the US company's financial statements.

FASB defines functional currency but does not list definitive criteria that, if satisfied, would with certainty result in the identification of an entity's functional currency. Rather, realizing that such criteria would be difficult to develop, FASB listed various factors that were intended to give management guidance in making the functional currency decision. These factors include

1. Cash flows (Do the foreign entity's cash flows directly affect the parent's cash flows and are they immediately available for remittance to the parent?)
2. Sales prices (Are the foreign entity's sales prices responsive to exchange rate changes and to international competition?)
3. Sales markets (Is the foreign entity's sales market the parent's country or are sales denominated in the parent's currency?)

4. Expenses (Are the foreign entity's expenses incurred primarily in the parent's country?)
5. Financing (Is the foreign entity's financing primarily from the parent or is it denominated in the parent's currency?)
6. Intercompany transactions (Is there a high volume of intercompany transactions between the parent and the foreign entity?)

If the answers to the questions above are predominantly yes, the functional currency is the reporting currency of the parent company (i.e., the US dollar). If the answers are predominantly no, the functional currency would most likely be the local currency of the foreign entity, although it is possible for a foreign currency other than the local currency to be the functional currency.

Translation methods. To deal with discrete circumstances, FASB chose two different methods to translate a company's foreign company's financial statements into US dollars: the *current rate* method and the *remeasurement* method. These are not alternatives, but rather are employed as circumstances dictate. The primary distinction between the methods is the classification of assets and liabilities (and their corresponding income statement amounts) that are translated at either the current or historical exchange rates.

The first method, known as the current rate method, is the approach mandated by ASC 830 when the functional currency is the foreign currency (e.g., the domestic currency of the foreign subsidiary or operation). All assets and liabilities are translated at the current rates while stockholders' equity accounts are translated at the appropriate historical rate or rates. Revenues and expenses are translated at rates in effect when the transactions occur, but those that occur evenly over the year may be translated at the weighted-average rate for the year.

Note that weighted-average, if used, must take into account the actual pace and pattern of changes in exchange rates over the course of the year, which will often not be varying at a constant rate throughout the period nor, in many instances, monotonically increasing or decreasing over the period. When these conditions do not hold, it is incumbent upon the reporting entity to develop a weighted-average exchange rate that is meaningful under the circumstances. When coupled with transactions (sales, purchases, et al.) that also have not occurred evenly throughout the year, this determination can become a fairly complex undertaking, requiring careful attention.

The theoretical basis for the current rate method is the "net investment concept," wherein the foreign entity is viewed as a separate entity in which the parent invested, rather than being considered part of the parent's operations. FASB's reasoning was that financial statement users can benefit most when the information provided about the foreign entity retains the relationships and results created in the environment (economic, legal, and political) in which the entity operates. Converting all assets and liabilities at the same current rate accomplishes this objective.

The rationale for this approach is that foreign-denominated debt is often used to purchase assets that create foreign-denominated revenues. These revenue-producing assets act as a natural hedge against changes in the settlement amount of the debt due to changes in the exchange rate. The excess (net) assets—which is the US parent company's net equity investment in the foreign operation—will, however, be affected by this foreign exchange risk, and this effect is recognized by the parent.

The second utilized method, the remeasurement method, has also been referred to as the monetary/nonmonetary method. This approach is required by ASC 830 when the foreign entity's accounting records are *not* maintained in the functional currency (e.g., when the US dollar is designated as the functional currency for a Brazilian subsidiary). This method translates monetary assets (cash and other assets and liabilities that will be settled in cash) at

the current rate. Nonmonetary assets, liabilities, and stockholders' equity are translated at the appropriate historical rates. The appropriate historical rate would be the exchange rate at the date the transaction involving the nonmonetary account originated. Also, the income statement amounts related to nonmonetary assets and liabilities, such as cost of goods sold (inventory), depreciation (property, plant, and equipment), and intangibles amortization (patents, copyrights), are translated at the same rate as used for the related balance sheet translation. Other revenues and expenses occurring evenly over the year may be translated at the weighted-average exchange rate in effect during the period, subject to the considerations discussed above.

Thus, to summarize, if the foreign entity's local currency is the functional currency, ASC 830 requires use of the current rate method when translating the foreign entity's financial statements. If, on the other hand, the US dollar (or other nonlocal currency) is the functional currency, ASC 830 requires the remeasurement method when translating the foreign entity's financial statements. Both of these methods are illustrated below. All amounts in the following two illustrations, other than exchange rates, are in thousands. The trailing zeros have been dropped in order to focus on applying the concepts.

Application of the Current Rate Method

Assume that a US company has a 100% owned subsidiary in Italy that commenced operations in 2009. The subsidiary's operations consist of leasing space in an office building. This building, which cost one million euros, was financed primarily by Italian banks. All revenues and cash expenses are received and paid in euros. The subsidiary also maintains its accounting records in euros. As a result, management of the US company has decided that the euro is the functional currency of the subsidiary.

The subsidiary's balance sheet at December 31, 2009, and its combined statement of income and retained earnings for the year ended December 31, 2009, are presented below in euros.

Italian Company
Balance Sheet
At December 31, 2009
(€000 omitted)

Assets		*Liabilities and Stockholders' Equity*	
Cash	€ 100	Accounts payable	€ 60
Accounts receivable	40	Unearned rent	20
Land	200	Mortgage payable	800
Building	1,000	Common stock	80
Accumulated depreciation	(20)	Additional paid-in capital	320
		Retained earnings	40
Total assets	€1,320	Total liabilities and Stockholders' equity	€1,320

Italian Company
Statement of Income and Retained Earnings
For the Year Ended December 31, 2009
(€000 omitted)

Revenues	€400
Expenses (including depreciation of €20)	340
Net income	60
Retained earnings, January 1, 2009	--
Less dividends declared	(20)
Retained earnings, December 31, 2009	€ 40

Various exchange rates for 2009 are as follows:

€1 = $1.50 at the beginning of 2009 (when the common stock was issued and the land and building were financed through the mortgage)
€1 = $1.55 weighted-average for 2009
€1 = $1.58 at the date the dividends were declared and paid and the unearned rent was received
€1 = $1.62 at the end of 2009

Since the euro is the functional currency, the Italian Company's financial statements must be translated into US dollars by the current rate method. This translation process is illustrated below.

Italian Company

	Euros	*Exchange rate*	*US dollars*
Investing activities			
Purchase of land	(200)	1.50	(300.00)
Purchase of building	(1,000)	1.50	(1,500.00)
Net cash used by investing activities	(1,200)		(1,800.00)
Financing activities			
Proceeds from issuance of common	400	1.50	600.00
Proceeds from mortgage payable	800	1.50	1,200.00
Dividends paid	(20)	1.58	(31.60)
Net cash provided by financing activities	1,180		1,768.40
Effect of exchange rate changes on cash	N/A		7.00
Increase in cash and equivalents	100		162.00
Cash at beginning of year	0		0
Cash at end of year	€ 100	1.62	$ 162.00

Note the following points concerning the current rate method:

1. All assets and liabilities are translated using the current exchange rate at the balance sheet date (€1 = $1.62). All revenues and expenses are translated at the rates in effect when these items are recognized during the period. Due to practical considerations, however, weighted-average rates can be used to translate revenues and expenses (€1 = $1.55).
2. Stockholders' equity accounts are translated by using historical exchange rates. Common stock was issued at the beginning of 2009 when the exchange rate was €1 = $1.50. The translated balance of retained earnings is the result of the weighted-average rate applied to revenues and expenses and the specific rate in effect when the dividends were declared (€1 = $1.58).
3. Translation adjustments result from translating all assets and liabilities at the current rate, while stockholders' equity is translated by using historical and weighted-average rates. The adjustments have no direct effect on cash flows. Also, the translation adjustment is due to the net investment rather than the subsidiary's operations. For these reasons, the cumulative translation adjustments balance is reported as a component of accumulated other comprehensive income (AOCI) in the stockholders' equity section of the US parent company's consolidated balance sheet. This balance essentially equates the total debits of the subsidiary (now expressed in US dollars) with the total credits (also in dollars). It also may be determined directly, as shown next, to verify the translation process.
4. The translation adjustments credit of $30.70 is calculated as follows for the differences between the exchange rate of $1.62 at the end of the year and the applicable exchange rates used to translate changes in net assets:

Net assets at inception (Land and building of $1,200,000 – Portion financed by mortgage of $800,000)	400 × ($1.62 – $1.50)	=	$48.00 credit
Net income	60 × ($1.62 – $1.55)	=	4.20 credit
Dividends declared	20 × ($1.62 – $1.58)	=	0.80 debit
Translation adjustment			$51.40 credit

5. The translation adjustments balance that appears as a component of AOCI in the stockholders' equity section is cumulative in nature. Consequently, the change in this balance during the year is disclosed as a component of other comprehensive income (OCI) for the period. In the illustration, this balance went from zero to $51.40 at the end of 2009. (The financial statement presentation of other comprehensive

income is covered in Chapter 3.) In addition, assume the following occurred during the following year, 2010:

Italian Company
Balance Sheet
At December 31
(€000 omitted)

Assets	2010	2009	Increase/(Decrease)
Cash	€ 200	€ 100	€100
Accounts receivable, net	--	40	(40)

	Euros	*Exchange rate*	*US dollars*
Revenues	€440	1.65	$726.00
Expenses (including depreciation of €10 [$12.50])	340	1.65	561.00
Net income	100	1.65	165.00
Retained earnings, 1/1/10	40	--	61.40
Less: Dividends declared	(80)	1.68	(134.40)
Retained earnings, 12/31/10	€ 60		$ 92.00

Italian Company
Statement of Cash Flows
Statement Translation
(The euro is the functional currency)
For the Year Ended December 31, 2010
(€/$000 omitted)

	Euros	*Exchange rate*	*US dollars*
Operating activities			
Net income	€100	1.65	$165.00
Adjustments to reconcile net income to net cash provided by operating activities			
Depreciation	20	1.65	33.00
Decrease in accounts receivable	40	1.65	66.00
Increase in accounts payable	40	1.65	66.00
Decrease in unearned rent	(20)	1.65	(33.00)
Net cash provided by operating activities	180		297.00
Investing activities			
Purchase of land	(100)	1.68	(168.00)
Net cash used by investing activities	(100)		(168.00)
Financing activities			
Mortgage payable	100	1.68	168.00
Dividends	(80)	1.68	(134.40)
Net cash provided by financing activities	20		33.60
Effect of exchange rate changes on cash	N/A		17.40
Increase in cash and equivalents	100		180.00
Cash at beginning of year	100		162.00
Cash at end of year	€200	1.71	$342.00

Using the analysis presented before, the **change** in the translation adjustment attributable to 2010 is computed as follows:

Net assets at January 1, 2010	€440	($1.71 – $1.62)	=	$39.60	credit
Net income for 2010	€100	($1.71 – $1.65)	=	6.00	credit
Dividends for 2010	€ 80	($1.71 – $1.68)	=	2.40	debit
Total				$43.20	credit

The balance in the cumulative translation adjustment component of accumulated other comprehensive income (AOCI) at the end of 2010 is $94.60. ($51.40 from 2009 and $43.20 from 2010.)

6. The use of the equity method by the US parent company in accounting for the subsidiary would result in the following journal entries (in $000s), based upon the information presented above:

	2009		2010	
Original investment				
Investment in Italian subsidiary	600*		--	
Cash		600		--

* *€80 of common stock + €320 of additional paid-in capital = €400 translated at €1. 50 = $600.*

	2009		2010	
Earnings pickup				
Investment in Italian subsidiary	93.00		165.00	
Equity in subsidiary income		93.00		165.00
Dividends received				
Cash	31.60		134.40	
Investment in Italian subsidiary		31.60		134.40
Translation adjustments				
Investment in Italian subsidiary	51.40		43.20	
OCI—Translation adjustments		51.40		43.20

Note that in applying the equity method to record this activity in the US parent company's accounting records, the parent's stockholders' equity should be the same whether or not the Italian subsidiary is consolidated. Since the subsidiary does not report the translation adjustments on its financial statements, care should be exercised so that it is not forgotten in the application of the equity method.

7. If the US company disposes of its investment in the Italian subsidiary, the cumulative translation adjustments balance becomes part of the gain or loss that results from the transaction and is eliminated. For example, assume that on January 2, 2011, the US company sells its entire investment for €465 thousand. The exchange rate at this date is €1 = $1.71. The balance in the investment account at December 31, 2010, is $786,600 as a result of the entries made previously.

	Investment in Italian Subsidiary	
1/1/09	600.00	
	93.00	31.60
	51.40	
1/1/10 balance	712.80	
	165.00	
	43.20	134.40
12/31/10 balance	786.60	

The following entries would be made by the US parent company to reflect the sale of the investment:

Cash (€465 × $1.71 conversion rate)	795.15	
Investment in Italian subsidiary		786.60
Gain from sale of subsidiary		8.55
AOCI—Translation adjustments	94.60	
Gain from sale of subsidiary		94.60

If the US company had sold only a portion of its investment in the Italian subsidiary, only a pro rata portion of the accumulated translation adjustments balance would have become part of the gain or loss from the transaction. To illustrate, if 80% of the Italian subsidiary was sold for €372 on January 2, 2011, the following journal entries would be made:

Cash (€372 × $1.71 exchange rate)	636.12	
Investment in Italian subsidiary (80% × $786.60)		629.28
Gain from sale of subsidiary		6.84
AOCI—Translation adjustments (80% × $94.60)	75.68	
Gain from sale of subsidiary		75.68

An exchange rate might not be available if there is a temporary suspension of foreign exchange trading. This occurred, for example, when Israel announced, on December 30, 1988, that it would devalue its currency, the shekel, on January 2, 1989, at which time it would resume settling unexecuted foreign currency transactions. ASC 830-30-55 provides that, if exchangeability between two currencies is temporarily lacking at a transaction date or the balance sheet date, the first subsequent rate at which exchanges could be made is to be used to implement ASC 830. While this circumstance has been rare, it could happen again.

Application of the Remeasurement Method

In the previous situation, the euro was the functional currency because the Italian subsidiary's cash flows were primarily in euros. Assume, however, that the financing of the land and building was denominated in US dollars instead of euros and that the mortgage payable is denominated in US dollars (i.e., it must be repaid in US dollars). Although the rents collected and the majority of the cash flows for expenses are in euros, management has decided that, due to the manner of financing, the US dollar is the functional currency. The accounting records, however, are maintained in euros.

The remeasurement of the Italian financial statements is accomplished by use of the remeasurement method (also known as the monetary/nonmonetary method). This method is illustrated below using the same information that was presented before for the Italian subsidiary.

Italian Company
Balance Sheet (Remeasurement)
(The US dollar is the functional currency)
At December 31, 2009
(€/$000 omitted)

Assets	*Euros*	*Exchange rate*	*US dollars*
Cash	€ 100	1.62	$ 162.00
Accounts receivable, net	40	1.62	64.80
Land	200	1.50	300.00
Building, net	980	1.50	1,470.00
Total assets	€1,320		$1,996.80
Liabilities and Stockholders' Equity			
Accounts payable	€ 60	1.62	$ 97.20
Unearned rent	20	1.58	31.60
Mortgage payable	800	1.62	1,296.00
Common stock	80	1.50	120.00
Additional paid-in capital	320	1.50	480.00
Retained earnings	40	(See income statement)	(28.00)
Total liabilities and stockholders' equity	€1,320		$1,996.80

Italian Company
Statement of Income and Retained Earnings (Remeasurement)
(The US dollar is the functional currency)

Financing activities			
Proceeds from issuance of common	400	1.50	600.00
Proceeds from mortgage payable	800	1.50	1,200.00
Dividends paid	(20)	1.58	(31.60)
Net cash provided by financing activities	1,180		1,768.40
Effect of exchange rate changes on cash	N/A		7.00
Increase in cash and equivalents	100		162.00
Cash at beginning of year	0		0
Cash at end of year	€100	1.62	$162.00

Note the following points concerning the remeasurement method:

1. Assets and liabilities which have historical cost balances (nonmonetary assets and liabilities) are remeasured by using historical exchange rates (i.e., the rates in effect when the transactions giving rise to the balance first occurred). Monetary assets and

monetary liabilities, cash and those items that will be settled in cash, are remeasured by using the current exchange rate at the balance sheet date. In 2010, the unearned rent from year-end 2009 of €10 would be remeasured at the rate of €1 = $1.58. The unearned rent at the end of 2009 is not considered a monetary liability. Therefore, the $1.58 historical exchange rate is used for all applicable future years. See the appendix at the end of this chapter for a listing of accounts that are remeasured using historical exchange rates.

2. Revenues and expenses that occur frequently during a period are remeasured, for practical purposes, by using the weighted-average exchange rate for the period. Revenues and expenses that represent allocations of historical balances (e.g., depreciation, cost of goods sold, and amortization of intangibles) are remeasured using historical exchange rates. Note that this is a different treatment as compared to the current rate method.
3. If the functional currency is the US dollar rather than the local foreign currency, the amounts of specific line items presented in the reconciliation of net income to net cash flow from operating activities will be different for nonmonetary items (e.g., depreciation).
4. The calculation of the remeasurement gain (loss), in a purely mechanical sense, is the amount needed to make the dollar debits equal the dollar credits in the Italian company's trial balance.
5. The remeasurement loss of $90.40 is reported on the US parent company's consolidated income statement because the US dollar is the functional currency. When the reporting currency is the functional currency, as it is in this example, it is assumed that all of the foreign entity's transactions occurred in US dollars (even if this was not the case). Accordingly, remeasurement gains and losses are taken immediately to the income statement in the year in which they occur as they can be expected to have direct cash flow effects on the parent company. They are not deferred as a translation adjustments component of AOCI as they were when the functional currency was the euro (applying the current rate method).
6. The use of the equity method of accounting for the subsidiary would result in the following entries by the US parent company during 2009:

	Debit	Credit
Original investment		
Investment in Italian subsidiary	600.00	
Cash		600.00
Earnings (loss) pickup		
Investment in Italian subsidiary	3.60	
Equity in subsidiary income		3.60
Dividends received		
Cash	31.60	
Investment in Italian subsidiary		31.60

Note that remeasurement gains and losses are included in the subsidiary's net income (net loss) as determined in US dollars before the earnings (loss) pickup is made by the US company.

7. In economies in which—per ASC 830-10-45—cumulative inflation is greater than 100% over a three-year period, FASB requires that the functional currency be the reporting currency, that is, the US dollar. Projections of future inflation cannot be used to satisfy this threshold condition. The remeasurement method must be used in this situation even though the factors indicate the local currency is the functional currency. FASB made this decision in order to prevent the evaporation of the for-

eign entity's fixed assets, a result that would occur if the local currency was the functional currency.

Cessation of highly inflationary condition. When a foreign subsidiary's economy is no longer considered highly inflationary, the entity converts the reporting currency values into the local currency at the exchange rates on the date of change on which these values become the new functional currency accounting bases for nonmonetary assets and liabilities.

Furthermore, ASC 830-740 states that when a change in functional currency designation occurs because an economy ceases to be highly inflationary, the deferred taxes on the temporary differences that arise as a result of a change in the functional currency are treated as an adjustment to the cumulative translation adjustments portion of stockholders' equity (accumulated other comprehensive income).

Applying ASC 740 to foreign entity financials restated for general price levels. Price-level-adjusted financial statements are preferred for foreign currency financial statements of entities operating in highly inflationary economies when those financial statements are intended for readers in the United States. If this recommendation is heeded, the result is that the income tax bases of the assets and liabilities are often restated for inflation. ASC 830-740 provides guidance on applying the asset-and-liability approach of ASC 740 as it relates to such financial statements. It discusses (1) how temporary differences are to be computed under ASC 740 and (2) how deferred income tax expense or benefit for the year is to be determined.

With regard to the first issue, temporary differences are computed as the difference between the indexed income tax basis amount and the related price-level restated amount of the asset or liability. The consensus reached on the second issue is that the deferred income tax expense or benefit is the difference between the deferred income tax assets and liabilities reported at the end of the current year and those reported at the end of the prior year. The deferred income tax assets and liabilities of the prior year are recalculated in units of the current year-end purchasing power.

On a related matter, ASC 830-10-45 states that, when the functional currency changes to the reporting currency because the foreign economy has become highly inflationary, ASC 740 prohibits recognition of deferred income tax benefits associated with indexing assets and liabilities that are remeasured in the reporting currency using historical exchange rates. Any related income tax benefits would be recognized only upon their being realized for income tax purposes. Any deferred income tax benefits that had been recognized for indexing before the change in reporting currency is effected are eliminated when the related indexed amounts are realized as income tax deductions.

Summary of Current Rate and Remeasurement Methods

1. Before foreign currency financial statements can be translated into US dollars, management of the US parent company must select the functional currency for the foreign entity whose financial statements will be incorporated into theirs by consolidation, combination, or the equity method. As the examples illustrated, this decision is important because it may have a material effect upon the financial statements of the US company.
2. If the functional currency is the local currency of the foreign entity, the current rate method is used to translate foreign currency financial statements into US dollars. All assets and liabilities are translated by using the current exchange rate at the balance sheet date. This method insures that all financial relationships remain the same in both local currency and US dollars. Owners' equity is translated using historical rates, while revenues (gains) and expenses (losses) are translated at the rates in ex-

istence during the period when the transactions occurred. A weighted-average rate can be used for items occurring frequently throughout the period. The translation adjustments (debit or credit) which result from the application of these rules are reported in other comprehensive income and then accumulated and reported as a separate component of stockholders' equity of the US company's consolidated balance sheet (or parent-only balance sheet if consolidation is not deemed appropriate).

3. If the functional currency is the parent company's reporting currency (the US dollar), the foreign currency financial statements are remeasured in US dollars. All foreign currency balances are restated in US dollars using both historical and current exchange rates. Foreign currency balances which reflect prices from past transactions are remeasured using historical rates, while foreign currency balances which reflect prices from current transactions are remeasured using the current exchange rate. Remeasurement gains/losses that result from the remeasurement process applied to foreign subsidiaries that are consolidated are reported on the US parent company's consolidated income statement.

The above summary can be arranged in tabular form as shown below.

Functional currency	*Functional currency determinants*	*Translation method*	*Reporting and display*
Local currency of foreign company	a. Operations not integrated with parent's operations b. Buying and selling activities primarily in local currency c. Cash flows not immediately available for remittance to parent d. Financing denominated in local currency	Current rate (all assets/ liabilities translated using current exchange rate; revenues/expenses use weighted-average rate; equity accounts use historical rates)	Accumulated translation adjustments are reported in equity section of the US parent company's consolidated balance sheet as part of accumulated other comprehensive income (AOCI). Changes in accumulated translation adjustments reported as a component of other comprehensive income (OCI). Effect of exchange rates on cash included in reconciliation of beginning and ending cash balances on statement of cash flows.
US dollar	a. Operations integrated with parent's operations b. Buying and selling activities primarily in the US and/or US dollars c. Cash flows immediately available for remittance to parent d. Financing denominated in US dollars	Remeasurement (monetary assets/liabilities use current exchange rate; historical cost balances use historical rates; revenues/expenses use weighted-average rates and historical rates, the latter for allocations like depreciation expenses).	Remeasurement gain/ loss is reported on the US company's consolidated income statement. Remeasurement gain/loss shown as a reconciliation item between net income and cash flows from operations in the statement of cash flows. Effect of exchange rates on cash included in reconciliation of beginning and ending cash balances on statement of cash flows.

Application of ASC 830 to an investment to be disposed of that is evaluated for impairment. Under ASC 830, accumulated foreign currency translation adjustments are reclassified to net income only when realized upon sale or upon complete or substantially complete liquidation of the investment in the foreign entity. ASC 830-30-45 addresses whether a reporting entity is to include the translation adjustments in the carrying amount of

the investment in assessing impairment of an investment in a foreign entity that is held for disposal if the planned disposal will cause some or all of the translation adjustments to be reclassified to net income. The standard points out that an entity that has committed to a plan that will cause the translation adjustments for an equity-method investment or consolidated investment in a foreign entity to be reclassified to earnings is to include the translation adjustments as part of the carrying amount of the investment when evaluating that investment for impairment. An entity would also include the portion of the translation adjustments that represents a gain or loss from an effective hedge of the net investment in a foreign operation as part of the carrying amount of the investment when making this evaluation.

Foreign Operations in the US

With the world economy as interconnected as it is, entities in the US are sometimes the subsidiaries of parent companies domiciled elsewhere in the world. The financial statements of the US company may be presented separately in the US or may be combined as part of the financial statements in the foreign country.

In general, financial statements of US companies are prepared in accordance with US generally accepted accounting principles. However, adjustments may be necessary to conform these financial statements to the accounting principles of the foreign country of the parent company where they will be consolidated.

Translation of Foreign Currency Transactions

According to ASC 830, a foreign currency transaction is a transaction " … denominated in a currency other than the entity's functional currency." Denominated means that the amount to be received or paid is fixed in terms of the number of units of a particular foreign currency regardless of changes in the exchange rate. From the viewpoint of a US company, a foreign currency transaction results when it imports or exports goods or services to or from a foreign entity or makes a loan involving a foreign entity and agrees to settle the transaction in currency other than the US dollar (the functional currency of the US company). In these situations, the US company has "crossed currencies" and directly assumes the risk of fluctuating exchange rates of the foreign currency in which the transaction is denominated. This risk may lead to recognition of foreign exchange transaction gains or losses in the income statement of the US company. Note that transaction gains or losses can result only when the foreign transactions are denominated in a foreign currency. When a US company imports or exports goods or services and the transaction is to be settled in US dollars, the US company is not exposed to a foreign exchange gain or loss because it bears no risk due to exchange rate fluctuations.

Example of foreign currency transaction translation

The following example illustrates the terminology and procedures applicable to the translation of foreign currency transactions. Assume that US Company, an exporter, sells merchandise to a customer in Italy on December 1, 2009, for €10,000. Receipt is due on January 31, 2010, and US Company prepares financial statements on December 31, 2009. At the transaction date (December 1, 2009), the spot rate for immediate exchange of foreign currencies indicates that €1 is equivalent to $1.30. To find the US dollar equivalent of this transaction, the foreign currency amount, €10,000, is multiplied by $1.30 to get $13,000. At December 1, 2009, the foreign currency transaction is recorded by US Company in the following manner:

Accounts receivable—Italy (€ denominated)	13,000	
Sales		13,000

The accounts receivable and sales are measured in US dollars at the transaction date using the spot rate at the time of the transaction. While the accounts receivable is measured and reported in US dollars, the receivable is denominated or fixed in euros. This characteristic may result in foreign exchange transaction gains or losses if the spot rate for the euro changes between the transaction date and the date the transaction is settled (January 31, 2010).

If financial statements are prepared between the transaction date and the settlement date, all receivables and liabilities denominated in a currency other than the functional currency (the US dollar) must be restated to reflect the spot rates in effect at the balance sheet date. Assume that on December 31, 2009, the spot rate for euros is €1 = $1.32. This means that the €10,000 are now worth $13,200 and that the accounts receivable denominated in euros has increased by $200. The following adjustment is recorded on December 31, 2009:

Accounts receivable—Italy (€ denominated)	200	
Foreign currency transaction gain		200

Note that the $13,000 credit to sales recorded on the transaction date is not affected by subsequent changes in the spot rate. This treatment exemplifies the two-transaction viewpoint adopted by FASB. In other words, making the sale is the result of an operating decision, while bearing the risk of fluctuating spot rates is the result of a financing decision. Therefore, the amount determined as sales revenue at the transaction date is not altered because of the financing decisions to wait until January 31, 2010, for payment of the account and to accept payment denominated in euros. The risk of a foreign exchange transaction loss can be avoided by (1) demanding immediate payment on December 1, 2009, (2) fixing the price of the transaction in US dollars instead of in the foreign currency, or (3) by entering into a forward exchange contract to hedge the exposed asset (accounts receivable). The fact that, in the example, US Company did not take any of these actions is reflected by recognizing foreign currency transaction gains or losses in its income statement (reported as financial or nonoperating items) in the period during which the exchange rates changed. This treatment has been criticized, however, because earnings will fluctuate because of changes in exchange rates and not because of changes in the economic activities of the enterprise. The counterargument, however, is that economic reality is that earnings *are* fluctuating because the management chose to commit the reporting entity to a transaction that exposes it to economic risks and, therefore, the case can be made that the volatility in earnings faithfully represents the results of management's business decision.

On the settlement date (January 31, 2010), assume the spot rate is €1 = $1.31. The receipt of €10,000 and their conversion into US dollars is recorded as follows:

Foreign currency (€)	13,100	
Foreign currency transaction loss	100	
Accounts receivable—Italy (€ denominated)		13,200
Cash	13,100	
Foreign currency (€)		13,100

The net effect of this foreign currency transaction was to receive $13,100 in settlement from a sale that was originally measured (and recognized) at $13,000. This realized net foreign currency transaction gain of $100 is reported on two income statements—a $200 gain in 2009 and a $100 loss in 2010. The reporting of the gain or loss in two income statements causes a temporary difference in the basis of the receivable for income tax and financial reporting purposes. This results because the 2009 unrealized transaction gain of $200 is not taxable until 2010, the year the transaction was ultimately completed or settled. Accordingly, deferred income tax accounting is required to account for the effects of this temporary difference.

It is important to note that all monetary assets and liabilities of US Company that are denominated in a currency other than US Company's functional currency (the US dollar) are required to be remeasured at each balance sheet date to the extent that they are affected by increases or decreases in the exchange rate. For example, a US Company whose functional currency is the US dollar holds a bank account in France that is denominated in euros. At each balance sheet date, by reference to the spot rate for the euro, US Company would remeasure the carrying amount of its French bank account and record any resulting transaction gains and losses in the same manner as above.

Intercompany Transactions and Elimination of Intercompany Profits

Gains or losses from intercompany transactions are reported on the US company's consolidated income statement unless settlement of the transaction is not planned or anticipated in the foreseeable future. In that case, which is atypical, gains and losses arising from intercompany transactions are reflected in the accumulated translations adjustments component of accumulated other comprehensive income in stockholders' equity of the US entity. In the typical situation (i.e., gains and losses reported on the US entity's income statement) gains and losses result whether the functional currency is the US dollar or the foreign entity's local currency. When the US dollar is the functional currency, foreign currency transaction gains and losses result because of one of the two situations below.

1. The intercompany foreign currency transaction is denominated in US dollars. In this case, the foreign subsidiary has a payable or receivable denominated in US dollars. This may result in a foreign currency transaction gain or loss that would appear on the foreign subsidiary's income statement. This gain or loss would be translated into US dollars and would appear on the US entity's consolidated income statement.
2. The intercompany foreign currency transaction is denominated in the foreign subsidiary's local currency. In this situation, the US entity has a payable or receivable denominated in a foreign currency. Such a situation may result in a foreign currency transaction gain or loss that is reported on the US parent entity's income statement.

The above two cases can be easily altered to reflect what happens when the foreign entity's local currency is the functional currency. The gain or loss from each of these scenarios would be reflected on the other entity's financial statements first (i.e., the subsidiary's rather than the parent's and vice versa).

The elimination of intercompany profits due to sales and other transfers between related entities is based upon exchange rates in effect when the sale or transfer occurred. Reasonable approximations and averages are allowed to be used if intercompany transactions occur frequently during the year.

Example of intercompany transactions involving foreign exchange

Cassiopeia Corporation buys an observatory-grade telescope from its Spanish subsidiary for €850,000, resulting in a profit for the subsidiary of €50,000 on the sale date at an exchange rate of $1: €0.6 (euros). The profit is eliminated at $1: €0.6. The payable to the subsidiary is due in 90 days, and is denominated in euros. On the payment date, the exchange rate has changed to $1: €0.65 Thus, rather than paying $1,416,667 to settle the payable, as would have been the case on the sale date, Cassiopeia must now pay $1,307,692 on the payable date. Cassiopeia presents the $108,975 exchange gain in its income statement in the following manner:

Sales	$20,000,000
Cost of sales	(14,000,000)
Gross profit	6,000,000
Operating expenses	(5,500,000)
Other revenues/gains (expenses/losses)	
Gain on translation of foreign currencies	(108,975)
Net income	$608,975

In a separate series of transactions, the subsidiary sends a weekly shipment of telescope repair parts to Cassiopeia, totaling €48,000 of profits for the entire year. For these transactions, the exchange rate varies from $1: €0.6 to $1: €0.75. A reasonable estimate of the average exchange rate for all the transactions is $1: €1.67. Consequently, the €48,000 profit is eliminated at the $1: €1.67(= $71,642) average exchange rate.

Foreign Currency Hedging

ASC 815, *Derivatives and Hedging*, provides complex hedging rules that permit the reporting entity to elect to obtain special accounting treatment relative to foreign currency risks with respect to the following items:

1. Recognized assets or liabilities
2. Available-for-sale debt and equity securities
3. Unrecognized firm commitments
4. Foreign-currency-denominated forecasted cash flows
5. Net investment in a foreign operation

Chapter 8 provides a detailed discussion of derivatives and hedging. The table on the next page provides a high-level summary of the complex provisions that apply to hedges related to foreign currency exposures.

Measuring hedge effectiveness. While any entity may utilize hedging strategies, under the provisions of ASC 815 the transaction must meet a number of important conditions in order to qualify for hedge accounting. Among these conditions (discussed in greater detail in Chapter 8) are the establishment, at inception, of criteria for measuring hedge effectiveness and ineffectiveness. Periodically, each hedge must be evaluated for effectiveness, using the preestablished criteria, and the gains or losses associated with hedge ineffectiveness must be reported currently in earnings, and not deferred to future periods. In the instance of foreign currency hedges, ASC 815 states that reporting entities must exclude from their assessments of hedge effectiveness the portions of the fair value of forward contracts attributable to spot-forward differences (i.e., differences between the spot exchange rate and the forward exchange rate).

In practice, this means that reporting entities engaging in foreign currency hedging will recognize changes in the above-described portion of the derivative's fair value in earnings, in the same manner that changes representing hedge ineffectiveness are reported, but these are not considered to represent ineffectiveness. These entities must estimate the cash flows on forecasted transactions based on the current spot exchange rate, appropriately discounted for time value. Effectiveness is then assessed by comparing the changes in fair values of the forward contracts attributable to changes in the dollar spot price of the pertinent foreign currency to the changes in the present values of the forecasted cash flows based on the current spot exchange rate(s).

Example

On October 1, 2009, Braveheart Co. (a US company) orders from its European supplier, Gemutlichkeit GmbH, a machine that is to be delivered and paid for on March 31, 2010. The price, denominated in euros, is €4,000,000. Although Braveheart will not make the payment until the planned delivery date, it has immediately entered into a firm commitment to make this purchase and to pay €4,000,000 upon delivery. This creates a euro liability exposure to foreign exchange risk; thus, if the euro appreciates over the intervening six months, the dollar cost of the equipment will increase.

To reduce or eliminate this uncertainty, Braveheart desires to lock in the purchase cost in euros by entering into a six-month forward contract to purchase euros on the date when the purchase order is issued to and accepted by Gemutlichkeit. The spot rate on October 1, 2009, is $1.40 per euro and the forward rate for March 31, 2010 settlement is $1.44 per euro. Braveheart enters into a forward contract on October 1, 2009, with the First Intergalactic Bank to pay US $5,760,000 in exchange for the receipt of €4,000,000 on March 31, 2010, which can then be used to pay Gemutlichkeit. No premium is received nor paid at the inception of this forward contract.

The transaction is a firm commitment consistent with the requirements of ASC 815, and fair value hedge accounting is used in accounting for the forward contract.

Hedging Foreign Currency Exposures

Hedges of foreign currency (FC) exposures (where FC is not the reporting entity's functional currency)

	A	B	C
Types of items that may qualify to be hedged	<u>Fair value (FV) hedges</u> A1. Recognized assets or liabilities A2. Available-for-sale debt securities A3. Available-for-sale equity securities A4. Unrecognized firm commitments (UFC)	<u>Cash Flow (CF) hedges</u> B1. Forecasted CF from recognized assets or liabilities B2. Forecasted external transactions B3. Forecasted intercompany transactions B4. Unrecognized firm commitments (UFC)	C. Hedges of a net investment in a foreign operation
Risk being hedged	Changes in FV of the hedged item that result from changes in the exchange rate (ER) of the FC in which it is denominated (which, by definition, is not the functional currency of the reporting entity)	The FC exposure to variability in the "equivalent functional currency cash flows" associated with the hedged item	Exposure of the net investment to changes in the exchange rate applicable to the functional currency of the investee
Type of instruments that qualify for use as hedging instruments	A1, A2, A3—Required to be derivatives A$ can be a derivative instrument or nonderivative financial instrument	Required to be derivatives	Can be derivative instrument or a nonderivative financial instrument; Nonderivative financial instruments, to be designated, cannot be subject to GAAP that requires that they be presented at FV since that accounting treatment would not result in foreign currency transaction gains or losses under ASC 830
Summary of accounting treatment	General Rule: When the ER changes, recognize in current earnings: (1) changes in FV of hedged item caused by the hedged risk, (2) gain or loss on changes in FV of the designated hedging instrument, and (3) hedge ineffectiveness, if any AFS securities: Change in FV of the security attributable to FC risk is reported in earnings; other changes in FV of the security, not attributable to the hedged risk continue to be reported in other comprehensive income	General Rule: The effective portion of the gain or loss on a derivative designated as a cash flow hedge is reported in other comprehensive income (OCI) and the ineffective portion is reported currently in earnings. In the period or periods during which a hedged forecasted transaction affects earnings, amounts in accumulated other comprehensive income (AOCI) are reclassified to earnings. Additional complex accounting provisions are provided by ASC 815-30	To the extent of hedge effectiveness, gains or losses on the hedging derivative instrument (or FC transaction gains or losses on the hedging nonderivative instrument) are accounted for in the same manner as a FC translation adjustment (i.e., reported as other comprehensive income and as a change in accumulated other comprehensive income); The hedged net investment is accounted for consistent with ASC 830 as described in this chapter; Any hedge ineffectiveness is reflected as a transaction gain or loss in earnings of the period in which it arises

Applicable conditions, criteria limitations or exceptions	**Fair value hedges** a. Fair value hedges are required to meet the requirements of ASC 815-20 with respect to such matters as timely hedge designation, tests of hedge effectiveness at inception and on an ongoing basis b. A3(i) The AFS equity security cannot be traded on an exchange or market where transactions are denominated in the investor's functional currency, and (ii) Dividends and all other cash flows associated with holding or selling the security must be denominated in the same foreign currency. c. A2, A4—The hedged transaction must be denominated in a FC other than the hedging unit's functional currency, and if consolidated financial statements, the party to the hedging instrument must be either (i) the operating unit with the FC exposure or (ii) another member of the consolidated group (subject to certain specified restrictions and meeting certain conditions) with the same functional currency as that operating unit. d. FC derivatives entered into with another member of the consolidated group can be designated as hedging instruments in all fair value hedge transaction types (A1-A4) only if that member has entered into an offsetting contract with an unrelated third party to hedge the exposure it acquired from issuing the derivative instrument to the affiliate that initiated the hedge. **Cash flow hedges and hedges of net investments in foreign operations** e. Cash flow hedges must meet the requirements of ASC 815-20 f. Cash flow hedges of forecasted transactions must additionally meet the requirements of ASC 815-20-25 g. Cash flow hedges of forecasted transactions (B1), and hedges of net investments in foreign operations (C) must also meet the criteria in d. above.		
Eligibility for ASC 825-10-25 Fair Value Option (FVO)	A4—Limited eligibility when the UFC involves only financial instruments	Not eligible	Not eligible

Assume the relevant time value of money is measured at 1/2% per month (a nominal 6% annual rate). The spot rate for euros at December 31, 2009, is $1.45, and at March 31, 2010, it is $1.48. The forward rate as of December 31 for March 31 settlement is $1.46.

Entries to reflect the foregoing scenario are as follows:

Date	Account	Debit	Credit
10/1/09	*No entries, since neither the forward contract nor the firm commitment have value on this date*		
12/31/09	Forward currency contract	78,818	
	Gain on forward contract		78,818
	To record present value (at 1/2% monthly rate) of change in value of forward contract [= change in forward rate (1.46 – 1.44) × €4,000,000 = $80,000 to be received in three months, discounted at 6% per annum]		
	Loss on firm purchase commitment	197,044	
	Firm commitment obligation		197,044
	To record present value (at 1/2% monthly rate) of change in amount of firm commitment [= change in spot rate (1.45 – 1.40) × €4,000,000 = $200,000 to be paid in three months, discounted at 6% per annum]		
	Gain on forward contract	78,818	
	Loss on firm purchase commitment		197,044
	P&L summary (then to retained earnings)	118,226	
	To close the gain and loss accounts to net income and thus to retained earnings		
3/31/10	Forward currency contract	81,182	
	Gain on forward contract		81,182
	To record change in value of forward contract {[= (1.48 – 1.44) × €4,000,000 = $160,000] – gain previously recognized ($78,818)}		
	Loss on firm commitment	122,956	
	Firm commitment obligation		122,956
	To record change in amount of firm commitment {[= (1.48 – 1.40) × €4,000,000] less loss previously recognized ($197,044)}		
	Firm commitment obligation	320,000	
	Machinery and equipment	5,600,000	
	Cash		5,920,000
	To record purchase of machinery based on spot exchange rate as of date of contractual commitment (1.40) and close out the firm commitment obligation (representing effect of change in spot rate during commitment period)		
	Cash	160,000	
	Forward contract		160,000
	To record collection of cash on net settlement of forward contract [= (1.48 – 1.44) × €4,000,000]		
	Gain on forward contract	81,182	
	P&L summary (then to retained earnings)	41,774	
	Loss on firm purchase commitment		122,956
	To close the gain and loss accounts to net income and thus to retained earnings		

Observe that in the foregoing example the gain on the forward contract did not precisely offset the loss incurred from the firm commitment. Since a hedge of an unrecognized foreign currency denominated firm commitment is accounted for as a fair value hedge, with gains and losses on hedging positions and on the hedged item both being recorded in current earnings, it may appear that the matter of hedge effectiveness is of academic interest only. However, according to ASC 815, even if both components (that is, the net gain or loss representing hedge ineffectiveness, and the amount charged to earnings which was excluded from the measurement of ineffectiveness) are reported in current period earnings, the distinction between them is still of importance.

With respect to fair value hedges of firm purchase commitments denominated in a foreign currency, ASC 815 directs that "the change in value of the contract related to the changes in the differences between the spot price and the forward or futures price would be

excluded from the assessment of hedge effectiveness." As applied to the foregoing example, therefore, the net credit to income in 2009 ($118,226) can be further analyzed into two constituent elements: the amount arising from the change in the difference between the spot price and the forward price, and the amount resulting from hedge ineffectiveness.

The former item, not attributed to ineffectiveness, arose because the spread between spot and forward price at hedge inception, (1.44 – 1.40 =) .04, fell to (1.46 – 1.45 =) .01 by December 31, for an impact amounting to (.04 – .01 =) .03 × €4,000,000 = $120,000, which, reduced to present value terms, equaled $118,227. The net credit to earnings in December 2009, ($78,818 + 118,226 =) $197,044, relates to the spread between the spot and forward rates on December 31 and is identifiable with hedge ineffectiveness.

Forward Exchange Contracts

Foreign currency transaction gains and losses on assets and liabilities that are denominated in a currency other than the functional currency can be hedged if a US company enters into a forward exchange contract. The following example shows how a forward exchange contract can be used as a hedge, first against a firm commitment and then, following delivery date, as a hedge against a recognized liability.

A general rule for estimating the fair value of forward exchange rates under ASC 815 is to use the changes in the forward exchange rates, and discount those estimated future cash flows to a present-value basis. An entity will need to consider the time value of money if significant in the circumstances for these contracts. The following example does not apply discounting of the future cash flows from the forward contracts in order to focus on the relationships between the forward contract and the foreign currency denominated payable.

Example

Durango, Inc. enters into a firm commitment with Dempsey Ing., Inc. of Germany, on October 1, 2009, to purchase a computerized robotic system for €6,000,000. The system will be delivered on March 1, 2010, with payment due sixty days after delivery (April 30, 2010). Durango, Inc. decides to hedge this foreign currency firm commitment and enters into a forward exchange contract on the firm commitment date to receive €6,000,000 on the payment date. The applicable exchange rates are shown in the table below.

Date	Spot rates	Forward rates for April 30, 2009
October 1, 2009	€1 = $1.55	€1 = $ 1.57
December 31, 2009	€1 = $1.58	€1 = $1.589
March 1, 2010	€1 = $1.58	€1 = $1.585
April 30, 2010	€1 = $1.60	

The example on the following pages separately presents both the forward contract receivable and the dollars payable liability in order to show all aspects of the forward contract. For financial reporting purposes, most companies present just the net fair value of the forward contract that would be the difference between the current value of the forward contract receivable and the dollars payable liability. Note that the foreign currency hedges in the illustration are not perfectly effective. However, for this example, the degree of ineffectiveness is not deemed to be sufficient to trigger income statement recognition per ASC 815. (Hedge effectiveness is discussed in Chapter 8.)

The transactions that reflect the forward exchange contract, the firm commitment and the acquisition of the asset and retirement of the related liability appear below. The net fair value of the forward contract is shown below each set of entries for the forward exchange contract.

In the case of using a forward exchange contract to speculate in a specific foreign currency, the general rule to estimate the fair value of the forward contract is to use the forward exchange rate for the remainder of the term of the forward contract.

The Fair Value Option

ASC 825-10-25, *Financial Instruments—Fair Value Option,* encourages reporting entities to voluntarily elect to use fair value to measure eligible financial assets and financial liabilities in their financial statements. This election is referred to as the Fair Value Option (FVO). Changes in the fair values of these assets and liabilities would be reflected in earnings as they occur.

In issuing ASC 825-10-25, FASB indicated that, among the reasons it decided to permit this election was that the election would "enable entities to achieve consistent accounting and, potentially, an offsetting effect for the changes in the fair values of related assets and liabilities without having to apply complex hedge accounting provisions, thereby providing greater simplicity in the application of accounting guidance."[1]

As noted in the table, Hedging Foreign Currency Exposure, presented earlier in this chapter, the provisions of ASC 825-10-25 have limited applicability with respect to foreign currency risks. The election does not affect cash flow hedges or hedges of a net investment in a foreign operation. With respect to fair value hedges, the reporting entity may elect the FVO for eligible nonderivative financial assets or liabilities. An unrecognized firm commitment (UFC) may qualify as a financial instrument if it only involves financial assets and liabilities. ASC 825-10-25 provides, as an example, a forward purchase contract for a loan that is not readily convertible to cash. This instrument would qualify for the FVO. In order to achieve the desired economic offsetting that would resemble hedge accounting, the reporting entity would also have to hold assets denominated in the same foreign currency (which is not the entity's functional currency) that give rise to foreign currency transaction gains or losses that would partially or fully offset changes in the fair value of the forward purchase contract during its term and at settlement.

Elections made under the FVO are irrevocable and, if made by early adopting ASC 825-10-25, also require the reporting entity to early adopt the disclosure provisions of ASC 820 that otherwise would not be effective until the same date as ASC 825-10-25.

---

[1] *ASC 825-10-25,* ***Financial Instruments—Fair Value Option.*** *Norwalk, CT: Financial Accounting Standards Board, 2007.*

Forward contract entries

(1) 10/1/08 (forward rate for 4/30/09 €1 = $1.57)

	Debit	Credit
Forward contract receivable	9,420,000	
Dollars payable		9,420,000

This entry recognizes the existence of the forward exchange contract using the gross method. Under the net method, this entry would not appear at all, since the fair value of the forward contract is zero when the contract is initiated. The amount is calculated using the 10/1/08 forward rate for 4/30/09 (€6,000,000 × $1.57 = $9,420,000).

Net fair value of the forward contract = $0

Note that the net fair value of the forward exchange contact on 10/1/08 is zero because there is an exact amount offset of the forward contract receivable of $9,420,000 with the dollars payable liability of $9,420,000. Many companies present only the net fair value of the forward contract on their balance sheets, and therefore, they would have no net amount reported for the forward contract at its inception.

(2) 12/31/08 (forward rate for 4/30/09 €1 = $1.589)

	Debit	Credit
Forward contract receivable	114,000	
Gain on hedge activity		114,000

The dollar values for this entry reflect, among other things, the change in the forward rate from 10/1/08 to 12/31/08. However, the actual amount recorded as gain or loss (gain in this case) is determined by all market factors.

Net increase in fair value of the forward contract = (1.589 – 1.57 = .019 × €6,000,000 = $114,000).

The increase in the net fair value of the forward exchange contract on 12/31/08 is $114,000 for the difference between the $7,134,000 ($7,020,000 plus $114,000) in the forward contract receivable and the $7,020,000 for the dollars payable liability. Many companies present only the net fair value on their balance sheet, in this case as an asset. And, this $114,000 is the amount that would be discounted to present value, if interest is significant, to recognize the time value of the future cash flow from the forward contract.

(4) 3/1/09 (forward rate for 4/30/09 €1 = $1.585)

	Debit	Credit
Loss on hedge activity	24,000	
Forward contract receivable		24,000

Hedge against firm commitment entries

(3) 12/31/08

	Debit	Credit
Loss on hedge activity	114,000	
Firm commitment		114,000

The dollar values for this entry are identical to those in entry (2), reflecting the fact that the hedge is highly effective (100%) and also the fact that the market recognizes the same factors in this transaction as for entry (2). This entry reflects the first use of the firm commitment account, a temporary liability account pending the receipt of the asset against which the firm commitment has been hedged.

(5) 3/1/09

	Debit	Credit
Firm commitment	24,000	
Gain on hedge activity		24,000

These entries again will be driven by market factors, and they are calculated the same way as entries (2) and (3) above. Note that the decline in the forward rate from 12/31/08 to 3/1/09 resulted in a loss against the forward contract receivable and a gain against the firm commitment [1.585 – 1.589 = (.004) × €6,000,000 = ($24,000)].

Forward contract entries

Net fair value of the forward contract = $90,000

The net fair value of the forward exchange contract on 3/1/09 is $90,000 for the difference between the $9,510,000 ($9,420,000 plus 114,000 minus $24,000) in the forward contract receivable and the $9,420,000 for the dollars payable liability. Another way of computing the net fair value is to determine the change in the forward contract rate from the initial date of the contract, 10/1/08, which is $1.585 – $1.57 = $.015 × €6,000,000 = $90,000. Also note that the amount in the firm commitment temporary liability account is equal to the net fair value of the forward contract on the date the equipment is received.

(7) 4/30/09 (spot rate €1 = $1.60)

Account	Debit	Credit
Forward contract receivable	90,000	
Gain on forward contract		90,000

The gain or loss (gain in this case) on the forward contract is calculated using the change in the forward to the spot rate from 3/1/09 to 4/30/09 [€6,000,000 × ($1.60 – $1.585) = $90,000]

Net fair value of the forward contract = $180,000

The net fair value of the forward exchange contract on 4/30/09 is $180,000 for the difference between the $9,600,000 ($9,510,000 plus $90,000) in the forward contract receivable and the $9,420,000 for the dollars payable liability. The net fair value of the forward contract at its terminal date of 4/30/09 is based on the difference between the contract forward rate of €1 = $1.57 and the spot rate on 4/30/09 of €1 = $1.60. The forward contract receivable has reached its maturity and the contract is completed on this date at the forward rate of €1 = $1.57 as contracted on 10/1/08. If the entity recognizes an interest factor in the forward contract over the life of the contract, then interest is recognized at this time on the forward contract, but no separate accrual of interest is required for the accounts payable in euros.

(9) 4/30/09

Account	Debit	Credit
Dollars payable	9,420,000	
Cash		9,420,000
Foreign currency units (€)	9,600,000	
Forward contract receivable		9,600,000

This entry reflects the settlement of the forward contract at the 10/1/08 contracted forward rate (€6,000,000 × $1.17 = $7,020,000) and the receipt of foreign currency units valued at the spot rate (€6,000,000 × $1.20 = $7,200,000).

Hedge against a recognized liability entries

(6) 3/1/09 (spot rate €1 = $1.58)

Account	Debit	Credit
Equipment	9,390,000	
Firm commitment	90,000	
Accounts payable (€)		9,480,000

This entry records the receipt of the equipment, the elimination of the temporary liability account (firm commitment), and the recognition of the payable, calculated using the spot rate on the date of receipt (€6,000,000 × $1.58 = $9,480,000).

(8) 4/30/09

Account	Debit	Credit
Transaction loss	120,000	
Accounts payable (€)	120,000	

The transaction loss related to the accounts payable reflects only the change in the spot rates and ignores the accrual of interest. [€6,000,000 × ($1.60 – $1.58) = $120,000]

(10) 4/30/09

Account	Debit	Credit
Accounts payable (€)	9,600,000	
Foreign currency units (€)		9,600,000

This entry reflects the use of the foreign currency units to retire the account payable.

APPENDIX

ACCOUNTS TO BE REMEASURED USING HISTORICAL EXCHANGE RATES

1. Marketable securities carried at cost (equity securities and debt securities not intended to be held until maturity)
2. Inventories carried at cost
3. Prepaid expenses such as insurance, advertising, and rent
4. Property, plant, and equipment
5. Accumulated depreciation on property, plant, and equipment
6. Patents, trademarks, licenses, and formulas
7. Goodwill
8. Other intangible assets
9. Deferred charges and credits, except policy acquisition costs for life insurance companies
10. Deferred income
11. Common stock
12. Preferred stock carried at issuance price
13. Revenues and expenses related to nonmonetary items
    a. Cost of goods sold
    b. Depreciation of property, plant, and equipment
    c. Amortization of intangible items such as goodwill, patents, licenses, etc.
    d. Amortization of deferred charges or credits, except policy acquisition costs for life insurance companies

24 PERSONAL FINANCIAL STATEMENTS

Perspective and Issues	**1132**
Definitions of Terms	**1132**
Concepts, Rules, and Examples	**1132**
Basis of presentation	1133
Measurement	1133
Appendix: Hypothetical Set of Personal Financial Statements	**1137**

PERSPECTIVE AND ISSUES

AICPA Statement of Position (SOP) 82-1, *Personal Financial Statements,* addresses the preparation and presentation of personal financial statements, or, more specifically, financial statements of individuals or groups of related individuals (i.e., families). Personal financial statements are generally prepared to organize and plan an individual's financial affairs on a more formal basis. Specific purposes that might require the preparation of personal financial statements include the obtaining of credit, income tax planning, retirement planning, gift and estate planning, or the public disclosure of financial affairs. Third-party recipients of personal financial statements use them in deciding whether to grant credit, in evaluating the financial condition of individuals, in assessing the financial affairs of public officials and candidates for public office, and for other purposes. Estimated current values of assets and liabilities are almost always specified for use in the preparation of personal financial statements as this information is more relevant to users than historical cost.

Sources of GAAP
SOP 82-1

DEFINITIONS OF TERMS

Estimated current value of an asset. The amount for which an item could be exchanged between a buyer and a seller, each of whom is well informed and willing, and neither of whom is compelled to buy or sell.

Estimated current amount of liabilities. Payables and other liabilities are to be presented at the discounted amounts of future cash to be paid. The interest rate used to discount the debt is the rate implicit in the transaction in which the debt was incurred. If, however, the debtor is able to repay the debt currently at a lower amount, the debt is to be presented at that reduced figure.

Net worth. The difference between total assets and total liabilities, after deducting estimated income taxes on the differences between the estimated current values of assets and the estimated current amounts of liabilities and their income tax bases.

CONCEPTS, RULES, AND EXAMPLES

Personal financial statements can be prepared for an individual, jointly for a husband and wife, or collectively for a family.

Personal financial statements consist of

1. **Statement of financial condition**—The only required financial statement, the statement of financial condition presents the estimated current values of assets and the estimated current amounts of liabilities. A liability is recognized for estimated income taxes on the difference between the asset and liability amounts set forth in the statement of financial condition and their respective income tax bases. Naturally, the residual amount after deducting the liabilities (including the estimated income tax liability) from the assets is presented as net worth at that date.
2. **Statement of changes in net worth**—An optional statement that presents the primary sources of increases and decreases in net worth over a period of time.
3. **Comparative financial statements**—The inclusion of a comparison of the current period's financial statements with one or more previous period's financial statements is optional.

Basis of presentation. The accrual basis, rather than the cash basis of accounting, is used in preparing personal financial statements. The presentation of personal financial statements does not require the classification of assets and liabilities as current and noncurrent. Instead, assets and liabilities are presented in order of liquidity and maturity.

Measurement. In personal financial statements, assets are presented at their estimated current values. This is defined by SOP 82-1 as the amount at which the item could be exchanged between a buyer and a seller, assuming both parties are well informed, and neither party is compelled to buy or sell. Disposal costs, if material, are deducted to arrive at current values. It is important to note that this definition has not been amended to conform to the definition of fair value as set forth in ASC 820, which is discussed in detail in Chapter 6. The definition of estimated current value in SOP 82-1 more closely resembles the definition of fair value less cost to sell that is used in FAS ASC 360, *Property, Plant, and Equipment* (See Chapter 11). Futhermore, SOP 82-1 specifically provides for adjustment of the current value of securities for the effects of transferability restrictions or the effects of the investor holding a large block of securities (blockage factor). Adjustments for blockage factors are specifically prohibited by ASC 820.

A specialist may need to be consulted in the determination of the current value of certain types of assets (e.g., works of art, jewelry, restricted securities, investments in closely held businesses, and real estate). If property is held in joint tenancy, as community property, or through a similar joint ownership arrangement, the finanacial statement preparer may require the advice of an attorney to determine, under applicable state law, the portion of the property interest that should be included in the indiviual's assets.

Liabilities are presented at the lesser of the discounted amount of cash to be paid or the current cash settlement amount. The discount rate should be the rate implicit in the transaction that gave rise to the liability. As a practical matter, the preparer may decide to use the individual's incremental borrowing rate at the inception of the transaction to discount the remaining cash flows.

The use of information about recent transactions involving similar types of assets and liabilities, in similar circumstances, constitutes a satisfactory means of determining the estimated current value of an asset and the estimated current amount of a liability. If recent transactional information cannot be obtained, it is permissible to use other methods (e.g., capitalization of past or prospective earnings, the use of liquidation values, the adjustment of historical cost based on changes in a specific price index, the use of appraisals, and the use of the discounted amounts of projected cash receipts and payments). The methods used should be followed consistently from period to period unless the facts and circumstances dictate a change to different methods.

Income taxes payable are to include unpaid income taxes for completed tax years and the estimated amount for the elapsed portion of the current tax year. Additionally, personal financial statements are required to include estimated income tax on the difference between the current value (amount) of assets (liabilities) and their respective income tax bases as if they had been realized or liquidated.

The table below summarizes the methods of determining "estimated current values" for assets and "estimated current amounts" for liabilities.

Assets and liabilities	*Discounted cash flow*	*Quoted market price*	*Appraised value*	*Other*
• Receivables	x			
• Marketable debt and equity securities		x		If traded on valuation day: closing price. If not traded: valuation must fall in range (between bid and ask price); Adjustments may be required for factors such as the holding of a large block of equity securities in an enterprise (blockage factor) or for restrictions on transfer of the securities
• Options—securities		x		If a quoted market price for the option is not available, compute based on the value of the asset subject to option considering factors such as the exercise price and length of option period
• Options—other assets*				Difference between the exercise price and the current value of the contracted asset, discounted at the interest rate that would be available to the indivisual to borrow with the asset under option as collateral
• Investment in life insurance				Cash surrender value less outstanding loans
• Investment in closely held business	x		x	Liquidation value, multiple of earnings, reproduction value, adjustment of book value or cost
• Real estate (including leaseholds)	x		x	By reference to sales of comparable property, appraisals used for the purpose of borrowing, by reference to assessed values used for property tax purposes, and to the relationship of assessed value to current value of properties in the geographic area
• Intangible assets	x			Net proceeds from current sale or discounted cash flows from asset; otherwise, may use cost of purchasing a similar asset, if available
• Future interests (nonforfeitable rights)**	x			
• Payables and other liabilities	x			Discharge amount if lower than discounted amount
• Noncancelable commitments***	x			
• Income taxes payable				Unpaid income tax for completed tax years and estimated income tax for elapsed portion of current tax year to date of financial statements

• Estimated income tax on difference between current values of assets and current amounts of liabilities and their respective tax bases	Computed as if current value of assets and liabilities had been respectively realized or liquidated considering applicable tax laws and regulations, recapture provisions and carryovers.
• Uncertain obligations*	Not covered by SOP 82-1; follow recognition, measurement, and disclosure guidance in ASC 450

* *Adapted from: "Personal Financial Statements: Valuation Challenges and Solutions," Michael D. Kinsman, CPA, PhD, and Bruce Samuelson,CPA, DBA,* ***Journal of Accountancy****, September 1987, pp. 138-148.*

** *Rights have all of the following attributes: (1) are for fixed or determinable amounts; (2) are not contingent on holder's life expectancy or occurrence of a particular event (e.g., disability/death), and (3) do not require future performance of service by holder.*

*** *Commitments have all of the following attributes: (1) are for fixed or determinable amounts; (2) are not contingent on others' life expectancies or occurrence of a particular event (e.g., disability/death); and (3) do not require future performance of service by others.*

Business interests that comprise a large portion of a person's total assets should be presented separately from other investments. An investment in a separate entity that is marketable as a going concern (e.g., a closely held corporation) should be presented as one amount. If the investment is a limited business activity, not conducted in a separate legal entity, separate asset and liability amounts should be shown (e.g., investment in real estate and related mortgage; only the person's beneficial interest in the investment is included in his/her personal financial statements).

The preparer must decide whether to value the net investment him/herself or to engage a qualified specialist. The possible valuation methods available are discounted cash flow, appraised value, liquidation value, multiple of earnings, reproduction value, adjustment of book value (e.g., equity method), or cost. In some cases it is appropriate to use a combination of approaches to reasonably estimate the current value.

The following disclosures are typically made in either the body of the financial statements or in the accompanying notes. (This list is not all-inclusive.) Source: SOP 82-1.

1. A clear identification of the individuals covered by the financial statements
2. That assets are presented at their estimated current values and liabilities are presented at their estimated current amounts
3. The methods used in determining the estimated current values of major assets and the estimated current amounts of major liabilities or major categories of assets and liabilities, and changes in methods from one period to the next
4. If assets held jointly by the person and by others included in the statements, the nature of the joint ownership
5. If the person's investment portfolio is material in relation to his or her other assets and is concentrated in one or a few companies or industries, the names of the companies or industries and the estimated current values of the securities
6. If the person has a material investment in a closely held business,
    a. The name of the company
    b. The person's percentage of ownership
    c. The nature of the business
    d. Summarized financial information about assets, liabilities, and results of operations for the most recent year based on the businesses' own financial statements as well as the basis of presentation (e.g. GAAP, cash basis, income tax basis, etc.), and any significant loss contingencies

7. Description of intangible assets and their estimated useful lives
8. The face amount of life insurance the individual owns
9. Certain nonforfeitable rights, such as pensions based on life expectancy
10. The methods and assumptions used to calculate estimated income taxes on the differences between the estimated current values of assets and the estimated current amounts of liabilities and their tax bases as well as a statement that the provision will probably differ from the amounts eventually paid as the timing and method of disposal as well as changes in the tax laws and regulations will affect the actual taxes to be paid
11. Unused operating loss and capital loss carryforwards and any other unused deductions or credits and, if applicable, the tax year in which they expire (under the current income tax code, there will frequently be unused alternative minimum tax credit carryfowards)
12. The differences between the estimated current values of major assets and the estimated current amounts of major liabilities or categories of assets and liabilities and their tax bases
13. Maturities, interest rates, collateral, and other pertinent details relating to receivables and debt
14. Certain noncancellable commitments such as operating leases

APPENDIX

HYPOTHETICAL SET OF PERSONAL FINANCIAL STATEMENTS

Marcus and Kelly Imrich
Statements of Financial Condition
December 31, 2009 and 2008

	2009	2008
Assets		
Cash	$ 381,437	$ 207,621
Certificate of deposit	20,000	10.000
Securities		
Marketable (Note 2)	128,787	260,485
Tax-exempt bonds (Note 3)	1,890,222	986,278
Loans receivable (Note 4)	262,877	362,877
Partnership and joint venture interests (Note 5)	935,000	938,000
Real estate interests (Note 6)	890,000	2,500,000
David Corporation (Note 7)	2,750,687	2,600,277
Cash surrender value of life insurance (Note 8)	388,000	265,000
Personal residences (Note 9)	2,387,229	2,380,229
Deferred losses from partnerships	68,570	60,830
Vested interest in David Corporation benefit plan	545,960	530,960
Personal jewelry and furnishings (Note 10)	513,000	6,700
Total assets	$11,161,769	$11,109,257
Liabilities		
Mortgage payable (Note 11)	$ 254,000	$ 267,000
Security deposits—rentals	--	5,700
Income taxes payable—current year balance	9,800	10,680
Total liabilities	263,800	283,380
Estimated income taxes on difference between estimated current values of assets and estimated current amounts of liabilities and their tax bases (Note 12)	555,400	731,000
Net Worth	10,342,569	10,094,877
Total liabilities and net worth	$11,161,769	$11,109,257

Marcus and Kelly Imrich
Statement of Changes in Net Worth
For the Years Ended December 31, 2009 and 2008

	2009	2008
Realized increases in net worth		
Salary and bonus	$ 200,000	$ 175,000
Dividends and interest income	184,260	85,000
Distribution from limited partnerships	280,000	260,000
Gain on sales of marketable securities	58,240	142,800
	722,500	662,800
Realized decreases in net worth		
Income taxes	180,000	140,000
Interest expense	25,000	26,000
Real estate taxes	21,000	18,000
Personal expenditures	242,536	400,000
	468,536	584,000
Net realized increase in net worth	253,964	78,800
Unrealized increases in net worth		
Marketable securities (net of realized gains on securities sold)	37,460	30,270
Benefit plan—David Corporation	15,000	14,000
Personal jewelry and furnishings	20,000	18,000
	72,460	62,270

Unrealized decreases in net worth		
Estimated income taxes on the difference between the estimated current values of assets and the estimated current amounts of liabilities and their tax bases	78,732	64,118
Net unrealized decrease in net worth	(6,272)	(1,848)
Net increase in net worth	247,692	76,952
Net worth at the beginning of year	10,094,877	10,017,925
Net worth at the end of year	$10,342,569	$10,094,877

Marcus and Kelly Imrich
Notes to Financial Statements

Note 1: The accompanying financial statements include the assets and liabilities of Marcus and Kelly Imrich. Assets are stated at their estimated current values, and liabilities at their estimated current amounts.

Note 2: The estimated current values of marketable securities are either (1) their quoted closing prices or (2) for securities not traded on the financial statement date, amounts that fall within the range of quoted bid and asked prices.

Marketable securities consist of the following:

	December 31, 2009		*December 31, 2008*	
Stocks	*Number of shares*	*Estimated current values*	*Number of shares*	*Estimated current values*
Susan Schultz, Inc.			1,000	$122,000
Ripley Robotics Corp.	500	$ 51,927	1,000	120,485
L.A.W. Corporation	300	20,700	100	5,000
Jay & Kelly Corp.	300	20,700	200	5,000
J.A.Z. Corporation	200	35,460	200	8,000
		$128,787		$260,485

Note 3: The interest income from state and municipal bonds is generally not subject to federal income taxes but is, except in certain cases, subject to state income tax and federal alternative minimum tax.

Note 4: The loan receivable from Carol Parker, Inc. matures January 2016 and bears interest at the prime rate.

Note 5: Partnership and joint venture interests consist of the following:

	Percent owned	*Cost*	*Estimated current value 12/31/2009*	*Estimated current value 12/31/2008*
East Third Partnership	50.0%	$ 50,000	100,000	100,000
631 Lucinda Joint Venture	20.0	10,000	35,000	38,000
27 Wright Partnership	22.5	10,000	40,000	50,000
Eannarino Partnership	10.0	40,000	60,000	50,000
Sweeney Joint Venture	30.0	100,000	600,000	600,000
Kelly Parker Group	20.0	20,000	100,000	100,000
707 Lucinda Joint Venture	50.0	(11,000)	--	--
			$935,000	$938,000

Note 6: Mr. and Mrs. Imrich own a one-half interest in an apartment building in DeKalb, Illinois. The estimated current value was determined by Mr. and Mrs. Imrich. Their income tax basis in the apartment building was $1,000,000 for both 2009 and 2008.

Note 7: Kelly Imrich owns 75% of the common stock of the David Corporation. A condensed statement of assets, liabilities, and stockholders' equity (income tax basis) of David Corporation as of December 31, 2009 and 2008 is summarized below.

	2009	*2008*
Current assets	$2,975,000	$3,147,000
Investments	200,000	200,000
Property and equipment (net)	145,000	165,000
Loans receivable	110,000	120,000
Total assets	$3,430,000	$3,632,000

Current liabilities	$2,030,000	$2,157,000
Other liabilities	450,000	400,000
Total liabilities	2,480,000	2,557,000
Stockholders' equity	950,000	1,075,000
Total liabilities and stockholders' equity	$3,430,000	$3,632,000

Note 8: At December 31, 2009 and 2008, Marcus Imrich owned a $1,000,000 whole life insurance policy. Mrs. Imrich is the sole beneficiary under the policy.

Note 9: The estimated current values of the personal residences are their purchase prices plus their cost of improvements. Both residences were purchased in 2007.

Note 10: The estimated current values of personal effects and jewelry are the appraised values of those assets, determined by an independent appraiser for insurance purposes.

Note 11: The mortgage (collateralized by the residence) is payable in monthly installments of $2,479, including interest at an annual rate of 6% through 2021.

Note 12: The estimated current amounts of liabilities at December 31, 2009, and December 31, 2008, equaled their income tax bases. Estimated income taxes have been provided on the excess of the estimated current values of assets over their tax bases as if the estimated current values of the assets had been realized on the dates of the statements of financial condition, using applicable income tax laws and regulations. The provision will probably differ from the amounts of income taxes that eventually will be paid because those amounts are determined by the timing and the method of disposal or realization and the income tax laws and regulations in effect at the time of disposal or realization.

The excess of estimated current values of major assets over their income tax bases are

	December 31	
	2009	*2008*
Investment in David Corporation	$1,400,000	$1,350,000
Vested interest in benefit plan	350,000	300,000
Investment in marketable securities	100,000	120,300
	$1,850,000	$1,770,300

BANKING AND THRIFT

PERSPECTIVE AND ISSUES

This topic is addressed by ASC 942, *Financial Services—Depository and Lending*.

While at one time regulator-imposed financial reporting rules (regulatory accounting principles, commonly called RAP) were mandated for official filings and were also often utilized for general purpose reporting, this is no longer true. Today, financial reporting by banks and thrifts must comply with GAAP, although some specialized industry guidance does exist within that body of standards. In general, certain characteristics unique to financial services entities do demand that certain accounting and financial reporting matters be given more elaboration and interpretation than do these same principles when applied to less specialized entities. These more complex areas are summarized in this section of Chapter 25.

The thrift and (to a lesser degree) banking industries endured difficult times in the 1980s and early 1990s, largely due to very difficult interest rate environments, and a record number of banks and thrifts failed. The formal insolvencies of the thrift insurance fund (FSLIC) and, to a lesser extent, of that for the banks (FDIC) seemed possible, and extraordinary steps were taken by government regulators to avert such events. Mergers were encouraged, and in some cases effectively insolvent institutions (i.e., those having liabilities in excess of assets, when both were adjusted to fair values) were acquired by healthier banks or thrifts. In some instances, acquisitions were encouraged by an unorthodox accounting treatment, whereby the net deficit was accounted for as "supervisory goodwill," to be amortized over an agreed-upon period (typically, fifteen to twenty-five years), with the net unamortized goodwill being con-

sidered a "valid asset" for purposes of computing regulatory capital (rather than being deducted from net assets, as would otherwise have been the case).

The accounting profession objected to this treatment, since this supervisory goodwill failed to meet the usual definition of goodwill as being related to excess future earnings potential. However, the profession was ultimately forced to acquiesce. Supervisory goodwill was eliminated as an acceptable asset for banks and thrifts by controversial government legislation, spawning a wave of litigation against the federal government which continues to the present time.

Under current GAAP (ASC 350), any goodwill remaining is no longer subject to amortization, but is to be tested for impairment at least annually, more often under defined circumstances (see general discussions in Chapters 11 and 13.

Banks and savings institutions are exempted from the need to present certain cash flow information. Specifically, gross amounts for such high-volume transaction categories as deposits and withdrawals need not be disclosed. Banks and thrifts are not exempt from presenting cash flow statements, however.

Lenders often incur significant costs directly related to the origination or purchase of loans and normally receive different nonrefundable fees at the inception of the loans. Historically, disparate accounting procedures had been applied in the reporting of these costs and fees. ASC 320 enumerated various categories of costs and fees and set forth the required accounting for each of them. Most fees are deferred and amortized, via the effective yield method, over the term of the arrangement.

ASC 310 requires loss recognition whenever loans are restructured, unless these involve only an extended payment schedule with full contractual rates of interest being applied to the new due dates. Apart from loan restructurings, however, the issue of when to provide loss reserves, and how these are to be determined, continues to receive a good deal of attention from accounting standard setters and regulatory authorities. The banking regulators and the SEC have indicated that heightened scrutiny is to be applied to loan loss provisions, and interpretative guidance has been offered.

ASC 942 addresses the accounting and financial reporting requirements applicable to banks and saving institutions, credit unions, and finance companies. It provides revised accounting guidance for sales of loan servicing rights and makes other recommendations.

ASC 310-30, *Loans and Debt Securities Acquired with Deteriorated Credit Quality,* addresses the accounting for the differences between contractual and expected future cash flows of acquired loans when these differences are attributable, at least in part, to credit quality. Under this standard, when loans are acquired with evidence of deterioration in credit quality since origination, the acquirer must estimate the cash flows expected to be collected on each loan; this is to be done both at the purchase date and periodically over the lives of the loans. Cash flows expected to be collected in excess of the purchase price will be recognized as yield, while contractual cash flows in excess of expected cash flows will not be so recognized, since to do so would probably cause later recognition of bad debts.

DEFINITIONS OF TERMS

Accretable yield. In the context of loans acquired in transfers, the cash flows expected to be collected in excess of the initial investment.

Carrying amount. The face amount of the interest-bearing asset plus (or minus) the unamortized premium (or discount).

Commitment fees. Fees charged for entering into an agreement that obligates the enterprise to make or acquire a loan or to satisfy an obligation of the other party under a specified condition. For purposes of this Statement, the term commitment fees includes fees for letters of credit and obligations to purchase a loan or group of loans and pass-through certificates.

General reserve. Used in the context of the special meaning this term has in regulatory pronouncements and in the US Internal Revenue Code.

Incremental direct costs. Costs to originate a loan that (1) result directly from and are essential to the lending transaction and (2) would not have been incurred by the lender had that lending transaction not occurred.

Long-term interest-bearing assets. For purposes of this section, these are interest-bearing assets with a remaining term to maturity of more than one year.

Net-spread method. Under this method, the acquisition of a savings and loan association is viewed as the acquisition of a leveraged whole rather than the acquisition of the separate assets and liabilities of the association.

Nonaccretable difference. In the context of loans acquired in a transfer, the excess of contractual cash flows over the amount of expected cash flows.

Origination fees. Fees charged to the borrower in connection with the process of originating, refinancing, or restructuring a loan. This term includes, but is not limited to, points, management, arrangement, placement, application, underwriting, and other fees pursuant to a lending or leasing transaction and also includes syndication and participation fees to the extent they are associated with the portion of the loan retained by the lender.

Pretax accounting income. Represents income or loss for a period, exclusive of related income tax expense, determined in conformity with generally accepted accounting principles.

Reserve for bad debts. Term is used in the context of the special meaning this term has in regulatory pronouncements and in the US Internal Revenue Code.

Separate-valuation method. Under this method, each of the identifiable assets and liabilities (assumed) of the acquired savings and loan association is accounted for in the consolidated financial statements at an amount based on fair value at the date of acquisition, either individually or by types of assets and types of liabilities.

Servicing asset or liability. A contract to service financial assets under which the estimated future revenues from contractually specified servicing fees, late charges, and other ancillary revenues are expected (asset) or not expected (liability) to adequately compensate the entity for providing the servicing.

Taxable income. Represents pretax accounting income (1) adjusted for reversal of provisions of estimated losses on loans and property acquired in settlement of loans, gains or losses on the sales of such property, and adjusted for permanent differences and (2) after

giving effect to the bad debt deduction allowable by the US Internal Revenue Code assuming the applicable tax return were to be prepared based on such adjusted pretax accounting income.

CONCEPTS, RULES, AND EXAMPLES

Justifying a Change in Accounting Principle

The following sources are preferred for banking and thrift industries that must justify a change in accounting principle:

1. ASC 942, *Financial Services—Depository and Lending*
2. ASC 310-30, *Loans and Debt Securities Acquired with Deteriorated Credit Quality*

Acquisition of a Banking or Thrift Institution

The following discussion applies not only to the acquisition of a savings and loan association, but also to acquisition of savings and loan holding companies, commercial banks, mutual savings banks, credit unions, and other depository institutions with assets and liabilities of the same type.

Purchase method. In accounting for the acquisition of a banking and thrift institution, the fair value of the assets and liabilities acquired must be determined using the separate-valuation method. Under this method, each of the identifiable assets and liabilities acquired are accounted for individually, or by type, at its fair value at the date of acquisition. The total amount is reported in the consolidated financial statements.

Note that use of the net-spread method is not considered appropriate for this type of business combination. The net-spread method, which views acquisition of the institution as a leveraged whole, does not appropriately recognize the fair value of individual, or types of, assets and liabilities.

Liabilities acquired are accounted for at their present value at the date of acquisition. The present value of savings deposits due on demand equals the face amount plus interest accrued or accruable at the acquisition date. The present value of other liabilities assumed is calculated by using interest rates for similar liabilities in effect at the date of acquisition.

Identified intangible assets. The purchase price of a banking or thrift institution may include intangible benefits from the purchase, such as the capacity of acquired assets to generate new business. Intangible assets that can be separately identified at a determinable fair value are to be assigned a portion of the total purchase price and are to be amortized over their estimated lives. Any portion of the purchase price that cannot be identified with specific tangible and intangible assets (less liabilities assumed) is assigned to goodwill.

Unidentifiable intangible asset. An unidentifiable intangible asset arises when the fair value of liabilities assumed exceeds the fair value of tangible and identified intangible assets acquired. This asset is amortized over a period no greater than the estimated remaining life of any long-term interest-bearing assets acquired. Amortization is applied to the carrying amount of the interest-bearing assets expected to be outstanding at the beginning of each subsequent period. If, however, the assets acquired do not include a significant portion of long-term interest-bearing assets, the unidentifiable intangible asset is amortized over a period not exceeding the estimated average remaining life of the existing customer base acquired. The amortization period may not exceed forty years.

In the sale or liquidation of a large segment, or separable group, of the operating assets of an acquired banking or thrift institution, the portion of the unidentifiable intangible asset identified with that segment, or separable group, shall be included in the cost of the assets sold. If the sale or liquidation of a large portion of the interest-bearing assets significantly

reduces the benefits of the unidentifiable intangible asset, any reduction shall be recognized as a charge to income.

Regulatory-assisted combinations. Bank regulatory authorities may grant financial assistance to encourage a bank acquisition. Generally, this is done when a failing bank is sold to a solvent one and the amount of any such direct assistance is less than the cost that would have been incurred honoring the deposit insurance commitment, net of recoveries on assets held by the failing bank. Under GAAP, the assistance should be accounted for as part of the combination if receipt of the assistance is probable and the amount to be received is reasonably estimable. Otherwise, assistance should be reported as a reduction of the unidentifiable asset (goodwill), with any excess over that amount being reported in income. If the grantee is required to repay all or a portion of the assistance, a liability would be recognized, together with a charge against income. Assistance received must be disclosed in the financial statements.

Of primarily historical interest now is another form of assistance that had been offered by regulatory authorities during the "thrift crisis" of the mid-1980s (and which also affected some banks). This was the right to treat the excess of acquired liabilities over acquired assets as an asset (called "supervisory goodwill"), which was permitted for purposes of computing regulatory capital. During that era, the objective was to avoid having the large numbers of thrift and bank failures deplete the insurance funds (FSLIC and FDIC). Later this was seen as having created other problems, and subsequent laws effectively eliminated this accounting treatment, which in turn contributed to another wave of institutional failure when formerly technically solvent banks were judged insolvent.

Many of the institutions which failed or were forced to shrink operations due to the change in federal policy sued for breach of contract. The result of some of these lawsuits was for the government to make some restitution to the savings institutions. ASC 720-20 states that any settlements received should be accounted for not as governmental financial assistance, but rather in the same manner as other litigation awards would normally be reported. These are not to be deemed extraordinary gains, but rather are to be included in operating income, with adequate disclosure made to avoid the drawing of misleading inferences regarding possible recurrence. Unsettled claims should be accounted for as only contingent gains (i.e., these should be disclosed, if material, but may not be accrued until and unless realized).

Elimination of special accounting for goodwill associated with bank and thrift mergers. The thrift, and later, banking crises of the 1980s gave rise to a number of unusual and often unwise practices. One of these was the invention of "supervisory goodwill," which sometimes was used as an inducement to relatively stronger institutions to acquire those that were, on a mark-to-market (i.e., fair value) basis, already insolvent. The net liabilities assumed, in such instances, was recognized as the intangible asset goodwill, although this would not have generally qualified as such under existing GAAP, since it often did not imply excess future earnings potential, the usual working definition for goodwill. However, thrift and banking regulators permitted the combined institutions to present this asset on their balance sheets, subject to amortization over agreed-upon periods, and to treat the unamortized balance as a qualified asset for capital computation purposes (whereas goodwill was otherwise to be deducted from equity for purpose of making this calculation).

The accounting profession objected to the recognition of supervisory goodwill for GAAP-basis reporting purposes, but ultimately had to acquiesce. Certain parameters were established for the amortization periods to be applied to such supervisory goodwill (referred to as an "unidentifiable intangible asset" in that standard). Thus, the intangible was to be amortized over a period no longer than the estimated remaining life of interest-bearing assets

(loans and investments) acquired, which would typically be shorter than the agreed-to terms under the various acquisition agreements then being encouraged by the regulators.

Beginning in 1989, supervisory goodwill was eliminated from regulatory filings, and although this did not require that such goodwill be deleted from GAAP-basis financial statements, this was largely the consequential effect. More recently, accounting for purchase business combinations has been revised in ASC 805, and the accounting for goodwill has been materially altered by ASC 350.

The requirements of ASC 850 deal with the assignment of purchase price to the various acquired assets and assumed obligations. ASC 805 also specifies that acquisitions of branches are to be accounted for as business combinations, if a branch meets the definition of a business, with the possibility of recognizing goodwill in such a transaction. If the branch does not meet the definition of a business, the transaction is to be accounted for as merely the acquisition of assets, and goodwill cannot be recognized. (The definition of a business is set forth in the Master Glossary.)

ASC 942-805 applies to combinations of mutual associations. It gives guidance on the application of long-term customer relationship intangibles often recognized in acquisitions of financial institutions—including depositor-relationship intangibles, borrower-relationship intangibles, and credit cardholder intangibles. The impairment testing of servicing assets, another commonly encountered bank or thrift intangible is set forth by ASC 860-50.

For those intangibles that arose in business combinations, the remaining unamortized balances are to be transferred to goodwill unless they can be identified as other specific intangibles (e.g., customer relationships). Amounts reclassified to goodwill are no longer subject to amortization, but tested at least annually for impairment.

Bad-Debt Reserves

Both stock and mutual savings and loan associations are required by regulatory authorities to place a portion of their earnings into a general reserve as protection for depositors. Savings and loan associations are allowed by the IRS to maintain a bad-debt reserve and to deduct any additions to their reserve in determining taxable income. Since this method differs from the method for determining bad debt expense, pretax accounting income and taxable income will differ.

Accounting by Creditors for Impairment of a Loan

A persistent practice problem has been in the proper determination of loan loss provisions. Since such reserves are necessarily matters of judgment, the possibility of manipulation (by either understatement or overstatement) in order to manage reported earnings or otherwise bias perceptions about the thrift's or bank's performance has always existed. In more recent years, this has received greater attention, first by the issuance of a detailed standard on accounting for impaired loans (ASC 310-10-35), and later by several FASB, SEC and banking regulatory authority policy announcements.

Under ASC 310-10-35, loans are deemed impaired when it is probable that a creditor will be unable to collect all amounts contractually due, including both principal and interest. This determination is made by applying normal loan review procedures. Once impairment has been identified, the creditor institution must compute the present value of all the estimated future cash flows, using the loan's effective interest rate as the discount factor. The effective rate is defined as the loan's contractual rate as adjusted for any deferred loan fees, premiums, or discounts. It is this effective rate, and not the market rate at the time of determination of impairment, which must be used to compute the loss provision.

If the computed present value of the expected future cash flows is less than the carrying amount of the loan, an impairment will be recognized and recorded in a valuation allowance. Significant changes in the amount and/or timing of future estimated cash flows require that the creditor recalculate the amount of the loan's impairment. Adjustments, subject to the LCM criteria, will be reflected through changes in the valuation allowance.

In the event of a formal loan restructuring through a troubled debt restructuring, the loan is remeasured at the fair market value at the date of the restructuring. This treatment differs from an impairment because it is assumed that a new, formally restructured loan reflects current market conditions; therefore, no impairment is deemed to exist.

The standard, as amended, provides that impairment losses be recognized as bad debts when measured; however, no guidance is provided on the recognition and measurement of amounts later recovered.

The FASB has indicated that loss provisions must be based only on probable losses which have occurred as of the balance sheet date, even if the individual loan which may have been impaired cannot be identified. Predictions of likely future losses to be incurred, even if such predictions have been historically highly accurate, cannot be used to anticipate losses that have not yet occurred.

Losses are to be provided when it is probable that the asset has been impaired and the amount is subject to reasonable estimation. ASC 310-10-35 requires certain methods of measurement for loans that are individually considered impaired, but it does not fundamentally change the recognition criteria for loan losses. It also provides guidance on measurement and disclosure for loans that are identified for evaluation and that are individually deemed to be impaired (because it is probable that the creditor will be unable to collect all the contractual interest and principal payments as scheduled in the loan agreement). It also includes all loans that are restructured in a troubled debt restructuring involving a modification of terms, except for those loans that are excluded from the scope of the standard.

In determining the existence and extent of impairment, "environmental" factors such as existing industry, geographical, economic, and political factors, should be given consideration. Obviously, the distinction between existing environmental factors and forecasts of changes in these factors over the near-term horizon is a subtle one, but it is one which must be maintained, since the latter cannot be used to justify current period loan loss provisions. For example, even if the consensus economic forecast is for a recession (which normally results in greater loan losses being experienced as current debtors face financial difficulties) if that downturn is not being experienced at the balance sheet date, loss reserves cannot be boosted to anticipate loan quality deterioration that has not yet occurred.

FASB has noted that some loans specifically identified for evaluation may be individually impaired, while other loans that are not impaired individually pursuant to ASC 310-10-35 may have specific characteristics that indicate that there would be probable loss in a group of loans with those characteristics. Loans in the first category must be accounted for under ASC 310-10-35, and loans in the second category should be accounted for as a loss accrual if characteristics of a loan indicate that it is probable that a group of similar loans includes some losses even though the loss could not be identified with a specific loan. Characteristics or risk factors must be specifically identified to support an accrual for losses that have been incurred but that have not yet reached the point where it is probable that amounts will not be collected on a specific individual loan. A creditor should not ignore factors and information obtained in the evaluation of the loan's collectibility.

For example, if an individual loan specifically identified for evaluation is fully collateralized with risk-free assets, then consideration of that loan as sharing characteristics with a group of uncollateralized loans is inappropriate. A loss is recognized if characteristics of a loan indicate that it is probable that a group of similar loans includes some losses even

though the loss could not be identified to a specific loan. However, a loss would be recognized only if it is probable that the loss has been incurred at the date of the financial statements and the amount of loss can be reasonably estimated.

If a creditor concludes that an individual loan specifically identified for evaluation is impaired, an allowance in addition to one measured ASC 310-10-35 may not be established. That is, the ASC 310-10-35 allowance should be the sole measure of impairment for that loan. This is equally true if the measurement of impairment results in no allowance. For example, a creditor might conclude that a given collateral-dependent loan is impaired, because it is probable that the creditor will be unable to collect all the contractual interest and principal payments as scheduled in the loan agreement. The creditor might, however, measure the impairment using the fair value of the collateral, which could result in no allowance if the fair value of the collateral is greater than the recorded investment in the loan.

Particularly objectionable is the practice of increasing (or not decreasing) the allowance for loan losses in "good" economic times to provide for losses expected to occur in the future. This income smoothing technique is invalid under all circumstances, and cannot be rationalized by citing the historical cyclicality of the economy and the reasonable likelihood that higher losses will follow periods having lower loss experience.

Nonrefundable Loan Fees and Costs

Loan origination fees. These fees should be deferred and recognized over the life of the loan as an adjustment of interest income. If there are any related direct loan origination costs, the origination fees and origination costs should be netted, and only the net amount should be deferred and amortized via the interest method. Origination costs include those incremental costs such as credit checks and security arrangements, among others, pertaining to a specific loan.

The only exception to the foregoing rule would be in the instance of certain loans that also qualify as debt instruments under ASC 320. For those carried in the "trading securities" portfolio, related loan origination fees should be charged to expense when incurred; the requirement that these be carried at fair value would make adding these costs to the asset carrying amounts a useless exercise.

Example 1

Debtor Corp. wishes to take out a loan with Klein Bank for the purchase of new machinery. The fair value of the machinery is $614,457. The loan is for ten years, designed to give Klein an implicit return of 10% on the loan. The annual payment is calculated as follows:

$$\text{Annual payment} = \frac{\$614{,}457}{PV_{10}, 10\%} = \frac{614{,}457}{6.14457} = \$100{,}000$$

Unearned interest on the loan would be $385,543 [(10 × $100,000) – $614,457].

Klein also is to receive a "nonrefundable origination fee" of $50,000. Klein incurred $20,000 of direct origination costs (for credit checks, etc.). Thus, Klein has *net* nonrefundable origination fees of $30,000. The new net investment in the loan is calculated below.

Gross investment in loan (10 × $100,000)	$1,000,000
Less: Unamortized net nonrefundable origination fees	(30,000)
	970,000
Less: Unearned interest income (from above)	385,543
Net investment in loan	$ 584,457

The new net investment in the loan can be used to find the new implicit interest rate.

$$\frac{100{,}000}{(1+i)^1} + \frac{100{,}000}{(1+i)^2} + \ldots + \frac{100{,}000}{(1+i)^{10}} = \$584{,}457$$

where i = implicit rate

Thus, the implicit interest rate is 11.002%. The amortization table for the first three years is set up as follows:

(a) Loan payments	(b) Reduction in unearned interest	(c) Interest revenue (PV x implicit rate of 11.002%)	(d) Reduction in net orig. fees (c-b)	(e) Reduction in PV of net invest (a-c)	(f) PV of net loan investment
					$584,457
$100,000	$61,446*	$64,302	$2,856	$35,689	548,759
100,000	57,590**	60,374	2,784	39,626	509,133
100,000	53,349***	56,015	2,666	43,985	465,148

* *($614,457 x 10%) = $61,446*
** *[$614,457 – ($100,000 – $61,446)] x 10% = $57,590*
*** *[$575,900 – ($100,000 – $57,590)] x 10% = $53,349*

Commitment fees and costs. Often fees are received in advance in exchange for a commitment to originate or purchase a loan. These fees should be deferred and recognized upon exercise of the commitment as an adjustment of interest income over the life of the loan, as in Example 1 for origination costs and fees. If a commitment expires unexercised, the fees should be recognized as income upon expiration.

As with loan origination fees and costs, if both commitment fees are received and commitment costs are incurred relating to a commitment to originate or purchase a loan, the net amount of fees or costs should be deferred and recognized over the life of the loan.

If there is a remote possibility of exercise, the commitment fees may be recognized on a straight-line basis over the commitment period as "service fee income." If there is a subsequent exercise, the unamortized fees at the date of exercise shall be recognized over the life of the loan as an adjustment of interest income, as in Example 1.

In certain cases, commitment fees are determined retroactively as a percentage of available lines of credit. If the commitment fee percentage is nominal in relation to the stated rate on the related borrowing, with the borrowing earning the market rate of interest, the fees shall be recognized in income as of the determination date.

Example 2

Glass Corp. has a $2 million, 10% line of credit outstanding with Ritter Bank. Ritter charges its annual commitment fee as 0.1% of any available balance as of the end of the prior period. Ritter will report $2,000 ($2 million × 0.1%) as service fee income in its current income statement.

Fees and costs in refinancing or restructurings. (Assume this is not a troubled-debt restructuring.) When the terms of a refinanced/restructured loan are as favorable to the lender as the terms for loans to customers with similar risks who are not in a restructuring, the refinanced loan is treated as a new loan, and all prior fees of the old loan are recognized in interest income when the new loan is made.

When the above situation is not satisfied, the fees or costs from the old loan become part of the net investment in the new loan.

Example 3

Jeffrey Bank refinanced a loan receivable to $1,000,000, at 10% interest, with annual interest receipts for ten years. Jeffrey's "normal" loan in its portfolio to debtors with similar risks is for $500,000 at 9% interest for five years. Jeffrey had loan origination fees from the original loan of $20,000. These fees are recognized in income *immediately* because the terms of the restructuring are as favorable to Jeffrey as a loan to another debtor with similar risks.

Example 4

Assume the same facts as in Example 3 except that the refinanced terms are $500,000 principal, 7% interest for three years. Since the terms of the restructuring are not as favorable to Jeffrey as a loan to another debtor with similar risks, the $20,000 origination fees become part of the new investment in the loan and recognized in interest income over the life of the new loan, as in Example 1.

Purchase of a loan or group of loans. Fees paid or fees received when purchasing a loan or group of loans should normally be considered part of the initial investment; to be recognized in income over the lives of the loans. However, if the loans qualify as debt securities under ASC 320 and are held in the lender's "trading securities" portfolio, these fees should be reported in income when paid or received, and not added to the cost of the loans.

Special arrangements. Often lenders provide demand loans (loans with no scheduled payment terms). In this case, any net fees or costs should be recognized on a straight-line basis over a period determined by mutual agreement of the parties, usually over the estimated length of the loan.

Under a revolving line of credit, any net fees or costs are recognized in income on a straight-line basis over the period that the line of credit is active. If the line of credit is terminated due to the borrower's full payment, any unamortized net fees or costs are recognized in income.

Example 5

Green Bank received $50,000 as a nonrefundable origination fee on a $2 million demand loan. Green's loan dictates that any fees are to be amortized over a period of ten years. Therefore, $5,000 (= $50,000 × 1/10) of origination fees will be recognized as an addition to interest income each year for the next ten years.

Financial statement presentation. The unamortized balance of origination, commitment, and other fees/costs that are recognized as an adjustment of interest income shall be reported on the balance sheet as part of the loan balance to which they relate. Except for any special cases as noted in the above paragraphs, the amount of net fees/costs recognized each period as an adjustment will be reported in the income statement as part of interest income.

Accounting for Loans Acquired by Transfer

Banks commonly acquire loans originated by other financial intermediaries. In some cases, these are impaired when first acquired. That is, due to changes in the borrowers' credit risks since loan inception, the expected cash flows from the purchased loans may not equal the contractual cash flows. (Note that the differences in expected cash flows versus contractual cash flows arising from changes in interest rates during the interval from loan inception to loan acquisition is a separate issue; the resulting discount or premium would be amortized by the effective yield method over the expected term of the loan.)

ASC 310-30 addresses the accounting for the differences between contractual and expected future cash flows of acquired loans when these differences are attributable, at least in part, to credit quality.

Under the provisions of ASC 310-30, purchased loans are to be displayed at the initial investment amount on the balance sheet. The amount of any discount is not to be displayed in the balance sheet nor should the acquirer carry over an allowance for loan losses established by the seller. This prohibition applies equally to stand-alone purchases of loans and to those which occur as part of purchase business combinations. Expanded disclosure requirements have also been established.

When loans are acquired with evidence of deterioration in credit quality since origination, the acquirer will be required to estimate the cash flows expected to be collected on the

loan. This exercise is to be done both at the purchase date and again periodically over the lives of the loans. Cash flows in excess of the initial investment (purchase price) expected to be collected should be recognized as yield; this is referred to as "accretable yield." On the other hand, contractual cash flows in excess of expected cash flows (the nonaccretable difference) should not be recognized as yield. (Accretion of this amount would necessitate, in most instances, later recognition of bad debt expense, and thus would distort multiple periods' results of operations.)

Changing expectations of future cash flows are to be handled differently, depending on whether these are decreases or increases. If, subsequent to acquisition, there are decreases in the probable cash flows, impairments are to be recognized. In other words, such a development cannot be handled prospectively as a yield adjustment over the remaining lives of the loans.

By contrast, probable increases in subsequent cash flows expected to be collected should be recognized prospectively as a yield adjustment. In cases where a new, higher yield on a loan is established (due to a probable increase in cash flows to be collected), that yield should be used as the effective interest rate in any later test for impairment.

If loans are refinanced or restructured after acquisition, these cannot be accounted for as new loans, unless these are troubled debt restructurings.

Under the provisions of ASC 310-30, acquired loans are not to be aggregated for purposes of determining evidence of postorigination credit deterioration. Rather, each loan, even if purchased in a pool, must be individually evaluated. However, subsequent pooling or aggregation of smaller-balance homogeneous loans is allowed for purposes of recognition, measurement, and disclosure. To be accounted for in the aggregate, loans must have a common credit risk (such as past due status or credit score) and have a common predominant risk characteristic (such as type of loan or date of origination). Furthermore, aggregation is limited to loans purchased in the same fiscal quarter.

The codification does not provide general guidance as to the recognition of income, because that guidance does not exist for originated loans. However, income recognition will still be prohibited on loans for which an investor expects to substantially improve the collateral for resale or expects to use the collateral in operations.

Variable loans with index rate decreases, contractual cash flow decreases, and expected cash flow decreases should be evaluated based on the change in expected cash flows attributable to the decrease in index rates. Those changes should be recognized prospectively, rather than as impairments. The decrease in expected cash flows due to index rate decreases must be ascertained, and those changes are to be evaluated against the loan's contractual payments receivable, which must be calculated based on the index rate as it changes over the life of the loan.

Conforming Practice by All Financial Institutions

ASC 942, *Financial Services—Depository and Lending,* reconciled and conformed the accounting and financial reporting provisions of the former AICPA AAG applicable to banks and saving institutions, credit unions, and finance companies. It furthermore added mortgage companies and corporate credit unions to the scope of coverage. The standard applies, additionally, to all entities which finance other entities, even via normal trade credit arrangements, and thus directs the accounting to be employed by manufacturers, retailers, wholesalers, and other business enterprises.

ASC 942 provides revised accounting guidance for sales of loan servicing rights, in order to comply with the revenue recognition model set forth in ASC 860-50-40. It also adopts the basis allocation approach set forth in ASC 860.

ASC 942 requires that, to the extent management has the intent and the ability to hold them for the foreseeable future or until maturity or payoff, loans should be reported on the balance sheet at outstanding principal adjusted for any charge-offs, the allowance for loan losses, any deferred fees or costs on originated loans, and any unamortized premiums or discounts on purchased loans. Nonmortgage loans held for sale should be reported at the lower of cost or fair value. When a decision is made to sell loans not previously held for sale, those loans should be reclassified as held-for-sale and carried at the lower of cost or fair value.

With regard to credit losses, these are to be deducted from the allowance. Loan balances should be charged off in the periods in which the loans are deemed uncollectible. Recoveries of amounts previously charged off should be recorded when received. Credit losses on off-balance-sheet instruments should be reported separately from valuation accounts for recognized instruments.

Under ASC 942, standby commitments to purchase loans are reported in one of two ways, depending on whether the settlement date is within a reasonable time and whether the entity has the intent and ability to accept delivery without selling assets. If both conditions are met, the entity should record the loans purchased at cost, net of the standby commitment fee received, on the settlement date. If one or both conditions are not met, or if the entity does not have the intent and ability to take delivery without selling assets, the standby commitment fee (which is essentially a written put option premium) should be reported as a liability. Thereafter, the liability should be reported at the greater of the initial standby commitment fee or the fair value of the written put option, with the unrealized gains or losses included in current operations.

A transfer of servicing rights should only be accounted for as a sale if the transfer qualifies as a sale under ASC 860-50-40, and if (1) the seller has written approval from the investor (if required), (2) the buyer is a currently approved seller/servicer, (3) if a seller-financed sale, the nonrefundable down payment is large enough to demonstrate the buyer's commitment to complete the transaction, and (4) the transferor receives adequate compensation for any temporary servicing it performs. Sales of servicing rights previously sold should be recognized in income consistent with this provision and the requirements under ASC 860.

ASC 942 also addresses a number of other issues. Thus, Federal Home Loan Bank and Federal Reserve Bank stock is to be classified as a restricted investment security, carried at cost, and evaluated for impairment. Also, any delinquency fees are to be recognized in income when chargeable, assuming collectibility is reasonably assured. Prepayment fees are not recognized in income until the loans or trade receivables are prepaid, except as set forth by ASC 310-20. Finally, accrual of interest income should not be affected by the possibility that rebates may be calculated using a method different than the interest method, except as set forth in ASC 310-20.

With regard to financial statement disclosures, ASC 942 requires that the summary of significant accounting policies state the basis of accounting for loans, trade receivables, and lease financings; the method used to determine the lower of cost or market of nonmortgage loans held for sale, the classification and method of accounting for interest-only strips, loans, and other receivables or retained interests in securitizations; and the method for recognizing interest income on loan and trade receivables, including the method of amortizing net deferred fees or costs. The accounting policies note should also describe the criteria for placing loans on nonaccrual status, for charging off uncollectible loans and trade receivables, and for determining past due or delinquency status.

The financial statement notes should include a description of the accounting policies and methodology used to estimate the allowance for loan losses, and any liability for off-balance-sheet credit losses, as well as the related charges for loan, trade receivable, or other credit losses. Aggregate gains or losses on sales of loans or trade receivables should be presented

separately in the financial statements or disclosed in the notes thereto. Major categories of loans or trade receivables should be presented separately either in the balance sheet or the notes, as should the allowance for credit losses, the allowance for doubtful accounts, and any unearned income. Receivables held for sale should be separately reported.

ASC 942 also requires that foreclosed and repossessed assets be reported separately on the balance sheet or disclosed in the notes. The recorded investment in loans and trade receivables on nonaccrual status should be disclosed, as should the amount of loans and trade receivables past due ninety days or more and still accruing.

The amount of securities deposited with state regulatory authorities (if required) should be disclosed. The carrying amount of loans, trade receivables, securities, and financial instruments that serve as collateral for borrowings should also be disclosed.

ASC 815 requires disclosure of the extent, nature, terms, and credit risk of financial instruments, not limited to derivatives with off-balance-sheet credit risk.

Previously, GAAP for banks and savings institutions did not require disclosure of capital requirements for branches of foreign banks, because those branches do not have capital. However, branches are subject to requirements to maintain certain levels of capital-equivalent deposits and may be required to maintain other specified reserves. Since failure to comply with those requirements potentially has an adverse impact on the reporting entity, disclosures about the balance requirements and a branch's compliance are required under ASC 942. Similarly, capital requirements for trust operations are unpublished, are subject to variations of interpretation as between regulatory agencies, and may not be uniformly applied to the trust operations of all institutions. Nonetheless, to the extent that an institution has been advised of an expectation that certain trust-related capital levels be maintained, its compliance with those expectations should be disclosed.

Servicing Assets and Liabilities

Financial institutions often acquire, or retain, servicing rights to financial assets, such as for loans originated and subsequently sold to other institutions or to qualified special-purpose entities. ASC 860-50-35 has significantly altered the accounting for retained or acquired servicing rights, which are now to be recorded, at acquisition, at fair value. If the contractually expected fees and other revenues are expected to exceed the cost of providing the servicing, a servicing asset is recorded; if a shortfall of revenue is expected, a liability is recognized. Subsequent accounting for servicing assets and liabilities can be either by the amortization or the fair value method, with the option to elect one or the other for a given class of financial asset being serviced.

The accounting for servicing is described in detail in Chapter 8.

Cash Flow Statement

Banks, savings institutions, and credit unions are not required to report gross cash receipts and payments for the following:

1. Deposits placed with other financial institutions
2. Withdrawals of deposits
3. Time deposits accepted
4. Repayments of deposits
5. Loans made to customers
6. Principal collections of loans

If an enterprise is part of a consolidated enterprise, net cash receipts and payments of the enterprise should be reported separate from the gross cash receipts and payments of the consolidated enterprise.

Other Accounting Guidance

ASC 815-15-55 addressed whether ADC (acquisition, development and construction) loans were to be accounted for as loans, investments, or interests in a joint venture. It also considered the accounting for a partial sale of an arrangement. These issues were resolved by the issuance of the AICPA Notice to Practitioners, *ADC Arrangements*, which covers ADC arrangements in which the lender expects to participate in residual profit and gives guidance on accounting and reporting concerns.

ASC 310-20-35-13 concluded that, for situations where a lender allows a borrower to make larger payments for some number of periods (at least twelve payments), after which the borrower is then relieved of any remaining obligation, the loss related to the forgiven portion should be accrued over the period of the larger payments.

ASC 860-10-55-60 stated that forward commitment GNMA "dollar rolls" should be marked to market.

In some instances, a reporting entity may sell a loan but retain a share in the interest income, as well as the servicing rights for that loan. ASC 860-50-40-10 mandated that a gain should be recognized upon the sale of mortgage service rights that include participation in the future interest stream of the loans. On another related topic, ASC 860-50-35-18 states that servicing fee rates set by secondary market makers (GNMA, FHLMC, FNMA) should be considered normal for transactions with those agencies.

ASC 860-50-40-7 addresses events in which a mortgage loan servicer (transferor) transfers the servicing rights and related risks to an unaffiliated enterprise (transferee), which then makes a subservicing agreement whereby the transferor services the loans for a fixed fee. Income recognition should be deferred, and treatment as a sale or a financing depends on the circumstances surrounding the transaction. However, this consensus does not apply to temporary subservicing agreements. In addition, a loss should be recognized currently if loan prepayments may result in future servicing losses. When there is such a sale of mortgage servicing rights with a subservicing agreement, ASC 860-50-40 through 860-50-40-10 states that this should be accounted for as a sale if substantially all the risks and rewards of ownership have been transferred to the buyer. If substantially all the risks and rewards have not been transferred, then the transaction must be accounted for as a financing.

Normal servicing fee rates for mortgage loans are those set by federally sponsored secondary market makers (GNMA, FHLMC, FNMA). For transactions with those agencies or for mortgage loans sold to private sector investors where the seller retains servicing rights, normal servicing rates should be considered. In the latter case, a stated servicing fee rate that differs from the normal rate requires adjustment to the sales price to yield the normal rate. In either case, according to ASC 860-50-35-17 through 860-50-35-18, a loss should be accrued if expected servicing costs exceed anticipated fees based on the stated servicing fee rate. If the servicer refinances a mortgage loan and actual prepayments differ from any anticipated payments, then the servicing asset must be adjusted.

ASC 805 states that when a mutual savings and loan association converts to stock ownership and pools with another S&L, its EPS should be excluded from the restated combined EPS for years before the date of conversion. The method of presentation must be disclosed.

ASC 815 addressed equity certificates of deposit, stating that contingent interest expense resulting from equity certificates of deposit be recognized concurrently with gains relating to the assets upon which the equity is given.

Any goodwill resulting from the acquisition of a bank or thrift institution is to be amortized according to ASC 350, prohibiting amortization of goodwill but requiring annual impairment testing.

ASC 260 mandates that neither equity commitment notes nor equity contract notes should be included in earnings per share computations.

ASC 605-20-25-9 holds that a guarantor should recognize loan guarantee fees as revenue over the term of the guarantee. Any direct costs related to the guarantee must be recognized in the same manner. If material, footnote disclosure is required, and the probability of loss should be continually assessed. ASC 460 requires that a liability be recognized, at the inception of a guarantee, for the fair value of the obligation undertaken by the guarantor.

Regarding distribution fees paid by mutual funds not having front-end charges (loads), the cost deferral method should be employed. Under this method, fees expected to be received over some future period should be recognized upon receipt. Deferred incremental direct costs are amortized while indirect costs are expensed as incurred.

RAP basis accounting is no longer used in general-purpose financial statements. ASC 942-740-45-1 states that the Comptroller's Banking Circular 202, which limits the net deferred tax debits allowable on a bank's statement of condition, applies only for regulatory purposes and does not affect GAAP financial statements.

ASC 310-10-25-7 addressed purchased credit card portfolios involving premiums paid to the seller. It held that the excess of the purchase price of a credit card portfolio including cardholder relationships over the amounts due should be allocated between the credit card loans acquired and the cardholder relationships acquired. The premium related to cardholder relationships is an identifiable intangible asset and is amortized over the period of benefit. The premium related to the loans is amortized over the life of the loans.

ASC 942-405-55-1 holds that the savings accounts deposited in a credit union must be unequivocally listed as a liability if the financial statements of the credit union are to comply with the (now superseded) AICPA Credit Union Guide. The statement of financial condition must present savings accounts either as the first item in the liabilities and equity section or as a separate subtotal before total liabilities.

Lending institutions often utilize what formerly were called special-purpose entities (SPEs), and which now may or may not qualify as qualified SPEs (QSPEs) or might be simply variable interest entities (VIEs). A fairly common transaction involves securitizations of credit card receivables, which sometimes have a feature called a "removal of accounts provision" (ROAP) that allows certain accounts to be withdrawn and replaced by other receivables. ASC 860 concluded that credit card securitizations with such a provision should be recognized as sales transactions as long as the removal meets any specified terms, doesn't reduce the interests of the investor in the pool, and doesn't reduce the seller's percentage interest below a contractually specified level. The accounting implications of a ROAP depend on whether it results in the transferor maintaining effective control over the transferred assets. Unconditional ROAPs and those conditioned on a transferor's decision would preclude sale accounting when the receivables are transferred.

On a related topic, ASC 310-20-25-18 stipulated that credit card origination costs that qualify for deferral should be netted against the credit card fee charged, if any, and the net amount should be amortized on a straight-line basis over the term of the credit card or one year, depending on the significance of the fee.

Additionally, for both purchased and originated credit cards, the accounting policies, the net amount capitalized, and the amortization period should be disclosed.

BROADCASTING

PERSPECTIVE AND ISSUES

ASC 920 sets forth accounting and reporting standards for the broadcasting industry. A broadcaster is an enterprise or an affiliated group of enterprises that transmits radio or televi-

sion program material. Broadcasters acquire program exhibition rights through license agreements. A typical license agreement for program material (e.g., features, specials, series, or cartoons) covers several programs (a package) and grants a television station, group of stations, network, pay television, or cable television system (licensee) the right to broadcast either a specified number or an unlimited number of showings over a maximum period of time (license period) for a specified fee. Ordinarily, the fee is paid in installments over a period generally shorter than the license period. The agreement usually contains a separate license for each program in the package. The license expires at the earlier of the last telecast allowed or the end of the license period. The licensee pays the required fee whether or not the rights are exercised. If the licensee does not exercise the contractual rights, the rights revert to the licensor with no refund to the licensee.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
920	Entertainment—Broadcasters

DEFINITIONS OF TERMS

Barter. The exchange of unsold advertising time for products or services.

Broadcaster. An enterprise or an affiliated group of enterprises that transmits radio or television program material.

Daypart. An aggregation of programs broadcast during a particular time of day (e.g., daytime, evening, late night) or programs of a similar type (e.g., sports, news, children's shows).

License agreement for program material. A typical license agreement for program material (e.g., features, specials, series, or cartoons) covers several programs (a package) and grants a television station, group of stations, network, pay television, or cable television system (licensee) the right to broadcast either a specified number or an unlimited number of showings over a maximum period of time (license period) for a specified fee.

Network affiliation agreement. A broadcaster may be affiliated with a network under a network affiliation agreement. Under the agreement the station receives compensation for the network programming that it carries based on a formula designed to compensate the station for advertising sold on a network basis and included in the network programming.

CONCEPTS, RULES, AND EXAMPLES

Accounting for License Agreements

A broadcaster accounts for a license agreement for program material as a purchase of rights. Thus, an asset and a liability are recorded for the program rights purchased and the liability incurred when the license period begins and the broadcaster has met the following requirements:

1. Knows or can reasonably determine the cost of each program
2. Has accepted the program material according to the license agreement
3. Has access to the program for the first telecast (unless an agreement with another licensee prevents the telecast)

The asset is capitalized and the liability reported at either the gross amount of the liability for program rights or, alternatively, at the fair value of the liability. If a present value technique is used to measure fair value, the difference between the gross and net liability must be accounted for as interest. Under either method, the capitalized costs are allocated to each program within a package based on the relative value of each program to the broadcaster.

The asset is separated into current and noncurrent portions based on expected time of program usage. The liability is likewise segregated according to the payment maturities.

Amortizing Capitalized Costs

The capitalized costs are amortized to expense as the program rights are used; generally based on the estimated number of program telecasts. However, licenses granting the right to unlimited broadcasts of programs such as cartoons are amortized over the license period, since the number of telecasts may be indeterminable.

Feature programs and program series require specific treatment. Feature programs are amortized program-by-program, unless amortization as a package produces approximately the same result. Syndicated programs are amortized as a series. If the broadcaster considers the first showing to be more valuable than reruns, the series is amortized using an accelerated method. If each showing is equally valuable, straight-line amortization is used.

Example of accounting for program license agreements

On July 31, 2009, Lakie Media Company executed a license agreement for three movies, which it plans to televise on its local television station. The agreement allows the broadcast of each movie twice during the license period. Lakie is a calendar year-end company. The appropriate rate for imputing interest is 12%. Additional facts and assumptions are as follows:

	License Period			*First telecast*		*Second telecast*	
Film	*From*	*To*	*Film availability date*	*Date*	*% of Total revenue*	*Date*	*% of Total revenue*
A	10/1/09	9/30/11	9/1/09	3/1/10	60%	6/1/11	40%
B	10/1/09	9/30/11	9/1/09	5/1/10	70%	7/1/11	30%
C	11/1/09	8/31/11	10/1/09	6/1/10	75%	8/1/11	25%

Payment terms and discounted present value data are as follows (Films A and B were acquired as a package):

	Payment		*Discount period**	
Film(s)	*Date*	*Amount*	*From*	*To*
A & B	7/31/09	$1,000		
	12/31/09	6,000	10/1/09	12/31/09
	12/31/10	6,000	10/1/09	12/31/10
		13,000		
C	12/31/10	3,750	11/1/09	12/31/10
		$16,750		

* *Discounted from the first day of the license period to the date of payment.*

Based on management's estimates of expected advertising revenues, Film A represents 70% and Film B 30% of the total package A and B.

Present value approach. When each film's license period begins, an asset and a liability are recorded at the present value of the liability. Since the first three payments apply to the package of films A and B, the $12,027 combined present value (see the amortization schedule below) must be allocated to these films according to the 70%/30% assumption stated above.

Film	*Asset and liability recognized*	
A	$ 8,419	($12,027 × 70%)
B	3,608	($12,027 × 30%)
	12,027	
C	3,283	
	$15,310	

In this case, all costs are capitalized in 2009 because all of the films' licensing periods begin in that year (assuming the three conditions are met).

The amount capitalized as an asset is amortized according to the percentage of revenues to be earned each year from each film. Interest is accrued on the unpaid balance of the liability for each

film. Note that for films A and B, the unpaid balance at December 31, 2009, is $11,027 ($12,027 – the $1,000 down payment).

Amortization Schedules—Annual Compounding

Description	Date	Payment	Interest at 12%	Principal	Balance
Films A and B					
Down payment	7/31/09	$ 1,000.00	--	$ 1,000.00	--
Discounted obligation	10/1/09				$11,027.23
Payment	12/31/09	6,000.00	$ 329.91	5,670.09	5,357.14
Payment	12/31/10	6,000.00	642.86	5,357.14	--
		13,000.00	972.77	12,027.23	
Film C					
Original obligation	11/1/09				3,283.44
Accrued interest	12/31/10	--	64.77	(64.77)	3,348.21
Payment	12/31/10	3,750.00	401.79	3,348.21	--
		3,750.00	466.56	3,283.44	
		$16,750.00	$1,439.33	$15,310.67	

	2009	2010	2011	Total
Amortization of film rights				
Film A				
($12,027 × 70% =) $8,419 × 60%		$ 5,051		
($12,027 × 70% =) $8,419 × 40%			$3,368	$ 8,419
Film B				
($12,027 × 30% =) $3,608 × 70%		2,526		
($12,027 × 30% =) $3,608 × 30%			1,082	3,608
				12,027
Film C				
$3,283 × 75%		2,462		
$3,283 × 25%			821	3,283
Total amortization of film rights		$10,039	$5,271	15,310
Interest expense per amortization schedule				
Films A and B	$330	$ 643		973
Film C	65	402		467
	$395	$ 1,045		1,440
				$16,750

Gross method. Costs are capitalized at the gross amount of the liability.

Film	Asset and liability recognized	
A	$ 9,100	($13,000 × 70%)
B	3,900	($13,000 × 30%)
C	3,750	
	$16,750	

Again, since the license period for all the films begins in 2009, the assets and liabilities are recognized in that year.

Under the gross approach, no interest is accrued on the unpaid liability. Thus the only expense recognized is the amortization of the program cost.

	Year of expense recognition				Total
Film	2010		2011		
A	$5,460	(1)	$3,640	(4)	$ 9,100
B	2,730	(2)	1,170	(5)	3,900
C	2,813	(3)	937	(6)	3,750
	$11,003		$5,747		$16,750

(1) $9,100 × 60% (4) $9,100 × 40%
(2) $3,900 × 70% (5) $3,900 × 30%
(3) $3,750 × 75% (6) $3,750 × 25%

Accounting for Network Affiliation Agreements

A broadcaster may be affiliated with a network under a network affiliation agreement. Under the agreement, the station receives compensation for the network programming that it carries based on a formula designed to compensate the station for advertising sold on a network-wide basis and included in the network programming. Program costs, a major expense of television stations, are generally lower for a network affiliate than for an independent station because an affiliate does not incur program costs for network programs.

Upon termination of a network affiliation agreement, immediate replacement, or an agreement to replace the affiliation, the broadcaster will recognize a loss measured by the unamortized cost of the previous affiliation less the fair value of the new affiliation. No gain is recognized if the fair value exceeds the unamortized cost. If the terminated affiliation is not replaced, its unamortized cost is charged to expense.

Accounting for Barter Transactions

Broadcasters may exchange unsold advertising time for products or services. The broadcaster benefits (providing the exchange does not interfere with its cash sales) by exchanging otherwise unsold time for such things as programs, fixed assets, merchandise, other media advertising privileges, travel and hotel arrangements, entertainment, and other services or products. Such transactions are reported at the fair value of the services or products (except when advertising time is exchanged for programs).

Barter revenue is recognized (per EITF 87-10, not included in codification as of late 2008; see ASC 920-845-25 for general guidance) when all of the following conditions are met:

1. Persuasive evidence exists of the advertising arrangement in the form of a noncancelable contract signed by both the broadcaster and the advertiser.
2. The production of the advertising is complete and has been delivered or is available for immediate and unconditional delivery in accordance with the terms of the arrangement.
3. The period of the arrangement has begun and the advertiser is entitled to use the advertising time.
4. The terms of the agreement and any fees involved are fixed and determinable.
5. Collectibility of any cash portion of the arrangement is reasonably assured.

If all of these conditions are satisfied except for the existence of a noncancelable contract, then the advertising revenue is not recognized until the advertising is aired.

The products or services received in exchange for the advertising time are reported when received or used. A liability results if products or services are received in advance of advertising revenue recognition and a receivable results if the advertising revenue is recognized prior to receipt of the products and services.

Reporting and Disclosure

The capitalized cost of program rights is reported in the balance sheet at the lower of unamortized cost or net realizable value. Net realizable value is estimated on a package, series, program-by-program, or daypart basis. Daypart is an aggregation of programs broadcast during a particular time of day (e.g., daytime, evening, late night) or programs of a similar type (e.g., sports, news, children's shows). Broadcasters generally sell access to viewing audiences to advertisers on a daypart basis. If the broadcaster expects the usefulness of a program to diminish, the program may have to be written down from unamortized cost

to estimated net realizable value. This establishes a new cost basis for the program. The write-down is not permitted to be restored in future periods.

Network affiliation agreements are reported in the balance sheet as intangible assets.

CABLE TELEVISION

PERSPECTIVE AND ISSUES

ASC 922 sets forth accounting and reporting standards for the cable television industry. These standards apply to cable television systems in the prematurity period. During the prematurity period, the cable television system is partially under construction and partially in service. The prematurity period begins with the first earned subscriber revenue. Its end will vary with the system's circumstances but will be determined based on plans for completion of the first major construction period or achievement of a specified predetermined subscriber level at which no additional investment will be required for other than cable television plant. The length of the prematurity period varies with the franchise development and construction plans. Except in the smallest systems, programming is usually delivered to portions of the system, and some revenues are obtained before construction of the entire system is complete. Thus, virtually every cable television system experiences a prematurity period during which it is receiving some revenue while continuing to incur substantial costs related to the establishment of the total system.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
922	Entertainment—Cable Television

DEFINITIONS OF TERMS

Cable television plant. The cable television plant refers to the equipment required to render service to subscribers including:

Head-end. This includes the equipment used to receive signals of distant television or radio stations, whether directly from the transmitter or from a microwave relay system. It also includes the studio facilities required for operator-originated programming, if any.

Cable. This consists of cable and amplifiers (which maintain the quality of the signal) covering the subscriber area, either on utility poles or underground.

Drops. These consist of the hardware that provides access to the main cable, the short length of cable that brings the signal from the main cable to the subscriber's television set, and other associated hardware, which may include a trap to block particular channels.

Converters and descramblers. These devices are attached to the subscriber's television sets when more than twelve channels are provided or when special services are provided, such as "pay cable" or two-way communication.

Direct selling costs. Direct selling costs include commissions, the portion of a salesperson's compensation other than commissions for obtaining new subscribers, local advertising targeted for acquisition of new subscribers, and costs of processing documents related to new subscribers acquired. Direct selling costs do not include supervisory and administrative expenses or indirect expenses, such as rent and other facilities costs.

Subscriber-related costs. Costs incurred to obtain and retain subscribers including costs of billing and collection, bad debts, and mailings; repairs and maintenance of taps and connections; franchise fees related to revenues or number of subscribers; general and administrative system costs, such as salary of the system manager and office rent; programming

costs for additional channels used in the marketing effort or costs related to revenues from, or number of subscribers to, per channel or per program service; and direct selling costs.

CONCEPTS, RULES, AND EXAMPLES

Accounting during the Prematurity Period

Before the first subscriber revenue is earned by the cable company, the beginning and end of the prematurity period must be established by management. This period generally will not exceed two years. Once the prematurity period has been established, it may not be changed except in extraordinary circumstances.

Separate accounting is required for any portion[1] of a cable television system that is in the prematurity period and that is distinct from the rest of the system. This distinction is made if the portion is characterized by a majority of the following differences:

- Accountability (e.g., separate forecasts, budgets, etc.)
- Investment decisions (e.g., separate ROI, breakeven, etc.)
- Geographical (e.g., separate franchise area)
- Mechanical (e.g., separate equipment)
- Timing (e.g., separate inception of construction or marketing)

If the portion meets these requirements, it will be charged costs of the entire system only if these costs are directly traceable to that portion. Separate projections are also developed for that portion.

During the prematurity period, costs incurred for the plant are capitalized as usual. General and administrative expenses and subscriber-related costs are considered period costs. Subscriber-related costs are costs incurred to obtain and retain subscribers to the cable television system.

System costs that will benefit the cable system upon completion (e.g., programming costs), and that will remain fairly constant despite changes in the number of subscribers, are separated into amounts benefiting current operations (which are expensed currently) and amounts allocable to future operations (which are capitalized). The amount to be currently expensed is determined by multiplying the total monthly system costs by a fraction calculated each month during the prematurity period as follows:

Current portion of system costs benefiting future periods =

Numerator: Greatest of
a) Average # of subscribers expected that month as estimated at beginning of prematurity period,
b) Average # of subscribers assuming straight-line progress towards estimated # of subscribers at end of prematurity period, or
c) Average # of actual subscribers

Denominator: Total # of subscribers expected at end of prematurity period

During the prematurity period, interest cost is capitalized using an interest capitalization rate as described in ASC 835-20. The amount of interest cost to be capitalized is determined as follows:

$$\text{Interest cost capitalized} = \text{Interest capitalization rate} \times \text{Average amount of qualifying assets during the period}$$

FAS 34 defines qualifying assets. The amount of capitalized interest cost may not exceed actual interest cost for the period.

---

[1] *The word "segment" has been used by some television enterprises. However, since ASC 280 uses segment in a different context, the FASB uses the word "portion" instead of "segment" to refer to the part of a cable television system that is still in the prematurity period.*

Depreciation and amortization during the prematurity period are determined as follows:

Depreciation and amortization expense	=	Monthly depreciation and amortization, of total capitalized costs expected on completion of the prematurity period (using depreciation method to be used at completion of prematurity period)	×	Fraction used to determine monthly system costs to be expensed currently

Amortization

Amortizable life for portions built at different times. Costs that have been capitalized for a portion of a cable television system that is in the prematurity period and that are clearly distinguishable on the basis of differences in timing between construction of that portion and the rest of the system are amortized over the same depreciation period used by the main cable plant.

Installation revenues and costs. A cable television system recognizes initial hookup revenue to the extent of the direct selling costs associated with that revenue. Any excess over the direct selling costs is deferred and amortized to income over the average period that subscribers are expected to be connected to the system.

Initial installation costs are capitalized and depreciated over a period that does not exceed the period used to depreciate the cable plant. After the initial installation, any costs incurred to disconnect or reconnect subscribers are charged to expense as incurred.

Franchise application costs. A cable television franchise is a right granted by a municipality to provide service to its residents. The treatment of franchise application costs depends upon whether or not the application is successful. If successful, the application costs are capitalized and amortized as intangible assets over the life of the franchise agreement. If unsuccessful or abandoned, all application costs are charged to expense.

Impairment. Capitalized plant and amortizable intangible assets are subject to the impairment provisions outlined in ASC 360 (discussed in detail in Chapter 11). Any of the system's intangible assets deemed to have an indefinite life are tested for impairment at least annually under the provisions of ASC 350. A separate evaluation is made for portions of the cable television system that are in their prematurity period. If total capitalized costs reach the maximum recoverable amount, capitalization continues. However, the provision to record an impairment loss to reduce capitalized costs to recoverable value is increased.

COMPUTER SOFTWARE DEVELOPERS

PERSPECTIVE AND ISSUES

As technology has come to play a more important role in businesses, increasing levels of activity have been devoted to the development of computer software. This involves a number of undertakings.

- Software licensed, purchased, or leased from others for internal use
- Software obtained from others for resale in the normal course of business (either on a stand-alone basis or as part of a larger product)
- Software developed internally for sale to others
- Software developed internally for the developer's own use

Software can be licensed, purchased, or leased and can reside on the user's hardware or be "hosted" by an application service provider (ASP) and leased to the user for remote use over the Internet. A growing set of accounting standards deal with some, but not all, of these issues.

The accounting for the cost of software developed internally for sale (or lease, etc.) to others is addressed by ASC 985-605; it provides that costs incurred prior to the point at which technological feasibility has been demonstrated are to be expensed as research and

development costs, but specified costs incurred subsequently are capitalized, and later amortized or expensed (e.g., as cost of sales) as appropriate.

The cost of software acquired from others for resale in the normal course of business is not separately addressed by GAAP, but would be handled as are any other inventory costs. The usual inventory costing methods (LIFO, FIFO, etc.) and financial reporting concerns (lower of cost or market, etc.) are applicable to such situations.

ASC 350-40 addresses accounting for the costs of software acquired from others, or developed internally, for internal use. Internal-use software and the related rules regarding costs of developing Web sites are discussed in connection with the discussion of intangible assets in Chapter 11. This standard establishes the conditions that must be met before internal use software costs are capitalized. To qualify for capitalization, costs must have been incurred subsequent to the completion of the conceptual formulation, design and testing of possible project alternatives (including the process of vendor selection for purchased software). In addition, management at the appropriate level of authority must have authorized funding for the development project and conclude that it is probable that the project will be completed and the software will be used to perform the intended functions. This prerequisite is roughly analogous to the "technological feasibility" threshold prescribed by ASC 985 for software to be sold or leased to customers. Costs that are eventually capitalized under ASC 350-40 will be amortized over the period of expected economic benefit, as is the case with all other long-lived assets used in the business.

The increasingly central role of technology has received the attention of accounting standard setters in another arena as well. For enterprises that sell computer software and associated goods and services (program upgrades, maintenance agreements, etc.), complicated issues of revenue recognition arise.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue	
605-35	Revenue—Construction-Type and Production-Type Contracts
Expenses	
720-45	Business and Technology Reengineering
Industry	
985-605	Software—Revenue Recognition

DEFINITIONS OF TERMS

Coding. Generating detailed instructions in a computer language to carry out the requirements described in the detail program design. The coding of a computer software product may begin prior to, concurrent with, or subsequent to the completion of the detail program design.

Customer support. Services performed by an enterprise to assist customers in their use of software products. Those services include any installation assistance, training classes, telephone question and answer services, newsletters, on-site visits, and software or data modifications.

Detail program design. The specifications of a computer software product that take product functions, features, and technical requirements to their most detailed, logical form and enables coding of the product.

Maintenance. Activities undertaken after the product is available for general release to customers to correct errors (commonly referred to as "bugs") or keep the product updated with current information. Those activities include routine changes and additions.

Product design. A logical representation of all product functions in sufficient detail to serve as product specifications.

Product enhancement. Improvements to an existing product that are intended to extend the life or improve significantly the marketability of the original product. Enhancements normally require their own product design and may require a redesign of all or part of the existing product.

Product masters. A completed version, ready for copying, of the computer software product, the documentation, and the training materials that are to be sold, leased, or otherwise marketed.

Testing. Performing the steps necessary to determine whether the coded computer software product meets function, feature, and technical performance requirements set forth in the product design.

Working model. An operative version of the computer software product that is completed in the same software language as the product to be ultimately marketed, performs all the major functions planned for the product, and is ready for initial customer testing (usually referred to as **beta testing**).

CONCEPTS, RULES, AND EXAMPLES

Costs of Software Developed Internally for Sale or Lease

A separate set of accounting issues arise in connection with the costs of computer software developed internally for lease or sale to others. The principal issue relates to the point in the development process at which development efforts are no longer characterized as research and development (R&D). The costs of R&D activities are required to be expensed currently as discussed in Chapter 11. The determination of this milestone has important accounting significance because specified costs incurred subsequent to the completion of R&D may be deferred (i.e., inventoried) and later reclassified as cost of sales as the finished products are sold or leased.

ASC 985 established the concept of technological feasibility to demarcate the point at which it is proper to begin to defer costs. According to this standard, all costs of development are considered research and development costs until technological feasibility has been established. This point is reached when all the necessary planning, designing, coding, and testing activities have been completed, to the extent these activities are necessary to establish that the product in question can meet its design specifications. Design specifications, in turn, may include such product aspects as functions, features, and technical performance requirements.

If the process of creating the software involves a detail program design, evidence of having achieved technological feasibility includes having performed these steps

1. The product design (the logical representation of the product) and detailed program design have been completed. This step includes having demonstrated that the necessary skills, hardware, and software technologies are accessible to the entity for completion of product development.
2. The detailed program design has been documented and traced to product specifications, thus demonstrating completeness and consistency.
3. The detailed program design has been reviewed for any high-risk elements, such as unproven functions or product innovations, and any such high-risk elements have been resolved through coding and testing.

If the software development effort does not involve creation of a detailed program design, then the following steps would require completion to demonstrate technological feasibility:

1. A product design and working model of the software have been completed.
2. The completeness of the working model and its consistency with the product design have been confirmed by testing.

If all the foregoing steps in either of the above listings have been completed as applicable, then technological feasibility has been demonstrated, and qualifying costs of producing product masters incurred thereafter are capitalized as production costs. Such costs include additional coding and testing activities that occur after the establishment of technological feasibility. The costs of producing product masters include not only the master copy of the software itself but also related user documentation and training materials. In the nonauthoritative opinion of the FASB Staff, capitalized production costs may include allocated indirect costs (e.g., occupancy costs related to programmers). This practice is inconsistent, however, with GAAP for software developed for internal use which prohibits such allocations (see Chapter 11).

Capitalization of software costs ceases once the product is available for general release to customers of the entity. Period costs, such as maintenance and ongoing customer support efforts, are expensed as incurred.

The capitalized production costs must be amortized, beginning when the product is first available for general release to customers. Amortization is computed on a product-by-product basis, which means that costs related to development of earlier products cannot be "rolled forward" into the costs of newer products, thereby delaying expense recognition. Periodic amortization must be the greater of (1) an amount determined with reference to total estimated revenues to be generated by the product, or (2) an amount computed on a straight-line basis with reference to the product's expected life cycle.

Example of amortization of capitalized computer software development costs

Assume total costs of $30,000 have been capitalized at the point product sales begin. Management estimates that the product will eventually generate revenues of $5,100,000 over a period of four years. For the current period (1/2 of a year), revenues of $600,000 have been earned. Capitalized costs of $3,750 must be amortized, which is the greater of the pro rata amount based on estimated total revenues to be derived from product sales [($600,000 ÷ $5,100,000) × $30,000 = $3,529] or the amount determined on a straight-line basis ($30,000 ÷ 4 × 1/2 = $3,750).

Other costs, such as product duplication, training material publication, and packaging, are capitalized as inventory on a unit-specific basis and expensed as cost of sales when product sales revenues are recognized.

Capitalized production costs are subject to annual evaluation for net realizable value; if impairment adjustments are recognized, the written-down amount becomes the new cost basis for further amortization purposes, as well as for comparison to net realizable value in the following period.

Capitalized inventory costs are subject to the same lower of cost or market evaluation as is required for inventories of tangible goods (see Chapter 9).

Software Revenue Recognition

The basic principles underlying ASC 985-605 are set forth in the following paragraphs.

Licensing vs. sales. AcSEC was concerned that transfers of rights to software by licenses rather than by outright sales (a technique widely employed to provide vendors with legal recourse when others engage in unauthorized duplication of their products) were being accounted for differently. It concluded that any legal distinction between a license and a sale should not cause revenue recognition to differ.

Product may not equate with delivery of software. Arrangements to deliver software, whether alone or in conjunction with other products, often include services. Services to be

provided in such contexts commonly involve significant production, modification, or customization of the software. Thus, physical delivery of the software might not constitute the delivery of the final product contracted for, absent those alterations, resulting in the requirement that such arrangements be accounted for as construction-type or production-type contracts in conformity with ASC 605-35. However, if the services do not entail significant production, modification, or customization of the software, the services are accounted for as a separate element.

Delivery is the key threshold issue for revenue recognition. This is consistent with the principles set forth in CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*, which states that

> *An entity's revenue-earning activities involve delivering or producing goods, rendering services, or other activities that constitute its ongoing major or central operations, and revenues are considered to have been earned when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues. . . [t]he two conditions (being realized or realizable and being earned) are usually met by the time the product or merchandise is delivered. . . to customers, and revenues. . . are commonly recognized at time of sale (usually meaning delivery).*

Revenue must be allocated to all elements of the sales arrangement, with recognition dependent upon meeting the criteria on an element-by-element basis. Under prior GAAP, the accounting for vendor obligations remaining after delivery of software was dependent upon whether or not the obligation was deemed to be significant. Under ASC 985-605, however, all obligations are accounted for and revenue is allocated to each element of the arrangement, based on vendor-specific objective evidence (VSOE) of the fair values of the elements. Revenue associated with a particular element is not recognized until the revenue-recognition conditions established by the SOP are met, as the earnings process related to that element will not be considered complete until that time.

Fair values for revenue allocation purposes must be vendor-specific. When there are multiple elements of an arrangement, revenue is generally recognized on an element-by-element basis as individual elements are delivered. Revenue is allocated to the various elements in proportion to their relative fair values. Under ASC 985-605, this allocation process requires that VSOE of fair value be employed, regardless of any separate prices stated in the contract for each element, since prices stated in a contract may not represent fair value and, accordingly, might result in an unreasonable allocation of revenue. This approach is consistent with the accounting for commingled revenue as set forth in the current standard on accounting for franchise fee revenue. The use of surrogate prices, such as those published by competitors or industry averages, was rejected because of the wide differences in products and services offered by vendors. Separate transaction prices for the individual elements comprising the arrangement, if they are also being sold on that basis, would be the best such evidence, although under some circumstances (such as when prices in the arrangement are based on multiple users rather than the single user pricing of the element on a stand-alone basis) even that information could conceivably be invalid for revenue allocation purposes. Relative sales prices of the elements included in the arrangement are to be used whenever possible.

The earnings process is not complete if fees are subject to forfeiture. Even when elements have been delivered, if fees allocated to those elements are subject to forfeiture, refund, or other concession if the vendor does not fulfill its delivery responsibilities relative to other elements of the arrangement, those fees are not treated as having been earned. The potential concessions are an indication that the customer would not have licensed the delivered elements without also licensing the undelivered elements. For that reason, there must be

persuasive evidence that fees allocated to delivered elements are not subject to forfeiture, refund, or other concessions before revenue recognition can be justified. Thus, for example, in determining the persuasiveness of the evidence, the vendor's history of making concessions that were not required by the provisions of an arrangement is more persuasive than are terms included in the arrangement that indicate that no concessions are required.

Operational Rules Established by ASC 985-605

1. If an arrangement to deliver software or a software system, either alone or together with other products or services, requires significant production, modification, or customization of software, the entire arrangement is accounted for in conformity with ARB 605-35.
2. If the arrangement does not require significant production, modification, or customization of software, revenue is recognized when all of the following criteria are met:
   a. Persuasive evidence of an arrangement exists;
   b. Delivery has occurred;
   c. The vendor's fee is fixed or determinable; and
   d. Collectibility is probable.
3. For software arrangements that provide licenses for multiple software deliverables (multiple elements), some of which may be deliverable only on a when-and-if-available basis, these deliverables are considered in determining whether an arrangement includes multiple elements. The requirements with respect to arrangements that consist of multiple elements are applied to all additional products and services specified in the arrangement, including those described as being deliverable only on a when-and-if-available basis.
4. For arrangements having multiple elements, the fee is allocated to the various elements based on VSOE of fair value, regardless of any separate prices stated for each element within the contract. VSOE of fair value is limited to the following:
   a. The price charged when the same element is sold separately; or
   b. For an element not yet being sold separately, the price established by management, if it is probable that the price, once established, will not change before the separate introduction of the element into the marketplace.

   The revenue allocated to undelivered elements cannot later be adjusted. However, if it becomes probable that the amount allocated to an undelivered element of the arrangement will result in a loss on that element, the loss must be immediately recognized. When a vendor's pricing is based on multiple factors such as the number of products and the number of users, the amount allocated to the same elements when sold separately must consider all the relevant factors of the vendor's pricing structure.

   In ASC 985-605, multiple-element arrangements are not accounted for as long-term construction contracts when (1) there is VSOE of the fair values of all undelivered elements, (2) VSOE does not exist for one or more of the delivered elements, and (3) all other revenue recognition criteria have been satisfied. In such cases, the newly defined "residual" method of allocation of selling price is to be utilized. This results in deferral of the aggregate fair value of the undelivered elements of the arrangement (to be recognized later as delivery occurs), with the excess of the total arrangement fee over the deferred portion being recognized in connection with the delivered components. This change was made to accommodate the situation whereby software is commonly sold with one "free" year of support,

where additional years of support are also marketed at fixed prices; in this case, the fair value of the "free" support is deferred (and amortized over the year), while the software itself is assigned a revenue amount which is the difference between the package price and the known price of one year's support.

5. If a discount is offered in a multiple-element arrangement, a proportionate amount of the discount is applied to each element included in the arrangement, based on each element's fair value without regard to the discount. However, no portion of the discount is allocated to any upgrade rights.
6. If sufficient VSOE does not exist for the allocation of revenue to the various elements of the arrangement, all revenue from the arrangement is deferred until the earlier of the point at which (1) such sufficient VSOE does exist, or (2) all elements of the arrangement have been delivered. The exceptions to this guidance, provided in ASC 985-605, are as follows:

   a. If the only undelivered element is postcontract customer support (PCS), the entire fee is recognized ratably over the contractual PCS period, or when the PCS rights are implicit in the arrangement, over the period that PCS is expected to be provided to the customer.
   b. If the only undelivered element is services that do not involve significant production, modification, or customization of the software (e.g., training or installation), the entire fee is recognized over the period during which the services are expected to be performed.
   c. If the arrangement is in substance a subscription, the entire fee is recognized ratably over the term of the arrangement, if stated, otherwise over the estimated economic life of the products included in the arrangement.
   d. If the fee is based on the number of copies delivered, how the arrangement is accounted for depends on whether the total fee is fixed, and on whether the buyer can alter the composition of the copies to be received, as follows:

      (1) If the arrangement provides customers with the right to reproduce or obtain copies of two or more software products at a specified price per copy (not per product) up to the total amount of the fixed fee, an allocation of the fee to the individual products generally cannot be made, because the total revenue allocable to each software product is unknown at inception and depends on subsequent choices to be made by the customer and, sometimes, on future vendor development activity. Nevertheless, certain arrangements that include products that are not deliverable at inception impose a maximum number of copies of the undeliverable product(s) to which the customer is entitled. In such arrangements, a portion of the arrangement fee is allocated to the undeliverable product(s). This allocation is made assuming that the customer will elect to receive the maximum number of copies of the undeliverable product(s).

      (2) In arrangements in which no allocation can be made until the first copy or product master of each product covered by the arrangement has been delivered to the customer, and assuming the four conditions set forth above are met, revenue is recognized as copies of delivered products are either (a) reproduced by the customer, or (b) furnished to the customer if the vendor is duplicating the software. Once the vendor has delivered the product master or the first copy of all products covered by the arrangement, any previously unrecognized licensing fees are recognized, since only duplication of the software is required to satisfy the vendor's delivery requirement

and such duplication is incidental to the arrangement. Consequently, the delivery criterion is deemed to have been met upon delivery to the customer of the product master or first copy. When the arrangement terminates, the vendor recognizes any licensing fees not previously recognized. Revenue is not recognized fully until at least one of the following conditions is met: either (a) delivery is complete for all products covered by the arrangement, or (b) the aggregate revenue attributable to all copies of the software products delivered is equal to the fixed fee, provided that the vendor is not obligated to deliver additional software products under the arrangement.

(3) The revenue allocated to the delivered products is recognized when the product master or first copy is delivered. If, during the term of the arrangement, the customer reproduces or receives enough copies of these delivered products so that revenue allocable to the delivered products exceeds the revenue previously recognized, the additional revenue is recognized as the copies are reproduced or delivered. The revenue allocated to the undeliverable product(s) is reduced by a corresponding amount.

7. The portion of the fee allocated to a contract element is recognized when the four revenue recognition criteria are met with respect to the element. In applying those criteria, the delivery of an element is considered not to have occurred if there are undelivered elements that are essential to the functionality of the delivered element, because functionality of the delivered element is considered to be impaired.
8. No portion of the fee can be deemed to be collectible if the portion of the fee allocable to delivered elements is subject to forfeiture, refund, or other concession if any of the undelivered elements are not delivered. If management represents that it will not provide refunds or concessions that are not required under the provisions of the arrangement, this assertion must be supported by reference to all available evidence. This evidence may include the following:
   a. Acknowledgment in the arrangement regarding products not currently available or not to be delivered currently;
   b. Separate prices stipulated in the arrangement for each deliverable element;
   c. Default and damage provisions as defined in the arrangement;
   d. Enforceable payment obligations and due dates for the delivered elements that are not dependent on the delivery of future deliverable elements, coupled with the intent of the vendor to enforce rights of payment;
   e. Installation and use of the delivered software; and
   f. Support services, such as telephone support, related to the delivered software being provided currently by the vendor.

Other Accounting Guidance

As a complex and still evolving area, the use of technology in general, and computer software in particular have created many accounting concerns.

Both software developers and motion picture companies engage in development of software products that combine entertainment (e.g., including well-known cartoon characters and film storylines in the software) and education. The term "edutainment" has been coined to refer to these hybrid products. Diversity in accounting practice had arisen whereby different companies engaged in edutainment development were using different combinations of GAAP to account for the same activities.

In ASC 985-705-S99 the SEC staff announced that

1. Entertainment and educational products developed for sale or lease, or that are otherwise marketed are to be accounted for under ASC 985-20.
2. Costs subject to ASC 985-20 accounting include film costs incurred in the development of the product that would otherwise be accounted for under ASC 926 (discussed later in this chapter).
3. Exploitation costs (marketing, advertising, publicity, promotion, and other distribution expenses) are to be expensed as incurred unless they qualify for capitalization as direct response advertising under ASC 340-20.

The SEC announcement should be deemed the most meaningful guidance on this topic.

In ASC 720-45-25, all expenditures incurred for business process reengineering activities (either by insiders or outsiders) are to be expensed as incurred. This guidance also applies when business process reengineering activities are part of development or implementation of internal-use software. Finally, the accounting for internal-use software development and acquisition of property, plant, and equipment are not affected by this consensus.

ASC 45-25 also states that, in cases where a third party is engaged for a business process reengineering project, the entire consulting contract price is to be allocated to each activity on the basis of the relative fair values of the separate components.

Some software users do not actually receive and load applications software on their computers, but instead merely access and use it via the Internet, on the vendor's or a third party's server, on an as-needed basis. (Commonly, the applications are "hosted" by companies known as application service providers, or ASPs.) In such arrangements, the customer is paying for two elements—the right to use the software and the storage of the software (and sometimes, the customer's proprietary data) on the provider's hardware. ASC 985-605 has addressed certain concerns arising in such circumstances.

When a vendor provides hosting, several revenue recognition issues may arise. First, the relationship between the customer and the ASP may be structured in the form of a service agreement providing Internet access to the specified site, without a corresponding software license. In such instances, the application of ASC 985-605 to the arrangement was unclear. Second, when the transaction is structured as a software license with a service element, evaluation of how the arrangement meets the delivery requirement of ASC 985-605 was unclear.

ASC 985-605 only applies if the customer has the right to take possession of the software at any time during the hosting period, without significant penalty, and install the software on its own hardware or contract with another service provider to host it. Most, if not all, ASP arrangements would not provide this option to the customer and therefore ASC 985-605 would not apply.

For those few hosting arrangements meeting the foregoing criteria, and thus subject to ASC 985-605, software delivery is deemed to have occurred when the customer first has the option to take possession. The criteria of ASC 985-605 must be met in order for the ASP to recognize revenue allocable to the software element; revenue relating to the hosting element is recognized as that service is provided.

Finally, ASC 985-605 provides authoritative guidance regarding the amounts and timing of revenue recognition in transactions involving the sale or license of computer software. Such transactions are often structured to bundle other software-related "elements" with the software such as future upgrades, postcontract customer support (PCS), training, customization, or other services. Those bundled arrangements are referred to as multiple-element arrangements (MEA).

ASC 985-605-15-3 states that in an MEA that includes software that is "more than incidental" to the arrangement, ASC 985-605 applies to the software-related elements enumerated above as well as any nonsoftware element for which the software element is essential to its functionality.

EMPLOYEE BENEFIT PLANS, INCLUDING PENSION FUNDS

PERSPECTIVE AND ISSUES

Employee benefit plans have become increasingly important and diverse. Using assets that are segregated from the plan sponsor, they provide benefits to employees and former employees in accordance with a plan agreement. The provisions of the plan agreement deal with such matters as eligibility, entitlement to benefits, funding, plan amendments, operation and administration, allocation of responsibilities among the fiduciaries, and fiduciaries' ability to delegate duties. A few examples of employee benefit plans are pension plans, profit-sharing plans, stock bonus plans, 401(k) plans, 403(b) plans, disability plans, health care plans, life insurance plans, unemployment benefit plans, tuition assistance plans, dependent care plans, and cafeteria/flexible benefit plans. For accounting and reporting purposes, the plans are divided into three major types: defined benefit pension plans, defined contribution pension plans, and health and welfare benefit plans.

Employee benefit plans that are sponsored by and provide benefits to the employees of state and local governmental entities[2] are outside of the scope of this publication. Readers instead should refer to the Wiley publication, *GAAP for Governments*.

All authoritative pronouncements in the GAAP hierarchy apply to employee benefit plans unless the pronouncement specifically excludes them from its scope. Certain authoritative pronouncements apply specifically to employee benefit plans. Because those pronouncements are particularly relevant to the transactions of employee benefit plans, they are discussed in this chapter.

ASC 960, *Plan Accounting—Defined Benefit Pension Plans*, is the principal standard involving the accounting and reporting of employee benefit plans. ASC 960 applies only to ongoing plans, not to plans that are terminated or expected to be terminated. The codification describes the objectives of plan financial statements and the necessary components of a complete set of plan financial statements.

ASC 230-10-15 exempts defined benefit pension plans and certain other employee benefit plans from ASC 230's requirement to present a statement of cash flows.

ASC 960-325-35 requires defined benefit pension plans to report all investment contracts, including guaranteed investment contracts issued by insurance companies, at fair value. Only contracts that incorporate mortality or morbidity risk (insurance contracts) may be reported at contract value.

ASC 960, ASC 962, and ASC 965 set standards for defined benefit pension plans, defined contribution pension plans, and health and welfare benefit plans, respectively. In addition to providing accounting and reporting guidance for the plans, they provide summaries of statutory rules and regulations applicable to employee benefit plans and illustrative financial statements.

ASC 965, *Plan Accounting—Health and Welfare Benefit Plans,* provides the standards for health and welfare benefit plans. It divides the diverse universe of plans into two major types: defined benefit health and welfare plans and defined contribution health and welfare plans. It requires defined benefit health and welfare plans to use certain provisions of ASC

---

[2] *See Chapter 1, Researching GAAP Matters, for a definition of "governmental entity."*

715, to measure benefit obligations. In addition, it applies many of the measurement and disclosure provisions of ASC 960 to health and welfare plans.

ASC 965-205-05 specifies the accounting for and disclosure of 401(h) features of defined benefit pension plans that offer medical benefits to retirees in addition to the normal retirement benefits.

This section presents a highly summarized discussion of accounting and reporting standards by employee benefit plans. Readers who desire a more in-depth discussion should refer to the Wiley publication, *GAAP for Employee Benefit Plans.*

This chapter does not describe an employer's requirements for reporting information about employee benefit plans. That information is described in Chapter 18.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Presentation	
230-10-15	Statement of Cash Flows

Industry	
960	Plan Accounting—Defined Benefit Pension Plans
965	Plan Accounting—Health and Welfare Benefit Plans

DEFINITIONS OF TERMS

Accumulated plan benefits or **benefit obligations.** Benefits that are attributable to services rendered by employees before the date at which the actuarial present value of the plan obligation is computed.

Defined benefit plan. A plan that promises stated or otherwise determinable benefits to participants based on factors such as compensation, years of service, and age.

Defined contribution plan. A plan in which benefits are based on amounts contributed, investment experience, and allocated forfeitures, net of administrative expenses. Each participant's benefits are computed based on his or her individual account.

Health and welfare benefit plan. Plans that provide benefits such as medical, dental, visual, or other health care, insurance, disability, vacation, education, or dependent care.

Net assets. The residual interest in the assets of an employee benefit plan that remains after deducting its liabilities. The liabilities of a plan do not include its accumulated plan benefits (defined benefit pension plans) or its benefit obligation (defined benefit health and welfare plans).

Plan sponsor. The company, association, employee group, or other group of representatives that established or maintains the plan.

CONCEPTS, RULES, AND EXAMPLES

In addition to varying by basic type (defined benefit plan, defined contribution plan, and health and welfare benefit plan), employee benefit plans vary by operating and administrative characteristics. Plans established by one employer or a group of controlled corporations are referred to as single employer plans. Alternatively, they can include the employees of many employers who are related in some way, often by all being parties to a collective-bargaining agreement. Those plans are referred to as multiemployer plans. A plan can be either contributory or noncontributory. A contributory plan requires both the employer and the participants to fund (contribute to) the cost of the future benefits. In a noncontributory plan, the participants do not fund any part of the cost of the future benefits. Insured plans are funded through insurance contracts. Self-funded plans are funded through contributions and

investment return. Split-funded plans are funded by a combination of insurance contracts, contributions, and investment return.

Complete Set of Financial Statements

The primary objective of a plan's financial statements is to provide the information necessary to assess the plan's ability to pay benefits when due. Thus, financial statements are to include information about the plan's resources, the results of transactions and events that changed the plan's resources, the stewardship of management over the plan's resources, and any other facts necessary to understand the information provided.

A complete set of financial statements includes a statement of net assets available for benefits as of the end of the plan year (balance sheet equivalent), a statement of changes in net assets available for benefits for the plan year ended (income statement equivalent), and notes to the financial statements. In addition, defined benefit plans must include information about the actuarial present value of accumulated benefits and changes in the accumulated benefits. That information can appear either as additional financial statements or in the notes to financial statements.

ASC 230-10-15 exempted defined benefit pension plans from the requirement that a statement of cash flows be provided. Other employee benefit plans were also exempted if they report similar to defined benefit pension plans, including ASC 960's requirement to report plan investments at fair value. Although not required, presentation of a statement of cash flows is encouraged if it would provide useful information about the plan's ability to pay future liabilities, as would be the case if the plan either holds illiquid investments or purchases investments using borrowed funds.

ASC 220-10-15 requires that changes in equity other than transactions with owners be reported in financial statements in the period in which they are recognized. The statement of changes in net assets available for benefits is a comprehensive income statement because all changes in net assets available for benefits are reflected in that statement. Thus, although it did not specifically exempt employee benefit plans from its provisions, the codification did not change the reporting for employee benefit plans.

Statement of Net Assets Available for Benefits

Most investments of the plan are reported at fair value. If there is an active market, quoted market prices are used. If market quotations are not available, investments are valued "in good faith" by the plan's trustees and administrator. The selling price of similar investments or discounted cash flows can be useful in estimating fair value. The use of an independent expert may be necessary for the valuation of certain investments. Investment contracts with an insurance company, bank, or other financial institution are reported at fair value. Only insurance contracts—contracts that incorporate mortality or morbidity risk (defined benefit pension plans) or that are fully benefit-responsive (defined contribution plans and health and welfare plans)—may be reported at contract value, and then only if the plan reports at contract value in its annual report filed with government agencies. The financial statements are to identify plan investments by type of investment and indicate how fair value was determined. It is not necessary to disclose the original cost of investments in the basic financial statements. Plans are to disclose in the notes to the financial statements any investments representing 5% or more of the net assets available for benefits as of the end of the year.

Contributions receivable include those due as of the reporting date from participants, employers, withdrawing employers of a multiemployer plan, and other sources (such as a state or federal government in the case of a grant or subsidy). Receivables arise from formal

commitments of an employer, legal requirements, or contractual requirements. The receivables are to be reduced by an allowance for uncollectible amounts if warranted.

Long-lived assets (such as buildings, equipment, furniture and fixtures, and leasehold improvements) that are used in the plan's operations are presented at cost less accumulated depreciation or amortization.

Statement of Changes in Net Assets Available for Benefits

The statement of changes in net assets available for benefits is a comprehensive income statement that includes all recognized transactions and events that change the net assets available for benefits. At a minimum, the statement is to include separate amounts for

1. Contributions from
   a. Employer(s)—separating cash from noncash contributions
   b. Participants, including those transmitted by the plan sponsor
   c. Other identified sources
2. Net appreciation or depreciation (realized and unrealized amounts may be combined) in fair value for each significant class of investment, presented by
   a. Investments measured by quoted market prices
   b. Investments measured by some other means
3. Investment income (not including appreciation or depreciation in fair value)
4. Payments to plan participants for benefits, excluding amounts paid by insurance contracts that are not included in plan assets
5. Payments to insurance companies to purchase contracts that are excluded from plan assets
6. Administrative expenses
7. Other changes, if necessary, with appropriate description(s)

Transactions with Related Parties (ASC 850)

Transactions between a plan sponsor and its employee benefit plans are subject to the disclosure requirements of ASC 850, *Related-Party Disclosures.* The required disclosures include

1. The nature of the relationship
2. A description of the transactions for each of the periods in which a statement of changes in net assets available for benefits is presented
3. The dollar amounts of transactions for each of the periods in which a statement of changes in net assets available for benefits is presented
4. The effects of any change from the prior period in the method of establishing terms of the transaction
5. The amounts due from related parties at the date of each statement of net assets available for benefits

The disclosures are not permitted to represent that transactions were made at arm's length unless such representations can be substantiated.

Risks and Uncertainties

Employee benefit plans must disclose the information required by ASC 275, *Risks and Uncertainties.* Risks that are unique to employee benefit plans include

1. A significant industry downturn that could cause employees to retire early in order to avoid being laid off, especially if the plan's participants are concentrated within a particular industry or with a single employer
2. Likelihood that an employer will significantly increase pension or health and welfare benefits in order to avoid a union walkout
3. A planned downsizing that is expected to offer early retirement to employees
4. Investments in the stock of the employer

Defined Benefit Plans

In addition to the statement of net assets available for benefits and the statement of changes in net assets available for benefits, defined benefit pension plans must provide information about the actuarial present value of accumulated plan benefits and changes in the actuarial present value of accumulated plan benefits. The information can be included as separate financial statements or as schedules in the notes to the financial statements.

Accumulated plan benefits include the present value of future benefits to retired or terminated employees or their beneficiaries, to beneficiaries of deceased employees, and to present employees or their beneficiaries. Whenever possible, plan provisions are to govern the measurement of accumulated plan benefits. If the benefits earned in each year are not determinable from the plan's provisions, a formula for measurement is provided in ASC 960. When calculating accumulated plan benefits, an ongoing plan is to be assumed, analogous to the going concern assumption used in preparing GAAP financial statements of other types of entities. Thus, interest rates used for discounting expected future payments are based on rates of return on investments for the benefit deferral period, and employee turnover and employee mortality are considered.

At a minimum, the information provided in the financial statements for accumulated plan benefits is to include

1. Vested benefits of participants currently collecting benefits
2. Other vested benefits
3. Nonvested benefits
4. Accumulated contributions of active employees in contributory plans, if applicable

Either a reconciliation or a narrative description is to identify significant factors affecting the accumulated plan benefits from the beginning of the year to the end. The information is to include

1. Effects of plan amendments
2. Changes in the nature of the plan, such as a merger or a spin-off
3. Changes in actuarial assumptions
4. Benefits accumulated during the year
5. Benefits paid during the year
6. Interest component (from amortizing the discount)
7. Other changes

The last four items can be combined into a single "other changes" category.

If the provisions of the defined benefit plan include a postretirement medical benefit component that is funded in accordance with IRC §401(h), ASC 965-205-05 specifies the accounting and disclosure rules with respect to the §401(h) component. These specialized rules are necessary due to legal requirements regarding the separate accounting for and funding of these arrangements.

Defined Contribution Plans

The three general types of defined contribution plans are profit-sharing plans, money purchase pension plans, and stock bonus plans. A profit-sharing plan is a plan that is neither a pension plan, as defined in the Internal Revenue Code, nor a stock bonus plan. Employer contributions to a profit-sharing plan are to be either discretionary or based on a fixed formula. Although the plan is called a profit-sharing plan, the contributions need not be made from the profits of the plan sponsor. A money purchase plan is a benefit plan that bases employer contributions on a fixed formula that is unrelated to profits. A stock bonus plan is a plan that makes its distributions to participants in the stock of the employer unless the participant chooses otherwise. Within these three categories of plans are more specialized plans, such as 401(k) plans, 403(b) plans, savings plans, employee stock ownership plans, target benefit plans, and Keogh plans.

The three primary attributes that distinguish a defined contribution plan from a defined benefit plan are

1. Employer contributions are determined at the discretion of the employer or according to a contractual formula, rather than being actuarially determined.
2. Individual accounts are maintained for each plan participant, rather than a single account in which all participants partake.
3. Benefits are determined based on the amount accumulated in a participant's account at the time he or she retires or withdraws from the plan, rather than being defined in the plan agreement. If vested, the account's value is either paid to the participant or used to purchase an annuity for the participant.

The liabilities of a defined contribution plan include accounts payable, amounts owed for securities purchases, and borrowings. The liabilities are not to include amounts that have not been paid to withdrawing participants. Those amounts are included in net assets available for benefits (representing the participants' equity in the plan net assets) and disclosed in the notes to the financial statements. Because those amounts are liabilities for regulatory purposes, a note to reconcile the financial statements to the Form 5500 may be necessary to comply with the Employee Retirement Income Security Act of 1974 (ERISA), as amended.

ASC 946-210-45 specifies that, if the net assets of an investment company contain fully benefit-responsive investment contracts, those assets shall be reported at their contract values, because that is the amount participants in the fund would receive if they were to initiate withdrawals under the terms of the plan. An asset is considered fully benefit-responsive if (1) the investment contract is between the fund and the issuer and prohibits the fund from assigning or selling the contract without issuer permission, (2) the issuer is obligated to repay principal and interest, or a financially responsible third party assures that the interest rate will not drop below zero, (3) all permitted participant-initiated transactions occur at contract value, and (4) an event that would limit the fund's ability to transact at contract value with the issuer is not probable. The codification also specifies disclosure requirements for this scenario.

Employee Health and Welfare Benefit Plans

Defined benefit health and welfare plans stipulate a determinable benefit amount, which may take the form of a payment directly to the participant or a payment to a third party (such as a service provider or an insurance company) on the participant's behalf. These benefits may be provided upon retirement of the participant or during the postemployment period between termination of employment and retirement. Factors such as length of employment,

age, and salary level determine the level of benefits to be provided. The contributions from the employer may be determined actuarially, by actual claims paid, or by a formula established by the plan sponsor. Regardless of the manner in which the plan is funded, the plan is a defined benefit health and welfare plan if its purpose is to provide a defined benefit.

Like defined benefit pension plans, defined benefit health and welfare plans must include information in their financial statements about the actuarial present value of benefit obligations earned by having performed past service. A benefit obligation exists if all of the following conditions are met:

1. The participants' rights to receive benefits are attributable to services already rendered.
2. The participants' benefits vest or accumulate.
3. Payment of benefits is probable.
4. The amount can be reasonably estimated.

If conditions 1. and 2. are not met, the obligation exists if the event that gives rise to the liability has already occurred and the amount can be reasonably estimated. The benefit obligations are measured as of the end of the plan year and include the actuarial present value of

1. Claims payable
2. Claims incurred but not reported (IBNR)
3. Insurance premiums due
4. Accumulated eligibility credits and postemployment benefits, net of amounts currently payable
5. Postretirement benefits for retired participants and their beneficiaries, other plan participants who are eligible to receive benefits, and participants who are not yet eligible to receive benefits.

Benefit obligations of defined benefit health and welfare plans, similar to accumulated plan benefits of defined benefit pension plans, do not appear as liabilities on the statement of net assets available for benefits. Instead, they are presented either as a separate financial statement, on the face of another financial statement, such as the statement of net assets available for benefits, or in the notes to the financial statements. Regardless of the location selected, the information about benefit obligations is required to be presented in its entirety in the same location.

A reconciliation, presented as a separate statement, on the face of another financial statement, or in the notes to the financial statements, is to identify significant factors comprising the change in the benefit obligation from the beginning of the year to the end. The changes are classified into at least three categories: (1) amounts currently payable, which includes claims payable, claims IBNR, and premiums due insurance companies, (2) accumulated eligibility credits and postemployment benefits, net of amounts currently payable, and (3) postretirement benefit obligations, net of amounts currently payable and claims IBNR. The information for each category is to include, at a minimum, the effects of

1. Plan amendments
2. Changes in the nature of the plan, such as a merger or a spin-off
3. Changes in actuarial assumptions
4. Benefits accumulated during the year
5. Benefits paid during the year
6. Interest component (from amortizing the discount)
7. Other changes

The last four items can be combined into a single "other changes" line.

ASC 965-205-50 requires the following additional disclosures:

1. The weighted-average assumed discount rate used to measure the obligation for postemployment benefits
2. Investments representing 5% or more of the net assets available for benefits as of the end of the plan year and
3. The portion of the plan's estimated cost of providing postretirement benefits that is funded by contributions from retirees.

Defined contribution health and welfare plans, like other defined contribution plans, maintain an account for each participant that determines the amount of benefits that the participant will eventually receive. The terms of a defined contribution health and welfare plan agreement determine the contribution that will be made by the employer or participant into each account. Defined contribution health and welfare plans do not report information about benefit obligations because a plan's obligation is limited to the amounts accumulated in the participants' accounts.

Government Regulations

Pursuant to the requirements of ERISA, the federal government oversees the operating and reporting practices of employee benefit plans. ERISA establishes minimum standards for participation, vesting, and funding. It defines the responsibilities of plan fiduciaries and standards for their conduct. It requires plans to annually report summarized plan information to plan participants.

The Department of Labor (DOL) and the Internal Revenue Service (IRS) are authorized to issue regulations establishing reporting and disclosure requirements for employee benefit plans that are subject to ERISA. Each year, plans are required to report certain information to the DOL, the IRS, and the Pension Benefit Guaranty Corporation (if applicable). For many plans, the information is reported using Form 5500, which includes financial statements prepared in conformity with GAAP and additional supplementary financial schedules.

Various provisions of the Internal Revenue Code apply to employee benefit plans. If an employee benefit plan qualifies under Section §401(a) of the Code, certain favorable tax treatments apply. For example, if a plan is qualified, the plan sponsor receives current deductions for contributions to the plan, and the plan participants do not pay income taxes on those contributions or the accumulated earnings on them until benefits are distributed to them. In addition, plan participants may receive favorable tax treatment on the distributions. Qualified plans are exempt from income taxes, except for taxes on unrelated business income. Nonqualified plans, which generally provide benefits selectively only to a few key employees, are not entitled to those favorable treatments.

Terminating Plans

If a decision has been made to terminate a plan, the plan is a terminating plan, even if another plan will replace the terminated plan. A terminating plan may continue to operate for as long as necessary to pay accrued benefits. Prominent disclosure of the relevant circumstances is necessary in all financial statements issued by the plan after the decision to terminate is made. Financial statements of a terminating plan are prepared on the liquidation basis of accounting for plan years ending after the termination decision. For plan assets, the change to the liquidation basis may have little or no effect, since many assets are already reported at current fair value. However, the liquidation basis for accumulated plan benefits (defined benefit pension plans) and benefit obligations (defined benefit health and welfare plans) may differ from the actuarial present value of benefits for an ongoing plan. For example, certain or all benefits may become vested upon plan termination.

FINANCE COMPANIES

PERSPECTIVE AND ISSUES

Finance companies provide lending and financing services to consumers (consumer financing) and to business enterprises (commercial financing). Some financing companies engage solely in consumer or commercial financing activities; others engage in both types.

Manufacturers, retailers, wholesalers and other business enterprises may provide financing to encourage customers to buy their products or services. Such financing is known as captive financing activity and may be provided by those companies or affiliated companies. Although most companies originally financed only their own products and services, many have expanded their financing activities to include a wide variety of products and services sold by unaffiliated businesses.

Consumer financing activities include direct consumer loans, retail sales contracts, and insurance services.

Commercial financing enterprises often provide a wide range of services, including factoring arrangements, revolving loans, installment and term loans, floor plan loans, and lease financing.

ASC 942, *Financial Services—Depository and Lending*, addresses GAAP for finance companies and conforms the accounting by various institutions such as banks, thrifts, credit unions, finance companies, corporate credit unions, and mortgage companies. It also is applicable to the financing activities of manufacturers, retailers, wholesalers, and other business enterprises. It eliminates differences in accounting and disclosure established by the respective financial institution AAGs, but carries forward accounting guidance for transactions determined to be unique to certain financial institutions.

The codification, has the following features:

- Mortgage companies and corporate credit unions are explicitly included in its scope.
- Regulatory capital disclosures are required for mortgage companies, credit unions, banks, and thrifts.
- Credit unions report amounts placed in their deposit insurance fund as an asset if such amounts are fully refundable, due to unique legal and operational aspects of the credit union share insurance fund. Banks and thrifts expense payments to their deposit insurance fund as incurred. Both practices have been preserved because of differences in how the funds operate.
- Finance companies record purchases and sales of securities on the settlement date, whereas banks, thrifts, and credit unions follow trade date accounting. Finance companies follow trade date accounting.
- ASC 310-10-35 addresses loan impairment measurement and disclosure requirements, but does not specify how to recognize income on impaired loans. ASC 942 gives specific guidance on the recognition of interest income on impaired loans.

Assets	
310	Receivables
Liabilities	
450	Contingencies
Broad Transactions	
860	Transfers and Servicing
Industry	
942	Financial Services—Depository and Lending

DEFINITIONS OF TERMS

Accounts receivable loan. A loan collateralized by the accounts receivable of the borrower.

Dealer reserves. Finance company liabilities for dealers' shares of finance charges on retail contracts purchased from dealers.

Direct consumer loan. A two-party transaction in which the finance company lends funds directly to the borrower; such a loan may or may not be collateralized.

Discount. Amount deducted from the face value in advance as a charge for the loan or a deduction for interest at the time of the loan or any charge for credit that is precomputed and included in the face of the instrument.

Discount loan. A loan that is written with the interest or finance charges included in the face amount of the note. Discount loans are also called *precompute* or *add-on* loans.

Effective interest rate. The implicit rate of interest based on the amount advanced and the amount and timing of the specified repayments over the period of the contract.

Factor. A company that engages primarily in factoring.

Factoring. Purchase, usually without recourse, of individual accounts receivable arising in the client's ordinary course of business. Under a factoring agreement, the finance company also provides credit checking, collection, and recordkeeping services.

Floor plan checking. Physical inspection of dealer's inventories that are collateral for advances to the dealer to be repaid from the proceeds from sale of specific items. Sometimes referred to as floor plan auditing.

Floor planning. Financing of dealers' inventories, particularly automobiles and other consumer goods, sometimes referred to as wholesaling. The dealers are obliged to repay the supplier or manufacturer from proceeds of sale of specific items, or after an elapsed period even though inventory is not sold.

Interest-bearing loan. A loan that is written at the principal amount advanced to the borrower and bearing interest computed monthly on the unpaid balance.

Interest method. A method of computing income under which interest income on a fixed-rate obligation is accrued over the life of the loan based on a constant rate (percent) of interest applied to the outstanding loan balance. As a result, the amount of income recognized at a given time is directly proportional to the outstanding loan balance. Also called the **actuarial method**.

Inventory loan. A loan collateralized by inventory of the borrower.

Nonrefundable fee. Any charge made in connection with a loan that does not have to be refunded to the borrower when the loan is prepaid.

Origination fee. An amount charged by finance companies for originating, refinancing, or restructuring a loan. The amount may be intended to cover costs such as underwriting, loan application processing, and reviewing legal title to property involved.

Overadvance (in factoring). An amount advanced to a client in excess of the amount of uncollected receivables purchased by the factor.

Points. Amounts, generally expressed as a percent of the loan, charged for granting loans, that primarily are adjustments of yield but also may be intended to cover costs such as underwriting, loan application processing, and reviewing title to collateral.

CONCEPTS, RULES, AND EXAMPLES

Finance Receivables

Finance receivables include both interest-bearing and discount loans. The face amount of an interest-bearing or simple interest loan is equal to the amount of cash loaned; unearned

interest is not computed. Conversely, for discount loans the amount of cash loaned is less than the face value of the loan. This difference represents unearned interest income to the borrower, and as such, is recognized by the lender over the life of the loan.

Allowance for Loan Losses

A finance company should maintain an allowance for loan losses that is adequate to cover estimated losses. The allowance for loan losses decreases the carrying amount of loans receivable to net realizable value. ASC 450 and ASC 310-10-35 provide guidance for the recognition of estimated losses from the uncollectibility of receivables. ASC 450 requires that an allowance for loan losses be established when it is probable that a loan has been impaired and the amount can be reasonably estimated. ASC 310-10-35 requires that impairment of a loan be based on the present value of expected future cash flows discounted at the loan's effective interest rate or at the loan's market price or at the fair value of the collateral of the loan if applicable.

Interest Income and Nonrefundable Loan Fees

The interest method should be used to account for interest income in accordance with ASC 310-20. Under this method, often called the actuarial method, interest on installment loans is computed and accrued over the lives of the loans to arrive at constant interest rates throughout the loans' lives. Use of this method produces loans that are carried at amounts equal to future receipts discounted at original implicit interest rates. The accounting for nonrefundable loan fees is also covered in ASC 310-20. (See the treatment of this area under the section on Banking and Thrift.)

Accounting for Loans Acquired by Transfer

Finance companies may acquire loans originated by other financial intermediaries. In some cases, these will have been impaired at the date they are acquired, due to changes in the borrowers' credit risks occurring subsequent to origination. ASC 310-30 addresses the accounting for the differences between contractual and expected future cash flows of acquired loans when these differences are attributable, at least in part, to credit quality.

ASC 310-30 is discussed under the Banking and Thrift section of this chapter.

Other Items

Factoring commissions. The amount a finance company charges as a factoring commission is dependent on such variables as sales volume, number of invoices issued, collection activities, and patterns of returns and chargebacks. Finance companies should recognize factoring commissions over the periods in which services are rendered. A finance company is considered as rendering services from the time a customer's credit is approved until the customer's account is settled.

Advances and overadvances to factoring clients. Finance companies generally do not treat advances to clients as receivables. Instead, advances are applied against amounts owed to clients from the purchase of the client's receivables. Finance companies generally limit advances to percentages of the unpaid amounts of factored receivables. Overadvances, which are amounts in excess of outstanding receivables purchased, should be recorded as loans receivable.

Repossessed assets acquired in liquidation of receivables. Finance companies may repossess goods or other property that collateralize loans when they foreclose on uncollectible loans. Repossessed assets are typically sold as soon as possible to minimize losses from defaulted loans. Certain types of collateral, such as automobiles, may be readily salable in

wholesale or other markets. Repossessions of such collateral are fairly common. Repossessions on commercial loans can result in significant losses because of the bargain prices associated with reselling inventories, plant, property, and equipment.

Terms of recourse arrangements include the following:

1. Full recourse—The dealer is required to pay off the uncollected receivable balance to the finance company at the date of repossession.
2. Partial or limited recourse—The dealer is liable for repossession losses up to an agreed amount.
3. Nonrecourse—Loss is borne entirely by the finance company.

Dealer reserves and holdbacks. Finance companies account for dealer reserves and holdbacks as liabilities. Dealer reserve accounts are credited for the dealers' share of the finance charges. Dealer reserve accounts may be charged as the result of customers paying off contracts early, losses on full or partial recourse contracts, and from payments to dealers in excess of minimum requirements.

Sales of receivables. A finance company may decide to sell a portfolio of receivables to another finance company or financial institution. ASC 860 controls whether such transactions should be accounted for as sales of receivables or as loans collateralized by receivables. Generally, a transfer is treated as a sale if the transferor surrenders control of the receivables. The provisions of ASC 860 are addressed in Chapters 7 and 8.

GOVERNMENT CONTRACTORS

PERSPECTIVE AND ISSUES

ASC 912 governs the accounting and income recognition issues concerning cost-plus-fixed-fee and fixed-price supply contracts. The fees under government cost-plus-fixed-fee contracts are recognized as income on the basis of partial performance if there is reasonable assurance of realization. Fees are also accrued as they become billable unless this accrual is not reasonably related to the proportionate performance of total work to be performed.

This pronouncement also covers renegotiation (refunds of excessive profits) and contracts terminated for the convenience of the government.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
912	Contractors—Federal Government

DEFINITIONS OF TERMS

Contractors. In the context of this discussion, contractors are enterprises that sell products or services to the US government pursuant to a formal contract. The relationship to the government can be direct (a prime contract between the enterprise and the government) or indirect (a subcontract between the enterprise and a prime contractor).

Contract. A legal agreement obligating a contractor (referred to as the "general contractor" or "prime contractor") to provide products or services to the US government. The term also refers to subcontracts obligating subcontractors to indirectly perform in a similar manner under the supervision and control of the prime contractor.

Cost-plus-fixed-fee contracts. An agreement that provides for contractors to receive a specified fixed fee and to be reimbursed for their allowable costs. Because title passes to the government and the contractor obtains an unconditional right to partial payment prior to delivery, delivery of the finished product is not necessarily evidence of performance.

Disposal credits. Deductions from the termination claim receivable for approved retention or sale of inventory previously included in the claim.

No-cost settlements. Settlements in which the contractor waives the right to make a claim. No sale is recorded and applicable costs retain their usual classification.

Service contracts. Contracts in which the contractor acts only as an agent.

Supply contracts. Contract in which the contractor's services extend beyond that of an agent. Contracts include services such as the use of the contractor's own facilities and the contractor assumes responsibility to creditors for material and services, and to employees for salaries.

Subcontractor's claims. Claims made in conjunction with a terminated contract resulting from costs incurred under the terminated contract that did not result in the transfer of billable materials or services to the contractor before termination.

CONCEPTS, RULES, AND EXAMPLES

Cost-plus-fixed-fee contracts (CPFFC) are used for the manufacture and delivery of products, the construction of plants and other facilities, and for management and other services. The amount of the flat-fee payment is usually determined by the ratio of the actual expenditures to the total estimated expenditures. CPFFC may be cancelled and terminated by the government. If this occurs, the contractor is entitled to reimbursement for expenditures and an appropriate portion of the fixed fee.

Normally, profits are recognized when the right to full payment is unconditional. However, revenues can be accrued and profits recognized for partial performance when total profit can be reasonably estimated and realization is reasonably assured. The fees are usually accrued as they become billable. Because risk is minimal and there is no credit problem, billable amounts are indicative of realization. The contractor's fee is considered earned when it is billable and when the related costs are incurred or paid. Accrual based on billable amounts is an application of the percentage-of-completion method, rather than a deviation from the accrual method. The fee is considered billable when approved by the government. An alternative date is used when a determination is made that estimated and final costs are significantly different. Accrual of the fee upon delivery or based on percentage of completion is more appropriate when excess costs are substantial.

For supply contracts, reimbursable costs and fees are included in sales. For service contracts, only fees are included in sales. Unbilled amounts are included in the balance sheet as a receivable but are to be captioned and presented separately from billed receivables. Advances in CPFFC are generally intended to assist the contractor in financing its costs. Thus, in general, advances are treated as liabilities and are not offset against contract receivables. Advances are permitted to be offset against contract receivables only when there is an expectation that the advances will be applied against those specific charges. Any such offsets require disclosure in the financial statements.

Renegotiation

Renegotiation typically addresses a refund to the government of "excessive" profits. In reality, it is more of an adjustment of the selling price. The financial statements are to disclose situations when a substantial portion of a contractor's business consists of contracts that are subject to renegotiation. When a reasonable estimate of renegotiation refunds can be made, a provision is shown as a deduction from revenue in the income statement and as a current liability on the balance sheet. Deferred income taxes are adjusted accordingly. When a reasonable estimate cannot be made, disclosure is required along with the reasons for the inability to make an estimate. Footnote disclosure is also required regarding material

uncertainties and their significance, and regarding the basis for determining the renegotiation provision.

Terminated Defense Contracts

These contracts are contracts terminated for the convenience of the government. Profits accrue as of the effective date of termination and are included in financial statements after the termination. Disclosure is made of all material facts and circumstances. Termination claims are recorded as a single amount even if they consist of several different types of cost reimbursements. Material termination claims are to be captioned separately from other receivables and such claims receivable directly from the government are to be presented separately from related claims against other contractors. Claims receivable are classified as current assets unless there is an indication of extended delay, such as a serious disagreement indicative of probable litigation. Pretermination contract advances are shown as a deduction from claims receivable and adequately explained. Termination loans are classified as current liabilities and cross-referenced to the related claims receivable.

Material termination claims are separately captioned in the revenues section of the contractor's statement of income. When inventory is reacquired by the contractor after including it in a termination claim, it is recorded as a purchase. The credit is applied against the termination claim receivable.

INSURANCE

PERSPECTIVE AND ISSUES

The two major types of insurance companies are life and property and casualty. Each category is further subdivided into stock companies and mutual associations. Due to the regulated nature of the insurance industry, financial reporting may be in conformity to statutory accounting principles (SAP) or GAAP. Furthermore, publicly held companies subject to SEC accounting rules will account for certain transactions and events in other manners dictated by those requirements. While accounting principles under GAAP are broadly applicable to all types of insurance companies (including those dealing in such specialized products as mortgage insurance, title insurance, and reinsurance), the nature of the estimation process (such as for claims liabilities) differs substantially depending upon the character of the risks assumed.

The main contrasts between SAP and GAAP arise from the more conservative nature of SAP, which is a reflection of the insurance regulatory agencies' concern with protection of the policyholders' interests, and hence with the liquidity and solvency of the insurance companies. Accordingly, under SAP certain costs, such as policy acquisition expenses, are written off as incurred; certain nonliquid assets, such as property and furniture, are not recognized; and claims liabilities are very conservatively estimated. In contrast to this essentially short-term perspective, financial statements prepared on the GAAP basis are more concerned with the value of the companies' investments and net worth on a going concern basis.

The primary source of insurance industry GAAP is ASC 944, *Financial Services—Insurance*. Insurance contracts are categorized as short duration (which includes most property and liability insurance) or long duration (which includes most life, mortgage, and title insurance). Nominal insurance contracts that are effectively investment contracts, however, are not accounted for as insurance.

ASC 944 discusses those aspects of accounting and auditing unique to life and health insurance entities, and contains significant discussions of statutory accounting practices (SAP), which comprise laws, regulations, and administrative rulings adopted by various states that govern the operations and reporting requirements of life insurance entities. It does not reflect

SAP under the National Association of Insurance Commissioners (NAIC) codification project.

The ASC also addresses the classification and valuation of liabilities, as well as disclosures for nontraditional annuity and life insurance contracts issued by insurance enterprises. Several of the conclusions reached on these topics are discussed later in this section.

An Invitation to Comment was issued in 2007 by FASB on the subject of separating insurance contracts into risk transfer and financing segments, so that these contract segments may be appropriately accounted for.

CONCEPTS, RULES, AND EXAMPLES

Premium Income

Premium income is recognized differently for short and long duration contracts. For short duration contracts, premium income is recognized over the contract term in proportion to the amount of insurance provided. In the case of long duration contracts, revenue is accrued as the premiums become due from policyholders, except for contracts that provide benefits over a term longer than the premium payment term (such as twenty-year life policies), in which case income is recognized over the longer period during which benefits may be provided.

Claim Cost Recognition

Costs of benefits are recognized when insured events such as property damage occur. Estimated costs are accrued for as claims incurred but not yet reported. For long duration contracts, the present values of estimated future benefits are accrued, net of the present values of future net premiums to be collected. Accrual of these benefit obligations generally involves actuarial determinations. Accountants may be dependent on the services of specialists in such cases, as they are in computing costs related to defined benefit pension plans. Recognition of other expenses is governed by the matching concept. For example, costs that vary with acquisition activity are capitalized and amortized over the period during which premium income is earned. Catastrophic losses (as from natural disasters such as hurricanes) are accrued under the guidelines of ASC 450: when impairment of the asset or incurring of a liability is probable and the amount is reasonably estimable.

Investments

The other major concern of GAAP for insurance enterprises relates to the presentation of investments held. ASC 320 established the accounting requirements for investments in debt and marketable equity securities. Briefly, those investments must be categorized as being either held-for-trading, available-for-sale, or held-to-maturity. Investments falling within the first two categories should be reported at fair value, with value changes affecting the trading securities portfolio being reflected in income, while changes in the available-for-sale portfolio are reported in a separate equity account. Securities to be held to maturity are accounted for at amortized historical cost, absent a permanent decline in value. Equity securities that do not meet the definition of "marketable" are also to be reported at fair value, with gains or losses reported in stockholders' equity. In addition, real estate acquired in settling mortgage guaranty and title insurance claims is to be reported at fair value.

Deferred Income Taxes

GAAP requires that deferred income taxes be provided for temporary differences. An exception was previously provided under the "indefinite reversal criterion," for stock life insurance companies only, for differences designated as policyholders' surplus. However, FAS 109 holds that deferred taxes must be provided, consistent with the accounting prescribed for all other temporary differences.

Other Matters

Reinsurance. Another specialized topic area pertinent to insurance companies is that of reinsurance, which is addressed by ASC 944. It requires that reinsurance receivables, including amounts related to claims incurred but not reported, be reported as assets, consistent with the manner in which liabilities relating to the underlying reinsured contracts are accounted for. The standard also establishes criteria for recognition as reinsurance, and sets forth detailed accounting for long and short duration contracts, as well as new disclosure requirements.

Loss reserves. ASC 944-605 concerns accounting for foreign property and liability reinsurance, and concludes that except for special circumstances, only the periodic method is acceptable in accounting for foreign reinsurance premiums. ASC 944-505-50 requires disclosures where permission was received from the National Association of Insurance Commissioners to use different accounting practices. ASC 944 also covers capitalization and amortization costs and several other matters for mutual life insurance companies, assessment enterprises, fraternal benefit societies, and stock life insurance companies.

Guaranty funds. ASC 405-30 addresses matters pertaining to guaranty funds and certain other insurance-related assessments. The key elements of this standard are discussed in the following paragraphs.

Under the standard, guaranty fund and similar assessments would be recognized when (1) it has been imposed or is deemed probable of being imposed, (2) the event obligating an entity to pay the assessment has occurred, and (3) the amount of the assessment can be reasonably estimated. All three conditions would have to be fulfilled before a liability could be accrued. Discounting to present value will be permitted. The codification offers specific guidance regarding the ability to reasonably estimate the liability for assessments.

Guaranty funds are essentially state-mandated insurance funds used to settle claims against insolvent insurers and, typically, all licensed insurers are assessed premiums based on the volume of defined lines of business they conduct in the given state. A variety of methods have been applied in determining the amounts of guaranty fund assessments (e.g., retrospectively, based on premiums written over the past two years; or prospectively, based on busi-

ness written over the next several years following an insolvency of a failed insurer), with the result that entities upon which assessments are being levied have been inclined to use different methods of recognizing the cost and related obligation. In general, to warrant accrual under the codification, an insolvency of another insurer would have to have occurred, since the presumption would be that the assessments would become probable (the threshold criterion) when there has been a formal determination of another entity's insolvency. An example of an exception would be when the state uses prospective premium-based guaranty fund assessments; if the reporting entity cannot avoid the obligation by ceasing to write policies, the obligating event would be the determination of insolvency, but if it could avoid the assessment, the obligating event is the writing of premiums after the insolvency.

Surplus notes. ASC 944-470 affects accounting by certain insurance companies that issue a security known as surplus notes. It requires that these instruments be accounted for as debt and included in the liabilities caption of the balance sheet. Furthermore, interest must be accrued over the term of the notes, whether or not payment of interest and/or principal has been approved by an insurance company. However, disclosure is required as to the status of the request for approval.

Deposit accounting. ASC 340-30 applies to entities entering into short duration insurance and reinsurance contracts that do not transfer insurance risk, or multiple year contracts that either do not transfer insurance risk or for which insurance risk transfer is not determinable. Insurance risk is comprised of timing risk and underwriting risk, and one or both of these may not be transferred to the insurer (assuming entity in the case of reinsurance) under certain circumstances. For example, many workers' compensation policies provide for "experience adjustments" which have the effect of keeping the underwriting risk with the insured, rather than transferring it to the insurer; in such instances, deposit accounting would be prescribed.

Under the provisions of ASC 340-30, for contracts that transfer only significant timing risk, or that transfer neither significant timing nor underwriting risk, a deposit asset (from the insured's or ceding entity's perspective, respectively, for insurance and reinsurance arrangements) or liability (from the insurer's or assuming entity's perspective, respectively, for insurance and reinsurance arrangements) should be recognized at inception. The deposit asset or liability should be remeasured at subsequent financial reporting dates by calculating the effective yield on the deposit to reflect actual payments to date and expected future payments. Yield is to be determined as set forth in ASC 310-20, using the estimated amounts and timings of cash flows. The deposit is to be adjusted to that which would have existed at the balance sheet date had the new effective yield been applied since inception of the contract; thus, expense or income for a period will be determined by first calculating the necessary amount in the related balance sheet account.

For contracts that transfer only significant underwriting risk, a deposit asset or liability is also established at inception. However, subsequent remeasurement of the deposit does not occur until such time as a loss is incurred that will be reimbursed under the contract; instead, the deposit is reported at its amortized amount. Once the loss occurs, the deposit should be remeasured by the present value of expected future cash flows arising from the contract, plus the remaining unexpired portion of the coverage. Changes in the deposit arising from the present value measure are to be reported in the insured's income statement as an offset against the loss to be reimbursed; in the insurer's income statement, the adjustment should be reported as an incurred loss. The reduction due to amortization of the deposit is reported as an adjustment to incurred losses by the insurer. The discount rate used to compute the present value is to be the rate on government obligations with similar cash flow characteristics,

adjusted for differences in default risk, which is based on the insurer's credit rating. Rates are determined at the loss date(s) and not revised later, absent further losses.

For insurance contracts with indeterminate risk, the procedures set forth in ASC 944-605 (the open-year method) should be applied. This involves balance sheet segregation of amounts that have not been adjusted due to lack of sufficient loss or other data. When sufficient information becomes available, the deposit asset or liability is adjusted, which is to be reported as an accounting change per ASC 250.

Demutualizations. ASC 944-805 addressed the increasingly common phenomenon of demutualizations (whereby formerly mutually owned insurers issue stock), as well as the formation of insurance holding companies (MIHC). A key concern is the accounting for the "closed block" of assets and liabilities, and of earnings allocable to the closed block. This pertains to mechanisms designed to protect the adjustable policy features and dividend expectations of participating life insurance policyholders from the competing interests of stockholders. Typically, the plan of demutualization describes how the closed block will operate. The closed block assets and cash returns on those assets will not inure to the stockholders of the demutualized company; instead, all cash flows from these assets will be used to benefit the closed block policyholders. The insurance enterprise remains obligated to provide for minimum guarantees under the participating policy, and it is consequently possible under certain circumstances that additional "stockholder" funds will have to be used to meet the contractual benefits of the closed block policyholders. The assets designated to the closed block are subject to the same liabilities, with the same priority in the case of insolvency or in liquidation, as assets outside the closed block. In many situations, commissions and other expenses (including management expenses) of operating and administering the closed block will not be charged to the closed block. Unless the state insurance department consents to an earlier termination, the closed block will continue in effect until the date on which none of the policies in the closed block remains in force.

Alternatives to the closed block have arisen in practice encompassing, for a number of types of contracts, various mechanisms believed by the insurance enterprise and state insurance regulators to be appropriate in the specific circumstances. Closed block alternative mechanisms have been used in lieu of closed blocks for certain participating life contracts to commit to the insurance regulator that the insurance company will continue to follow its established dividend practices. Closed block alternative mechanisms also have been used to protect nonguaranteed elements of participating and nonparticipating insurance contracts such as interest credits on deferred annuities and adjustable premiums on adjustable premium term business. In some instances, the methodology and limitations defined in the agreements with the state insurance regulators have considered only specific profit components, such as mortality experience on a block of term insurance or investment spreads on a block of annuities, and in other instances have considered virtually all components of product profitability. Where there is a limitation on the profits that may inure to the stockholders, there generally is a formal agreement between the insurance company and the insurance regulators that defines (1) the contracts covered by the limitation, (2) the profit limitation calculation, and (3) the timing and manner (for example, as policy dividends, reduced premiums, or additional benefits) in which amounts that may not be distributed to stockholders are to be distributed to policyholders.

Some of the more important conclusions reached were as follows:

1. The classification of expenses related to a demutualization and the formation of an MIHC should be considered other than extraordinary expense.
2. Closed block assets and liabilities from the closed block should be included with the corresponding financial statement items of the insurance enterprise.

3. ASC 944 should continue to be applied after conversion to a stock company.
4. The maximum future contribution of the closed block to the earnings of the company is typically the excess of the GAAP liabilities over the GAAP assets at the date of demutualization. Under ASC 944, a dividend liability should be established for current earnings that will be paid to policyholders through future benefits. From a shareholder perspective, excess earnings of the closed block that will never inure to the shareholders should be set up as a liability. There should be a dividend liability for excess earnings due to policyholders that cannot inure to shareholders.
5. For a "distribution-form" demutualization, an insurance enterprise should reclassify all of its retained earnings as of the date of demutualization to capital stock and additional paid-in capital accounts. A "subscription-form" demutualization should not, in and of itself, result in reclassification of retained earnings. The equity accounts of the MIHC at the date of formation should be determined using the principles for transactions of companies under common control with the amount of retained earnings of the demutualized insurance enterprise, before reclassification to the capital accounts, being reported as retained earnings of the MIHC.

Nontraditional Long-Duration Contracts

ASC 944 also addresses the classification and valuation of liabilities as well as disclosures for nontraditional annuity and life insurance contracts issued by insurance enterprises. The requirements under this standard are set forth in the following paragraphs.

The portion of separate account assets representing contract holder funds are to be measured at fair value and reported in the insurance enterprise's financial statements as a summary total, with an equivalent summary total for related liabilities, if the separate account arrangement meets all the specified criteria. If the arrangement does not meet the criteria, assets representing contract holder funds should be accounted for as general account assets, and any related liability should be accounted for as a general account liability.

Assets underlying an insurance enterprise's proportionate interest in a separate account do not represent contract holder funds, and thus are not to be separately reported and valued. If a separate account arrangement meets the criteria in ASC 944 and (1) the terms of the contract allow the contract holder to invest in additional units in the separate account or (2) the insurance enterprise is marketing contracts that permit funds to be invested in the separate account, the assets underlying the insurance enterprise's proportionate interest in the separate account should be accounted for in a manner consistent with similar assets held by the general account that the insurance enterprise may be required to sell.

If the enterprise's proportionate interest in the separate account is less than 20% of the separate account, and all of the underlying investments of the separate account meet the definition of securities under the Master Glossary, or the definition of cash and cash equivalents, the enterprise may report its portion of the separate account value as an investment in equity securities classified as trading under ASC 320.

Assets transferred from the general account to a separate account should be recognized at fair value to the extent of third-party contract holders' proportionate interest in the separate account if the separate account arrangement meets the criteria set forth in the codification. Any gain related to the third-party contract holder's proportionate interest should be recognized immediately in earnings of the general account of the insurance enterprise, if the risks and rewards of ownership have been transferred to contract holders using the fair value of the asset at the date of the contract holder's assumption of risks and rewards. A guarantee of the asset's value or minimum rate of return or a commitment to repurchase the asset would indicate that the risks of ownership have not been transferred, and no gain can be recognized. If

the separate account arrangement does not meet the criteria in the codification, the transfer generally should have no financial reporting effect (that is, general account classification and carrying amounts should be retained). In certain situations loss recognition may be appropriate.

The basis for determining the balance that accrues to the contract holder for a long-duration insurance or investment contract that is subject to ASC 944 is the accrued account balance. The accrued account balance equals

1. Deposit(s) net of withdrawals;
2. Plus amounts credited pursuant to the contract;
3. Less fees and charges assessed;
4. Plus additional interest (for example, persistency bonus); and
5. Other adjustments, such as appreciation or depreciation recognized under the codification, to the extent not already credited.

For contracts that have features that may result in more than one potential account balance, the accrued account balance should be the highest contractually determinable balance that will be available in cash or its equivalent at contractual maturity or the reset date, without reduction for future fees and charges. The accrued account balance should not reflect any surrender adjustments (for example, fair value annuity adjustments, surrender charges, or credits). For contracts in which amounts credited as interest to the contract holder are reset periodically, the accrued balance should be based on the highest crediting rate guaranteed or declared through the reset date.

For a contract not accounted for under ASC 815 that provides a return based on the total return of a contractually referenced pool of assets either through crediting rates or termination adjustments, the accrued account balance should be based on the fair value of the referenced pool of assets (or applicable index value) at the balance sheet date, even if the related assets are not recognized at fair value.

To determine the accounting under ASC 944 for a contract that contains death or other insurance benefit features, the enterprise should first determine whether the contract is an investment or universal-life-type contract. If the mortality or morbidity risks are other than nominal and the fees assessed or insurance benefits are not fixed and guaranteed, the contract should be classified as an ASC 944 universal-life-type contract. A rebuttable presumption is that a contract has significant mortality risk where the additional insurance benefit would vary significantly in response to capital markets volatility. The determination of significance should be made at contract inception, other than at transition, and should be based on a comparison of the present value of expected excess payments (that is, insurance benefit amounts and related incremental claim adjustment expenses in excess of the account balance) to be made under insurance benefit features to the present value of all amounts expected to be assessed against the contract holder (revenue).

For contracts classified as insurance contracts that have amounts assessed against contract holders each period for the insurance benefit feature that are assessed in a manner that is expected to result in profits in earlier years and subsequent losses from that insurance benefit function, a liability should be established in addition to the account balance to recognize the portion of such assessments that compensates the insurance enterprise for benefits to be provided in future periods in accordance with the guidance in the codification.

If a reinsurer assumes the insurance benefit feature, it should assess the significance of mortality and morbidity risk within the reinsurance contract according to the guidance in ASC 944, regardless of whether there is an account balance. The reinsurer should determine the classification of the reinsurance contract as an investment contract or as an insurance contract at the inception of the reinsurance contract. For reinsurance contracts, the mortality

or morbidity risk could be deemed other than nominal even if the original issuer did not determine mortality or morbidity to be other than nominal. Similarly, the issuer of a contract that provides only an insurance benefit feature that wraps a noninsurance contract, for example, a guaranteed minimum death benefit related to a mutual fund balance, should evaluate its contract in the same manner. A reinsurer or issuer of the insurance benefit features of a contract should calculate a liability for the portion of premiums collected each period that represents compensation to the insurance enterprise for benefits that are assessed in a manner that is expected to result in current profits and future losses from the insurance benefit function. That liability should be calculated using the methodology described in ASC 944.

Contracts may provide for potential benefits in addition to the account balance that are payable only upon annuitization, such as annuity purchase guarantees, guaranteed minimum income benefit (GMIB), and two-tier annuities. Insurance enterprises should determine whether such contract features should be accounted for under the provisions of ASC 815. If the contract feature is not accounted for under the provisions of ASC 815, an additional liability for the contract feature should be established if the present value of expected annuitization payments at the expected annuitization date exceeds the expected account balance at the expected annuitization date in accordance with the guidance in ASC 944.

Sales inducements provided to the contract holder, whether for investment or universal-life-type contracts, should be recognized as part of the liability for policy benefits over the period for which the contract must remain in force for the contract holder to qualify for the inducement or at the crediting date, if earlier, in accordance with the codification. No adjustments should be made to reduce the liability related to the sales inducements for anticipated surrender charges, persistency, or early withdrawal contractual features.

Sales inducements that are recognized as part of the liability under ASC 944, that are explicitly identified in the contract at inception, and that meet the criteria specified in the codification should be deferred and amortized using the same methodology and assumptions used to amortize capitalized acquisition costs.

The financial statements of an insurance enterprise should disclose information about the following:

1. Separate account assets and liabilities; the nature, extent, and timing of minimum guarantees related to variable contracts; and the amount of gains and losses recognized on assets transferred to separate accounts.
2. An insurance enterprise's accounting policy for sales inducements, including the nature of the costs capitalized and the method of amortizing those costs; the amount of costs capitalized and amortized for each of the periods presented; and the unamortized balance as of each balance sheet date presented.
3. The nature of the liabilities and methods and assumptions used in estimating any contract benefits recognized in excess of the account balance pursuant to the codification.

Deferred Acquisition Costs for Insurance Contract Modifications or Exchanges

ASC 944-30 addresses the accounting for deferred acquisition costs related to the internal replacement of selected insurance and investment contracts. An internal replacement is a modification of an insurance product's benefits, features, rights, or coverages (described hereafter as "benefits") by a variety of means, including the extinguishment and replacement of a contract.

If an internal replacement occurs and the rights and obligations of the parties are essentially unchanged, then the replacement contract is considered a continuation of the replaced contract. In this case, the replaced contract's unamortized deferred acquisition costs, un-

earned revenue liabilities, and deferred sales inducement assets should continue to be recognized as part of the replacement contract. Also, costs incurred in connection with such a replacement are charged to expense as incurred.

A contract change must meet all of the following criteria in order to be considered a continuation of the replaced contract—if any condition is not met, the change is treated as a substantially changed contract:

1. The insured event, risk, or period of coverage has not changed.
2. The contract holder's investment return rights have not changed.
3. Either there is no change in the insurance premium, or a premium reduction is matched by a corresponding reduction in benefits.
4. Net of distributions, there is no net reduction in contract value.
5. There is no change in contractual participation or dividend features.
6. There is no change in the contract's amortization method or revenue classification.

If benefits replacement results in a substantially changed contract, then the replaced contract is considered extinguished, in which case unamortized deferred acquisition costs, unearned revenue liabilities, and deferred sales inducement assets from the replaced contract should not be deferred as part of the replacement contract.

If a contract is accounted for as a long-duration participating contract, the estimated gross profit of the replacement contract is treated as a revision of the replaced contract's gross profit when determining the amortization of deferred acquisition costs, deferred sales inducement assets, and the recognition of unearned revenues. If a contract is accounted for as nonrefundable fees, the cash flows of the replacement contract revise the cash flows of the replaced contract for purposes of calculating the interest rate amortization of unamortized deferred acquisition costs and deferred sales inducement assets.

This standard does not apply to contract modifications resulting from an election by the contract holder that was within the original contract, as long as (1) the election followed the terms of the original contract, (2) the election is not subject to any underwriting, (3) the insurance provider cannot decline the coverage or adjust contract pricing, and (4) the benefit had been accounted for since the contract inception. The standard also does not apply if a contract feature is nonintegrated (it provides coverage that is priced solely for the incremental benefits coverage, and does not alter other components of the contract), in which case it should be accounted for as a separately issued contract.

Other Accounting Guidance

In ASC 944-20-S99, it was noted that industry practice is to amortize the present value of future profits (PVP) using an interest method with accrual of interest added to the unamortized balance. In the past, there has been some diversity in the application of this method in practice, and so the codification mandates that the interest rate used to amortize PVP should be the liability or contract rate. It also states that changes in estimates of future gross profits on contracts should be accounted for as a catch-up adjustment. And finally, PVP and any related liability should be subject to the premium deficiency test required in ASC 944-60.

ASC 944-20 includes criteria for the recognition and amounts of assets and liabilities by the assuming and ceding enterprises, respectively, and accounting for changes in coverage during the reinsurance period. A number of conditions are identified, satisfaction of which is necessary for a contract to be treated as reinsurance, and in their absence such contracts are to be accounted for by the deposit method.

ASC 944-20-25 addresses how enterprises other than insurance companies should account for contracts with insurance companies covering various types of risks such as product

and environmental liability risks. This EITF also addresses "pooled risk" contracts and reinsurance contracts entered into by a captive insurer. In order for a contract to be considered insurance it must indemnify the insured party as this would result in a transfer of risk. If no transfer of risk exists, then the contract is not considered insurance, and the balance of the premium less any amount to be retained by the insurer should be accounted for as a deposit.

ASC 325-20 provided guidance on the accounting for those formerly mutual insurance companies that have undergone demutualization transactions and converted to stock enterprises. In order to effect a demutualization, a company may be required to issue consideration, often in the form of stock, to existing participating policyholders in exchange for their current membership interests. The receipt of such stock has no direct effect on the policyholders' contractual interests of their insurance policies (for example, it does not alter the cash surrender value of their life insurance policies). However, the governance of the mutual insurance company and, in particular, the participating policyholders' interest in that governance are modified. Thus, stock received from a demutualization should be accounted for at fair value with a gain recognized in income from continuing operations.

ASC 944-605 addressed the lack of uniformity of practices among foreign reinsurers, and in particular how US insurers were to account for property and liability reinsurance assumed from foreign companies.

ASC 944-505-55 illustrates disclosures for insurance enterprises that have received permission by the insurance department in their domiciliary states to use accounting practices other than those prescribed by state laws, regulations, and rules and by the National Association of Insurance Commissioners (NAIC).

ASC 944 provides guidance in accounting for mutual life insurance contracts. Capitalization and amortization of acquisition costs are discussed. Premiums are to be reported as revenue when due from policyholders. Death and surrender benefits are reported as expenses, and annual dividends are reported separately as expenses. The calculation of estimated gross margin and liability for future policy benefits is described.

ASC 405-30 addresses the diversity in practice of accounting for assessments made by government agencies against insurance activities such as workers' compensation second injury funds, this standard imposed accrual accounting requirements and set forth the conditions that must be met before a liability may be recognized.

ASC 340-30 provides guidance on how to account for insurance and reinsurance contracts that do not have the effect of transferring insurance risk. It applies to all entities and all types of insurance or reinsurance contracts, other than long duration life and health insurance contracts. The method prescribed by this standard is "deposit accounting."

ASC 944-805 provides necessary guidance to the proper accounting for demutualization transactions and also for the formation of mutual insurance holding companies.

ASC 944-605-25 states that recognition of an unearned revenue liability representing amounts that have been assessed to compensate insurers for services to be performed over future periods is a requirement under ASC 944. Importantly (given recent alleged abuses by some insurers), this liability is not to be used to inappropriately level or smooth out gross profit over the term of the contract or produce a level gross profit from the mortality benefit over the life of the contract.

The staff of the SEC's Division of Corporate Finance has issued guidance in its "Current Accounting and Disclosure Issues" publication regarding the proper disclosures required of publicly held property-casualty insurance companies. The disclosure about the policies and methodologies for estimating the liability for unpaid claims and claim adjustment expenses should (1) separately address each material line of business, (2) identify and describe the actuarial method used, (3) describe any policy for adjusting the liability for unpaid claims and claim adjustment expenses to an amount differing from the amount calculated by its ac-

tuaries, and (4) describe any difference in the annual and interim procedures for determining the liability for unpaid claims and claim adjustment expenses. Further, the disclosure of the reasons for incurred claims and claim adjustment expenses in the current income statement that are attributed to insured events in prior years should (1) quantify the amount by line of business and by accident year within each line, (2) describe the new events or information obtained since the last reporting period that led to any changes in estimate, and (3) explain why recognition occurred in the current period, rather than in earlier periods.

The SEC staff also requires disclosure about reserving assumptions. For each material line of business, disclosure should include (1) the key assumptions affecting the estimate of liability for unpaid claims and claim adjustment expenses, and (2) a quantification of any material assumption changes from the preceding period. Finally, registrants should disclose whether the liability for claims and claim adjustment expenses is likely to change in the future. This disclosure should include, for each material line of business, (1) the identification of key assumptions that are reasonably likely to change, (2) an explanation of why management believes each change is likely, and (3) quantification of the effect that these changes may have on future financial position, liquidity, and results of operations.

INVESTMENT COMPANIES

PERSPECTIVE AND ISSUES

An investment company pools shareholders' funds to provide shareholders with professional investment management. Investment companies' activities include selling capital shares to the public, investing the proceeds in securities, and distributing net income and net realized gains to its shareholders.

ASC 946 discusses those aspects of accounting and auditing unique to investment companies, and provides guidance on accounting for offering costs, amortization of premium or discount on bonds, liabilities for excess expense plans, reporting complex capital structures, payments by affiliates, and financial statement presentation and disclosures for investment companies and nonpublic investment partnerships.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
946	Financial Services—Investment Companies

DEFINITIONS OF TERMS

Closed-end fund. An investment company having a fixed number of shares outstanding, which it does not stand ready to redeem. Its shares are traded similarly to those of other public corporations.

Closed-up fund. An open-ended investment company that no longer offers its shares for sale to the general public but still stands ready to redeem its outstanding shares.

Equalization. An accounting method used to prevent a dilution of the continuing shareholders' per share equity in undistributed net investment income caused by the continuous sales and redemptions of capital shares.

Ex-dividend or ex-distribution. Synonym for shares being traded without dividend or without capital gains distribution. The buyer of a stock selling ex-dividend does not acquire a right to receive a previously declared but not-yet-paid dividend. Dividends are payable on a fixed date to shareholders recorded on the stock transfer books of the disbursing company as of a previous date of record. For example, a dividend may be declared as payable to holders of record on the books of the disbursing company on a given Friday. Because five business days are allowed for delivery of the security in regular-way transactions on a stock ex-

change or over-the-counter, the exchange or the National Association of Securities Dealers (NASD) declares the stock ex-dividend as of the opening of the market on the preceding Monday or on one business day earlier for each intervening nontrading day. Therefore, anyone buying the stock on and after Monday is not entitled to the dividend. In the case of nontraded shares of mutual funds, the ex-dividend date is the same as the record date.

Open-end investment company. A mutual fund that is ready to redeem its shares at any time and that usually offers its shares for sale to the public continuously.

CONCEPTS, RULES, AND EXAMPLES

Several types of investment companies exist: management investment companies, unit investment trusts, collectible trust funds, investment partnerships, certain separate accounts of life insurance companies, and offshore funds. Management investment companies include open-end funds (mutual funds), closed-end funds, special purpose funds, venture capital investment companies, small business investment companies, and business development companies.

All of the investment companies mentioned have the following characteristics:

1. Investment activity—Investing in assets, usually in securities of other entities, for current income, appreciation, or both.
2. Unit ownership—Ownership in the investment company is represented by stock or other units of ownership, to which proportionate shares of net assets can be attributed.
3. Pooling of funds—The funds of the investment company owners are pooled together to take advantage of professional investment management.
4. Reporting entity—The investment company is the primary reporting entity.

Accounting Policies

The accounting policies for an investment company result from the company's role as a vehicle through which investors can invest as a group. These policies are largely governed by the SEC, Small Business Administration, and specific provisions of the Internal Revenue Code relating to investment companies.

Investment companies report all investment securities at market value, or if quoted market values are not available, at fair values as determined by management. Along with other industry groups for which specialized GAAP already existed, calling for presentation of all investments at market value (a group that includes broker-dealers and defined benefit pension plans), investment companies were exempted from the provisions of ASC 320.

Security purchases and sales are generally recorded at the trade date; therefore, the effects of all securities trades entered into by the investment company to the date of the financial statements are included in the financial report.

Investment companies record dividend income on the ex-dividend date, not on the later record or payable date. The rationale for this treatment is that the market price of market securities may be affected by the exclusion of the declared dividend. Additionally, investment companies record a liability for dividends payable on the ex-dividend date because mutual fund shares are purchased and redeemed at prices equal to or based on net asset value. If investors purchase shares between the declaration and ex-dividend dates they are entitled to receive dividends; however, investors purchasing shares after the ex-dividend date are not entitled to receive dividends.

Open-end investment companies often employ the practice of equalization. This theory states that the net asset value of each share of capital stock sold comprises the par value of the stock, undistributed income, and paid-in capital and other surplus. When shares are sold

or repurchased, the investment company calculates the amount of undistributed income available for distribution to its shareholders. Based on the number of shares outstanding, the investment company determines the per share amount; this amount is credited to an equalization account when shares are sold. Conversely, the equalization account is charged when shares are repurchased.

Accounting for High-Yield Debt Securities

The accounting by creditors for investments in "step interest" and "PIK" debt securities, if these qualify as "high-yield" securities, is addressed by the Guide. Step interest bonds are generally unsecured debentures that pay no interest for a specified period after issuance, then pay a stipulated rate for a period, then a higher rate for another period, etc., until maturity. Thus, they combine some of the characteristics of zero-coupon bonds with some features of current interest bonds. PIK (payment in kind) bonds pay some or all interest in the form of other debt instruments ("baby" or "bunny" bonds), which in turn may also pay interest in the form of baby bonds. All babies mature at the due date of the parent bond.

The Guide, as amended, requires that the effective interest method should be used for step interest bonds; to the extent that interest income is not expected to be realized, a reserve against the income should be established. A previously employed technique, the bifurcation method, is no longer acceptable. For PIK bonds, the effective interest method is also required; the market value method, which was widely used in the past, can no longer be employed.

Exemptions from the Requirement to Provide a Statement of Cash Flows

The following conditions must be met for an investment company to be exempted from providing a statement of cash flows:

1. Substantially all of the entity's investments were highly liquid.
2. The entity's investments are carried at market value.
3. The entity had little or no debt, based on average debt outstanding during the period, in relation to average total assets.
4. The entity provides a statement of changes in net assets.

Taxes

Investment companies that distribute all taxable income and taxable realized gains qualifying under Subchapter M of the Internal Revenue Code are not required to record a provision for federal income taxes. If the investment company does not distribute all taxable income and taxable realized gains, a liability should be recorded at the end of the last day of the taxable year. The rationale for recording on the last day of the year is that only shareholders of record at that date are entitled to credit for taxes paid.

Commodity Pools

ASC 946-210 stipulates that investment partnerships which are commodity pools subject to regulation by the CFTC are subject to its guidance. Thus, notwithstanding the rapid turnover common among such pools, the financial statements must include a schedule of investments.

Other Accounting Guidance

ASC 946-320 concludes that for PIK and step bonds, (1) the effective-interest method should be used to determine interest income; (2) a reserve against income should be estab-

lished for interest income not expected to be realized; (3) the cost plus any discount should not exceed undiscounted future cash collections; (4) SEC yield-formula calculations must be made; and (5) all high-yield and restricted debt securities whose values were estimated should be indicated in the portfolio. For defaulted debt securities, any interest receivable written off that had been recognized as income constitutes a reduction of income. Write-offs of purchased interest increase the cost basis and represent an unrealized loss until the security is sold. "Capital infusions" are accounted for as an addition to the cost basis, while related "workout expenditures" are recorded as unrealized losses. Any ongoing expenditures to protect the value of the investment are recorded as operating expenses. Auditors should consider additional pricing valuation audit procedures.

In ASC 946-830, it was concluded that transactions denominated in a foreign currency must originally be measured in that currency. Reporting exchange rate gains and losses separately from any gain/loss on the investment due to changes in market price is allowable but not required.

ASC 946-210-50 pertains to investment partnerships that are exempt from SEC registration under the Investment Company Act of 1940. Specifically, the statement requires that the financial statements include a condensed schedule of securities that categorizes investments by type, country or geographic region, and industry; discloses pertinent information concerning investments comprising greater than 5% of net assets; and aggregates any securities holdings less than the 5% of net assets threshold. The statement of operations for nonpublic investment companies shall be presented in conformity with requirements for public investment companies per the AAG so as to reflect their comparable operations. The financial statements shall also present management fees and disclose their computation.

ASC 946-20 requires investment companies with enhanced 12b-1 plans or board-contingent plans for which the board has committed to pay costs to recognize a liability and the related expense, for the amount of excess costs. This liability should be discounted at an appropriate current rate if the amount and timing of cash flows are reliably determinable and if distribution costs are not subject to a reasonable interest charge. Excess costs are recorded as a liability as the fund has assumed an obligation to pay the 12b-1 fee after the termination of the plan to the extent that the distributor has excess costs.

In a related matter, ASC 946-605 specifies the accounting for cash received from a third party for a distributor's right to future cash flows relating to distribution fees for previously sold shares. Revenue recognition is deemed proper when cash is received from a third party if the distributor has no continuing involvement nor recourse; any deferred costs related to the sale of shares is to be expensed concurrently. It further defines absence of continuing involvement and recourse.

ASC 946-10-65-1 concludes that an entity falls within the guidelines of the codification if the entity is regulated by the Investment Company Act of 1940, such as a management investment company, unit investment trust, small business investment company, business development company and certain offshore funds. It also notes that investment company accounting should be retained in the financial statements of the parent company of an investment company or equity method investor in an investment company if (1) the subsidiary is an investment company, (2) the consolidated group follows policies distinguishing the nature and type of investments made by the investment company from the nature and type of investments made by other entities within the consolidated group that are not investment companies, and (3) the parent company or equity method investor should be investing for current income, capital appreciation, or both, rather than for strategic operating purposes.

Amendment to ASC 946. ASC 946-210 affects the required display of certain contracts held by investment companies if these are fully benefit-responsive. Both the fair val-

ues of the contracts, segregated between guaranteed investment contracts and so-called wrapper contracts, and the contract (guaranteed) values, must be displayed in the investment company's balance sheet.

A contract is deemed fully benefit-responsive if *all* five conditions set forth by the FSP are met. These conditions are defined as

1. The contract is negotiated directly between the fund and the issuer, and it prohibits the fund from assigning or selling the contract or its proceeds to another party without the consent of the issuer.
2. Either (a) the repayment of principal and interest credited to participants in the fund is guaranteed by the issuer of the investment contract, or (b) the fund provides for prospective interest crediting rate adjustments to participants in the fund on a designated pool of investments held by the fund, provided that the terms of the agreement with participants in the fund specify that the crediting interest rate cannot be less than zero. The risk of decline in the interest crediting rate below zero must be transferred to a financially responsible third party through a "wrapper" contract. If an event (e.g., decline in creditworthiness of the contract issuer or wrapper provider) has occurred that may affect the realization of full contract value for a particular investment contract, the contract no longer is to be considered fully benefit-responsive.
3. The terms of the contract require all permitted participant-initiated transactions with the fund to occur at contract value with no conditions, limits, or restrictions. Permitted participant-initiated transactions are those transactions allowed by the underlying defined-contribution plan, such as withdrawals for benefits, loans, or transfers to other funds within the plan.
4. Events that limit the ability for the fund to transact at contract value with the issuer (e.g., premature termination of the contracts by the plan, plant closings, layoffs, plan termination, bankruptcy, mergers, and early retirement incentives) must be *probable* of *not* occurring.
5. The fund itself must allow participants reasonable access to their funds.

This standard requires that balance sheets of investment companies report separately investments, including guaranteed investment contracts, at fair value, and wrapper contracts, also at fair value. The balance sheet must also display an additional account to bring the total assets being reported to contract amounts—that is, the amounts at which participants can transact with the fund.

Additionally, the following information must be disclosed in footnotes to the financial statements for each investment contract, and be reconciled to corresponding line items on the balance sheet:

1. The fair value of the wrapper contract and the fair value of each of the corresponding underlying investments;
2. Adjustment from fair value to contract value (if the investment contract is fully benefit-responsive); and
3. Major credit ratings of the issuer or wrapper provider.

Other expanded disclosures are mandated for investment companies having fully benefit-responsive contracts, as follows:

1. A description of the nature of the investment contracts, how they operate, and the methodology for calculating the crediting interest rate, including the key factors that could influence future average crediting interest rates, the basis for and frequency of determining credit interest-rate resets, and any minimum crediting interest rate

under the terms of the contracts. This disclosure should explain the relationship between future crediting rates and the amount reported on the balance sheet representing the adjustment of the portion of net assets attributable to fully benefit-responsive investments from fair value to contract value.

2. A reconciliation between the beginning and ending balance of the amount presented on the balance sheet that represents the difference between net assets at fair value and net assets for each period in which a statement of changes in net assets is presented. This reconciliation should include
   a. The change in the difference between the fair value and contract value of all fully benefit-responsive investment contracts, and
   b. The increase or decrease due to changes in the fully benefit-responsive status of the fund's investment contracts.
3. The average yield earned by the entire fund (without regard to the interest rate credited to participants in the fund) for each period for which a balance sheet is presented.
4. The average yield earned by the entire fund with an adjustment to reflect the actual interest rate credited to participants in the fund covering each period for which a balance sheet is presented.
5. Two different sensitivity analyses
   a. The effect on the weighted-average crediting interest rates calculated at the latest balance sheet date and the next four reset dates, under two or more scenarios where there is an immediate hypothetical increase or decrease in interest rates, with no change to the duration of the underlying investment portfolio and no contributions or withdrawals. These scenarios should include, at a minimum, immediate hypothetical changes in market yields equal to one-quarter and one-half of the current yield.
   b. The effect on the weighted-average crediting interest rates calculated at the latest balance sheet date and the next four reset dates, under two or more scenarios where there are the same immediate hypothetical changes in market yields in the first analysis, combined with an immediate hypothetical 10% decrease in the net assets of the fund due to participant transfers, with no change to the duration of the portfolio.
6. A description of the events which limit the ability of the fund to transact at contract value with the issuer (for example, premature termination of the contracts by the plan, plant closings, layoffs, plan termination, bankruptcy, mergers, and early retirement incentives), including a statement that the occurrence of such events is probable or not probable.
7. A description of the events and circumstances that would allow issuers to terminate fully benefit-responsive investment contracts with the fund and settle at an amount different from contract value.

To be considered within the scope of the foregoing guidance, all, or essentially all, of the investment company's net assets will need to be held by participants in one or more qualified employer-sponsored defined-contribution plans. In order to be considered within the scope of the guidance in this standard, any portion of the net assets of the investment company that is not held by participants in qualified employer-sponsored defined-contribution plans as of the effective date are not permitted to increase due to gross contributions, loan repayments, or transfers into the fund.

MORTGAGE BANKING

PERSPECTIVE AND ISSUES

Mortgage banking comprises two activities.

1. The origination or purchase of mortgage loans and subsequent sale to permanent investors, and
2. Long-term servicing of the mortgage loan.

To the extent that mortgage banking activities discussed in this section may be undertaken by subsidiaries or divisions of commercial banks or savings institutions, the same accounting and reporting standards apply. Normal, nonmortgage lending of those enterprises, however, is accounted for in accordance with the lender's normal accounting policies for such activities.

Mortgage loans held for sale are valued at the lower of cost or market. Mortgage-backed securities are reported under ASC 320 as held-to-maturity, trading, or available-for-sale, depending on the entity's intent and ability to hold the securities.

Loan origination fees and related direct costs for loans held for sale are capitalized as part of the related loan and amortized, using the effective yield method. However, fees and costs associated with commitments to originate, sell, or purchase loans are treated as part of the commitment, which is a derivative accounted for under ASC 815.

Loan origination fees and costs for loans held for investment are deferred and recognized as an adjustment to the yield.

ASC 942, *Financial Services—Depository and Lending,* provides uniform and consistent guidance for the accounting and reporting practices for similar transactions by various types of depository and lending institutions, and has now been incorporated in a unified AAG. The standard includes in its scope, corporate credit unions and mortgage companies and, in fact, affects disclosure practices for any entity that extends credit to customers. (See the summary under the Banking and Thrift Institutions section of this chapter for a discussion of the general disclosure requirements for all enterprises. These general requirements also apply, when applicable, to mortgage banking enterprises and are not repeated in this section.) In addition, the standard prescribes required disclosures for mortgage banking enterprises regarding their regulatory capital and net worth requirements.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
320	Investments—Debt and Equity Securities
Broad Transactions	
860	Transfers and Servicing
Industry	
942	Financial Services—Depository and Lending
958	Not-for-Profit Entities

DEFINITIONS OF TERMS

Affiliated enterprise. An enterprise that directly or indirectly controls, is controlled by, or is under common control with another enterprise; also, a party with which the enterprise may deal if one party has the ability to exercise significant influence over the other's operating and financial policies.

Current (normal) servicing fee rate. A servicing fee rate that is representative of servicing fee rates most commonly used in comparable servicing agreements covering similar types of mortgage loans.

Federal Home Loan Mortgage Corporation (FHLMC). Often referred to as "Freddie Mac," FHLMC is a private corporation authorized by Congress to assist in the development and maintenance of a secondary market in conventional residential mortgages. FHLMC purchases and sells mortgages principally through mortgage participation certificates (PC) representing an undivided interest in a group of conventional mortgages. FHLMC guarantees the timely payment of interest and the collection of principal on the PC. FHLMC has been effectively taken over by the federal government as part of the banking bailout that began in late 2008.

Federal National Mortgage Association (FNMA). Often referred to as "Fannie Mae," FNMA is an investor-owned corporation established by Congress to support the secondary mortgage loan market by purchasing mortgage loans when other investor funds are limited and selling mortgage loans when other investor funds are available. FNMA has been effectively taken over by the federal government as part of the banking bailout that began in late 2008.

Gap commitment. A commitment to provide interim financing while the borrower is in the process of satisfying provisions of a permanent loan agreement, such as obtaining a designated occupancy level on an apartment project. The interim loan ordinarily finances the difference between the floor loan (the portion of a mortgage loan commitment that is less than the full amount of the commitment) and the maximum permanent loan.

Government National Mortgage Association (GNMA). Often referred to as "Ginnie Mae," GNMA is a US governmental agency that guarantees certain types of securities (mortgage-backed securities) and provides funds for and administers certain types of low-income housing assistance programs.

Internal reserve method. A method for making payments to investors for collections of principal and interest on mortgage loans by issuers of GNMA securities. An issuer electing the internal reserve method is required to deposit in a custodial account an amount equal to one month's interest on the mortgage loans that collateralize the GNMA security issued.

Mortgage-backed securities. Securities issued by a governmental agency or corporation (e.g., GNMA or FHLMC) or by private issuers (e.g., FNMA, banks, and mortgage banking enterprises). Mortgage-backed securities generally are referred to as mortgage participation certificates or pass-through certificates (PC). A PC represents an undivided interest in a pool of specific mortgage loans. Periodic payments on GNMA PC are backed by the US government. Periodic payments on FHLMC and FNMA PC are guaranteed by those corporations and are not backed by the US government.

Mortgage banking enterprise. An enterprise that is engaged primarily in originating, marketing, and servicing real estate mortgage loans for other than its own account. Mortgage banking enterprises, as local representatives of institutional lenders, act as correspondents between lenders and borrowers.

Permanent investor. An enterprise that invests in mortgage loans for its own account, for example, an insurance enterprise, commercial or mutual savings bank, savings and loan association, pension plan, real estate investment trust, or FNMA.

Repurchase financing. A repurchase agreement that relates to a previously transferred financial asset between the same counterparties, and which is entered into contemporaneously with, or in contemplation of, the initial transfer.

Securitization. The transformation of a pool of financial assets (e.g., mortgages) into securities (asset-backed securities).

Servicing. Mortgage loan servicing includes collecting monthly mortgagor payments, forwarding payments and related accounting reports to investors, collecting escrow deposits

for the payment of mortgagor property taxes and insurance, and paying the taxes and insurance from the escrow funds when due.

Standby commitment. A commitment to lend money with the understanding that the loan probably will not be made unless permanent financing cannot be obtained from another source. Standby commitments ordinarily are used to enable the borrower to obtain construction financing on the assumption that permanent financing will be available on more favorable terms when construction is completed. Standby commitments normally provide for an interest rate substantially above the market rate in effect when the commitment is issued.

CONCEPTS, RULES, AND EXAMPLES

Mortgage Banking Activities

A mortgage banking enterprise (MBE) acts as an intermediary between borrowers (mortgagors) and lenders (mortgagees). MBE activities include purchasing and originating mortgage loans for sale to permanent investors and performing servicing activities during the period that the loans are outstanding. The mortgage loans offered for sale to permanent investors may be originated by the MBE (in-house originations); purchased from realtors, brokers, or investors; or converted from short-term, interim credit facilities to permanent financing. The common technique used by the MBE to market and sell the loans is referred to as securitization because the mortgage loans receivable are pooled and converted to mortgage-backed securities and sold in that form.

MBEs customarily retain the rights to service the loans that they sell to permanent investors in exchange for a servicing fee. The servicing fee, normally a percentage of the mortgage's outstanding principal balance, compensates the MBE for processing of mortgagor payments of principal, interest and escrow deposits, disbursing funds from the escrow accounts to pay property taxes and insurance on behalf of the mortgagor, and remitting net proceeds to the permanent investor along with relevant accounting reports.

Mortgage loans. The MBE is required to classify mortgage loans that it holds as either (1) held-for-sale, or (2) held for long-term investment.

Loans held-for-sale. Mortgage loans held for sale are reported at the lower of cost or market as of the balance sheet date. Any excess of cost over market is accounted for as a valuation allowance, changes in which are to be included in income in the period of change.

Determination of cost basis. The following matters must be considered with respect to the cost basis used for the purposes of the lower of cost or market value determination:

1. If a mortgage loan has been identified as a hedged item in a fair value hedge under ASC 815, the cost basis used reflects adjustments to the loan's carrying amount for changes in the loan's fair value attributable to the risk being hedged.
2. Purchase discounts on mortgage loans reduce the cost basis and are not amortized as interest revenue during the period that the loans are held for sale.
3. Capitalized costs attributable to the acquisition of mortgage servicing rights associated with the purchase or origination of mortgage loans are excluded from the cost basis of the mortgage loans.

Determination of market value. The market value of mortgage loans held for sale is determined by type of loan; at a minimum, separate determinations are made for residential and commercial loans. Either an aggregate or individual loan basis may be used in determining the lower of cost or market for each type of loan. Market values for loans subject to investor purchase commitments (committed loans) and loans held for speculative purposes (uncommitted loans) must be determined separately as follows:

1. For committed loans, market value is defined as fair value.

2. For uncommitted loans, market value is based on quotations from the market in which the MBE normally operates, considering
   a. Market prices and yields sought by the MBE's normal market outlets,
   b. Quoted Government National Mortgage Association (GNMA) security prices or other public market quotations of rates for long-term mortgage loans, and
   c. Federal Home Loan Mortgage Corporation (FHLMC) and Federal National Mortgage Association (FNMA) current delivery prices.

Loans held for long-term investment. Mortgage loans may be transferred from the held-for-sale classification to the held-for-long-term investment classification only if the MBE has both the intent and ability to hold the loan for the foreseeable future or until maturity. The transfer to the long-term investment classification is recorded at the lower of cost or market value on the date of transfer. Any difference between the loan's adjusted carrying amount and its outstanding principal balance (e.g., purchase discounts as discussed above) is recognized as a yield adjustment using the interest method.

If recoverability of the carrying amount of a mortgage loan held for long-term investment is doubtful and the impairment is judged to be other than temporary, the loan's carrying amount is reduced by the amount of the impairment to the amount expected to be collected with the related charge recognized as a loss. The adjusted carrying value becomes the loan's new cost basis and any eventual gain on recovery may only be recognized upon the loan's sale, maturity, or other disposition.

Mortgage-backed securities. The securitization of mortgage loans held-for-sale is accounted for as a sale of the mortgage loans and purchase of mortgage-backed securities.

Classification and valuation. After the securitization of a held-for-sale mortgage loan, any mortgage-backed securities retained by the MBE are classified as (1) trading, (2) available-for-sale, or (3) held-to-maturity under the provisions of ASC 320. As is the case with the MBE's mortgage loans held for investment, the MBE must have both the intent and ability to hold the mortgage-backed securities for the foreseeable future or until maturity in order to classify them as held-to-maturity. If the MBE had committed to sell the securities before or during the securitization process, the securities are required to be classified under the trading category. Mortgage-backed securities held by a not-for-profit organization are stated at fair value under ASC 958-320.

The fair value of uncommitted mortgage-backed securities collateralized by the MBE's own loans is ordinarily based on the market value of the securities. If the trust holding the loans may be readily terminated and the loans sold directly, fair value of the securities is based on the market value of either the loans or the securities, depending on the entity's intentions. Fair value for other uncommitted mortgage-backed securities is based on published yield data.

Repurchase agreements. Mortgage loans or mortgage-backed securities held for sale may be temporarily transferred by an MBE to another financial institution under a formal or informal agreement which serves as a means of financing these assets. Such agreements are accounted for as collateralized financing arrangements; the loans and securities transferred under the agreements are still reported by the MBE as held for sale.

A formal repurchase agreement specifies that the MBE retains control over future economic benefits and also the risk of loss relating to the loans or securities transferred. These assets are subsequently reacquired from the financial institution upon the sale of the assets by the mortgage banking enterprise to permanent investors.

An informal repurchase agreement exists when no formal agreement has been executed but loans or securities are transferred by an MBE that does all of the following:

1. Is the sole marketer of the assets
2. Retains any interest spread on the assets
3. Retains risk of loss in market value
4. Reacquires uncollectible loans
5. Regularly reacquires most or all of the assets and sells them to permanent investors

When mortgage loans held for sale are transferred under a repurchase arrangement, they continue to be reported by the transferor as loans held for sale. Mortgage-backed securities sold under agreements to repurchase are reported as trading securities as defined in ASC 320.

Servicing Mortgage Loans

Rights to service mortgage loans for others are recognized as separate assets by an MBE. If the enterprise acquires such rights through purchase or origination of mortgage loans and retains them upon sale or securitization, the total cost of the mortgage loans must be allocated between the rights and the loans (without the rights) based on their relative fair values. If it is impossible to determine the fair value of the mortgage servicing rights apart from the mortgage, the MBE/transferor records the mortgage servicing rights at zero value (ASC 860). Otherwise, mortgage servicing rights are capitalized at their fair value and recognized as a net asset if the benefits of servicing the mortgage are expected to be more than adequate compensation to the servicer for performing the duties. If the benefits of servicing the mortgage are not expected to adequately compensate the servicer, the servicer recognizes a liability. The asset Mortgage Servicing Contract Rights is initially measured at its fair value. Subsequent impairment is recognized as follows:

1. The mortgage servicing assets are stratified based on predominant risk characteristics.
2. Impairment is recognized through a valuation allowance for an individual stratum. The amount of impairment equals the carrying amount for a particular stratum minus its fair value.
3. The valuation allowance is adjusted to reflect changes in the measurement of impairment after the initial measurement of impairment.

Servicing fees. Servicing fees are usually based on a percentage of the outstanding principal balance of the mortgage loan. When a mortgage loan is sold with servicing rights retained, the sales price must be adjusted if the stated rate is materially different from the current (normal) servicing fee rate so that the gain or loss on the sale can be determined. The adjustment is

Adjustment	=	Actual Sales Price	–	Estimated sales price obtainable if normal servicing fee rate had been used

This adjustment allows for recognition of normal servicing fees in subsequent years.

The adjustment and any recognized gain or loss is determined as of the sale date. If estimated normal servicing fees are less than total expected servicing costs, then this loss is accrued on the sale date as well.

Repurchase Financing

A repurchase financing involves the transfer of a previously transferred financial asset back to the lender as collateral for a financing between the borrower and the lender. The lender usually returns the financial asset to the borrower when the financing is repaid. The borrower and lender cannot separately account for an asset transfer and related repurchase

financing unless the two transactions have a valid business purpose for being entered into separately, and the repurchase financing does not result in the lender retaining control over the financial asset. If a transaction meets these criteria, then evaluate the initial transfer without the repurchase financing to see if it meets the requirements for sale accounting (ASC 860). If the transaction does not meet these criteria, then the arrangement is probably a forward contract.

Sales to Affiliated Enterprises

When mortgage loans or mortgage-backed securities are sold to an affiliated enterprise, the carrying amount of the assets must be adjusted to lower of cost or market as of the date that management decides that the sale will occur. This date is evidenced by formal approval by a representative of the affiliated enterprise (purchaser), issuance of a purchase commitment, and acceptance of the purchase commitment by the seller. Any adjustment is charged to income.

If a group of (or all) mortgage loans are originated specifically for an affiliate, then the originator is an agent of the affiliated enterprise. In this case, the loans are transferred at the originator's cost of acquisition. This treatment does not apply to "right of first refusal" or similar contracts in which the originator retains all risks of ownership.

Issuance of GNMA Securities

An issuer of GNMA securities who elects the internal reserve method must pay one month's interest cost to a trustee. This cost is capitalized (at no greater than the present value of net future servicing income) and amortized.

Loan and Commitment Fees and Costs

Mortgage bankers may pay or receive loan and commitment fees as compensation for various loan administration services. These fees and costs are accounted for as described in the following paragraphs.

Loan origination fees received. Loan origination fees and related direct costs are deferred and amortized, using the effective yield method. Fees and costs associated with commitments to originate, sell, or purchase loans, however, must be considered part of the commitments, which are deemed to be derivatives under ASC 815. If the loan is held for investment, loan origination fees and costs are recognized as an adjustment of yield using the effective interest method.

Services rendered. Fees for specific services rendered by third parties as part of a loan origination (e.g., appraisal fees) are recognized when the services are performed.

Commitment fees paid to investors on loans held for sale. Residential or commercial loan commitment fees paid to permanent investors are recognized as expense when the loans are sold or when it is determined that the commitment will not be used. Since residential loan commitment fees typically cover groups of loans, the amount of fees recognized as revenue or expense relating to an individual transaction is calculated as

$$\text{Revenue or expense recognized on individual transaction} = \text{Total residential loan commitment fee} \times \frac{\text{Amount of individual loan}}{\text{Total commitment amount}}$$

Loan placement fees (fees for arranging a commitment directly between investor and borrower) are recognized as revenue once all significant services have been performed by the MBE. In some cases, an MBE secures a commitment from a permanent investor before or at the same time a commitment is made to a borrower and the latter commitment requires

1. Simultaneous assignment to the investor, and

2. Simultaneous transfer to the borrower of amounts paid by the investor.

The fees related to such transactions are also accounted for as loan placement fees.

Expired commitments or early repayment of loans. At the time that a loan commitment expires unused or is repaid before repayment is due, any related fees that had been deferred are recognized as revenue or expense.

Reporting

An MBE must, on its balance sheet, distinguish between mortgage loans and mortgage-backed securities that are held for sale and those that are held for long-term investment. The notes to the financial statements are to disclose whether the MBE used the aggregate method or the individual-loan method to determine the lower of cost or market.

ASC 942, *Financial Services—Depository and Lending,* contains specific capital disclosure requirements including, at a minimum

1. A description of the minimum net worth requirements related to
   a. Secondary market investors, and
   b. State-imposed regulatory mandates.
2. The actual or possible material effects of noncompliance with those requirements.
3. Whether the entity is in compliance with the regulatory capital requirements including, as of the date of each balance sheet presented, the following measures:
   a. The amount of the entity's required and actual net worth
   b. Factors that may significantly affect adequacy of net worth such as potentially volatile components of capital, qualitative factors, or regulatory mandates
4. If the entity is not in compliance with capital adequacy requirements as of the most recent balance sheet date, the possible material effects of that condition on amounts and disclosures in the financial statements.
5. Loan servicers with net worth requirements imposed by more than one source are to disclose the new worth requirements of
   a. Significant servicing covenants with secondary market investors with commonly defined servicing requirements,
   b. Any other secondary market investor where violation of the net worth requirement would have an adverse effect on the business, and
   c. The most restrictive third-party agreement if not already included in the above disclosures.

The standard points out that noncompliance with minimum net worth requirements may trigger substantial doubt about the entity's ability to continue as a going concern.

MOTION PICTURES

PERSPECTIVE AND ISSUES

The production, sale, licensing, and distribution of motion pictures (and television series) are fraught with uncertainties. The industry is speculative in nature with studios routinely investing multimillion dollar sums in the hope that the production will achieve critical acclaim and that moviegoers will flock to the box office, purchase licensed merchandise tied to the film and its characters, and purchase and rent videos and DVDs. Due to the uncertainties involved in estimating the revenues that will be earned and costs that will be incurred over a film's life, an acceptable estimation methodology is required to achieve proper matching of costs and revenues and accurately reflect the results of the film's financial performance. This methodology is provided in ASC 926, *Entertainment—Films*.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Broad Transactions

835-20	Interest—Capitalization of Interest

Industry

926	Entertainment—Films

DEFINITIONS OF TERMS

Cross-collateralized. A contractual arrangement granting distribution rights to multiple films, territories and/or markets to a licensee. In this type of arrangement, the exploitation results of the entire package are aggregated by the licensee in determining amounts payable to the licensor.

Distributor. The owner or holder of the rights to distribute films. Excluded from this definition, for the purposes of applying ASC 926, are entities that function solely as broadcasters, retailers (such as video stores), or movie theaters.

Exploitation costs. All direct costs incurred in connection with the film's distribution. Examples include marketing, advertising, publicity, promotion, and other distribution expenses.

Film costs. Film costs include all direct negative costs incurred in the physical production of a film, including allocations of production overhead and interest capitalized in accordance with ASC 835-20. Examples of direct negative costs include costs of story and scenario; compensation of cast members, extras, directors, producers, and miscellaneous staff; costs of set construction and operations, wardrobe and accessories; costs of sound synchronization; rental facilities on location; and postproduction costs such as music, special effects, and editing.

Film prints. The materials containing the completed audio and video elements of a film which are distributed to a theater to exhibit the film to its customers.

Firm commitment. An agreement with a third party that is binding on both parties. The agreement specifies all significant terms, including items to be exchanged, consideration, and timing of the transaction. The agreement includes a disincentive for nonperformance that is sufficiently large to ensure the expected performance. With respect to an episodic television series, a firm commitment for future production includes only episodes to be delivered within one year from the date of the estimate of ultimate revenue.

Market. A distribution channel located within a certain geographic territory for a certain type of media, exhibition, or related product. Examples include theatrical exhibition, home video (laser disc, videotape, DVD), pay television, free television, and the licensing of film-related merchandise.

Nonrefundable minimum guarantee. Amount to be paid by a customer in a variable fee arrangement that guarantees an entity a minimum fee on that arrangement. This amount applies to payments paid at inception, as well as to legally binding commitments to pay amounts over the license period.

Overall deal. An arrangement whereby an entity compensates a creative individual (e.g., producer, actor, or director) for the exclusive or preferential use of that party's creative services.

Participation costs. Frequently, persons involved in the production of a film are compensated, in part or in full, with an interest (referred to as a "participation") in the financial results of the film. Determination of the amount of compensation payable to the participant is usually based on formulas (participations) and by contingent amounts due under provisions of collective bargaining agreements (residuals). The recipients of this compensation are referred to as participants and the costs are referred to as participation costs. Participa-

tions may be paid to creative talent (e.g. actors or writers), or to entities from whom distribution rights are licensed.

Producer. An individual or enterprise that is responsible for all aspects of a film. Although the producer's role may vary, his or her responsibilities include administration of such aspects of the project as initial concept, script, budgeting, shooting, postproduction, and release.

Revenue. Amounts earned by an entity from its direct distribution, exploitation, or licensing of a film, before deduction for any of the entity's direct costs of distribution. In markets and territories where the entity's fully or jointly owned films are distributed by third-party distributors, revenue is the net amount payable to the entity by the distributor. Revenue is reduced by appropriate allowances, estimated returns, price concessions, or similar adjustments, as applicable.

Sale. The transfer of control of the master copy of a film and all of the associated rights that accompany it.

Set for production. A film qualifies as being set for production when all of the following conditions have been met: (1) management with relevant authority authorizes (implicitly or explicitly) and commits to funding the film's production; (2) active preproduction has begun; and (3) the start of principal photography is expected to begin within six months.

Territory. A geographic area in which a film is exploited, usually a country. In some cases, however, a territory may be contractually defined as countries with a common language.

CONCEPTS, RULES, AND EXAMPLES

ASC 926, *Entertainment—Films,* provides the authoritative guidance with respect to accounting for arrangements to sell, license, or exhibit films. The term "film" is generic and includes intellectual property produced on traditional celluloid film as well as videotape, digital, or other video-recording formats. The content or format of films includes (1) feature films, (2) television series, (3) television specials, and (4) similar products (including animated films and television programming). The guidance in the standard applies to producers and distributors who own or hold rights to distribute or exploit films. The standard does not apply to the following specialized industries or applications that have their own specialized GAAP:

1. The recording industry (ASC 928)
2. Cable television (ASC 922)
3. Broadcasters (ASC 920)
4. Computer software to be sold, leased, or otherwise marketed (ASC 985-20)
5. Software revenue recognition (ASC 985-605)
6. Entertainment and educational software products (ASC 985-705)

There are many varieties of contractual sales or licensing arrangements governing the rights or group of rights to a single or multiple films. The film's producer (referred to in the standard and in this discussion as "the entity") may license it to distributors, theaters, exhibitors, or other licensees (referred to in the standard and in this discussion as "customers") on an exclusive or nonexclusive basis in a particular market or territory. The terms of the license may be for a fixed (or flat) fee or the fee may be variable based on a percentage of the customer's revenue. If the arrangement is variable, it may include a nonrefundable minimum guarantee payable either in advance or over the licensing period.

Revenue Recognition

An entity recognizes revenue from a sale or licensing arrangement only when all of the following conditions are met:

1. Persuasive evidence exists of a sale or licensing arrangement with a customer.
2. The film is complete and, in accordance with the terms of the arrangement, has been delivered or is available for immediate and unconditional delivery.
3. The license period for the arrangement has started and the customer can begin exploitation, exhibition, or sale.
4. The arrangement fee is fixed or determinable.
5. Collection of the arrangement fee is reasonably assured.

If any of the above conditions has not been met, the entity defers recognizing revenue until all of the conditions are met. If the entity recognizes a receivable on its balance sheet for advances under an arrangement for which all of the above conditions have not been met, a liability for deferred revenue of the same amount is to be recognized until such time as all of the conditions have been met.

Persuasive evidence of an arrangement. This condition is met solely by documentary evidence that sets forth, at a minimum, the following terms: (1) the license period, (2) the film or films covered by the agreement, (3) a description of the rights transferred, and (4) the consideration to be exchanged. If the agreement is ambiguous regarding the parties' rights and obligations, or if there is significant doubt as to the ability of either party to perform under the agreement, revenue is not recognized. Acceptable documentary evidence must be verifiable (e.g., a contract, a purchase order, or an online authorization).

Delivery. The delivery condition may be satisfied by an arrangement providing the customer with immediate and unconditional access to a film print held by the entity. The customer may also receive a lab access letter that authorizes it to order a film laboratory to make the film immediately and unconditionally available for its use. Under these conditions, the delivery condition is satisfied if the film is complete and available for immediate delivery.

Some licensing arrangements require the entity to make significant changes to the film after it becomes initially available. Significant changes are changes that are additive to the film and that result from the entity creating additional content after the film becomes initially available. The changes can consist of the reshooting of selected scenes or adding additional special effects. When such changes are required to be made to the film, the arrangement does not meet the delivery condition. The costs incurred for these significant changes are added to film costs and subsequently recorded as expense when the related revenue is recognized.

Changes that are not considered to be significant changes include insertion or addition of preexisting film footage, addition of dubbing or subtitles to existing footage, removal of offensive language, reformatting to fit a broadcaster's screen dimensions, or adjustments to allow for the insertion of television commercials. Such insignificant changes do not alter the film's qualification to meet the delivery condition. The expected costs of these insignificant changes are accrued and charged directly to expense by the entity at the time that revenue recognition commences even if they have not yet been incurred.

Commencement of exploitation. Some arrangements impose on the customer a release date or "street date" before which the film may not be exhibited or sold. Such a date defines the commencement date of the exploitation rights. The entity does not begin to recognize revenue on the arrangement until this restriction has expired.

Fixed or determinable arrangement fee. When there is a flat fee that covers a single film, the amount of the fee is, of course, considered fixed and determinable and the entity recognizes the entire license fee as revenue when all of the conditions set forth above have been satisfied.

If the flat fee applies to multiple films, some of which have not been produced or completed, the entity allocates the fee to each individual film by market or territory based on relative fair values of the rights to exploit each film under the licensing arrangement. The entity bases the allocations to a film or films not yet produced or completed on the amounts that would be refundable if the entity did not ultimately complete and deliver the films to the customer. The entity allocates the remaining flat fee to completed films based on the relative fair values of the exploitation rights to those films under the arrangement. These allocations may not be adjusted subsequently even if better information becomes available. After making the allocations described above, the entity recognizes revenue for each film when all of the above conditions are met with respect to that film by market and territory. If the entity is not able to determine relative fair values for the exploitation rights, then the fee is not fixed or determinable and the entity may not recognize revenue until such a determination can be made and it meets all five of the conditions.

An entity's arrangement fees may be variable based on a percentage of the customer's revenue from exploitation of the film. When all five conditions have been met, the entity commences revenue recognition as the customer exploits or exhibits the film.

Certain variable fee arrangements include a nonrefundable minimum guarantee whereby the customer guarantees to pay the entity a nonrefundable minimum amount that is applied against the variable fees on a film or group of films that are not cross-collateralized. In applying the revenue recognition conditions, the amount of the nonrefundable minimum guarantee is considered to be fixed and determinable and is recognized as revenue when all of the other conditions have been met. If the nonrefundable minimum guarantee is applied against variable fees from a group of films on a cross-collateralized basis, the amount of the minimum guarantee attributable to each individual film cannot be objectively determined. In this situation, the entity recognizes revenue as described in the preceding paragraph (i.e., when all five of the conditions have been met as the customer exhibits or exploits each film). Under this scenario, if there is a remaining portion of the nonrefundable minimum guarantee that is unearned at the end of the license period, the entity recognizes the remaining guarantee as revenue by allocating it to the individual films based on their relative performance under the arrangement.

Returns and price concessions can affect whether the arrangement fee meets the condition of being fixed and determinable. The factors to consider include the provisions of the arrangement between the entity and its customer and the entity's policies and past actions related to granting concessions or accepting product returns. If the arrangement includes a right-of-return provision or if its past practices allow for such rights, the entity must meet all of the conditions in ASC 605, in order for it to recognize revenue. Among those conditions is a requirement that the entity be able to reasonably estimate the amount of future returns. ASC 605 is discussed in detail in Chapter 10.

Barter revenue. If an entity licenses programming to television stations in exchange for a specified amount of advertising time on those stations, the exchange is accounted for as a nonmonetary exchange in accordance with ASC 845. See the discussion of nonmonetary transactions in Chapter 11.

Modifications of arrangements. If, during the term of a licensing arrangement, the entity and its customer agree to extend an existing arrangement for which all of the revenue recognition conditions have been met, the accounting follows the same rules cited above for

flat-fee arrangements, variable fee arrangements, and variable fee arrangements with minimum guarantees.

For modifications that are not extensions of an existing arrangement, the modification is accounted for as a new arrangement and a termination of the former arrangement. At the time the former arrangement is terminated, the entity accrues and expenses all costs associated with the arrangement or reverses previously reported revenue to reflect refunds and concessions that result from the new arrangement. In addition, the entity adjusts accumulated film cost amortization and accrued participation costs attributable to the excess revenue. The new arrangement fee is accounted for by applying the provisions of the standard.

Example

Eva Enterprises produced a film that did not meet revenue expectations. The film was originally projected to gross $9,500,000 and to date has only earned $2,300,000.

The original arrangement called for a fixed fee of $150,000. Eva had previously met all five criteria for recognizing the $150,000 fixed fee as revenue. To placate its customers, Eva negotiated a new arrangement that reduced the original fixed fee from $150,000 to $80,000 and substituted a variable component based on 1% of the customers' revenues from exploiting the film. The effects of the new arrangement on Eva's revenue are computed as follows:

Revenue recognizable under new arrangement	
Fixed fee	$ 80,000
Variable fee earned to date (1% of $2,300,000)	23,000
	103,000
Original fixed fee recognized as revenue	150,000
Reduction in revenue due to new arrangement	$(47,000)

In addition to the adjustment above, Eva also must adjust its previously recorded accumulated amortization of film costs and accrued participation costs attributable to the excess revenue previously recorded. Prospectively, the new arrangement is accounted for in accordance with the provisions of the standard.

Product licensing. Any revenue from licensing arrangements to market film-related products is deferred until the release date of the film.

Present value. Revenue that an entity recognizes in connection with licensing arrangements is recorded at the present value of the license fee computed in accordance with ASC 835 as of the date that the entity first recognizes the revenue.

Costs and Expenses—Components

Costs associated with the production and bringing to market of a film can be categorized as one of the following:

1. Film costs
2. Participation costs
3. Exploitation costs
4. Manufacturing costs

Film costs. Film costs are presented separately on the entity's balance sheet. They consist of direct negative costs, production overhead, and production period interest capitalized in accordance with ASC 835-20. Direct negative costs include costs to acquire the rights to intellectual property (e.g., film rights to books or stage plays, or original screenplays); the cost of adaptation or development of the property; compensation of the cast, directors, producers, extras, and other staff members; costs of set construction and operations, wardrobe and accessories; costs of sound synchronization; on-location rental facilities; and postproduction costs such as music, special effects, and editing. Production overhead includes allocation of costs of individuals or departments with exclusive or significant responsibility

for the production of films. However, production overhead does not include general and administrative expenses, the costs of certain overall deals, or charges for losses on properties sold or abandoned. If the entity presents a classified balance sheet, unamortized film costs are presented as a noncurrent asset. The amortization of film costs is explained later in this section.

Participation costs. Participation costs are contingent compensation paid to creative talent such as actors or writers, or to entities from whom the distribution rights are licensed, such as the publisher of a novel on which a screenplay is based (these recipients are referred to as participants). The costs are computed (accrued) based on contractual formulas (participations) and by contingent amounts due under provisions of collectively bargained union agreements (residuals). The accrual of these costs is discussed later in this section.

Exploitation costs. Exploitation costs are the direct costs associated with the film's distribution. The advertising cost component of exploitation costs is accounted for in accordance with ASC 340-20 which is discussed in Chapter 11. All other exploitation costs, including marketing costs, publicity, promotion, and other distribution expenses, are expensed as incurred.

Manufacturing costs. The cost of making theatrical film prints is charged to expense over the period benefited. The cost of manufacturing and/or duplication of products to be held for sale such as videocassettes and digital video discs is charged to expense on a unit-specific basis when the related product revenue is recognized. Unsold inventories are to be evaluated at each balance sheet date, for net realizable value and obsolescence.

Costs and Expenses—Amortization of Film Costs and Accrual of Participation Costs

Amortization of capitalized film costs and accrual (expensing) of participation costs commences when the film is released and the entity begins to recognize revenue from the film. The method used to compute the amortization of film costs and the accrual of participation costs is called the individual-film-forecast-computation method. This method amortizes film costs using the following formula:

$$\frac{\text{Current period actual revenue}}{\text{Estimated remaining unrecognized ultimate revenue as of the beginning of the fiscal year}} \times \text{Unamortized film costs at the beginning of the fiscal year} = \text{Film cost amortization for the fiscal year}$$

Similarly, participation costs are accrued and expensed using the following formula:

$$\frac{\text{Current period actual revenue}}{\text{Estimated remaining unrecognized ultimate revenue as of the beginning of the fiscal year}} \times \text{Unaccrued ultimate participation costs at the beginning of the fiscal year} = \text{Amount of participation costs to be accrued (expensed) for the fiscal year}$$

Irrespective of the above calculation, participation costs are subject to special rules. The liability is only accrued if it is probable that there will be a sacrifice of assets to settle the entity's obligation under the participation agreement. In addition, at each balance sheet date, accrued participation costs must at least equal the amounts that the entity is obligated to pay at that date.

Using this formulaic approach, if the actual results from the exploitation of the film are realized as originally estimated, the entity would earn a constant rate of profit over the ultimate period for each film before considering exploitation costs, manufacturing costs and other period costs.

It is, of course, likely that the actual results will vary from the estimates and that the estimates will require review and refinement. At each reporting date, the entity reviews and revises estimates of ultimate revenue and ultimate participation costs to reflect the most current information available to it. As a result of this review, the denominator is revised to in-

clude only the remaining ultimate revenue at the beginning of the fiscal year of change. In this way, these changes in estimate are accounted for prospectively as of the beginning of the fiscal year of the change. The numerator is unaffected by the change since it is based on actual results. The entity uses this revised denominator in the fraction applied to the net unamortized film costs and to the film's unaccrued ultimate participation costs. The difference between expenses determined using the new estimates and any amounts previously recorded as expense during that fiscal year are charged (or credited) to the income statement in the period (e.g., quarter) during which the estimates are revised.

Ultimate revenue. In general, ultimate revenue to be included in the denominator of the fraction includes estimates of revenue to be recognized by the entity from the exploitation, exhibition, and sale of a film in all markets and territories. There are, however, certain limitations that apply to the determination of ultimate revenue.

1. The period over which ultimate revenue for a film may be estimated is limited to ten years following the date of the film's initial release.
2. For previously released films acquired as part of a film library, the period over which ultimate revenue may be estimated is limited to twenty years from the date of acquisition of the library. A film must have been initially released at least three years prior to the acquisition date of the film library in order to be categorized as part of the library for the purposes of applying this limitation.
3. Ultimate revenue includes estimates of revenue for a market or territory only if persuasive evidence exists that the revenue will be earned, or if an entity can demonstrate a history of earning revenue in that market or territory. Ultimate revenue includes estimates of revenue from newly developing territories only if an existing arrangement provides persuasive evidence that the entity will realize the revenue.
4. Ultimate revenue includes estimates of revenue from licensing arrangements with third parties to market film-related products only if there is persuasive evidence that the revenue from that arrangement will be earned for that particular film (e.g., a signed contract to receive a nonrefundable minimum guarantee or nonrefundable advance) or if the entity can demonstrate a history of earning revenue from that form of arrangement.
5. Ultimate revenue includes estimates of the portion of the wholesale or retail revenue from an entity's sale of peripheral items (such as toys and apparel) attributable to the exploitation of themes, characters, or other contents related to a particular film only if the entity can demonstrate a history of earning revenues from that form of exploitation in similar kinds of films. Under this limitation, the amount of revenue to be included in ultimate revenue is an estimate of the amount that would be earned by the entity if rights for such a form of exploitation had been granted under licensing arrangements with third parties. Thus, the entity's estimate of ultimate revenue does not include the entire gross wholesale or retail revenue from the sale of peripheral items, but rather, the amount that it would realize in net license fees from the sales.
6. Ultimate revenue excludes estimates of revenue from unproven or undeveloped technologies.
7. Ultimate revenue excludes estimates of wholesale promotion or advertising reimbursements to be received from third parties. These reimbursements are accounted for as an offset against exploitation costs.
8. Ultimate revenue excludes estimates of amounts related to the sale of film rights for periods after those identified in 1. and 2. above.

With respect to episodic television series, the following rules apply:

1. The period over which ultimate revenue for an episodic television series may be estimated is limited to ten years from the date of delivery of the first episode or, if the series is still in production, five years from the date of delivery of the most recent episode, if later.
2. Ultimate revenue includes estimates of secondary market revenue (revenue from syndication of the series to markets other than the initial market) for produced episodes only if the entity can demonstrate through its experience or industry norms that the number of episodes already produced, plus those for which a firm commitment exists and the entity expects to deliver, can be licensed successfully in the secondary market.
3. Ultimate revenue excludes estimates of amounts related to the sale of rights for periods after those identified in 1. above.

Ultimate revenue is a gross undiscounted amount and does not include amounts representing projections of future inflation. The portion of ultimate revenue that is expected to be received in a foreign currency is valued at current spot rates.

Ultimate participation costs. The estimate of unaccrued ultimate participation costs to be used in the individual-film-forecast-computation method is made using assumptions consistent with the entity's estimates of film costs, exploitation costs, and ultimate revenue subject to the limitations set forth above. If, at any balance sheet date, the recognized participation costs liability exceeds the estimated unpaid ultimate participation costs for an individual film, the excess liability is first applied to reduce unamortized film costs with any remaining excess credited to income. If the entity continues to incur participation costs after the film costs have been fully amortized, the participation costs are accrued and expensed as the related revenues are recognized.

Example of individual film forecast computation method

Paula Pictures incurred film costs and earned revenues from its motion picture, Arachno-Man, as follows:

	Year 1	*Year 2*
1. Film cost, including capitalized interest (FC)	$15,000	
2. End-of-year estimate of ultimate revenue (UR)	36,000	$30,000
3. Remaining ultimate revenue at beginning of year* (RUR)	--	11,000
4. Actual earned revenues for the year (ER)	19,000	5,000
5. End-of-year estimate of ultimate participation costs (UPC)	3,600	3,000
6. Actual participation costs for the year (APC)	1,600	500

* *Revised estimate of ultimate revenue less actual revenue earned from date of release through the beginning of the year.*

The individual film forecast computation method is applied as follows:

Year 1

Film cost amortization:

$$\frac{\$19,000\text{ ER}}{\$36,000\text{ UR}} \times \$15,000\text{ FC} = \$7,917\text{ Film cost amortization}$$

Accrual of participation costs:

$$\frac{\$19,000\text{ ER}}{\$36,000\text{ UR}} \times \$3,600\text{ UPC} = \$1,900\text{ Accrued participation costs}$$

Year 2

Film cost amortization:

$$\frac{\$5{,}000 \text{ ER}}{\$11{,}000 \text{ RUR}^{*}} \times \$7{,}083^{**} \text{ Unamortized film costs} = \$3{,}220 \text{ Film cost amortization}$$

* *Computed as Year 2 revised estimate of ultimate revenue of $30,000 less actual revenue recognized in prior year of $19,000.*

** *Computed as film cost of $15,000 less prior amortization expense recognized of $7,917.*

Accrual of participation costs:

$$\frac{\$5{,}000 \text{ ER}}{\$11{,}000 \text{ RUR}} \times \$1{,}100 \text{ Remaining ultimate participation costs}^{***} = \$500$$

*** *Computed as Year 2 revised estimate for ultimate participation costs of $3,000 less the prior year accrued amount of $1,900.*

Valuation of Unamortized Film Costs

Consistent with the rules for recognizing impairment of long-lived assets in ASC 360, the standard sets forth examples of events or changes in circumstances that indicate that the entity must assess whether the fair value of the film (whether it has been completed or is still in production) is less than the carrying amount of its unamortized film costs.

1. An adverse change in the expected performance of the film prior to its release
2. Actual costs substantially in excess of budgeted costs
3. Substantial delays in completion or release schedules
4. Changes in release plans, such as a reduction in the initial release pattern
5. Insufficient funding or resources to complete the film and to market it effectively
6. Actual performance subsequent to release fails to meet prerelease expectations

Upon making the comparison between the film's fair value and its unamortized costs, any excess of the unamortized costs over the fair value is to be written off as an operating expense on the income statement. Amounts written off may not be subsequently restored.

The fair value of a film is often estimated using a traditional discounted cash flow model. The limits regarding the number of years of revenue to include in the determination of ultimate revenue do not apply to the estimation of future cash flows associated with the film for the purpose of determining the film's fair value. Factors to be considered by management in estimating future cash inflows for a film include

1. The film's performance in prior markets, if previously released
2. The public's perception (the popularity and market appeal) of the film's story, cast, director, or producer
3. Historical results of similar films
4. Historical results of the cast, director, or producer on prior films
5. The running time of the film

In addition to estimating the film's cash inflows, management must estimate future costs to complete the film (if any), future exploitation and participation costs, and other necessary cash outflows necessary to achieve the estimated cash inflows.

When using the traditional discounted cash flow method to estimate fair value, the estimates of future cash inflows and outflows represent management's best estimates of the most likely cash flows. The discount rate used is adjusted to consider the level of risk inherent in investing in a project of this nature.

When using the expected cash flow approach to estimate fair value (which is preferred and encouraged by ASC 360), all possible relevant future cash inflows and outflows are probability-weighted by period and the estimated average for each period used. In employ-

ing this method, the discount rate is risk-adjusted as described above only if the probable expected cash flows have not already been risk-adjusted. Guidance for applying these two estimation techniques is contained in CON 7, discussed in detail in Chapter 1 and illustrated in Chapter 11.

Subsequent events. When evidence of the possible need for a write-down of unamortized film costs arises after the date of the balance sheet but before the entity issues its financial statements, a rebuttable presumption exists that the conditions leading to the write-off existed at the balance sheet date. When this situation arises, whether the film was released before or after the balance sheet date, the entity uses this subsequent evidence to compute the adjustment necessary to record a change in estimate in its financial statements. If management is able to demonstrate that the conditions leading to the write-down did not exist at the balance sheet date, the presumption can be overcome, and the recognition of the effects of the change in estimate can be postponed until the subsequent period. However, full disclosure of the circumstances and amounts is required in the current financial statements.

NOT-FOR-PROFIT ORGANIZATIONS

PERSPECTIVE AND ISSUES

Not-for-profit organizations have several characteristics that distinguish them from business enterprises. First, and perhaps foremost, not-for-profit organizations exist to provide goods and services without the objective of generating a profit. Rather than obtaining resources by conducting exchange transactions at a profit or from capital infusions from owners, a not-for-profit organization obtains most resources from others that share its desire to serve a chosen mission—an educational, scientific, charitable, or religious goal. Although not-for-profit organizations can be "owned" or controlled by another, the ownership interest is unlike that of business enterprises because the "owner" cannot remove resources from the entity for personal use or gain; the resources must be used for a mission-related purpose. Examples of not-for-profit organizations are: churches and religious organizations, colleges and universities, health care organizations, libraries, museums, performing arts organizations, civic or fraternal organizations, federated fund-raising organizations, professional and trade associations, social clubs, research organizations, cemeteries, arboretums, and zoos.

Specifically excluded from the list of not-for-profit organizations are organizations that exist to provide dividends, lower costs, or other economic benefits directly and proportionately to their members, participants, or owners, such as mutual insurance companies, credit unions, farm or utility cooperatives, and employee benefit plans. Further, some not-for-profit organizations are governmental[3] and are required to follow the standards of the Governmental Accounting Standards Board (GASB). Governmental organizations are outside of the scope of this publication. Readers instead should refer to the Wiley publication, *GAAP for Governments.*

All authoritative pronouncements in the FASB codification apply to not-for-profit organizations unless the pronouncement specifically excludes not-for-profit organizations from its scope. Certain standards apply specifically to not-for-profit organizations. Because those standards are particularly relevant to the transactions of not-for-profit organizations they are discussed in this chapter.

ASC 958, *Not-for-Profit Entities* applies specifically to not-for-profit organizations. It requires not-for-profit organizations to depreciate their long-lived assets and to disclose bal-

[3] *See Chapter 1, Researching GAAP Matters, for a definition of "governmental entity."*

ances for the major classes of assets, depreciation for the period, accumulated depreciation, and the organization's policy for computing depreciation.

ASC 958-605 establishes standards for recognition and display of contributions received and contributions made. It requires all contributions received and made to be measured at fair value and recognized in the period the gift is made. It applies to any contribution of assets, including contributions of cash, securities, supplies, long-lived assets, use of facilities or utilities, services, intangible assets, or unconditional promises to give those items in the future.

ASC 958-205 establishes standards for the general-purpose financial statements issued by not-for-profit organizations. It defines a complete set of financial statements for most organizations as a statement of financial position, a statement of activities, a statement of cash flows, and accompanying notes. It requires an organization's net assets and its revenues, expenses, gains, and losses to be classified based on the existence or absence of restrictions imposed by donors.

ASC 958-320 establishes standards for investments held by not-for-profit organizations. It requires equity securities with readily determinable fair values and debt securities to be reported at fair value with the resulting holding gains and losses reported in the statement of activities. It also establishes standards for reporting investment return, including losses on donor-restricted endowment funds.

ASC 958-20 establishes standards for transfers of assets to a not-for-profit organization or a charitable trust that raises or holds contributions for others. Although it primarily affects federated fund-raising organizations, community foundations, and institutionally related foundations, all organizations are subject to its standards because they can be the beneficiaries of the contributions raised by those organizations.

Combinations in which the acquiring entity is a not-for-profit organization, unlike combinations in which the acquiring entity is a business enterprise, cannot be assumed to be an exchange of commensurate value. Acquired not-for-profit organizations lack owners who are focused on receiving a return on and return of their investment. Moreover, the parent or governing body of an acquired organization may place its mission effectiveness ahead of achieving maximum price when negotiating a combination agreement. Thus, when two not-for-profit organizations combine, it will be necessary to determine if there was an exchange of commensurate value (in which case, standards similar to ASC 850 would be applied) or if there is a contribution inherent in the transaction that would be reported in accordance with ASC 958-605.

If there is a contribution inherent in the transaction, it would be measured as the excess of the net fair values of the identifiable assets acquired and the liabilities assumed over the fair value of the consideration exchanged. If the acquired entity is a business enterprise, the contribution inherent in a combination would be measured as the excess of the fair value of the acquired business enterprise over the cost of that business enterprise. The primary difference is that no goodwill would be recognized in most contributions of not-for-profit organizations, although it would be in the contributions of business entities.

In the rare cases in which the sum of the fair values of the liabilities assumed exceeds the sum of the fair values of the identifiable assets acquired, the acquiring organization would initially recognize that excess as an unidentifiable intangible asset (goodwill).

ASC 954 applies to providers of health care services, including hospitals, nursing homes, medical clinics, continuing care retirement communities, health maintenance organizations, home health agencies, and rehabilitation facilities. It discusses the aspects of financial statement preparation and audit particularly relevant to the organizations within its scope.

ASC 958-810 establishes standards for consolidation by not-for-profit organizations of investments in for-profit entities and other not-for-profit organizations. It also describes the disclosures required when related entities are not consolidated because the relationship does not meet the criteria of control and economic benefit.

ASC 958-720 establishes standards for the functional classification of expenses incurred in activities that combine program or management and general components with fund-raising. It requires that all costs of the combined activity be classified as fund-raising expenses unless three criteria—purpose, audience, and content—are met.

ASC 954-815 clarifies that the performance indicator required to be reported in the financial statements of a not-for-profit health care organization is analogous to income from continuing operations of a business (for-profit) enterprise.

This chapter contains a highly summarized discussion of accounting and reporting standards for not-for-profit organizations. Readers who desire a more in-depth discussion should refer to the Wiley publication, *Not-for-Profit GAAP*.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Broad Transactions	
810	Consolidation
850	Related-Party Disclosures
Industry	
954	Health Care Entities
954-815	Health Care Entities—Derivatives and Hedging
958	Not-for-Profit Entities
958-20	Not-for-Profit Entities—Financially Interrelated Entities
958-205	Not-for-Profit Entities—Presentation of Financial Statements
958-320	Not-for-Profit Entities—Investments—Debt and Equity Securities
958-360	Not-for-Profit Entities—Property, Plant, and Equipment
958-605	Not-for-Profit Entities—Revenue Recognition
958-720	Not-for-Profit Entities—Other Expenses
958-810	Not-for-Profit Entities—Consolidation

DEFINITIONS OF TERMS

Agent. An entity that acts for and on behalf of another. For example, a not-for-profit organization acts as an agent for and on behalf of a donor if it receives resources from the donor and agrees to transfer the resources or the return generated by investing those resources to another entity named by the donor. Similarly, a not-for-profit organization acts for and on behalf of a beneficiary if it agrees to solicit contributions in the name of the beneficiary and distribute any contributions thereby received to the beneficiary.

Collections. Works of art, historical treasures, or similar assets that meet the following three criteria: (1) they are held for public exhibition, education, or research in service to the public rather than for financial gain; (2) they are protected, kept unencumbered, cared for, and preserved; and (3) they are subject to a policy requiring that the organization use the proceeds from the sale of an item to acquire another item for the collection.

Contribution. A voluntary and unconditional transfer of assets to an entity (the donee) from another entity that does not expect to receive equivalent value in exchange and does not act as an owner (the donor). A contribution can also take the form of a settlement or cancellation of the donee's liabilities.

Donor-imposed restriction. A donor stipulation that specifies a use for contributed resources that is narrower than the limitations that result from the nature of the organization, the environment in which it operates, and the purposes specified in its articles of incorporation, bylaws, or similar documents. A restriction may be temporary or permanent. A temporary restriction is a restriction that will expire (be satisfied) either by an action of the

organization (such as spending the resources for the purpose described by the donor) or by the passage of time. A permanent restriction never expires. Instead, it requires that the contributed resources be maintained permanently, although it allows the organization to spend the income or to use the other economic benefits generated by those resources.

Donor-imposed condition. A donor stipulation that specifies a future and uncertain event whose occurrence (or failure to occur) gives the donor the right of return of resources it has transferred or releases the donor from the obligation to transfer assets in the future. For example, "I will contribute one dollar for each dollar raised during the month of July in excess of $10,000," includes a donor-imposed condition. If only $9,000 is raised, the donor has no obligation to transfer assets.

Endowment fund. A fund of cash, securities, or other assets held to provide income for the support of a not-for-profit organization. A donor-restricted endowment fund is a fund established by a donor, specifying that the gift must be invested permanently to generate support (a permanent endowment fund) or invested for a specified period of time (a term endowment fund). A quasi endowment fund is a fund established by an organization's governing board to provide income for a long, but usually unspecified, period of time. A quasi endowment fund may be created from unrestricted resources or from resources that are for a restricted purpose but not required by the donor to be invested.

Intermediary. An organization that acts as a facilitator for the transfer of resources between two or more other parties. An intermediary generally does not take possession of the assets transferred.

Net assets. The residual interest in the assets of a not-for-profit organization that remains after deducting its liabilities. Net assets are divided into three categories—permanently restricted, temporarily restricted, and unrestricted—based on the nature and existence (or absence) of donor-imposed restrictions. Permanently restricted net assets are the portion of net assets that result from contributions and other inflows of resources that are subject to permanent donor-imposed restrictions. Permanently restricted net assets are not permitted to be expended or used up. Temporarily restricted net assets are the portion of net assets that result from contributions and other inflows of resources that are subject to temporary donor-imposed restrictions. They are permitted to be expended or used up as long as their use is consistent with the limitations imposed by the donor. Unrestricted net assets are the portion of net assets that are neither permanently nor temporarily restricted by donors. The use of unrestricted net assets is subject only to the limitations imposed by the nature of the organization, its articles of incorporation or bylaws, and the environment in which it operates.

Promise to give. A written or oral agreement to contribute resources to another entity at a future date. A promise to give can be either conditional or unconditional. The obligation of the donor who makes a conditional promise to give is dependant on the occurrence (or failure to occur) of a donor-imposed condition. An unconditional promise to give depends only on the passage of time or demand by the donee for payment of the promised assets.

Trustee. An entity that holds and manages assets for the benefit of a specified beneficiary in accordance with a charitable trust agreement.

Voluntary health and welfare organization. An organization formed for the purpose of attempting to prevent or solve health and welfare problems of society, and in many cases, of particular individuals.

CONCEPTS, RULES, AND EXAMPLES

The Reporting Entity

Not-for-profit organizations were exempted from the provisions of ASC 850 and ASC 350. Consequently the financial statement preparer must consider the applicability of ASC

958-810 in determining the reporting entity. It provides guidance on reporting investments in majority-owned for-profit subsidiaries, investments in common stock in which the not-for-profit organization owns a 50% or less voting interest, and certain relationships with other not-for-profit organizations.

If a not-for-profit organization has a controlling financial interest in a for-profit organization (generally a majority voting interest), it follows the standards in ASC 810. Not-for-profit organizations as defined in the Master Glossary are specifically exempted from following the consolidations provisions of ASC 810. ASC 810 does, however, include an antiabuse provision that provides that the scope exemption does not apply if the not-for-profit organization is being used by a business enterprise in a manner similar to a variable interest entity in order to circumvent ASC 810. Variable interest entities are discussed at length in Chapters 13 and 16.

If a not-for-profit organization has significant influence over the operating and financial policies of the investee (generally owns 20% or more but less than 50% of the voting stock), it either follows the standards in ASC 323 or reports the investment at fair value.

Different combinations of control and economic interest determine the appropriate accounting for relationships with other not-for-profit organizations, as shown in the following table. Control is defined for this purpose as the direct or indirect ability to determine the direction of management and policies through ownership, contract, or otherwise. Economic interest is defined as an interest in another entity that exists if (1) the other entity holds or utilizes significant resources that must be used for the purposes of the reporting organization, either directly or indirectly by producing income or providing services or (2) the reporting organization is responsible for the liabilities of the other entity.

Control?	*Economic interest?*	*Standards*
Yes, via ownership of a majority voting interest	Yes	Consolidate.
Yes, via ownership of a majority voting interest	No	Consolidate.
Yes, via majority voting interest in the board of the other entity, as a majority owner	Yes	Consolidate.
Yes, via majority voting interest in the board of the other entity, as a majority owner	No	Consolidation is prohibited, and disclosure required.
Yes, via a contract or an affiliation agreement	Yes	Consolidation is permitted, but not required.
Yes, via a contract or an affiliation agreement	No	Consolidation is prohibited, and disclosure required.
No	Yes	Consolidation is prohibited, and disclosure required.
No	No	Consolidation is prohibited. No disclosure required.

In all cases, consolidation is prohibited if control is likely to be temporary or does not rest with the majority owner.

Certain disclosures are necessary if consolidated statements are not presented. If consolidated statements are not presented when consolidation is permitted, but not required, the not-for-profit organization must disclose the identity of the other organization, the nature of the relationship, and summarized financial data in addition to the information required by ASC 850. If consolidation is prohibited, the not-for-profit organization must disclose the information required by ASC 850.

Complete Set of Financial Statements

Financial statements are intended to help donors, creditors, and others who provide resources to a not-for-profit organization assess the services provided by the not-for-profit organization and its ability to continue to provide those services. The statements should also help them assess whether management has properly discharged its stewardship responsibilities and whether it has performed satisfactorily in its other management duties.

ASC 958, *Not-for-Profit Entities,* requires all not-for-profit organizations to present a statement of financial position, a statement of activities, a statement of cash flows, and notes to the financial statements any time it purports to present a complete set of financial statements. In addition, voluntary health and welfare organizations are required to present a statement of functional expenses as an additional basic financial statement. In most ways, the content and format of those financial statements are similar to the financial statements prepared by business enterprises.

However, three major differences between not-for-profit organizations and business enterprises cause differences in the content and format of financial statements of not-for-profit organizations. First, there is no profit motive in the nonprofit sector, and thus no single indicator of performance comparable to a business enterprise's net income or bottom line. In fact, the best indicators of the performance of a not-for-profit organization are generally not measurable in dollar amounts but rather in the reader's qualitative judgment about the effectiveness of the organization in achieving its mission. Nevertheless, dollars are the language of financial reporting. Information to help assess performance is provided in financial statements (1) by reporting revenues and expenses gross rather than net and (2) by classifying expenses based on the mission-related programs and supporting activities they sustain, rather than by their natural classifications (salaries, utilities, depreciation, etc.).

Second, because the bottom line of a not-for-profit organization's statement of activities is not a performance measure, but simply a change in net assets for the reporting period, there is no need for not-for-profit organizations to distinguish between components of comprehensive income as business enterprises do. All revenues, expenses, gains, and losses are reported in a single statement rather than being divided between an income statement and a statement of other comprehensive income.

Third, not-for-profit organizations receive contributions, a type of transaction that is without counterpart in business enterprises. Those contributions often are subject to donor-imposed restrictions which can affect the types and levels of service that a not-for-profit organization can offer. Because donor-imposed restrictions are prevalent, recurring, and, in some cases, permanent, financial reporting by not-for-profit organizations needs to reflect the nature and extent of donor-imposed restrictions and changes in them that occur during the reporting period.

If the reporting entity is a not-for-profit health care organization, the standard requires it to include within its statement of activities an intermediate subtotal called a performance indicator. ASC 954-815 clarifies that the performance indicator is analogous to income from continuing operations of a business (for-profit) enterprise, and thus would exclude items that are required to be reported in or reclassified from other comprehensive income, extraordinary items, the effect of discontinued operations, the cumulative effect of accounting changes, transactions with owners acting in that capacity, and equity transfers from entities that control the reporting entity, are controlled by the reporting entity, or are under common control with the reporting entity. The performance indicator also excludes restricted contributions, contributions of and reclassification related to gifts of long-lived assets, unrealized gains and losses on investments not restricted by donors or law (except for investments classified as trading), and investment returns restricted by donors.

Net Assets and Changes in Net Assets

The nature and extent of donor-imposed restrictions are reported in the statement of financial position by distinguishing between the portions of net assets that are permanently restricted, temporarily restricted, and unrestricted. Separate line items on the face of that statement or details in the notes to the financial statements are used to meet the requirement to disclose the amounts for different types of permanent and temporary restrictions.

Changes in donor-imposed restrictions are reported in the statement of activities. The organization's revenues, expenses, gains, and losses for the period are classified into the three classes of net assets so that the statement of activities reports amounts for the change in permanently restricted net assets, the change in temporarily restricted net assets, and the change in unrestricted net assets, as well as the change in net assets in total. Transactions and events that do not change the net assets of the organization as a whole, but only their classification, are reported separately as reclassifications. Reclassifications are events that simultaneously increase one class of net assets and decrease another. For example, unrestricted net assets increase and temporarily restricted net assets decrease when the purchase of a long-lived asset fulfills a donor-imposed restriction to acquire long-lived assets with the gift (sometimes referred to as a release of restrictions).

Not-for-profit organizations often use fund accounting as a tool for tracking compliance with donor-imposed restrictions and internal designations. Fund accounting is a system of recording resources whose use is limited either by donors, granting agencies, governing boards, law, or legal covenants. A separate fund (a self-balancing group of accounts composed of assets, liabilities, and net assets) is maintained for each purpose limitation. For external reporting, a fund may be classified entirely in one net asset class or it may need to be allocated among two or three classes. (For an example of the allocations necessary to restate a fund balance to net asset classes, see the discussion of endowment funds in "Investments" in this section.)

Reporting Revenues

Revenues are reported in the statement of activities as increases in unrestricted net assets unless the use of the resources received is subject to a donor-imposed restriction. Thus, contribution revenues increase unrestricted net assets, temporarily restricted net assets, or permanently restricted net assets, depending on the existence and nature of donors' restrictions. Revenues from most exchange transactions (such as sales of goods or services) are classified as unrestricted.

Revenues from exchange transactions only increase restricted net asset classes if a preexisting donor-imposed restriction limits the use of the resources received. For example, if a donor contributes a car to the local library and requires that the proceeds from the sale of the car be used to purchase children's books, the proceeds from the sale of the car (an exchange transaction) increase temporarily restricted net assets. Investment income and gains (which are also exchange transactions) increase unrestricted net assets unless a donor required that the gift be invested and the investment return used for a restricted purpose. For example, assume a donor contributes securities worth $85,000 to a zoo, requires that all dividends and gains be retained and reinvested until the accumulated value is $100,000, and states that the $100,000 must be maintained as a permanent endowment fund, the income of which is to be used for the purchase of animals. In the early years of the endowment, before the accumulated value reaches $100,000, investment income and gains increase permanently restricted net assets. Investment income and gains earned after the accumulated value of the fund reaches $100,000 increase temporarily restricted net assets with the restriction expiring upon use of those funds to purchase animals.

ASC 958-605, *Not-For-Profit Entities—Revenue Recognition*, requires contributions to be recognized as revenue at the time of the gift and measured at the fair value of the contributed assets regardless of the form of the assets contributed. Donor-imposed restrictions do not change the timing of recognition of a contribution. Donor-imposed restrictions, or the absence of them, affect only a contribution's classification as an increase in permanently restricted net assets, temporarily restricted net assets, or unrestricted net assets. Donor-imposed conditions, however, affect the timing of recognition. Because a contribution is an unconditional transfer, a transfer of assets subject to donor-imposed conditions is not a contribution yet, although it may become one at a future date. Conditional transfers are not recognized as contribution revenues until the conditions are substantially met. Thus, the distinction between donor-imposed restrictions and donor-imposed conditions is very important to the timing of recognition. If a donor's stipulations do not clearly state whether a gift depends on meeting a stated stipulation and the ambiguity cannot be resolved by communicating with the donor or by examining the circumstances surrounding the gift, a transfer is presumed to be conditional.

Unconditional promises to give cash or other assets are recognized in financial statements when the promise is made and received, provided that there is sufficient evidence in the form of verifiable documentation (written, audio, or video). If payments of the promises are due in future periods, the promise has an implied time restriction that expires on the date the payment is due. Thus, unless circumstances surrounding the receipt of the promise indicate that the donor intended the gift to support the current period's activities, unconditional promises increase temporarily restricted net assets. A present value technique is used to measure unconditional promises to give, although short-term promises (due in less than one year) may be reported at net realizable value. Conditional promises are not recognized as revenue until the conditions are substantially met; however, they are required to be disclosed in notes to the financial statements.

In a manner similar to recognizing promises to give, a beneficiary recognizes contributions held on its behalf by an agent, trustee, or intermediary. For example, if the assets held by the agent were transferred subject to a condition that is not yet met, the beneficiary does not recognize its potential rights to the assets held by the agent. If a beneficiary has an unconditional right to receive cash flows from a charitable trust or other pool of assets, the beneficiary recognizes its rights when the beneficial interest is created and measures the rights using the present value of the estimated expected cash flows. However, if the beneficiary and the agent, trustee, or intermediary are financially interrelated organizations, the beneficiary reports its rights to the assets held using a method similar to the equity method of accounting for investments. (For further discussion, see "Transfers received as an agent, trustee, or intermediary" in this section.)

The value of volunteer services received by the organization is recognized in certain circumstances. Contributed services that create or improve a nonfinancial asset (such as building a shed or replacing a roof) are recognized as revenue as contributions either by valuing the hours of service received or by measuring the change in the fair value of the nonfinancial asset created or improved. Other contributed services are recognized only if they meet all three of the following criteria: (1) they require specialized skills, (2) they are provided by persons possessing those skills, and (3) they would typically need to be purchased if not provided by donation. If volunteer services neither meet those three criteria nor create or improve nonfinancial assets, they cannot be recognized in the organization's financial statements. However, organizations are required to describe the programs or activities for which contributed services are used, the nature and extent of services received for the period (regardless of whether those services are recognized), and disclose the amount recognized as revenues.

An organization that maintains works of art, historical treasures, and similar assets in collections, as defined, does not recognize gifts of items that are added to its collections unless it also capitalizes its collections. However, gifts that are not added to collections or items given to organizations that do not maintain collections in accordance with the definition are recognized as revenues and measured at the fair value of the assets received.

Reporting Expenses

Expenses are recognized in the statement of activities as decreases in unrestricted net assets. Financing an expense with donor-restricted resources does not make the expense restricted; instead, it releases the restriction on the restricted resources, causing a reclassification to be reported in the statement of activities.

Expenses must be reported by functional classifications either on the face of the statement of activities or in the notes to the financial statements. The functional classifications describe the major classes of program services and supporting activities of an organization. Program services are the mission-related activities of the organization that result in goods and services being distributed to clients, customers, or members. They are the activities that are the major purpose of and the major output of the organization. For example, a not-for-profit organization with the mission of enhancing the lives of the community's senior citizens might have senior center, home visits, transportation services, and home maintenance as its program expense classifications. Supporting activities are all activities of a not-for-profit organization other than program services. Fund raising expenses and management and general are two common supporting activity classifications.

ASC 958-205 encourages, but does not require, most not-for-profit organizations to provide an analysis of expenses by natural classification. Information about expenses by natural classifications (salaries, benefits, rent, depreciation, and so forth) can help readers of the financial statements understand the mix of fixed and discretionary costs incurred by the organization. Only voluntary health and welfare organizations are required to report information about expenses by both functional and natural classification. Those organizations must provide that information in a matrix format in a statement of functional expenses.

ASC 958-360, *Not-for-Profit Entities—Property, Plant, and Equipment,* requires the depreciation of land, buildings, and equipment used by not-for-profit organizations. An exception to that requirement is provided for certain works of art, historical treasures, and similar assets. If a not-for-profit organization can demonstrate both (1) that an asset individually has cultural, historical, or aesthetic value worth maintaining in perpetuity and (2) that the organization has the ability to protect and preserve that value essentially undiminished and is doing so, depreciation need not be recognized. Depreciation expense is a natural expense classification that must be allocated to programs and supporting activities in reporting expenses by functional classification.

Many not-for-profit organizations solicit contributions as part of conducting activities that also serve their program or management and general functions. For example, an organization that has a mission of reducing the incidence of cancer might conduct a direct mail campaign and include in an envelope a listing of lifestyle changes that will lessen the risks of cancer and a request for contributions. When a fund-raising activity is conducted in conjunction with an activity that serves a program or other support purpose, the activity is referred to as a joint activity. Users of the financial statements of not-for-profit organizations are particularly interested in the extent to which the organization is able to minimize its fund-raising and management and general costs. Because neither of these types of costs directly benefit the beneficiaries of the organization's programs, successful organizations attempt to minimize them as a percent of the organization's support and revenue. Since the effective-

ness of the management of a not-for-profit organization is often judged on operating metrics of this nature, there is a natural incentive for management to maximize the portion of the costs of these joint activities that is characterized as program expenses.

ASC 958-720 established standards for reporting the costs of joint activities. It begins with the presumption that the costs of a joint activity are reportable as fund-raising expenses. To overcome that presumption, three criteria must be met: purpose, audience, and content. If all three of the criteria are met, the costs of a joint activity are to be charged as follows:

- Costs identifiable with a particular function are charged to that function.
- Joint costs are allocated between fund-raising and the appropriate program or management and general function.

Joint costs are the costs of conducting joint activities that are not directly identifiable with a particular component of the activity. Joint costs might include the costs of salaries, professional fees, paper, printing, postage, event advertising, telephones, broadcast airtime, and facility rentals.

Determining whether all three criteria are met is complicated because the purpose and audience criteria have additional tests within them. The purpose test includes a call to action test, a compensation or fees test, a similar scale and same medium test, and an other evidence test. The audience criterion includes a prior donor test, an ability and likelihood to contribute test, and a need to use or reasonable potential for use test. Failure of one of the additional tests often causes the activity to fail the criterion.

If any of the three criteria is not met, all costs of the joint activity must be reported as fund-raising expense. "All costs" includes the costs that would have been considered program or management and general if they had been incurred in a different activity. There is an exception to the rule that all costs are charged to fund-raising expense if one or more of the criteria is not met. The costs of goods or services provided in an exchange transaction (sometimes referred to as a quid pro quo contribution) that is part of the joint activity are charged to cost of goods sold rather than fund-raising expense. For example, the costs of direct donor benefits, such as the value of items sold at a fund-raising auction or meals served at a fund-raising dinner, are not charged to fund-raising expenses.

ASC 958-720 requires that the method used to allocate the joint costs be rational and systematic and that it result in a reasonable allocation of costs. The method selected is to be applied consistently given similar facts and circumstances. No particular method of allocation is required by the standard, but three allocation methods are illustrated: the physical units method, the relative direct cost method, and the stand-alone joint-cost-allocation method.

Organizations that allocate joint costs are required to disclose the types of activities in which joint costs have been incurred, a statement that the costs have been allocated, and the total amount of joint costs allocated, and the portion of joint costs allocated to each functional expense category. The standard also encourages disclosure of the amount of joint costs for each type of joint activity.

Transfers Received as an Agent, Trustee, or Intermediary

ASC 958-20 and ASC 958-605 establish standards for transactions in which a donor makes a contribution by using an agent, trustee, or intermediary. (Agents, trustees, and intermediaries are referred to as recipient organizations.) The donor transfers assets to the recipient organization. The recipient organization accepts the assets from the donor and agrees to use the assets on behalf of or transfer the assets, their investment return, or both to another entity—the beneficiary—named by the donor. It also establishes standards for transactions that take place in a similar manner but are not contributions because the transactions are

revocable, repayable, or reciprocal. It does not set standards for recipient organizations that are trustees.

In general, a recipient organization reports a liability if it accepts assets from a donor and agrees to use those assets on behalf of or transfer those assets to another organization or individual specified by the donor. When it subsequently spends the assets on behalf of the beneficiary or transfers the assets, their return, or both to the beneficiary, the nonprofit organization reduces the liability it recorded earlier. If the assets received from the donor are donated materials, supplies, or other nonfinancial assets, the recipient organization may choose either to (1) report the receipt of the assets as liability to the beneficiary concurrent with recognition of the assets received or (2) not to report the transaction at all. The choice is an accounting policy that must be applied consistently from period to period and disclosed in the notes to the financial statements.

If the donor explicitly grants the recipient organization variance power, the recipient organization, rather than the beneficiary, recognizes contribution revenue. Variance power is the unilateral power to direct the transferred assets to an entity other than the specified beneficiary. Unilateral power means that the recipient organization does not have to contact the donor, the beneficiary, or any other interested party in order to substitute a different beneficiary. Variance power must be granted by the instrument transferring the assets.

If the recipient organization and the specified beneficiary are financially interrelated organizations, the recipient organization reports contribution revenue and the specified beneficiary recognizes its interest in the net assets of the recipient organization using a method similar to the equity method of accounting for investments in common stock. Organizations are financially interrelated if the relationship between them has both of the following characteristics: (1) one organization has the ability to influence the operating and financial decisions of the other and (2) one organization has an ongoing economic interest in the net assets of the other. The ability to influence the operating and financial decisions of the other can be demonstrated in several ways: (1) the organizations are affiliates as defined in ASC 850, *Related-Party Disclosures*, (2) one organization has considerable representation on the governing board of the other, (3) the charter or bylaws of one organization limit its activities to those that are beneficial to the other, or (4) an agreement between the organizations allows one organization to actively participate in the policymaking processes of the other. An ongoing economic interest in the net assets of another is a residual right to the other organization's net assets that results from an ongoing relationship. A common example of financially interrelated organizations is a foundation that exists to raise, hold, and invest assets for a specific beneficiary that it supports.

In addition to establishing standards for contributions transferred to beneficiaries via agents, trustees, and intermediaries, ASC 958-20 sets standards for transfers that take place in a similar manner but are not contributions because the terms of the transfer or the relationships between the parties make the transfer revocable, repayable, or reciprocal. Transfers are recognized by the recipient organization as liabilities if one or more of the following situations are present: (1) the transfer is subject to the transferor's right to redirect the transferred assets to another beneficiary, (2) the transfer is accompanied by the transferor's conditional promise to give, (3) the transferor controls the recipient organization and specifies an unaffiliated beneficiary, or (4) the transferor specifies itself or its affiliate as the beneficiary of a transfer that is not an equity transaction. An equity transaction is a transfer that has all of the following terms: (1) the transferor specifies itself or its affiliate as beneficiary, (2) the transferor and the recipient organization are financially interrelated organizations, and (3) neither the transferor nor its affiliate expects payment of the transferred assets (although payment of investment return is allowable). Equity transactions are reported by the recipient organization as a separate line item in the statement of activities.

Investments and Endowment Funds

ASC 958-320 requires investments in equity securities with readily determinable fair values and all debt securities to be reported at fair value. Although the standard applies to the same securities that ASC 320 covers for business enterprises, accounting for the resulting gains and losses is different than specified by that standard. Gains and losses (both realized and unrealized) are reported in a not-for-profit organization's statement of activities.

ASC 958 establishes standards for reporting other investments. The appropriate standards to apply depend on whether the not-for-profit organization is a college or university, a voluntary health and welfare organization, a health care organization, or another type of not-for-profit organization. Most organizations have the option of reporting their other investments at either cost or at the lower of cost or market.

Not-for-profit health care organizations are required to apply the provisions of ASC 815 in the same manner as business enterprises, including the provisions pertaining to cash flow hedge accounting. The gain or loss items that affect a business enterprise's income from continuing operations similarly affect the not-for-profit health care organization's performance indicator, and the gain or loss items that are excluded from a business enterprise's income from continuing operations (such as items reported in other comprehensive income) are to be excluded from the performance indicator.

Many of the investments held by not-for-profit organizations are held as the investments of endowment funds. Endowment funds generally are established by gifts from donors who desire to provide support for the organization permanently (a permanently restricted endowment fund) or for a specified period of time (a term endowment fund). In addition, a governing board may determine that certain resources be invested and that only the return generated be spent by the organization. These board-designated amounts are referred to as quasi endowment funds or funds functioning as endowment. The net assets of an endowment fund are classified in accordance with the restrictions placed on the resources by donors, if any. Because a donor can place different restrictions on each source of the net assets (original gift, investment gains and losses, and investment income), each source must be examined separately to achieve the proper classification.

Each source is unrestricted unless its use is temporarily or permanently restricted by the donor or by a law that extends the donor's restriction to the source. Thus, the net assets of an endowment fund created by the governing board from a large unrestricted bequest (or from unrestricted net assets) are classified as unrestricted because no donor was involved in the transaction of creating the endowment fund and all amounts transferred to that fund are free of donor-imposed restrictions.

In contrast, assume that a donor contributes $50,000 to a museum and stipulates that the gift be invested in perpetuity and the investment income be used to purchase works of art. The donor further stipulates that any gains on the investment be added to the original gift and invested in perpetuity. The donor's original gift ($50,000) increases permanently restricted net assets because of the stipulation that the gift be invested in perpetuity. The income earned by the investment of the gift increases temporarily restricted net assets. When works of art are purchased, the restriction on net assets resulting from the income is fulfilled and the net assets are reclassified to unrestricted net assets. The realized and unrealized gains from investment of the gift increase permanently restricted net assets because the donor required that those gains also be reinvested in perpetuity.

In most cases, the classification of the original gift and the investment income is straightforward because donors explicitly state the time and purpose restrictions on them. Classification of gains and losses on the investments is not as clearly determinable unless the donor explicitly states how gains are to be used and whether losses must be restored imme-

diately from other sources, from future gains on the investments, or not at all. However, donors are often silent in their agreements about those matters.

In the absence of explicit donor restrictions, the law in most states provides some direction about the restrictions on investment gains of donor-restricted endowment funds. The Uniform Management of Institutional Funds Act (UMIFA) extends certain donor restrictions to the net appreciation (accumulated net gains) of donor-restricted endowment funds. In states that have adopted UMIFA, net appreciation is expendable unless the donor states otherwise. UMIFA provides that the net appreciation can be spent for the uses and purposes for which the endowment fund was established. Thus, unless the donor specifies otherwise, gains increase unrestricted net assets if the endowment's income is not restricted by the donor, and gains increase temporarily restricted net assets if the endowment's income is temporarily restricted by the donor. Assume in the earlier example of the $50,000 gift to the museum that the donor was silent about the use of gains earned by investing the original gift. In a state that has adopted UMIFA, the accumulated gains on the endowment fund would be restricted to the purchase of artwork because the law requires that the donor's restriction be extended to those gains. The restrictions on those temporarily restricted net assets expire when the museum purchases works of art even if the money to purchase the work of art is not withdrawn from the fund. Thus, this single endowment fund can be composed of permanently restricted net assets (the original $50,000 gift), temporarily restricted net assets (the gains on which restrictions have not yet been met), and unrestricted net assets (the gains on which restrictions have been met).

ASC 958-320 requires that losses on the investments of an endowment fund reduce temporarily restricted net assets to the extent that temporary restrictions on net appreciation have not yet been met before the loss occurs. The remainder of the loss, if any, reduces unrestricted net assets. If the losses reduce the value of the fund below the level required by the donor or by law, future gains that restore the value to the required level are classified as unrestricted net assets.

Expanding on the previous example, assume that several years after the fund was established, the assets of the fund have increased in value to $65,000. Assume also that the classification of the net assets in the fund is: $50,000 permanently restricted (the original gift), $10,000 temporarily restricted (accumulated gains on which the restrictions have not been met), and $5,000 unrestricted (gains on which the restriction was met by purchasing a work of art with unrestricted funds in years after the inception of the fund). A market correction causes the value of the investments to fall to $58,000. The $7,000 loss decreases temporarily restricted net assets from $10,000 to $3,000. Assume that a further market correction reduces the value of the investments another $9,000 from $58,000 to $49,000. The $9,000 loss reduces temporarily restricted net assets by $3,000 (the amount remaining after the $7,000 loss decreased the original $10,000) and reduces unrestricted net assets by $6,000. After recording the loss, the classification of the $49,000 value of the endowment fund would be: $50,000 permanently restricted (the original gift) and ($1,000) deficit in unrestricted net assets. A not-for-profit organization is required to disclose the amount by which the value of the endowment fund is less than the level required by the donor.

Continuing the example, assume that the next year the value of the investments increases from $49,000 to $53,000. The $4,000 gain increases unrestricted net assets by $1,000 (the restoration of the deficit) and increases temporarily restricted net assets by $3,000. After the gain, the net assets of the endowment fund are $50,000 permanently restricted (the original gift) and $3,000 temporarily restricted for the purchase of works of art.

Collections

Not-for-profit organizations are allowed an exception to the normal requirement to capitalize purchases of property, plant, and equipment. If a not-for-profit organization maintains collections of works of art, historical treasures, or similar assets in the manner defined in the Master Glossary, it can choose whether it will capitalize and report those collections in its statement of financial position. To qualify for the exception, an organization must (1) hold the items for public exhibition, education, or research in service to the public rather than for financial gain, (2) protect the items, keep them unencumbered, care for them, and preserve them, and (3) use the proceeds from the sale of any items to acquire other items for the collection. If an organization meets those criteria, it can choose one of the following policies: (1) capitalize its collections, (2) capitalize only collection items acquired after the adoption of ASC 958-605, or (3) not capitalize any collections. An organization cannot selectively choose to capitalize only certain collections.

If an organization does not capitalize its collections, transactions involving collection items must be reported separately on the face of its statement of activities. Similarly, if an organization chose to capitalize its collections prospectively when it adopted ASC 958-605, it would separately report transactions involving collection items not previously capitalized. Descriptions of the collections, including information about stewardship policies and items deaccessed (removed from the collection), must be included in notes to the financial statements by organizations that do not capitalize their collections or that capitalize them prospectively.

Capitalization is required of works of art, historical treasures, and similar assets that are not collection items, even if those items are held by organizations that regularly maintain collections. Thus, if a museum does not capitalize its collections and it is given a work of art that it does not to add to its collection (perhaps because it duplicates other collection items), the museum would recognize that contribution and report the asset in its statement of financial position as a work of art held for sale.

Split-Interest Agreements

A split-interest agreement is an arrangement in which a donor transfers assets to a not-for-profit organization or to a charitable trust and requires the benefits of ownership of those assets be split among two or more beneficiaries. Charitable gift annuities, annuity trusts, charitable remainder unitrusts, charitable lead trusts, and pooled (or life) income funds are examples of split-interest agreements. ASC 958 provides guidance for reporting the initial gifts that create these funds and the annual adjustments necessary to report them properly. Accounting for split-interest gifts is a complex area; the following discussion is highly summarized and overly simplified.

Not-for-profit organizations are required to report their interests in irrevocable split-interest agreements. If another party, such as a bank, holds the assets, a not-for-profit organization recognizes its interest as a contribution and measures its interest at fair value, usually based on the present value of the cash flows to be received. If the not-for-profit organization holds the assets and is also a beneficiary of the agreement, it reports the fair value of the assets received from the donor as its assets and reports the actuarially computed present value of the payments to be made to other beneficiaries as its liability. The difference between the two amounts is the contribution received by the not-for-profit organization. Each year thereafter, the liability to the beneficiaries is recomputed based on revaluations of the amounts to be paid, the expected lives of the beneficiaries, and other relevant actuarial assumptions.

The net assets resulting from most split-interest agreements are classified as temporarily restricted because they are subject to time restrictions and purpose restrictions. The net assets are time-restricted either because the distributions are not yet due (when amounts are held by a third party) or because the contribution amount cannot be used by the not-for-profit organization until the death of the beneficiary or some other future specified date. However, the net assets are classified as permanently restricted if the donor has permanently restricted the organization's use of the assets. (For example, the donor requires that the not-for-profit organization use the remaining assets to create a permanent endowment fund at the end of the agreement.) Similarly, if upon the establishment of the agreement the organization can immediately spend the contribution portion without restriction, as is the case for some gift annuities, the net assets would be classified as unrestricted.

Revocable split-interest agreements are not recorded unless the not-for-profit organization holds the assets. Assets received by a not-for-profit organization that acts as trustee under a revocable agreement are recognized as refundable advances at their fair value.

OIL AND GAS PRODUCERS

PERSPECTIVE AND ISSUES

Oil and gas producing activities are those activities that involve the acquisition of mineral interests in properties, exploration, development, and production of crude oil, including condensate and natural gas liquids, and natural gas. Specialized GAAP does not address refining, marketing, or transportation issues. The successful efforts method of accounting adheres to a traditional historical cost basis. Property acquisition costs, whether the property is proved or unproved, are capitalized as incurred. For other costs incurred under this method, a direct relationship between the costs incurred and specific reserves discovered is required before costs are permitted to be capitalized. Under the successful efforts method, costs that cannot be directly related to the discovery of specific oil and gas reserves are expensed immediately as incurred, analogous to research and development. Oil and gas producing companies are also subject to the requirements of ASC 410 regarding the recognition of asset retirement obligations.

The use of the successful efforts method is preferred, but not required by GAAP. An oil and gas producing company is permitted to use, as an alternative to the successful efforts method, a prescribed form of the full cost method permitted by the SEC. All enterprises are required to disclose the method used for accounting for costs incurred and the method of disposition used for capitalized costs. The SEC requires additional disclosures for publicly traded companies and also provides guidance (SAB 106) on ensuring that the expected cash flows associated with asset retirement obligations are not double-counted in making computations under the full cost method.

For an enterprise that uses the full cost method of accounting, assets being depreciated, depleted, or amortized are considered to be in use in the earning activities of the enterprise and, consequently, do not qualify for interest capitalization. However, assets employed in ongoing exploration or development activities but that are not yet engaged in earning activities and not presently being depreciated, depleted or amortized, are subject to interest capitalization.

Exploratory wells or tests that are in progress at the end of the period present unique accounting issues. If, subsequent to the end of the period, but before the financial statements are issued, a well or test is found to be unsuccessful, the incurred costs, less salvage value, are expensed. Retroactively restated financial statements are not permitted.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
932	Extractive Industries—Oil and Gas

CONCEPTS, RULES, AND EXAMPLES

The following is a discussion of the recommended treatment of oil and gas activities as per ASC 932. (Note that this treatment is recommended, but not required.)

The costs of the special types of assets used in oil and gas producing activities are capitalized when incurred. Some examples include

1. Mineral interests in properties
   a. Unproved—Properties with no proved reserves
   b. Proved—Properties with proved reserves
2. Wells and related equipment and facilities
3. Support equipment and facilities
4. Uncompleted wells, equipment, and facilities

Costs associated with drilling exploratory wells or exploratory-type stratigraphic wells are capitalized until it is determined that the well has proved reserves at which time the capitalized costs are reclassified to wells and related equipment and facilities. If, however, proved reserves are not found, the capitalized drilling costs of the well are charged to expense. When drilling is completed if it is determined that the well has reserves but those reserves cannot be classified as proved, the reporting enterprise will continue to capitalize drilling costs if (1) the reserves found are sufficient to justify completion of the well as a producing well and, (2) the reporting enterprise is making sufficient progress assessing the reserves and the economic and operating viability of the project.

These costs are amortized as reserves are produced and, along with lifting (production) costs, are classified as costs of production. Periodically, unproved properties are evaluated for impairment. The impairment model used for drilling and mineral rights is not the same model set forth in ASC 350 for intangible assets, but rather, is based on the level of established reserves (ASC 932-350-50). If impaired, a loss is recognized.

Acquisition costs incurred to obtain oil and gas properties through purchase, lease, etc., are capitalized.

Geological and geophysical costs, unproved properties' carrying costs, and the costs of dry hole and bottom hole contributions are expensed. Drilling costs are capitalized until a determination has been made as to the success of the well. If successful, these costs are transferred to uncompleted wells, related equipment, and facilities. The cost of drilling, less residual value, is charged to expense if proved reserves are not found.

Development costs are incurred in order to

1. Get access to and prepare well locations
2. Drill and equip development wells
3. Set up production facilities
4. Provide better recovery systems

These costs are capitalized as uncompleted equipment and facilities until drilling or construction is completed.

The cost of support equipment is capitalized and depreciated. This depreciation, along with other operating costs, is allocated to exploration, development, or production costs, as appropriate.

Production involves different costs ranging from lifting to field storage. These costs, together with depreciation, depletion, and amortization of capitalized acquisition, exploration, and development costs, are part of the cost of the oil and gas produced.

Unproved properties are reclassified to proved properties upon discovery of proved reserves. When proved reserves are found, the costs capitalized as uncompleted wells, equipment, and facilities are reclassified as completed wells, equipment, and facilities. Capitalized costs are amortized or depleted by the unit of production method. Estimated residual values must be considered when determining amortization and depreciation rates.

Any information that becomes available between the end of the period and the date when the financial statements are issued is to be considered in the evaluation of conditions existing at the balance sheet date. With respect to the costs of a company's wells, related equipment, facilities, and the costs of related proved properties, the provisions for impairment as outlined in ASC 360 are applicable.

RECORDING AND MUSIC

PERSPECTIVE AND ISSUES

ASC 928 sets forth accounting and reporting standards for the recording and music industry. In this industry, business is transacted through license agreements, contractual arrangements entered into by an owner (licensor) of a music master or copyright. License agreements are modifications of the compulsory provisions of the copyright law. The licensor grants the licensee the right to sell or distribute recordings or sheet music for a fixed fee paid to the licensor or for a fee based on sales. This section presents the proper accounting by both the licensor and the licensee for license agreements in the recording and music industry.

The industry is currently attempting to adapt its business models for copyright protection, product distribution, and artist compensation to new electronic distribution channels. The new business models that inevitably evolve may require additional accounting guidance.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
928	Entertainment—Music

DEFINITIONS OF TERMS

Advance royalty. An amount paid to music publishers, producers, songwriters, or other artists in advance of their earning royalties from recording or sheet music sales. These amounts are based on contractual terms and are generally nonrefundable.

License agreements. Contractual arrangements entered into by an owner (licensor) of a master or music copyright and a licensee that grant the licensee the right to sell or distribute recordings or sheet music for a fixed fee paid to the licensor or for a fee based on sales.

Minimum guarantee. An amount paid in advance by a licensee to a licensor for the right to sell or distribute recordings or sheet music.

Recording (or record) master. The master tape resulting from the performance of the artist. It is used to produce tapes for use in making cartridges, cassettes, and compact discs.

Royalties. Amounts paid to producers, songwriters, or other artists for their participation in making recordings and to sheet music publishers for their copyright interest in music.

CONCEPTS, RULES, AND EXAMPLES

Accounting by Licensors

Revenues. A license agreement is considered an outright sale when the licensor has

1. Signed a noncancelable contract
2. Agreed to accept a specified fee
3. Transferred the music rights to the licensee, who is able to use them
4. Fulfilled all significant duties owed the licensee

When all of these conditions are met, the earnings process is complete and revenue is recognized if there is reasonable assurance that the license fee is fully collectible.

In some cases the licensee pays a minimum guarantee, which is an amount paid in advance to a licensor for the right to sell or distribute recordings or sheet music. A minimum guarantee is first recorded by the licensor as a liability and then amortized to income as the license fee is earned. If the amount of the fee that is earned is indeterminable, then straight-line recognition of revenue from the guarantee is required over the license period.

Example

A licensor receives a $10,000 minimum guarantee under a five-year license agreement. The entry to record the receipt of cash is

Cash	10,000	
Liability under license agreement		10,000

The licensor recognizes revenue from the guarantee on a straight-line basis. At the end of each year of the license period, the licensor records the following entry:

Liability under license agreement	2,000	
License fees earned (revenue)		2,000

A licensor may charge fees for such items as free recordings beyond a certain number given away by a recording club. The amount of such fees is not determinable when the license agreement is made. Therefore, the licensor can recognize revenue only when the amount can be reasonably estimated or when the license agreement expires.

Cost of artist compensation. Royalties are paid to producers, songwriters, or other artists for their participation in making recordings and to music publishers for their copyright interest in music. Amounts for artists are determined by the terms of personal service contracts negotiated between the artists and media companies and usually are determined based upon a percentage of sales activity and license fee income, adjusted for estimated sales returns. Publishing royalties are generally based on copyright or other applicable laws. Royalties are recorded as a period expense of the licensor.

Advance royalties are amounts paid to music publishers, producers, songwriters, or other artists in advance of their earning royalties. Such royalties are based on contractual terms and are generally nonrefundable. Advance royalties are recorded as assets if the licensor expects that the artist's recording will be successful enough to provide for full recovery of the advance from future royalties due the artist. As royalties are subsequently earned by the artist, the capitalized advance is charged to expense. The advance must be apportioned between current and noncurrent assets according to how soon each portion is expected to be charged to expense. If it later appears that the advance will not be fully recovered from subsequent royalties earned by the artist, then the unrecoverable portion is charged to expense in the period in which the loss becomes apparent.

Cost to produce masters. A master is the media that contains the recording of the artist's performance. The costs of producing a master include (1) the cost of the musical talent (musicians, vocal background, and arrangements); (2) the cost of the technical talent for en-

gineering, directing, and mixing; (3) costs for the use of the equipment to record and produce the master; and (4) studio facility charges. Under the standard type of artist contract, the media company bears a portion of the costs and recovers a portion of the cost from the artist out of designated royalties earned. However, either party may contractually agree to bear all or most of the cost.

The portion of the cost that is paid by the media company is recorded as an asset if the company expects that sales of the artist's recording will be successful enough to provide for full recovery of the accumulated costs. If this is not the case, then these costs are expensed. Any amount capitalized is amortized over the useful life of the recording in a manner that relates the costs to estimated net revenue to be realized. Costs to produce masters that are recoverable from the artist's royalties are treated as advanced royalties by the media company.

Accounting by Licensees

When a licensee pays a minimum guarantee in advance, the guarantee is recorded as an asset and then amortized to expense according to the terms specified in the license agreement. If it later appears that the minimum guarantee is not fully recoverable through use of the rights received under the agreement, then the unrecoverable portion is charged to expense.

Fees for which the amount is indeterminable before the agreement expires are sometimes stipulated in the license agreement. An example is a fee charged to a recording club for free recordings beyond a certain number given away. The licensee must estimate the amount of such fees and accrue them on a license-by-license basis.

REGULATED OPERATIONS

PERSPECTIVE AND ISSUES

Although various businesses are subject to regulatory oversight to greater or lesser degrees, as used in GAAP the term regulated operations refers primarily to public utilities, whose ability to set selling prices for the goods or services they offer is constrained by government actions. Generally, the regulatory process has been designed to permit such enterprises to recover the costs they incur, plus a reasonable rate of return to stockholders. However, given the political process of rate-setting by regulatory authorities, and the fact that costs such as those for plant construction have escalated, the ability to recover all costs through rate increases has become less certain. For this and other reasons, specialized GAAP has been promulgated.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Liabilities	
410-20	Liabilities—Asset Retirement and Environmental Obligations
Industry	
980	Regulated Operations
980-340	Regulated Operations—Deferred Costs and Other Assets
980-605	Regulated Operations—Revenue Recognition
980-715	Regulated Operations—Compensation-Retirement Benefits

CONCEPTS, RULES, AND EXAMPLES

These accounting principles apply to regulated enterprises only if they continue to meet certain criteria, which relate to the intended ability to recover all costs through the rate-setting process. When and if these conditions are no longer met, due to deregulation or a

shift to rate-setting which is not based on cost recovery, then application of the specialized GAAP is to terminate.

Asset Recognition

If certain costs are not recognized for current rate-setting purposes, but it is probable that the costs will be recovered through future revenue, then these costs can be capitalized even though a nonregulated enterprise would be required to expense these costs currently. Deferred costs can include an imputed cost of equity capital, if so accounted for rate-setting purposes, even though this would not normally be permitted under GAAP. Thus, the regulatory process can result in the accounting recognition of an asset that would not otherwise be recognized by a commercial enterprise. If at any time it becomes apparent that the incurred cost will not be recovered through generation of future revenue, that cost is to be charged to expense. If a regulator subsequently excludes specific costs from allowable costs, the carrying value of the asset recognized is to be reduced to the extent of the excluded costs. Should the regulator allow recovery of these previously excluded costs or any additional costs, a new asset is to be recognized and classified as if these costs had been initially included in allowable costs.

Imposition of Liabilities

In other situations, the regulatory process can result in the accounting recognition of a liability. This usually occurs when regulators mandate that refunds be paid to customers, which must be accrued when probable and reasonably estimable, per ASC 450, *Contingencies.* Furthermore, regulatory rates may be set at a higher level, in order to recover costs expected to be incurred in the future, subject to the caveat that such amounts will be refunded to customers if it later becomes apparent that actual costs incurred were less than expected. In such cases, the incremental rate increase related to recovery of future costs must be accounted for as a liability (unearned revenue), until the condition specified is satisfied. Finally, regulators may stipulate that a gain realized by the utility will be returned to customers over a specified future period; this will be accounted for by accrual of a liability rather than by recognition of the gain for accounting purposes.

Phase-in Plans

Special rules apply to phase-in plans, as defined in ASC 980-340, *Regulated Enterprises—Deferred Costs and Other Assets*. If a phase-in plan was ordered by regulators for a plant that had been substantially constructed before 1988, then all allowable costs which are deferred for regulatory purposes, subject to the phase-in plan, are also deferred for financial reporting purposes. However, the imputed cost of capital permitted by regulators (in effect, interest on the deferred costs) cannot be capitalized for financial reporting. Specific criteria must be met in order to utilize phase-in accounting, and the method cannot be employed for plants not constructed until after 1987.

Abandonment

Accounting for abandonments is also stipulated for regulated enterprises. If an abandonment occurs or becomes probable, any costs which are probable of not being recovered are required to be written off as a loss. Furthermore, if the return on the investment that will be recoverable will not be equal to the normal rate of return, then an additional loss accrual must be recognized currently. This loss is measured by the difference between the projected future revenues, discounted at the enterprise's incremental borrowing rate, and the remaining costs to be recovered. The amount of loss to be recognized obviously depends on the enter-

prise's estimate of time to elapse until rate increases are effective, and the length of time over which the increases will remain in effect. These estimates may change over time, and the effect of revisions in the estimate will be reflected in earnings in the periods the new estimates are made.

The carrying value of the costs of an abandoned plant is increased during the period from the abandonment until recovery occurs through rate increases as promised by the regulatory authorities. If full return of investment is anticipated, the cost of abandoned assets is accreted at the rate (the enterprise's overall cost of capital) permitted for rate-setting purposes. If partial or no return on investment is expected, the asset value is accreted at the same rate that was used to compute the loss accrual, which is the enterprise's incremental borrowing rate. During the recovery period, the costs of the abandoned plant are amortized. If full return on investment is expected, this amortization is to be computed on the same basis as is permitted for rate-setting purposes. If partial or no return is expected, amortization is recognized in amounts that provide a constant rate of return on the unamortized balance of the investment in the costs of the abandoned plant.

Accounting for Liabilities Related to Asset Retirement Obligations

Historically, and particularly since the advent of nuclear energy generation, public utilities have faced the problem of accounting for costs which are expected to be incurred attendant upon the retirement from service of the generating facilities. Environmental and other laws and regulations typically mean that very substantial costs have to be borne, in order to dispose of waste, restore the land (not merely the power generating facility site, but, in the case of coal-fired plants, restoration of the strip mining locations) and ameliorate other problems. These issues are addressed by ASC 410-20, *Asset Retirement Obligations*.

Chapter 11 presents a detailed examination of ASC 410-20, and that discussion is not duplicated here. In brief, this pronouncement establishes standards for measuring the future cost to retire an asset and recognizing it in the financial statements as a liability and correspondingly, as part of the depreciable cost of the asset. ASC 410-20 applies to legal obligations associated with the retirement of tangible long-lived assets that result from their acquisition, construction, development and/or normal operation. It does not apply to situations where moral suasion is to be applied to encourage cleanup efforts, even if the reporting entity has a history of making such voluntary gestures. However, the principle of "promissory estoppel" does create legal obligations even absent contractual or statutory requirements, in some cases.

If costs, such as those related to nuclear decommissioning, are legal obligations, the present value of the future expenditures is recognized as an added cost of the asset, and as a liability, at acquisition. Further cost accretion is required due to the passage of time. Depreciation charges are based on the recorded cost of the asset, including the estimated future retirement costs. Changes in estimates, which are inevitable, are handled differently if they are increases versus decreases, as described in Chapter 11.

Accounting for Asset Impairments

While not unique to regulated industries (public utilities, in particular), the issue of asset impairment will often be dealt with in these operations, due to the large investment in very long-lived fixed assets and the potential impact of changes in technology over time. ASC 360 addresses this issue. Briefly, under defined conditions, assets must be reviewed to determine whether their carrying value will be fully recovered from future cash flows from using and disposing of them. If the future estimate of cash flows over the asset's (or group of assets') remaining estimated useful life, undiscounted, is less than the carrying value, the

asset is considered impaired, and the carrying value is reduced to the fair value of the asset with the impairment loss being charged to expense in the current period. Typically, a projected cash flows approach is used in estimating value, although in some instances a more direct approach, relying on market prices, might be usable. ASC 360 is discussed in detail in Chapter 11.

Accounting for Deregulation and "Stranded Costs"

In recent years the utilities industries have undergone varying degrees of deregulation. This will have significant effects on the financial reporting of many of the entities operating in these industries, since under GAAP many had recognized regulatory assets and regulatory liabilities which will no longer be recognizable once full deregulation occurs. Also, certain costs may no longer be recoverable in a deregulated environment, transforming certain assets into "stranded costs."

ASC 980-20-35 addresses the matter of deregulation. When deregulation legislation has been enacted affecting all or a portion of the entity's operations, it is to cease applying ASC 980 to the affected operations. In cases in which the effects of deregulation are imposed by means of a rate order, such an order would have to be sufficiently detailed so that the entity would be able to determine how it will be affected. Regulatory assets would not, however, be immediately written off; instead, an evaluation of regulatory cash flows would be conducted to determine whether an impairment had occurred and to determine whether the portion of the business from which the regulatory cash flows are derived is still subject to ASC 980. Only if the asset is impaired (applying ASC 360 criteria) or if ASC 980 is no longer applicable would the asset be written off before being recovered. Similarly, regulatory liabilities would not be reclassified into income until the obligation is eliminated by the regulatory authority.

A related concern is whether the new regulatory assets or liabilities must be given recognition to reflect expenses and obligations that will arise from the portion of the business being deregulated. The same "source of cash flow" type of analysis noted above is to be applied to make these determinations. Thus, a cost or obligation is recognized as a regulatory asset or liability, respectively, once it is expensed or incurred after ASC 980 is applied to that portion of the operations, if it has been designated for recovery or settlement, respectively, via regulated cash flows.

Other Accounting Guidance

ASC 980-605-25 states that Nonutility Generators (NUG) are to recognize the lesser of (1) the amount billable under the contract or (2) a formula-based pricing arrangement, as revenue. The formula-based pricing arrangement is determined by the kilowatt-hours (kwhs) made available during the period multiplied by the estimated average revenue per kwh over the term of the contract for the fixed or scheduled price period of the contract. Revenue is not to be recognized utilizing the formula-based pricing arrangement if its only purpose is to establish liquidating damages. Additionally, a receivable arises when the amounts billed are less than the amount computed pursuant to the formula-based pricing arrangement and if the contract requires a payment, probable of recovery, to the NUG at the end of the contract term.

ASC 980-605-25 also addresses the treatment of additional revenues of rate-regulated utility companies that are to be billed in the future under alternative revenue programs. It identifies two types of alternative revenue programs, defined as Type A and Type B. The revenues from alternative revenue programs are to be recognized when the events permitting

billing of the revenues have occurred and three specific criteria that are discussed in the abstract are met.

Also, rate-regulated utilities recognizing revenues from an alternative revenue program that do not meet the conditions of this consensus must amend the plan or change the program to meet the conditions.

ASC 980-715-25 holds that, if the regulator includes other postemployment benefits (OPEB), costs in rates on a pay-as-you-go basis, the regulatory asset relating to the cost under ASC 715 is not to be recognized. Further, the regulatory asset for a rate-regulated enterprise is to recognize the difference between ASC 715 costs and the OPEB costs if future revenue will at least offset the deferred cost and meet four specific criteria, which are discussed in the standard.

Regarding the accounting for regulatory assets, ASC 980-715-25-8 states that a rate-regulated enterprise that fails to initially meet the asset recognition criteria can recognize a regulatory asset for other postemployment benefits costs in a future period when applicable criteria are met. This consensus applies also to all regulatory assets recognized pursuant to ASC 980-10-05 criteria.

Additionally, it was noted that the carrying amount of the regulatory asset to be recognized is to be reduced by any impairment that may have occurred.

Fixed price arrangements are to be handled in accordance with ASC 980-605-25. Variable price arrangements in which the rate is at least equal to expected costs are to recognize revenue as billed, in accordance with the provisions of the contract for that variable price period. A long-term power sales contract is to be reviewed periodically to determine whether it is a loss contract, in which case the loss is to be recognized immediately. Finally, any premium related to a contractual rate in excess of the current market rate is to be amortized over the remaining portion of the contract for long-term power sales contracts acquired in a purchase business combination.

TITLE PLANT

PERSPECTIVE AND ISSUES

ASC 950-350*, Financial Services—Title Plant,* presents accounting and reporting standards for costs relating to the construction and operation of title plants. A title plant comprises a record of all transactions or conditions that affect titles to land located in a specified area. The length of time spanned by a title plant depends upon regulatory requirements and the time frame required to gather sufficient information to efficiently issue title insurance. Updating occurs frequently as documentation of the current status of a title is added to the title plant.

This pronouncement applies to enterprises such as title insurance companies, title abstract companies, and title agents that use a title plant in their operations. The standard provides that costs directly incurred to construct a title plant are to be capitalized when the entity can use the title plant to do title searches and that such capitalized costs are not normally depreciated. The statement also requires that the costs of maintaining a title plant and of doing title searches be expensed as incurred.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
ASC 950-350	Financial Services—Title Plant

DEFINITIONS OF TERMS

Title plant. Consists of (1) indexed and catalogued information for a period concerning the ownership of, and encumbrances on, parcels of land in a particular geographic area; (2) information relating to persons having an interest in real estate; (3) maps and plats; (4) copies of prior title insurance contracts and reports; and (5) other documents and records. In summary, a title plant constitutes a historical record of all matters affecting title to parcels of land in a particular geographic area.

CONCEPTS, RULES, AND EXAMPLES

Acquisition Costs

The cost of constructing a title plant includes the cost of obtaining, organizing, and summarizing historical information pertaining to a particular tract of land. Costs incurred to assemble a title plant are to be capitalized until the record is usable for conducting title searches. Costs incurred to construct a backplant (a title plant that predates the time span of an existing title plant) must also be capitalized. However, an enterprise may capitalize only those costs that are directly related to and traceable to the activities performed in constructing the title plant or backplant.

The purchase of a title plant or backplant, or an undivided interest therein (the right to its joint use) is recorded at cost as of the date acquired. If the title plant is acquired separately, it is recorded at the fair value of consideration given.

Capitalized title plant costs are not amortized or depreciated unless an impairment in the carrying amount of the title plant occurs. The following events or changes in circumstances can indicate that the carrying amount may not be recoverable. An impairment may be indicated by the following circumstances (not intended to be an exhaustive list):

1. Changing legal or statutory requirements
2. Economic factors, such as changing demand
3. Loss of competitive advantage
4. Failure to maintain an up-to-date title plant
5. Circumstances that indicate obsolescence, such as abandonment of title plant

The provisions of ASC 360 apply to any such impairment. See Chapter 11 for a complete discussion of this topic.

Operating Costs

Costs of title plant maintenance and of conducting title searches are required to be expensed currently. A title plant is maintained through frequent, often daily, updating which involves adding reports on the current status of specific real estate titles and documentation of security or other ownership interests in such land. A title search entails a search for all information or documentation pertaining to a particular parcel of land. This information is found in the most recently issued title report.

Once a title plant is operational, costs may be incurred to convert the record from one storage and retrieval system to another or to modify the current storage and retrieval system. These costs may not be capitalized as title plant. However, they may be separately capitalized and amortized using a systematic and rational method.

Reporting Title Plant Sales

The sale of a title plant is to be reported separately. The amount to be reported is determined by the circumstances surrounding the sale as follows:

Terms of sale	*Amount reported*
Sale of title plant and waiver of all rights to future use	Amount received less adjusted cost of title plant
Sale of undivided ownership interest (rights to future joint use)	Amount received less pro rata portion of adjusted cost of title plant
Sales of copies of title plant or the right to use it	Amount received

Note that in the last instance the amount reported is simply the amount received. In this case, no cost is allocated to the item sold unless the title plant's value drops below its adjusted cost as a result of the sale.

APPENDIX A

DISCLOSURE CHECKLIST FOR COMMERCIAL BUSINESSES

The disclosure checklist presented below provides a quick reference to those disclosures that are common to the financial statements of most commercial business enterprises. Selected references to items required by the SEC, for public companies only, are also incorporated as many private company financial statement preparers believe these to be "best practices" to be emulated, but this checklist does not purport to be suitable for use as a comprehensive SEC disclosure checklist, nor is it designed to be used for reporting entities that are not-for-profit organizations, state or local governments, or that are engaged in other industries that are subject to specialized accounting and reporting rules.

Notes to the Financial Statement Preparer:

The most effective way to use this checklist to document the preparer's thought process is to use a standardized tickmark or letter key such as the following:

✓– Disclosure made;	IM– Disclosure considered and judged to be immaterial;
NA– Disclosure not applicable	X– Disclosure not made (For each item marked X, append an explanation)

B. Disclosures 1296

GENERAL

A. Basis of Reporting

1. Name of entity for which statements are being presented (if d/b/a different name than legal name, indicate both). _____
2. Titles of statements should be appropriate (certain titles denote and should be reserved for GAAP financial statements; other titles denote other comprehensive basis of accounting [OCBOA] financial statements). _____
3. Dates and periods covered should be clearly stated. _____
4. If one or more consolidated subsidiaries have different fiscal periods than the parent (not to exceed 3 months), disclose any intervening events that materially affect financial position or results of operations. _____
5. If comparative statements are presented, repeat footnotes from prior years to extent appropriate. _____
6. Differences between "economic" entity and legal entity being presented should be noted (e.g., consolidated or not? subsidiaries included and excluded, combined statements?, etc.) Disclose summarized financial information for previously unconsolidated subsidiaries. _____
7. Identify new accounting principles not yet adopted and expected impact of adoption. _____

B. Accounting Policies

Chapter 5 includes a listing of accounting policies frequently disclosed by reporting entities (the listing is not intended to be all-inclusive)

1. Description of business unless otherwise apparent from statements themselves. _____
2. Identify and describe significant accounting principles followed and methods of applying them that materially affect statements; disclosures should include principles and methods that involve

a. Selection from acceptable alternatives. _____
b. Principles and methods peculiar to the company's industry. _____
c. Unusual or innovative applications of generally accepted accounting principles. _____
d. Consolidation or combination policy. _____

3. If there have been any material changes in classifications made to previously issued financial statements, these should be noted. _____

C. Accounting Changes

1. Nature and justification of change in accounting principle. _____

   a. The nature of and reasons for making the change, addressing preferability of the newly adopted principle. _____
   b. Descriptions of prior period items that have been restated. _____
   c. The effects of the change for both current period and prior period(s) being presented; specific quantification of the effects on income from continuing operations, net income, any other financial statement caption materially affected, and corresponding per share amounts for each. _____
   d. The cumulative effect on retained earnings at the beginning of the earliest period's financial statements presented. _____
   e. If ASC 250 requirement to restate prior periods is not adhered to, based on impracticability criterion, explain and provide details regarding method of accounting applied. _____
   f. When indirect effects of change in accounting principle are included, describe these effects and state the amounts recognized in the current reporting period, together with per share amounts. If possible, also state the indirect effects of the change in each of the prior periods being presented. _____

2. For change in reporting entity, nature of change and reason for it; also, effect of change on income before extraordinary items and net income for all periods presented (also per share amounts). _____
3. For a change in entity not having material effect currently but anticipated to have such effect in later periods, the nature of the change and reason the change was made. _____
4. For a change in accounting estimate, if the change affects several future periods (e.g., for change in useful lives of fixed assets), disclose the effect on income from continuing operations and net income of current period (and related per share amounts). _____
5. For a change in estimate not having material effect in the current period, but which is deemed likely to have material effects on later periods, describe the change. _____
6. For the correction of an error, disclose the nature of the error in previously issued statements and the effect of its correction on income before extraordinary items and net income (only in period of discovery and correction), with per share equivalents. _____

D. Related Parties

1. Nature of relationship and amounts due to or from related parties with significant terms and manner of settlement. _____
2. For each income statement presented, a description of and dollar amounts of transaction, including those to which no or nominal amounts are assigned, as well as guarantees or other terms which are needed for understanding of financial statement impact, and description of any change in terms. _____
3. Economic dependency (e.g., major customer, supplier, franchisor, franchisee, distributor, general agent, borrower, or lender) should be described and amount of transactions disclosed. _____

4. Nature and extent of related-party leases. _____
5. The nature of control relationship, even absent any transactions, of companies under common ownership or management control, if such could lead to operating results or financial position significantly different than what would have resulted if entities were autonomous. _____
6. Amount of investments in related parties. _____

E. Contingencies and Commitments

1. When accruals are not made because probable loss could not be estimated, describe the nature of the contingency. _____
2. Report the upper limit of range of estimates for cases in which lower limit is accrued because no best estimate exists. _____
3. The nature of reasonably possible losses and either the estimated amount of the loss or a statement that no estimate is possible. _____
4. Describe unasserted claims for which it is both probable that a claim will be asserted, and reasonably possible that an unfavorable outcome will result. _____
5. Report events occurring after balance sheet date that may give rise to a loss contingency, either via a footnote or by means of a pro forma presentation. _____
6. Gain contingencies may be disclosed (but not accrued), if described such that the likelihood of realization is not overstated. _____
7. Disclose about guarantees, including guarantees of the indebtedness of others
    a. The nature of the guarantee, including the approximate term, how the guarantee arose, and the events or circumstances that would require the guarantor to perform under the guarantee. _____
    b. The maximum potential amount of the future payments (undiscounted) that the entity would be required to make, or if the guarantee provides no limitation on future payments, that fact. _____
    c. The reasons why the maximum future payments cannot be estimated, if the entity is unable to estimate that amount. _____
    d. The current carrying amount of the liability. _____
    e. The nature of any recourse provisions that would enable the entity to recover from third parties any amounts paid under the guarantee, and the extent to which the proceeds are expected to cover the amount in b. above. _____
    f. A description of any assets (collateral) that can be liquidated to recover amounts paid under the guarantee, and the extent to which the proceeds from liquidation are expected to cover the amount in b. above. _____
8. Disclose material commitments and purchase obligations. _____
9. Describe any pending renegotiation of government contracts. _____
10. Pending litigation in which the entity is involved should be described, with gross potential losses and potential recovery (e.g., from insurance) separately identified. _____
11. Tax contingencies or disputes to which the entity is a party should be noted. _____
12. Unused letters of credit. _____
13. Environmental risks and liabilities should be described. _____
14. Accounts or notes receivable sold with recourse; other guarantees to repurchase receivables. _____
15. Unusual purchase or sales commitments. _____
16. Compensated absences or postemployment benefits that cannot be reasonably estimated but that otherwise meet criteria for accrual should be described. _____

F. Risks and Uncertainties

1. Nature of operations including description of major products, services, principal markets served, locations, and relative importance of operations in various businesses and basis for determination of relative importance (e.g., sales volume, profits, etc.). _____

2. Explanation that the preparation of financial statements requires the use of management's estimates. _____
3. Significant estimates used in the determination of the carrying amounts of assets or liabilities or in the disclosure of gain or loss contingencies when, based on information known to management prior to issuance of the financial statements it is at least reasonably possible that the effect on the financial statements of a condition, situation, or set of circumstances existing at the balance sheet date for which an estimate has been made will change in the near term due to one or more future confirming events and the effect of the change would be material to the financial statements. (If the estimate involves a loss contingency covered by ASC 450, include an estimate of the possible loss or range of loss, or state such estimate cannot be made.) _____
4. Vulnerability due to concentrations in the volume of business with a particular customer, supplier, or lender; revenue from particular products or services; available sources of supply of materials, labor, or other inputs; and market or geographic area. (For concentrations of labor subject to collective bargaining agreements, disclose both the percentage of the labor force covered by a collective bargaining agreement and the percentage of the labor force covered by a collective bargaining agreement that will expire within one year. For concentrations of operations located outside of the entity's home country, disclose the carrying amounts of net assets and the geographic areas in which they are located.) _____

G. Nonmonetary Transactions

1. Nature of transaction. _____
2. Gain or loss and basis of accounting for assets transferred. _____
3. For advertising barter transactions
   a. Amount of revenue and expense recognized from advertising barter transactions. _____
   b. Volume and type of advertising surrendered and received (e.g., number of equivalent pages, broadcast minutes) that was not recognized in the income statement because the fair value was not determinable. _____

H. Subsequent Events

1. Adjust financial statements for conditions existing at balance sheet date. _____
2. Disclose for conditions subsequent to balance sheet (consider pro forma presentation); examples are: for sale of a bond or capital stock issue, purchase or sale of a business, settlement of litigation when event giving rise to claim occurred subsequent to balance sheet date, loss of plant or inventories as a result of fire or flood, losses on receivables resulting from conditions (such as a customer's major casualty) arising subsequent to balance sheet date, significant net realized and unrealized marketable equity security gains and losses after the date of the financial statements, substantial loans to insiders or affiliates, significant long-term investments, substantial dividends not in the ordinary course of business, loss contingencies arising after the date of the financial statements, or significant foreign currency rate changes after the balance sheet date and their effects on unsettled balances pertaining to foreign currency transactions. _____

I. Rights and Privileges of Various Equity Securities Outstanding

1. Show each class separately and any changes during the period. _____
2. Par value, assigned or stated value should be disclosed. _____
3. Liquidation preferences are to be stated. _____
4. Participations (for preferred classes) are to be disclosed. _____
5. Call, conversion, and exercise data are to be noted. _____
6. Redeemable preferred stock should be described. _____

J. Business Combinations and Variable Interest Entities (VIEs)

Notes to the preparer:

- Disclosures required by ASC 810 regarding a VIE are to be included in the same note to the financial statements as the information required by this section.
- Information regarding VIEs may be aggregated for similar entities if separate reporting would not provide the user with additional material information.

1. Business combinations *occurring during the reporting period* or after the reporting date but before the financial statements are issued, **including variable interest entities** (VIEs) where the VIE is a business.

   The acquirer is to disclose the following information for each business combination that occurs during the reporting period

   a. The name and a description of the acquiree. _____
   b. The acquisition date. _____
   c. The percentage of voting equity interest acquired. _____
   d. A description of how the acquirer obtained control over the acquiree. _____
   e. The primary reasons for the business combination. _____
   f. The amounts recognized as of the acquisition date for each major class of assets acquired and liabilities assumed. _____
   g. Receivables acquired not subject to ASC 310-30, such as trade receivables with repayment terms of one year or less:

   The following disclosures are to be provided by major class of receivable such as loans, direct finance leases under ASC 840, and any other class of receivables

      (1) The fair value of the receivables. _____
      (2) The gross contractual amount of the receivables. _____
      (3) The best estimate at the acquisition date of the contractual cash flows not expected to be collected. _____

   h. Contingent consideration arrangements and indemnification assets

      (1) Amounts recognized as of the acquisition date. _____
      (2) A description of the arrangements and the basis for determining the amount of payment. _____
      (3) An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why. _____
      (4) If the maximum amount potentially due under the arrangement is unlimited, the acquirer is to disclose that fact. _____

   i. Assets and liabilities arising from acquiree contingencies

      The acquirer is permitted to aggregate these disclosures for assets and liabilities that are similar in nature

      (1) The amounts recognized at the acquisition date or an explanation of why no amount was recognized. _____
      (2) The nature of recognized and unrecognized contingencies. _____
      (3) An estimate of the range of outcomes (undiscounted) for contingencies (recognized and unrecognized) or, if a range cannot be estimated, that fact and the reasons why a range cannot be estimated. _____

   j. Goodwill

      (1) A qualitative description of the factors that make up goodwill recognized (e.g., expected synergies from combining acquiree operations with those of the acquirer, intangible assets that do not qualify for recognition separately from goodwill, or other factors). _____

(2) The total amount of goodwill that is expected to be deductible for tax purposes. _____
(3) If the assignment of goodwill to reporting units (as required by ASC 350) has not been completed on the financial statements' issuance date, the acquirer is to disclose that fact. _____

k. Bargain purchases

(1) The amount of gain recognized. _____
(2) The line item in the income statement in which the gain is recognized. _____
(3) A description of the reasons why the transaction resulted in a gain. _____

l. Transactions recognized separately from the acquisition of assets and assumption of liabilities in the business combination (e.g., settlement of preexisting acquirer/acquiree relationships, arrangements to compensate employees or former owners of the acquiree for future services, acquirer reimbursements made to the acquiree or its former owners for paying acquisition-related costs of the acquirer)

(1) A description of each transaction. _____
(2) How the acquirer accounted for each transaction. _____
(3) The amounts recognized for each transaction and the line item in the financial statements in which each amount is recognized. _____
(4) If the transaction effectively settled a preexisting relationship, the method used to determine the settlement amount. _____

m. Acquisition-related costs

(1) The amount recognized as expense and the line item or items in the income statement in which recognized. _____
(2) Amount of issuance costs not recognized as an expense and how they were recognized. _____

n. Step acquisitions (business combinations achieved in stages)

(1) The fair value at the acquisition date of the equity interest in the acquiree held by the acquirer immediately preceding the acquisition date. _____
(2) The amount of gain or loss recognized from the remeasurement to fair value of the equity interest in the acquiree held by the acquirer prior to the business combination and the line item in the income statement in which that gain or loss is recognized. _____

o. Business combinations where the acquirer holds less than 100% of the equity interests of the acquiree at the acquisition date

(1) The fair value of the noncontrolling interest in the acquiree at the acquisition date. _____
(2) The valuation technique or techniques used to measure the fair value of the noncontrolling interest and the significant inputs used. _____

p. Acquirers that are public entities (defined in the Master Glossary)

(1) The amounts of revenue and the net income of the acquiree since the acquisition date included in the consolidated income statement for the reporting period. _____
(2) The following supplemental pro forma information.

If the acquirer believes disclosure of any of the information required by this section is impractical, the acquirer is to disclose that fact accompanied by an explanation of why management believes this to be the case

(a) The amounts of revenue and net income of the consolidated entity for the current reporting period as though the acquisition date for all business combinations that occurred during the year had been as of the beginning of the annual reporting period. _____

(b) If comparative financial statements are presented, the revenue and net income of the consolidated entity for the comparable prior reporting period as though the acquisition date for all business combinations that occurred during the current year had occurred as of the beginning of the comparable prior annual reporting period. _____

(3) If the acquirer is required to disclose segment information, the amount of goodwill by reportable segment. _____

q. The primary beneficiary of a VIE that is not a business is to disclose the amount of gain or loss recognized on the initial consolidation of the VIE. _____

r. For business combinations occurring during the reporting period that are deemed immaterial individually but that are considered collectively material, the acquirer is to disclose the information required by items 1f. through 1p. in the aggregate. _____

s. Subsequent business combinations—If the acquisition date of a business combination is after the reporting date but before issuance of the financial statements, the acquirer is to disclose the information required by items 1a. through 1q. unless the initial accounting for the business combination is incomplete at the time the financial statements are issued. If this is the case, the acquirer is to indicate which disclosures it is unable to make and the reasons why. _____

2. Adjustments to current and prior period business combinations, **including variable interest entities** (VIEs) where the VIE is a business

The following disclosures are to be made for each material business combination or, in the aggregate for individually immaterial business combinations that collectively are material

a. *Provisional amounts recognized during measurement period*—If the initial accounting for the business combination is incomplete with respect to certain assets, liabilities, noncontrolling interests, or items included in the consideration transferred and the amounts recognized in the financial statements for the business combination are considered to be provisional

(1) The reasons why the initial accounting is incomplete. _____

(2) The assets, liabilities, equity interests, or items included in the consideration transferred for which the initial accounting is incomplete. _____

(3) The nature and amount of any measurement-period adjustments recognized during the reporting period. _____

b. *Contingent consideration assets/liabilities*—For each reporting period after the acquisition date until the entity collects, sells, or otherwise loses the right to an asset representing contingent consideration, or until the entity settles a contingent consideration liability or the liability is cancelled or expires

(1) Any changes in the recognized amounts, including any difference arising upon settlement. _____

(2) Any changes in the range of outcomes (undiscounted) and the reasons for those changes. _____

(3) The disclosures required to be made in each interim and annual reporting period by ASC 820-10-50 regarding recurring fair value measurements subsequent to initial recognition. These disclosures are to be made separately for each major category of assets and liabilities that represents contingent consideration:

(a) The fair value measurements at the reporting date. _____

(b) The level within the fair value hierarchy in which the fair value measurements fell in their entirety, segregating fair value measurements by classification as Level 1 (using quoted prices in active markets for identical assets or liabilities), Level 2 (using significant other observable inputs), or Level 3 (using significant unobservable inputs). _____

(c) For Level 3 fair value measurements, a reconciliation of the beginning and ending balances, separately presenting changes during the period attributable to the following:

1] Total gains or losses for the period (realized and unrealized) segregating those gains or losses included in net income and a description of where those gains or losses included in net income are reported in the statement of income _____

a] Separate disclosure of the portion attributable to changes in unrealized gains or losses related to those assets and liabilities still held at the reporting date and a description of where those gains or losses are reported in the statement of income. _____

2] Purchases, sales, issuances, and settlements (net). _____

3] Transfers in and/or out of Level 3 (e.g., due to changes in the observability of inputs significant to the valuation). _____

(d) In annual reporting periods only: The valuation techniques used to measure fair value and a discussion of changes in valuation techniques, if any, during the period. _____

c. *Acquiree contingencies*—For each reporting period after the acquisition date, until the acquirer collects, sells, or otherwise loses the rights to recognized assets arising from contingencies, or the acquirer settles recognized liabilities or its obligation to settle them is cancelled or expires

(1) Any changes in the recognized amounts of assets and liabilities arising from contingencies and the reasons for those changes. _____

(2) Any changes in the range of outcomes (undiscounted) for both recognized and unrecognized assets and liabilities arising from contingencies and the reasons for those changes. _____

d. *Goodwill reconciliation*—The reconciliation of the carrying amount of goodwill at the beginning and end of the reporting period required by ASC 350, (See *Goodwill and Identifiable Intangibles* under "Balance Sheet" disclosures). _____

3. Any additional information necessary to meet the overarching disclosure objectives with respect to business combinations, **including variable interest entities** (VIEs) where the VIE is a business, to enable users of the financial statements to _____

- Evaluate the nature and financial effects of business combinations occurring either during the current reporting period, or after the reporting date but before issuance of the financial statements.

- Evaluate the financial effects of adjustments recognized in the current reporting period that relate to business combinations that occurred in the current or previous reporting periods.

4. Disclosures to be made by the primary beneficiary of a variable interest entity (unless that party also holds a majority voting interest)

   a. The nature, purpose, size, and activities of the VIE. _____
   b. The carrying amount and classification of consolidated assets that are collateral for the VIE's obligations. _____
   c. Any lack of recourse by creditors (or beneficial interest holders) of a consolidated VIE to the general credit of the primary beneficiary. _____

5. Disclosures to be made by an enterprise that holds a significant variable interest in a VIE but is *not* the primary beneficiary

   a. The nature of its involvement with the VIE and when that involvement began. _____
   b. The nature, purpose, size, and activities of the VIE. _____
   c. The enterprise's maximum exposure to loss as a result of its involvement with the VIE. _____

6. An enterprise that does not apply ASC 810 to one or more VIE or potential VIE because after exhaustive efforts it is unable to obtain the necessary information is to make the following disclosures:

   a. The number of entities to which ASC 810 is not being applied and the reason why the information required to apply ASC 810 is not available. _____
   b. The nature, purpose, size (if the information is available), and activities of the VIE or potential VIE and the nature of the enterprise's involvement with those entities. _____
   c. The enterprise's maximum exposure to loss as a result of its involvement with the entity or entities. _____
   d. The amount of income, expense, purchases, sales, or other measure of activity between the reporting enterprise and the entity (entities) for all periods presented. (If not practicable to present the prior period information in the first set of financial statements to which this requirement applies, that prior period information may be omitted.) _____

K. Consolidations

1. A parent with one or more less-than-wholly-owned subsidiaries is to disclose for each reporting period

   a. Separately on the face of the consolidated financial statements, the amounts of consolidated net income and consolidated comprehensive income and the related amounts of each attributable to the parent and the noncontrolling interest. _____
   b. Either on the face of the consolidated income statement or in the notes, amounts attributable to the parent for the following items, if reported in the consolidated financial statements

      (1) Income from continuing operations. _____
      (2) Discontinued operations. _____
      (3) Extraordinary items. _____

   c. Either in the consolidated statement of changes in equity if presented, or in the notes, a reconciliation of beginning of period and end of period carrying amounts of total equity, equity attributable to the parent, and equity attributable to the noncontrolling interest separately disclosing

(1) Net income. _____
(2) Transactions with owners acting in their capacity as owners, separately showing contributions and distributions. _____
(3) Each component of other comprehensive income. _____

d. A separate schedule in the notes to the consolidated financial statements showing the effects of any changes in the parent's ownership interest in a subsidiary on the equity attributable to the parent. _____

2. If a subsidiary is deconsolidated during the reporting period, the parent is to disclose

a. The amount of gain or loss recognized. _____
b. The caption in the income statement in which the gain or loss is recognized unless presented separately on the face of the income statement. _____
c. The portion of any gain or loss that relates to the remeasurement to fair value of any investment retained by the former parent in its former subsidiary. _____

L. Collaborative Arrangements—In the initial interim or annual period and all annual periods thereafter, a participant to a collaborative arrangement is to disclose the following information. This information is to be disclosed separately for each individually significant collaborative arrangement

1. Information regarding the nature and purpose of its collaborative arrangements. _____
2. The entity's rights and obligations under the arrangements. _____
3. The accounting policy for collaborative arrangements. _____
4. The amounts attributable to transactions arising from the collaborative arrangement between participants for each period an income statement is presented and their classification in the income statement. _____
5. Upon initial application of 07-1, the following is to be disclosed:

a. A description of the prior period information that was retrospectively adjusted, if any. _____
b. The effect of the change on revenue and operating expenses (or other appropriate captions of changes in the applicable net assets, and on any other affected financial statement line item. _____

M. Fair Value and the Fair Value Option

Notes to the preparer:

- Unless otherwise indicated, the disclosures included in this section are required to be presented in interim and annual financial statements.

Disclosures required to be made separately for each major category of assets and liabilities measured at fair value on a recurring basis in periods subsequent to initial recognition.

1. The amount of the fair value measurements at the reporting date. _____
2. The level within the fair value hierarchy in which the fair value measurements fall within their entirety; separately disclosing the amounts of fair value measurements that use quoted prices in active markets for identical assets or liabilities (Level 1), significant other observable inputs (Level 2), and significant unobservable inputs (Level 3). _____
3. For those fair value measurements using significant unobservable (Level 3) inputs, a reconciliation of the beginning and ending balances, separately stating changes during the period attributable to[1]

[1] *For the purposes of this reconciliation, derivative assets and liabilities are permitted to be presented net.*

a. Total realized and unrealized gains or losses for the period segregating those gains or losses included in income (changes in net assets) and a description of where those gains or losses are reported in the statement of income (statement of activities)

(1) The unrealized gains or losses included in this disclosure that relate to assets and liabilities still held at the balance sheet date. _____

(2) A description of where, in the statement of income, those unrealized gains or losses are reported. _____

b. Purchases, sales, issuances, and settlements (net). _____

c. Transfers in and/or out of Level 3 (e.g., due to changes in the observability of significant inputs). _____

4. In the first interim period of the fiscal year of adoption and subsequently in annual financial statements, the valuation techniques used to measure fair value and discussion of changes in valuation techniques, if any, during the period. _____

Separate disclosures required for each major category of assets and liabilities measured at fair value on a nonrecurring basis in periods subsequent to initial recognition.

5. Fair value measurements recorded during the period and the reasons for the measurements. _____
6. The level within the fair value hierarchy in which the fair value measurements fall; in their entirety; separately disclosing the amounts of fair value measurements in Level 1, Level 2, and Level 3. _____
7. For Level 3 fair value measurements, a description of the inputs and the information used to develop them. _____
8. In the first interim period of the fiscal year of adoption and subsequently in annual financial statements, the valuation techniques used to measure fair value and a discussion of changes in valuation techniques used to measure similar assets and/or liabilities in prior periods. _____
9. Any entity that has not applied the provisions of ASC 820 in interim or annual financial statements is to disclose the following until that Statement is applied in its entirety to all assets and liabilities within its scope: _____

a. The fact that, pursuant to the deferral provided by FSP FAS 157-2 for certain nonfinancial assets and nonfinancial liabilities, except those that are recognized or disclosed at fair value in the financial statements on a recurring basis (at least annually), the entity has only partially applied ASC 820. _____

b. Each major category of assets and liabilities that are recognized or disclosed at fair value for which the entity has not applied the provisions of ASC 820. _____

Fair Value Option (FVO) disclosures required by ASC 825-10-25

Disclosures required as of each interim and annual balance sheet date

10. The reasons that management elected the FVO for each eligible item or group of similar eligible items. _____
11. If management elected the FVO for some but not all of the eligible items within a group of similar items

a. A description of the items in the group and the reasons for the partial election. _____

b. Information sufficient to enable users to understand how the group of similar items relates to the individual line items presented on the balance sheet. _____

12. For each balance sheet line item that includes one or more items for which the FVO was elected

a. Information sufficient to enable users to understand how each balance sheet line item relates to major categories of assets and liabilities presented in accordance with the fair value disclosure requirements of ASC 820 (see above) that provide the reader with information with respect to the level or levels within the fair value hierarchy in which the assumptions used to measure fair value (referred to as "inputs") are derived. _____
b. The aggregate carrying amount of items included in each balance sheet line item, if any, that are not eligible for the FVO. _____

13. The difference between the aggregate fair value and the aggregate unpaid principal balance of

a. Loans and long-term receivables (other than securities subject to ASC 820) with contractual principal amounts and for which the FVO has been elected. _____
b. Long-term debt instruments that have contractual principal amounts and for which the FVO has been elected. _____

14. For loans held as assets for which the FVO has been elected

a. The aggregate fair value of loans on nonaccrual status if the entity's policy is to recognize interest income separately from other changes in fair value. _____
b. The aggregate fair value of loans that are 90 or more days past due. _____
c. The difference between the aggregate fair value and the aggregate unpaid principal balance for loans that are 90 or more days past due, in nonaccrual status, or both. _____

15. For investments that, absent election of the FVO, would have been accounted for under the equity method, the following disclosures from ASC 323 are to be made. The extent of disclosures necessary to inform the reader of the financial position and results of operations of an investee is based on management's evaluation of the significance of an investment to the financial position and results of operations of the reporting entity.

a. Parenthetical disclosure, or disclosure in the notes to the financial statements or in separate statements or schedules of

(1) The name of each investee and the percentage of ownership of its common stock held by the reporting entity. _____
(2) The accounting policies of the investor with respect to investments in common stock. _____

b. When investments in common stock of corporate joint ventures or other investments accounted for under the equity method are, in the aggregate, material to the investor's financial position and results of operations, it may be necessary to present in the notes, or in separate statements, either individually or in groups, summarized information as to assets, liabilities, and results of operations of the investees. _____

Disclosures required in each interim and annual period for which an income statement is presented about items for which the FVO has been elected

16. For each line item in the balance sheet, the amounts of gains and losses from changes in fair value included in net income during the period and the specific line in the income statement on which those gains and losses are reported. ASC 825-10-25 permits management to meet this requirement by aggregating these disclosures with respect to items for which the FVO was elected with the amounts of gains and losses from changes in fair value with respect to other items measured at fair value as required by other authoritative literature. _____
17. A description of how interest and dividends are measured and where they are reported in the statement of income. _____

18. With respect to gains and losses included in net income during the period attributable to changes in instrument-specific credit risk associated with loans and other receivables held as assets
    a. The estimated amount of such gains or losses. _____
    b. How the gains or losses were determined. _____
19. For liabilities with fair values that have been significantly affected during the reporting period by changes in instrument-specific credit risk
    a. The estimated amount of gains and losses from changes in fair value included in net income attributable to changes in the instrument-specific credit risk. _____
    b. How the gains and losses were determined. _____
    c. Qualitative information regarding the reasons for those changes. _____

Other required disclosures

20. In annual financial statements only, the methods and significant assumptions used to estimate the fair value of items for which the FVO was elected. _____
21. If management elects the FVO upon the occurrence of an event where (1) an investment newly becomes subject to the equity method, (2) a subsidiary or a variable interest entity that the investor previously consolidated ceases to qualify for consolidation but the investor continues to hold common stock in the entity, or (3) an eligible item is required to be measured or remeasured at fair value at the time of the event but is not required to be subsequently remeasured at each succeeding reporting date, the following disclosures are required in the financial statements covering the period of the election
    a. Qualitative information about the nature of the event. _____
    b. Quantitative information by balance sheet line item indicating which line items in the income statement include the effect on net income of initially electing the FVO for the item. _____

N. Other Disclosures

1. Asset valuation allowances. _____
2. Pledged and encumbered assets. _____
3. Current and noncurrent classifications, if so utilized. _____
4. For derivatives, the hedging or trading objectives and policy. _____

BALANCE SHEET

A. Cash and Cash Equivalents

1. Segregate and classify the amount of restricted cash according to the nature of the restriction. _____
2. Compensating balances disclosed as to their nature and amount (if use of cash on balance sheet is not restricted, separate presentation on balance sheet is not required). _____
3. Classify cash to be used to settle long-term liability as noncurrent. _____
4. Classify cash to be used to acquire long-lived assets as noncurrent. _____
5. Overdrafts are to be presented as a current liability. _____
6. If uninsured balances are material, concentration of credit risk must be disclosed. _____
7. For SEC, foreign bank balances are to be distinguished. _____

B. Accounts, Notes, and Loans Receivable

1. Separately report each major category of loans and trade receivables. _____
2. Separately report receivables involving officers, employees, and other related parties and disclose amount and nature of transactions. _____

3. State the allowance for doubtful accounts or loan losses and the current period provision. _____
4. Disclose any unearned income, unamortized premiums or discounts, and any net unamortized deferred fees and costs related to loans or trade receivables. _____
5. If unbilled receivables (work in process) are reported, distinguish from billed receivables. _____
6. The recorded investment in loans (and trade receivables, if applicable) on nonaccrual status, as of each balance sheet presented is stated. _____
7. State the recorded investment in loans (and trade receivables, if applicable) on accrual status that are past due ninety days or more, as of each balance sheet presented. _____
8. The carrying amount of financial instruments that serve as collateral for borrowings. _____
9. The amount of receivables held for sale. _____
10. The amount and nature of receivables sold without recourse. _____
11. The amount of foreclosed or repossessed assets, which can be included in the other assets category if the notes to the financial statements disclose the amount. _____
12. Credit balances reclassified as a current liability. _____
13. Concentrations of risk. _____
14. Transfers of receivables with recourse. _____
15. For impaired loans, disclose

    a. For each balance sheet

        (1) Investment in impaired loans. _____
        (2) Amount of allowance for credit losses. _____
        (3) Policy of income recognition for interest. _____

    b. For each income statement, disclose the average investment in impaired loans, interest income recognized and activity in the allowance for credit losses account. _____

16. For noninterest-bearing notes or inappropriate stated interest rates, disclose the discount or premium, the effective rate of interest and face amount, amortization for the period, and issue costs. _____
17. All other nontrade receivables (e.g., tax refunds, contract claims, etc.) are separately presented. _____
18. The basis for accounting for trade receivables, loans receivable, and lease financings, including those held for sale. _____
19. The method for recognizing interest income on loan and trade receivables, including related fees and costs, and the method of amortizing net deferred fees or costs. _____
20. The accounting policies and methodology used to estimate the allowance for doubtful accounts and/or loan losses, including the factors that influenced management's judgment (such as existing economic conditions and historical losses). _____
21. The accounting policies and methodology used to estimate any liability for off-balance-sheet credit losses, including the factors that influenced management's judgment. _____
22. The policy for placing loans (and trade receivables, if applicable) on nonaccrual status. _____
23. The policy for recording payments received on loans (and trade receivables, if applicable) that are on nonaccrual status. _____
24. The policy for resuming interest accruals on loans that are on nonaccrual status. _____
25. The policy for charging off uncollectible trade receivables and loans. _____
26. Whether past due or delinquency status is based on how recently payments have been made or on contractual terms. _____
27. Whether aggregate or individual asset basis is used in determining the lower of cost or fair value of nonmortgage loans held for sale. _____

28. The aggregate amount of gains or losses on sales of loans or trade receivables (including the amounts of adjustments to record receivables held for sale at the lower of cost or fair value) separately presented in the financial statements or disclosed in the notes. _____
29. The classification and method of accounting for receivables that can be contractually prepaid or otherwise settled in a way that the entity would not recover substantially all of its recorded investment. _____
30. For certain loans or debt securities acquired in a transfer (per ASC 310-30), the following disclosures are required:
    a. How prepayments on loans receivable are accounted for. _____
    b. For loans acquired through purchase, including in a business combination, separately for loans accounted for as debt securities and for those not accounted for as debt securities
        (1) The outstanding balance (undiscounted cash flows owed). _____
        (2) The carrying amount at the beginning of the period. _____
        (3) The carrying amount at the end of the period. _____
        (4) A reconciliation of the amount of accretable yield at the beginning of the period to the amount of accretable yield at the end of the period. _____
        (5) For loans acquired in the current period
            (a) The contractually required payments receivable. _____
            (b) The cash flows expected to be collected. _____
            (c) The fair value at acquisition. _____
            (d) The carrying amount of any acquired loans in nonaccrual status. _____
        (6) The carrying amount of all loans in a nonaccrual status. _____
        (7) For loans not accounted for as debt securities
            (a) The amount of any expense recognized for impairment. _____
            (b) The amount of any reduction in a valuation allowance for losses that results from an increase in cash flows previously expected to be collected. _____
            (c) The amount of the allowance for uncollectible loans at the beginning of the period. _____
            (d) The amount of the allowance for uncollectible loans at the end of the period. _____

C. Short-Term Investments

For all classifications (trading, available-for-sale, or held-to-maturity), disclose the following information:

1. Fair value. _____
2. Gross unrealized gains. _____
3. Gross unrealized losses. _____
4. Amortized cost for each major security type. _____
5. Maturity date for those debt instruments held to maturity. _____
6. For each period for which the results of operations are presented, disclose
    a. Proceeds from sales of available-for-sale securities and gross realized gains and gross realized losses on those sales. _____
    b. Basis on which cost was determined in computing realized gain or loss. _____
    c. Gross gains and gross losses included in earnings from transfers of securities from available-for-sale category into trading category. _____
    d. Change in net realized holding gain or loss on available-for-sale securities that has been included in separate component of shareholders' equity during the period. _____

e. Change in net unrealized holding gain or loss on trading securities that has been included in earnings during the period. _____

7. For any sales/transfers from held to maturity classification, disclose

a. Cost of security. _____
b. Realized or unrealized gain or loss. _____
c. Circumstances leading to decision to sell or transfer the security. _____

8. For SEC reporting—Substantial post-balance-sheet market decline. _____

D. Inventories

1. Basis of valuation (cost, lower of cost or market, etc.). _____
2. Cost flow assumptions employed (FIFO, LIFO, etc.). _____
3. Classification (materials, work in process, etc.), with amounts of inventory in each. _____
4. Inventory accounting principles peculiar to a particular industry. _____
5. Pledging of inventories in borrowing agreements. _____
6. Product financing arrangements. _____
7. Accrued net losses on firm purchase commitments. _____
8. Liquidation of LIFO inventories and effects on income. _____
9. Amount of revenue and costs associated with inventory exchanges recognized at fair value. _____
10. Lower of cost or market "losses," if material. _____

E. Investments—Equity Method

1. Name of each investee and the percentage of ownership of common stock. _____
2. Accounting policies with respect to each of the investments. _____
3. Difference between the carrying amount for each investment and its underlying equity in the investee's net assets and the accounting treatment of the difference between these amounts. _____
4. For those investments which have a quoted market price, the aggregate value of each investment. _____
5. If investments in investees are considered to have a material effect on the investor's financial position and operating results, summarized data for the investor's assets, liabilities, and results of operations. _____
6. If potential conversion of convertible securities and exercise of options and warrants would have material effects on the investor's percentage of the investee. _____

F. Other Investments

1. For equity and debt securities

a. Classification as a held-to-maturity or an available-for-sale investment. _____
b. Basis of accounting. _____
c. Any valuation accounts in stockholders' equity which reflect unrealized gains and losses and any income statement effects. _____

2. In the reporting entity's annual financial statements: For all investments for which there is an unrealized loss where impairment has not been recognized because the loss is not considered "other than temporary"

a. Quantitative disclosure in tabular form and aggregated by category of investment under ASC 320 and ASC 958-320, and cost-method investments, as of the date of each balance sheet presented. _____

NOTE: The disclosures in (1) and (2) below are to be segregated by those investments that have been in a continuous unrealized loss position for less than 12 months and those that have been in a continuous unrealized loss position for 12 months or longer.

(1) The aggregate amount of unrealized losses. _____
(2) The aggregate related fair value of investments with unrealized losses. _____

b. A narrative as of the date of the most recent balance sheet that provides sufficient information to enable the reader of the financial statements to understand the disclosures in a. above, as well as both the positive and negative information that the investor considered in reaching the conclusion that the impairment is not other than temporary. _____

NOTE: These disclosures may be aggregated by investment category; however, individually significant unrealized losses should not be aggregated.

Examples of relevant information that could be included in this narrative are

- The nature of the investments
- The causes(s) of the impairment(s)
- The number of investment positions in an unrealized loss position
- The severity and duration of the impairment(s)
- Other evidence considered by the investor in concluding that the impairment is not other than temporary (e.g., reports from industry analysts, sector credit ratings, volatility data regarding the fair value of the security, and/or any other relevant information that the investor considered)

c. For investments valued using the cost method, as of the date of each balance sheet presented in the annual financial statements

(1) The aggregate carrying amount of all investments valued using the cost method. _____
(2) The aggregate carrying amount of cost-method investments not evaluated for impairment by the investor. _____
(3) The fact that the fair value of a cost-method investment is not estimated by management if no events or changes in circumstances have been identified that potentially would have a significant adverse effect on the investment's fair value, and either

a. The investor determined that it is not practicable to estimate the fair value of the investment, or _____
b. The investor is exempt from estimating fair value. _____

G. Property, Plant, and Equipment

1. Classes of assets, including separate identification of

a. Assets held and used. _____
b. Assets held for sale. _____
c. Assets under construction and not in service. _____
d. Idle assets. _____

2. The bases of valuation. _____
3. The methods of computing depreciation. _____
4. The amount of accumulated depreciation either by classes of assets or in total. _____
5. A description of and the amount of any assets pledged as collateral. _____
6. Capitalized interest cost

a. The total amount of interest cost incurred during the period. _____
b. The amount which has been capitalized. _____

7. Estimated costs to complete, for major construction. _____
8. Capitalized preproduction costs related to long-term supply agreements. Aggregate amount of assets recognized

a. Pursuant to agreements providing for contractual reimbursement of pre-production design and development costs. _____
b. Molds, dies, and other tools that the supplier *owns*. _____
c. Molds, dies, and other tools that the supplier *does not own*. _____

9. Asset retirement obligations (ARO)

a. General description of ARO and the related long-lived assets. _____
b. Description of how the fair value of the liability for ARO was determined. _____
c. Funding policy, if any, for ARO. _____
d. Fair value of assets, if any, that are legally restricted to satisfy the liability. _____
e. Reconciliation of the beginning and ending aggregate carrying amount of the liability separately showing the changes resulting from

(1) Additional liability incurred during the current period. _____
(2) Settlements of the liability during the current period. _____
(3) Accretion expense. _____
(4) Revisions in expected cash flows. _____
(5) Explanation of any significant changes in ARO not otherwise apparent. _____

10. Impairment of assets classified as held and used

a. Description of impaired assets (asset groups) and situation surrounding the impairment. _____
b. Amount of the impairment loss and the method used to determine fair value. _____
c. If impairment losses are not reported separately or parenthetically, the caption that includes the losses. _____
d. For SEC registrants: the business segment affected. _____
e. Disclosures required for exit and disposal activities, and discontinued operations (including lessee's early termination of leases and early termination of other executory contracts) are included in Income Statement (O) in this Appendix [RN1]. _____

H. Goodwill, Identifiable Intangibles, and Other Assets

1. For goodwill, a reconciliation of changes in the carrying amount during the period, showing separately

a. The gross amount and accumulated impairment losses at the beginning of the period. _____
b. Additional goodwill recognized during the period, except goodwill that is included in a disposal group that, upon acquisition, meets the criteria in ASC 360 to be classified as held for sale. _____
c. Adjustments resulting from the subsequent recognition of deferred income tax assets during the period (ASC 805-740). _____
d. Goodwill included in a disposal group classified as held for sale. _____
e. Goodwill derecognized during the period without having previously been reported in a disposal group classified as held for sale. _____
f. Impairment losses recognized during the period. _____
g. Net foreign exchange differences arising during the period. _____
h. Any other changes in carrying amounts during the period. _____
i. The gross amount and accumulated impairment losses at the end of the period. _____

2. Goodwill impairment losses recognized during the period

a. The facts and circumstances causing the impairment. _____

b. The method of determining fair value of the associated reporting unit (whether based on quoted market prices; prices of comparable businesses; or present value or other valuation techniques; or a combination of these methods). _____

c. If the amount recognized is an estimate that has not yet been finalized, that fact and the reasons why the estimate is not yet complete. _____

3. Goodwill impairment losses that had been estimated in prior periods

   a. In periods subsequent to recognition of an estimated goodwill impairment loss, disclose the nature and amount of any significant adjustments made to the initial estimate. _____

4. For each major class of intangible asset, for each period-end for which a balance sheet is presented

   a. For amortizable intangibles

      (1) Gross carrying amount and accumulated amortization, in total and by major class of intangible asset. _____
      (2) Amortization expense for the period. _____
      (3) Estimated aggregate amortization expenses for each of the five succeeding fiscal years as of the date of the latest balance sheet presented. _____

   b. For intangible assets not subject to amortization, the total carrying amount and the carrying amount for each major intangible asset class. _____
   c. The entity's accounting policy on the treatment of costs incurred to renew or extend the term of a recognized intangible asset. _____
   d. For intangible assets that have been renewed or extended in the period for which the balance sheet is presented

      (1) For entities that capitalize renewal or extension costs, the total amount of costs incurred in the period to renew or extend the term of a recognized intangible asset, by major intangible asset class. _____
      (2) The weighted-average period prior to the next renewal or extension (both explicit and implicit), by major intangible asset class. _____

5. For each impairment loss recognized related to an intangible asset (other than goodwill), the following disclosures are to be made in financial statements that include the period the loss is recognized:

   a. A description of the impaired intangible asset. _____
   b. The facts and circumstances that caused the impairment. _____
   c. The amount used to determine fair value. _____
   d. The amount of the impairment loss, and the caption of the income statement in which it is included. _____

6. In the period of acquisition either individually or in a group of assets, as part of an asset acquisition transaction or a business combination, the following information as of acquisition date. This information is to be disclosed separately for each material business combination or in the aggregate for individually immaterial business combinations that are material collectively if the aggregate fair values of the intangible assets acquired, other than goodwill, are significant.

   a. For each class of intangible asset subject to amortization

      (1) The total amount assigned and the amount assigned to any major intangible asset class. _____
      (2) The amount of any significant residual value, in total and by major intangible asset class. _____

(3) The weighted-average amortization period, in total and by major intangible asset class. _____

b. For intangible assets *not* subject to amortization, the total amount assigned and the amount assigned to any major intangible asset class. _____
c. For intangible assets with renewal or extension terms, the weighted-average period prior to the next renewal or extension (both explicit and implicit) by major class of intangible asset. _____

7. For entities subject to segment reporting requirements under ASC 280

a. The disclosures regarding goodwill in H.1. above are to be provided in total and for each reportable segment along with any significant changes in the allocation of goodwill by reportable segment. _____
b. If any portion of goodwill has not yet been allocated to a reporting unit at the date the financial statements are issued, disclosure is to be made of that amount and the reasons it has not yet been allocated. _____
c. For any impairment losses recognized with respect to intangible assets other than goodwill, disclose the reportable segment in which the impaired intangible asset is reported. _____

8. Research and Development (R&D) Activities

a. The amount of R&D assets acquired in a transaction other than a business combination and written off in the period and the line item in the income statement in which the amounts written off are included. _____
b. The total research and development costs charged to expense for each period for which an income statement is presented. _____
c. For contractual agreements

(1) The terms of significant agreements under the R&D arrangements as of the date of each balance sheet presented. _____
(2) The amount of compensation earned and costs incurred under contract for each period for which an income statement is presented. _____

9. Deferred charges and other assets

a. Charges, segregated by type. _____
b. Carrying value of capitalized computer software. _____

10. Computer software

a. Capitalized value. _____
b. Amortization. _____
c. Write-downs to realizable value. _____

11. Capitalized direct-response advertising. _____
12. For obligations to service financial assets

a. Amounts of servicing assets/liabilities recognized and amortized. _____
b. Fair value of items (methods and assumptions). _____
c. Risk and amounts of impairment. _____

I. Accounting for Transfers and Servicing of Financial Assets

1. For all servicing assets and liabilities

a. The amounts recognized and amortized during the period. _____
b. Fair value of such recognized items including methods and assumptions. _____
c. Risk characteristics of assets used to measure impairment. _____
d. Activity in the valuation allowance for impairment. _____

2. For securitizations accounted for as a sale

   a. Accounting policies for initially and subsequently measuring retained interests, including how fair value was determined. _____
   b. A description of the entity's continuing involvement with the transferred assets. _____
   c. The gain or loss from the securitizations. _____
   d. The key assumptions used in measuring the fair value of retained interests, both initially and subsequently. _____
   e. A sensitivity analysis or stress test showing the hypothetical effect on the fair value of retained interests for two or more variations from the expected level for each key assumption used in measuring the fair value of retained interests. _____
   f. Cash flows between the securitization SPE and the entity. _____

3. For securitized assets that the entity continues to service

   a. The total principal amount outstanding of the securitized assets and any other financial assets that the entity manages with them, the portion that has been derecognized, and the portion that continues to be recognized for each category reported on the balance sheet. _____
   b. Delinquencies at the end of the period. _____
   c. Credit losses, net of recoveries, during the period. _____

4. Other disclosures

   a. Security required for repurchase agreements or security lending transactions. _____
   b. Fair value of assets transferred, or description and reasons why fair value cannot be measured. _____
   c. Any assets pledged as collateral that are not separately reported on the face of the balance sheet. _____
   d. Fair value of any assets accepted as collateral, and the amount that has been sold or repledged. _____

J. Current Liabilities

1. For accounts payable, disclose amounts that are

   a. Trade. _____
   b. Nontrade. _____
   c. Related parties (affiliates; investees for which the equity method is used; employee trusts; principal owners; management, immediate families of owners and management; or any party capable of significantly influencing a transaction). _____

2. Callable obligations:

   For long-term obligations which have become callable due to a violation of the debt agreement, report

   a. A description of covenants violated. _____
   b. In unclassified balance sheet, include surrounding circumstances with disclosure of long-term debt maturities. _____
   c. Obligation that will be classified as noncurrent because it is probable that a violation of debt agreement will be cured within a grace period or a waiver has been obtained. _____

3. Income taxes payable

   a. Current portion. _____
   b. Deferred portion. _____

4. Notes payable

   a. Description of note. _____
   b. Classified by type

      (1) Trade creditors. _____
      (2) Bank. _____
      (3) Factors or other financial institutions. _____
      (4) Holders of commercial paper. _____
      (5) Related parties (see Accounts Payable, 1.c.). _____
      (6) Employees, underwriters, and promoters (other than related parties). _____

   c. Describe assets used as security. _____
   d. Interest rate. _____
   e. Aggregate maturities and maturities for next five years. _____

5. Product warranties

   a. The nature of the product warranty, including how the warranty arose and the events or circumstances in which the entity must perform under the warranty. _____
   b. The entity's accounting policy and methodology used in determining its liability. _____
   c. A reconciliation of the beginning and ending liability balances showing separately the changes during the period attributable to warranties issued, claims paid or otherwise settled, and any adjustments to the liability. _____
   d. The nature and extent of any recourse provisions or available collateral that would enable the entity to recover the amounts paid under the warranties. _____
   e. The disclosures required by ASC 850 if the warranties are made to benefit related parties. _____

6. Other current liabilities

   a. Accruals. _____
   b. Advances or deposits. _____
   c. Current portions of long-term liabilities. _____
   d. Compensated absences. _____
   e. Liabilities not recorded because amounts could not be estimated. _____
   f. Short-term debt expected to be refinanced

      (1) Terms of new obligation incurred or expected to be incurred. _____
      (2) Terms of equity securities issued or expected to be issued. _____

   g. Bank overdrafts. _____
   h. Special termination benefits. _____
   i. Credit balances in accounts receivable. _____
   j. Terms, interest rates, collateral, and other significant information about the underlying obligation. _____

K. Current and Deferred Income Tax Assets and Liabilities

1. Classify as current if related to asset or liability that is current or will result in net taxable or deductible amounts next year. Otherwise classify as noncurrent. _____
2. Total of deferred income tax liabilities. _____
3. Total of deferred income tax assets. _____
4. Report the valuation allowance for deferred income tax assets, allocated pro rata between current and noncurrent deferred income tax assets, and changes in the allowance during the year. _____
5. Deferred income tax liabilities and assets attributable to different taxpaying components or to different tax jurisdictions are not permitted to be offset. _____

6. The approximate income tax effect of each type of temporary difference and carryforward that gives rise to a significant portion of deferred income tax liabilities and assets. For non-SEC reporting, disclose the types of temporary differences and carryforwards but may omit disclosure of the income tax effects of each type. _____
7. The amounts and expected timing of reversals of deductible temporary differences. _____
8. Any portion of the valuation allowance for deferred income tax assets for which subsequently recognized income tax benefits will be allocated to reduce goodwill or other noncurrent intangible assets of an acquired entity or directly to contributed capital. _____
9. The amounts and expiration dates of net operating loss and income tax credit carryforwards for income tax purposes. _____
10. The reporting entity's accounting policy on classification of interest and penalties. _____
11. At the end of each annual reporting period

    a. A tabular reconciliation of the total amounts of unrecognized income tax benefits at the beginning and end of the period including, at a minimum

        (1) The gross amounts of the increases and decreases in unrecognized income tax benefits as a result of income tax positions taken during a prior period. _____
        (2) The gross amounts of increases and decreases in unrecognized income tax benefits as a result of income tax positions taken during the current period. _____
        (3) The amounts of decreases in the unrecognized income tax benefits relating to settlements with taxing authorities. _____
        (4) Reductions in unrecognized income tax benefits resulting from a lapse of the applicable statue of limitations. _____

    b. The total amount of unrecognized income tax benefits that, if recognized, would affect the effective tax rate. _____
    c. The total amounts of interest and penalties recognized in the statement of income and the total amounts of interest and penalties recognized in the balance sheet. _____
    d. For income tax positions for which it is reasonably possible that the total amounts of unrecognized income tax benefits will significantly increase or decrease within 12 months of the reporting date

        (1) The nature of the uncertainty. _____
        (2) The nature of the event that could occur in the next 12 months that would cause the change. _____
        (3) An estimate of the range of the reasonably possible change or a statement that an estimate of the range cannot be made. _____

    e. The tax years that remain subject to examination by major income tax jurisdictions. _____

L. Long-Term Debt and Debt Extinguishment

1. Notes and bonds

    a. The aggregate amount of debt shown as a long-term liability on the face of the financial statements net of the current portion due within one year and any discount or premium. _____
    b. The detail relating to each debt issue, including

        (1) Nature of the liabilities. _____
        (2) Maturity dates. _____
        (3) Interest rates (effective and stated). _____

(4) Call provisions. _____
(5) Conversion privileges. _____
(6) Restrictive covenants (i.e., sinking fund requirements, restrictions on retained earnings, etc.). _____
(7) Assets pledged as collateral (these assets are shown in the asset section of the balance sheet). _____
(8) Amounts due to related parties including officers, directors, and employees, and terms of settlement. _____
(9) Disclosure of notes or bonds issued subsequent to the balance sheet date. _____
(10) Amounts of unused letters of credit. _____

c. The current portion of the long-term debt is shown as a current liability unless other than current assets will be used to satisfy the obligation. _____

d. Long-term debt is classified as current if the debtor is in violation of a debt covenant at the balance sheet date which

(1) Makes the obligation callable within one year, or _____
(2) Will make the obligation callable within one year if the violation is not cured within a specified grace period. _____

e. The debt referred to in d. above need not be reclassified if either of the following conditions are met:

(1) The creditor has waived or has subsequently lost the right to demand repayment for one year (or, if longer, the operating cycle) from the balance sheet date, or _____
(2) It is probable (likely) that the violation will be cured by the debtor within the grace period stated in the terms of the debt agreement, thus preventing the obligation from being called. _____

2. For the extinguishment of debt the following information provided either on the face of the financial statements or in the notes:

a. A description of the extinguishment transaction, including the sources of the funds used, if practicable. _____
b. The income tax effect of the transaction. _____
c. The amount and the per share amount of the aggregate gain or loss, net of tax. _____
d. For debt considered to be extinguished by an in-substance defeasance, a general description of the transaction and the amount of debt that is considered extinguished at the end of the period so long as that debt remains outstanding. _____
e. A description of the restrictions on assets set aside solely for satisfying scheduled payments on a specific debt obligation. _____

3. Troubled debt restructurings

a. Disclosures by the debtor

(1) A description of the changes in terms and/or major features of the settlement. _____
(2) The aggregate gain on restructuring and the related tax effect. _____
(3) The aggregate net gain or loss on the transfer of assets recognized during the period. _____
(4) The per share amount of the aggregate gain or loss, net of tax. _____

b. Disclosures by the creditor

(1) For the outstanding restructured receivables, the aggregate recorded investment. _____
(2) The amount of commitments to lend additional funds to debtors owing receivables whose terms have been modified by restructurings. _____

(3) The recorded investment amount for which impairment has been recognized, including the total allowance for credit losses related to those impaired loans, and recorded investments not requiring an allowance. _____

(4) The activity in the allowance for credit losses account, including the balance in the allowance for credit losses account at the beginning and end of each period, additions charged to operations, direct write-downs charged against the allowance, and recoveries of amounts previously charged off. _____

(5) The creditor's interest income recognition policy on impaired loans, including how cash receipts are recorded. _____

(6) For each period of operation, the amount of interest income related to impaired loans, the average investment impaired and if practical, the amount of interest income using a cash-basis method. _____

4. Unconditional purchase obligations are to be disclosed, if all the following criteria are met:

a. It is noncancelable, or cancelable only

(1) Upon the occurrence of some remote contingency. _____

(2) With the permission of the other party. _____

(3) If a replacement agreement is signed between the same parties. _____

(4) Upon payment of a penalty in an amount such that continuation of the agreement appears reasonably assured. _____

b. It is negotiated as part of a supplier's product financing arrangement for the facilities that will provide the contracted goods or services or for costs related to those goods or services (e.g., carrying costs for contracted goods); and _____

c. It has a remaining term in excess of one year. _____

d. If the obligation fulfills the foregoing criteria and is recorded on the balance sheet, the following disclosures are required:

(1) Aggregate amount of payments to be made. _____

(2) Aggregate amount of maturities and sinking fund requirements for all long-term borrowings. _____

e. If the obligation is not recorded on the balance sheet, then the following footnote disclosures are required:

(1) The nature and term of the obligation(s). _____

(2) The total amount of the fixed or determinable portion of the obligation(s) at the balance sheet date in the aggregate and for each of the next five years, if determinable. _____

(3) The nature of any variable components of the obligation(s). _____

(4) The amounts purchased under the obligation(s) (as in take-or-pay or through-put contracts) for each period for which an income statement is presented. _____

5. For contingently convertible debt securities, disclose the qualitative and quantitative terms that users need to understand the potential impact of conversion, including: events or changes in circumstances that would cause the contingency to be met and features necessary to understand the conversion rights, the conversion price and number of shares, events or changes that could adjust or change any features of the securities, and the manner of settlement upon conversion. _____

6. The following disclosures are to be made in annual financial statements with respect to convertible debt instruments that were outstanding during any of the periods presented and that are within the scope of FSP APB 14-1, *Accounting for Convertible Debt Instruments That May Be Settled in Cash upon Conversion (Including Partial Cash Settlement), which has not been incorporated in the codification as of late 2008)*

   a. As of each date for which a balance sheet is presented

      (1) The carrying amount of the equity component. _____
      (2) The principal amount of the liability component, its unamortized discount, and its net carrying amount. _____

   b. As of the date of the *most recent* balance sheet presented

      (1) The remaining period over which any discount on the liability component will be amortized. _____
      (2) The conversion price and the number of shares on which the aggregate consideration to be delivered on conversion is determined. _____
      (3) For public entities (as defined in the Mater Glossary), the amount by which the if-converted value of the instrument exceeds its principal amount, irrespective of whether the instrument is currently convertible. _____
      (4) Information about derivative transactions entered into in connection with the issuance of the instruments, including the terms of those derivative transactions, how those transactions relate to the instruments, the number of shares underlying the derivative transactions, and the reasons for entering into those derivatives transactions. This disclosure is required regardless of whether the related derivative transactions are accounted for as assets, liabilities, or equity instruments. _____

   c. For each period for which an income statement is presented

      (1) The effective interest rate for the period on the liability component. _____
      (2) The amount of interest cost recognized in the period relating to both the contractual interest coupon and amortization of the discount on the liability component. _____

M. Financial Instruments and Derivatives

Note that for the purposes of these disclosures, the term "financial instruments" includes derivative instruments accounted for under ASC 815.

1. The method and significant assumptions used to estimate fair value. _____
2. If not practicable to estimate fair value, disclose pertinent information such as carrying amount, effective interest rate, and maturity and the reason why it is not practicable. _____
3. Disclose all significant concentrations of credit risk arising from all financial instruments (except financial instruments of a pension plan and certain other financial instrument identified in ASC 825), whether from an individual counterparty or groups of counterparties, including

   a. Information about the (shared) activity, region, or economic characteristic that identifies the concentration. _____
   b. The maximum amount of loss due to credit risk that, based on the gross fair value of the financial instrument, the entity would incur if parties to the financial instruments that make up the concentration failed completely to perform according to the terms of the contracts and the collateral or other security, if any, for the amount due proved to be of no value to the entity. _____

c. The company's policy of requiring collateral or other security to support financial instruments subject to credit risk, information about the entity's access to that collateral or other security, and the nature and a brief description of the collateral or other security supporting those financial instruments. _____

d. The company's policy of entering into master netting arrangements to mitigate the credit risk of financial instruments, information about the arrangements for which the entity is a party, and a brief description of the terms of those arrangements, including the extent to which they would reduce the entity's maximum amount of loss due to credit risk. _____

4. Entities with derivative instruments are to disclose information that will enable users of the financial statements to understand

   a. How and why the entity uses derivatives. _____
   b. How derivatives and related hedged items are accounted for. _____
   c. How derivatives and related hedged items affect the entity's financial position, financial performance, and cash flows. _____

   Quantitative disclosures about derivative instruments may be more useful and less likely to be considered out of context or otherwise misunderstood, if similar information is disclosed about other financial instruments or nonfinancial assets and liabilities to which the derivative instruments are related by activity. In those situations, management is encouraged, but not required, to present a more complete picture of its activities by disclosing that information.

5. For derivative instruments that are not designated or qualifying as hedging instruments, if the entity's policy is to include these derivative instruments in its trading activities (such as part of a trading portfolio that includes derivative and nonderivative or cash instruments), management can elect not to separately disclose gains and losses as required by 6.d. (5) below, provided all of the following information is disclosed

   a. A description of the nature of the entity's trading activities and related risks and how the entity manages those risks. _____
   b. The gains and losses on its trading activities (including both derivative and nonderivative instruments) recognized in the income statement, separately by major types of items (e.g., fixed income/interest rates, foreign exchange, equity, commodity, and credit). _____
   c. The line items in the income statement that include gains and losses from trading activities. _____

6. Companies that hold or issue derivative instruments (or nonderivative instruments that are designated and qualify as hedging instruments) are to disclose the following information for every interim and annual reporting period for which a balance sheet and income statement are presented:

   If information about derivative instruments (or nonderivative instruments that are designated and qualify as hedging instruments) is disclosed in more than a single note, the entity is to cross-reference from the derivative note to other notes in which derivative-related information is disclosed.

   The amounts required to be reported for nonderivative instruments designated and qualifying as hedging instruments are to be the carrying value of the nonderivative hedging instrument, including the adjustment for the foreign currency transaction gain or loss on that instrument.

   a. The objectives for holding or issuing those instruments within a context needed to understand those objectives and its strategies for achieving those objectives. _____

Information regarding these instruments is to be disclosed in the context of each instrument's underlying risk exposure (e.g., interest rate, credit, foreign exchange rate, or overall price). These instruments are also to be distinguished between those used for risk management purposes and those used for other purposes.

Qualitative disclosures regarding management's objectives and strategies for using derivatives are more meaningful if described in the context of the entity's overall risk exposures related to interest rates, foreign currency exchange, commodity prices, credit risk, and equity price risk. Additional qualitative disclosures, if made, are to include a discussion of those exposures even if the entity does not manage some of those exposures by using derivatives. Management is encouraged, but not required, to provide these additional qualitative disclosures about these risks and how they are managed.

Derivatives used for risk management purposes include those designated as hedging instruments as well as those used as economic hedges for other purposes with respect to the risk exposures of the entity. The description is to distinguish between hedging instruments designated as fair value hedges, cash flow hedges, and hedges of foreign currency exposure in a net investment in a foreign operation. For derivatives not designated as hedging instruments, the description is to indicate the purpose of the derivative activity for which the derivatives are held or issued.

b. Information to enable users of the financial statements to understand the volume of the entity's derivative activity. Management is to select the format and specifics of these volume-related disclosures that are most relevant and practical for their individual facts and circumstances. _____

c. Present, in a tabular format, all of the following information regarding the location and fair value amounts of derivative instruments reported in the balance sheet _____

   (1) The fair value of derivative instruments is to be presented on a gross basis even when the instruments are subject to master netting arrangements and qualify for net presentation in the balance sheet under ASC 815-10-45. Cash collateral payables and receivables associated with derivative instruments are not to be added to or netted against the fair value amounts. _____

   (2) Fair value amounts are to be presented as separate asset and liability values segregated between derivatives designated and qualifying as hedging instruments and those that are not. Within each of these two broad categories, fair value amounts are to be presented separately by type of derivative contract (e.g., interest rate contracts, foreign exchange contracts, equity contracts, commodity contracts, credit contracts, etc.). _____

   (3) The disclosure is to identify the line item or items in the balance sheet in which the fair value amounts for these categories are included. _____

d. Present, in a tabular format, all of the following information, except item (1), regarding the location and amount of the gains and losses on derivative instruments and related hedged items reported in the income statement (or, when applicable in the balance sheet, such as in the case of gains or losses initially recognized in other comprehensive income [OCI]). Gains and losses are to be separately presented for the following items:

   This information is to be presented separately by type of derivative contract (e.g., contracts relating to interest rates, foreign exchange, equity, commodities, credit, etc.). The disclosures are to identify the line item or items in the income statement in which the gains or losses for these categories of derivative instruments are included. Information about hedged items can be presented in a tabular or nontabular format.

(1) Derivative instruments designated and qualifying as fair value hedges and the related hedged items. _____
(2) The effective portion of gains and losses on derivative instruments designated and qualifying in cash flow hedges and net investment hedges that was recognized in OCI during the current period. _____
(3) The effective portion of gains and losses on derivative instruments designated and qualifying as cash flow hedges and net investment hedges recorded in accumulated other comprehensive income (AOCI) during the term of the hedging relationship and reclassified to earnings during the current period. _____
(4) The portion of gains and losses on derivative instruments designated and qualifying in cash flow hedges and net investment hedges representing

(a) The amount of the hedges' ineffectiveness, and _____
(b) The amount, if any, excluded from the assessment of hedge effectiveness. _____

(5) Derivative instruments not designated or qualifying as hedging instruments. _____

e. The existence and nature of credit-risk-related contingent features and the circumstances that could trigger the features in derivative instruments that are in a net liability position at the end of the reporting period. _____
f. The aggregate fair value amounts of derivative instruments that contain credit-risk-related contingent features that are in a net liability position at the end of the reporting period. _____
g. The aggregate fair value of assets that are already posted as collateral at the end of the reporting period, and

(1) The aggregate fair value of additional assets that would be required to be posted as collateral, and/or _____
(2) The aggregate fair value of assets needed to settle the instrument immediately, if the credit-related contingent features were triggered at the end of the reporting period. _____

7. Disclosures for every interim and annual reporting period for which a balance sheet and income statement are presented are also to include the following:

a. For fair value hedges

(1) For derivative instruments as well as nonderivative instruments that may give rise to foreign currency transaction gains or losses under ASC 830, that have been designated and have qualified as fair value hedging instruments and for the related hedged items

(a) The net gain or loss recognized in net income during the reporting period representing _____

1] The amount of the hedges' ineffectiveness, and _____
2] The component of the derivative instrument's gain or loss, if any, excluded from the assessment of hedge effectiveness. _____

(b) The amount of net gain or loss recognized in net income when a hedged firm commitment no longer qualifies as a fair value hedge. _____

b. For cash flow hedges

(1) For derivative instruments that have been designated and have qualified as cash flow hedging instruments and for the related hedging transactions

(a) A description of the transactions or other events that will result in the reclassification into earnings of gains and losses that are reported in accumulated other comprehensive income (AOCI), and the estimated net amount of the existing gains or losses at the reporting date that is expected to be reclassified into earnings within the next 12 months. _____

(b) The maximum length of time over which the entity is hedging its exposure to the variability in future cash flows for forecasted transactions excluding those forecasted transactions related to the payment of variable interest on existing financial instruments. _____

(c) The amount of gains or losses reclassified into earnings as a result of the discontinuance of cash flow hedges because it is probable that the original forecasted transactions will not occur by the end of the originally specified time period or within the additional period of time as specified by ASC 815-30-40. _____

8. Except for those financial instruments specifically exempted under ASC 825-10-50, disclose (except for small, nonpublic entities as set forth in ASC 815)[2]

   a. The fair value of financial instruments and related carrying amount for which it is practicable to estimate that value. _____
   b. The methods and significant assumptions used to estimate fair value of financial instruments. _____

9. If not practicable to estimate the fair value of a financial instrument or classes of financial instruments, provide

   a. Information pertinent to estimating fair value of that financial instrument or class of financial instruments, such as carrying amount, effective interest rate, and maturity date. _____
   b. The methods and significant assumption used to estimate fair value of financial instruments. _____

10. For forward sales contracts, forward purchase contracts, purchased put options, and purchased call options that are indexed to, and potentially settled in, a company's own stock, disclose the gains and losses that are included in earnings. _____
11. Disclose any gains or losses on written put options that require net cash settlement or give the counterparty a choice of net cash settlement or settlement in the company's stock. _____
12. Disclose the accounting policy for the premium paid (time value) to acquire an option that is classified as held-to-maturity or available-for-sale. _____

N. Pensions and Other Postretirement Benefits

An employer that sponsors one or more defined benefit pension plans or one or more other defined benefit postretirement plans is to provide the following information, separately for pension plans and postretirement plans. Amounts related to the employer's results of operations are to be included for each period for which an income statement is presented. Amounts related to the employer's financial position are to be disclosed as of the date of each balance sheet presented.

---

[2] *The preparer should consult with FSP FAS 126-1, which expanded the definition of a public entity to include entities that are "conduit bond obligors." As a result of this expanded definition, certain reporting entities that were previously considered to be private companies are now considered public companies and, consequently, are no longer exempt from the fair value disclosures required by ASC 825-10-50. Note that FSP FAS 126-1 has not been incorporated, as of late 2008, into the codification.*

Note that the term "changes in foreign currency exchange rates" as used herein is applicable to plans of a foreign operation whose functional currency is not the reporting currency, as those terms are defined in ASC 830.

1. Defined benefit plans and other postretirement plans

   a. Schedule reconciling beginning and ending balances of the benefit obligation, (for defined benefit pension plans, the benefit obligation is the projected benefit obligation; for defined benefit postretirement plans, the benefit obligation is the accumulated postretirement benefit obligation) separately showing if applicable, the effects during the period attributable to each of the following (not required for nonpublic entities)

      (1) Service cost. _____
      (2) Interest cost. _____
      (3) Contributions by plan participants. _____
      (4) Actuarial gains and losses. _____
      (5) Changes in foreign currency exchange rates. _____
      (6) Benefits paid including prescription drug benefits. _____
      (7) Plan amendments. _____
      (8) Business combinations. _____
      (9) Divestitures. _____
      (10) Curtailments. _____
      (11) Settlements. _____
      (12) Special termination benefits. _____
      (13) Gross amount of subsidy receipts from prescription drug benefits from the benefits provided by the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (for employers sponsoring postretirement health care plans that provide prescription drug benefits). _____

   b. Schedule reconciling beginning and ending balances of the fair value of plan assets, separately showing if applicable (not required for nonpublic entities)

      (1) Actual return on plan assets. _____
      (2) Changes in foreign currency exchange rates. _____
      (3) Employer contributions. _____
      (4) Employee or retiree contributions. _____
      (5) Gross benefit payments including prescription drug benefits, if applicable. _____
      (6) Gross amount of subsidy receipts under the Medicare Prescription Drug, Improvement and Modernization Act of 2003. _____
      (7) Business combinations. _____
      (8) Divestitures. _____
      (9) Settlements. _____

   c. Information on the funded status of the plan(s), and amounts recognized in the balance sheet, separately presenting the assets and current and noncurrent liabilities recognized (not required for nonpublic entities). _____

   d. The following information regarding assets of the plan:

      (1) The percentage of the fair value of the total plan assets held as of the measurement date used for each balance sheet presented, by each major category of plan assets including, but not limited to

         (a) Equity securities. _____
         (b) Debt securities. _____
         (c) Real estate. _____
         (d) All other assets. _____

(2) A narrative description of investment policies and strategies, including target allocation percentages or ranges of percentages for each major category of plan assets presented on a weighted-average basis as of the measurement date(s) of the latest balance sheet presented, if applicable, and other factors pertinent to an understanding of the policies or strategies such as investment goals, risk management practices, permitted and prohibited investments including the use of derivatives, diversification, and the relationship between plan assets and benefit obligations. _____

(3) A narrative description of the basis used to determine the overall expected long-term rate-of-return-on-assets assumption, such as the general approach used, the extent to which the overall rate-of-return-on-assets assumption was based on historical returns, the extent to which adjustments were made to those historical returns to reflect expectations of future returns, and how those adjustments were determined. _____

(4) Disclosure of additional asset categories and additional information about specific assets within a category is encouraged if such information is expected to be useful to understand the risks associated with the each asset category and the overall expected long-term rate of return on assets. _____

e. Defined benefit pension plans: The accumulated benefit obligation. _____

f. The benefits, as of the date of the latest balance sheet presented, that are expected to be paid in each of the next five fiscal years, and in the aggregate for the five fiscal years thereafter. The estimate of expected benefits is to be based on the same assumptions used to measure the entity's benefit obligation at the end of the year and is to include benefits attributable to estimated future service by employees. The estimate is also to include in the expected benefit payments, the gross benefit payments expected for prescription drug benefits, if applicable. Separate disclosure is also to be made of the gross amount of expected subsidy receipts under the Medicare Prescription Drug, Improvement and Modernization Act of 2003. _____

g. The best estimate of the employer, as soon as reasonably determinable, of contributions expected to be paid to the plan during the next fiscal year that begins after the date of the latest balance sheet presented. Estimated contributions are permitted to be presented in the aggregate combining

(1) Contributions required by funding laws and regulations. _____
(2) Discretionary contributions. _____
(3) Noncash contributions. _____

h. Net periodic benefit cost recognized, separately showing (not required for nonpublic entities)

(1) Service cost. _____
(2) Interest cost. _____
(3) Expected return on plan assets for the period. _____
(4) Amortization of unrecognized transition asset or obligation. _____
(5) Recognized gains or losses. _____
(6) Recognized prior service costs or credits. _____
(7) Transition asset or obligation. _____
(8) Recognized settlement or curtailment gain or loss. _____

i. Separate disclosure of the net gain or loss and net prior service cost or credit recognized in other comprehensive income (OCI) for the period and reclassification adjustments of OCI for the period, as those amounts, including amortization of the net transition asset or obligation, are recognized as components of net periodic benefit cost. _____

j. The amounts in accumulated other comprehensive income (AOCI) not yet recognized as components of net periodic benefit cost, separately presenting the net gain or loss, net prior service cost or credit, and net transition asset or obligation. _____

k. The following assumptions used in the accounting for the plans, on a weighted-average basis:

   (1) Assumed discount rates. _____
   (2) For pay-related plans, rates of compensation increase. _____
   (3) In a tabular format, expected long-term rates of return on plan assets, specifying the assumptions used to determine

      (a) The benefit obligation. _____
      (b) Net benefit cost. _____

l. Assumed health care cost trend rate(s) for the next year used to measure the expected cost of benefits covered by the plan (gross eligible charges), and a general description of the direction and pattern of change in the assumed trend rates thereafter, along with the ultimate trend rate(s) and when that rate is expected to be achieved. _____

m. The effect of both a 1% increase and a 1% decrease in the assumed health care cost trend rates on each of the following: (not required for nonpublic entities)

   (1) Service and interest cost components (aggregated) of the net periodic postretirement health care benefit costs. _____
   (2) Health care accumulated postretirement benefit obligation for health care benefits (APBO) (based on the substantive plan and while holding all other assumptions constant). _____

n. Other, if applicable

   (1) Amounts and types of employer and related-party securities included in plan assets. _____
   (2) Approximate amount of future annual benefits covered by insurance contracts by the employer and related parties. _____
   (3) Any significant transactions between the employer and related parties with the plan during the period. _____

o. Alternative amortization method used to amortize prior service amounts or net gains and losses, if applicable (not required for nonpublic entities). _____

p. Existence and nature of substantive commitments, such as past practice or a history of regular benefit increases, used as the basis for accounting for the benefit obligation, if applicable (not required for nonpublic entities). _____

q. Special or contractual termination benefits recognized during the period (not required for nonpublic entities) including a description of the

   (1) Nature of the event. _____
   (2) Cost. _____

r. If not otherwise apparent, an explanation (not required for nonpublic entities) of matters of significance in regard to changes in

   (1) Benefit obligation. _____
   (2) Plan assets. _____
   (3) Unamortized prior service cost amount. _____

s. The amounts in AOCI expected to be recognized as components of net periodic benefit cost during the fiscal year following the most recent annual balance sheet presented, separately presenting

(1) Net gain or loss. _____
(2) Net prior service cost or credit. _____
(3) Net transition asset or obligation. _____

t. The amount and timing of any plan assets expected to be returned to the business entity during the 12-month period, or operating cycle if longer, that follows the most recent annual balance sheet presented.

2. Employers with two or more defined benefit plans (pension, postretirement, or both) are, in general, to separately aggregate all of the employer's defined benefit pension plans and all of the employer's defined benefit postretirement plans.

a. Disaggregate into groups if otherwise required or if it would provide useful information. _____
b. Disclosures are to be made as of the date of each balance sheet presented. _____
c. Generally, the entity is permitted to aggregate disclosures regarding pension plans with assets in excess of the ABO with disclosures regarding pension plans with ABO in excess of assets. The same aggregation is permitted for other postretirement benefit plans. If the disclosures are aggregated, however, the employer is to disclose

(1) For plans where the ABO is in excess of plan assets as of the measurement date of each balance sheet presented, disclose the

(a) Aggregate benefit obligation. _____
(b) Aggregate fair value of plan assets. _____

(2) For pension plans where the ABO is in excess of plan assets, disclose the

(a) Aggregate pension accumulated benefit obligation. _____
(b) Aggregate fair value of plan assets. _____

d. US pension and OPEB plans and plans outside the US may be combined unless benefit obligations outside the US are significant relative to the total benefit obligation and those plans use significantly different assumptions. _____

3. For postretirement health care plans that provide prescription drug benefits

a. Until management has determined whether benefits provided by the plan are actuarially equivalent, the following disclosures are to be included in interim and annual financial statements of the reporting entity/plan sponsor. _____
b. The existence of the Medicare Prescription Drug Improvement and Modernization Act of 2003 (the Act). _____
c. The exclusion from APBO or net periodic postretirement benefit cost of amounts associated with the subsidy due to the fact that management is unable to reach a conclusion as to whether the benefits provided by the plan are actuarially equivalent to Medicare Part D under the Act. _____
d. In interim and annual financial statements for the first period in which the reporting entity/plan sponsor includes the effects of the subsidy in measuring net periodic postretirement benefit cost

(1) The reduction in the APBO for the subsidy related to benefits attributed to past service. _____
(2) The effect of the subsidy on the current period net periodic postretirement benefit cost including

(a) Amortization, if any, of the actuarial experience gain in (a) as a component of the net amortization called for by ASC 715-60-35. _____
(b) The reduction of current period service cost resulting from the subsidy. _____

(c) The reduction in interest cost on the APBO resulting from the subsidy. _____

(3) Pursuant to ASC 715-20-50, if not otherwise apparent, an explanation of any significant change in the benefit obligation or plan assets. _____

4. Streamlined disclosure requirements applicable to nonpublic entities

A nonpublic entity sponsoring one or more defined benefit pension plans or one or more other defined benefit postretirement plans is to provide the following information, separately for pension plans and other postretirement benefit plans. Amounts related to the employer's results of operations are to be disclosed for each period for which an income statement is presented. Amounts related to the employer's financial position are to be disclosed at the date of each balance sheet presented.

a. Benefit obligation, fair value of plan assets, funded status of plan. _____
b. Employer contributions, participant contributions, benefits paid. _____
c. Information about plan assets

(1) For each major category of plan assets (including but not limited to equity securities, debt serurities, real estate, and all other assets), the percentage of the fair value of total plan assets held as of the measurement date used for each balance sheet presented. _____
(2) A narrative description of the plan's investment policies and strategies, including target allocation percentages or range of percentages for each major category of plan assets, presented on a weighted-average basis as of the measurement date(s) of the latest balance sheet presented, if applicable, and other factors pertinent to understanding the policies and strategies, such as investment goals, risk management practices, permitted and prohibited investments including the use of derivatives, diversification, and the relationship between plan assets and benefit obligations. _____
(3) A narrative description of the basis used to determine the overall expected long-term rate-of-return-on-assets assumption, such as the general approach used, the extent to which the assumption was based on historical returns, the extent to which adjustments were made to those historical returns to reflect expectations of future returns, and how those adjustments were determined. _____
(4) Disclosure of additional asset categories and additional information about specific assets within a category is encouraged if the information is expected to be useful in understanding the risks with respect to each asset category and the overall expected long-term rate of return on assets. _____

d. For defined benefit plans, the accumulated benefit obligation (ABO). _____
e. As of the date of the latest balance sheet presented, the benefits expected to be paid in each of the next five fiscal years, and in the aggregate for the five fiscal years thereafter. The expected benefits are to be estimated using the same assumptions used to measure the entity's end-of-year benefit obligation and are to include benefits attributable to estimated future service by employees. _____
f. The employer's best estimate, as soon as it can be determined reasonably, of contributions expected to be paid to the plan during the next fiscal year beginning after the date of the latest balance sheet presented. Estimated contributions may be presented in the aggregate, combining

(1) Contributions required by funding laws or regulations. _____
(2) Discretionary contributions. _____
(3) Noncash contributions. _____

g. The amounts recognized in the balance sheets, showing separately the postretirement benefit assets and current and noncurrent postretirement benefit liabilities. _____
h. Separate disclosure of the net gain or loss, and the net prior service cost or credit recognized in OCI for the period, and reclassification adjustments of OCI for the period as those amounts, including amortization of the net transition asset or obligation, are recognized as components of net periodic benefit cost. _____
i. The amounts in AOCI that have not yet been recognized as components of net periodic benefit cost, separately presenting the net gain/loss, net prior service cost/credit, and net transition asset/obligation. _____
j. The amount included within OCI for the period that results from a change in the additional minimum pension liability recognized. _____
k. The assumed health care cost trend rate(s) for the next year used to measure the expected cost of benefits covered by the plan (gross eligible charges), and a general description of the direction and pattern of change in the assumed trend rates thereafter, together with the ultimate trend rate(s) and when the rate is expected to be achieved. _____
l. The amounts and types of securities, if applicable, of the employer and related partied included in plan assets, the approximate amount of future annual benefits of plan participants covered by insurance contracts issued by the employer or related parties, and any significant transactions between the employer or related parties and the plan during the period. _____
m. The nature and effect of significant nonroutine events, such as amendments, combinations, divestitures, curtailments, and settlements. _____
n. The amounts in AOCI expected to be recognized as components of net periodic benefit cost over the fiscal year following the date of the most recent annual balance sheet presented, with separate presentation of the net gain/loss, net prior service cost/credit, and net transition asset/obligation. _____
o. The amount and timing of any plan assets expected to be returned to the employer during the 12-month period (or operating cycle, if longer) following the most recent annual balance sheet presented. _____

5. Defined contribution plans

a. Separately from disclosures regarding defined benefit plans, the employer is to disclose the following information for all periods presented:

(1) Cost recognized for defined contribution pension plans. _____
(2) Cost recognized for other defined contribution postretirement benefit plans. _____
(3) Description of the nature and effect of any significant changes during the period affecting comparability, such as a change in the employer contribution rate, a business combination, or a divestiture. _____

6. Multiemployer plans

a. Total amount of contributions for each annual period for which an income statement is presented, without disaggregating amounts with respect to pension plans and other postretirement benefit plans. _____
b. Description of nature and effect of any significant changes affecting comparability, such as a change in the employer's contribution rate, a business combination, or a divestiture. _____
c. Apply the accounting and disclosure provisions of ASC 450, *Contingencies,* in situations where it is either reasonably possible or probable that

(1) The employer would withdraw from the plan under circumstances resulting in an obligation to the plan for a portion of the unfunded pension plan benefit obligation, *or* _____
(2) The employer's contributions to the fund would be increased during the remainder of the contract period to make up for a shortfall in the funds needed to maintain the negotiated level of benefit coverage (referred to as a "maintenance of benefits" clause). _____

O. Leases—General Disclosures and Disclosures of Lessees

1. For capital leases, disclose

   a. The gross amount of assets recorded under capital leases presented by major classes according to function or nature. _____
   b. Future minimum lease payments in the aggregate and for each of the next five fiscal years with separate deductions made for executory costs (including any profit thereon) included in the minimum lease payments, and the amount of imputed interest needed to reduce the net minimum lease payments to present value. _____
   c. Total of minimum sublease rentals to be received in the future under noncancelable subleases. _____
   d. Total contingent rentals actually incurred for each period for which an income statement is presented. _____
   e. Depreciation on capital leases should be separately disclosed. _____

2. For sale-leaseback transactions, disclose

   a. In addition to requirements of ASC 840 and ASC 360, financials of seller-lessee shall describe terms of sale-leaseback transaction, including future commitments, obligations, provisions, or circumstances requiring or resulting in seller-lessee's involvement. _____
   b. Where seller-lessee has accounted for transaction by deposit method or as a financing

      (1) The obligation for future minimum lease payments as of the date of the latest balance sheet presented in the aggregate and for each of the five succeeding fiscal years. _____
      (2) The total of minimum sublease rentals, if any, to be received in the future under noncancelable subleases in the aggregate and for each of the five succeeding fiscal years. _____

3. For operating leases having a remaining noncancelable term in excess of one year, disclose

   a. Future minimum lease payments in the aggregate and for each of the next five fiscal years. _____
   b. Total of minimum rentals that will be received under noncancelable subleases. _____

4. For all operating leases

   a. Present rental expense disclosing separately the amount for minimum rentals, contingent rentals, and sublease rentals. _____
   b. Rental payments for leases with terms of a month or less that were not renewed may be excluded. _____

5. General description required of lessee's leasing arrangements including, but not limited to

a. Basis of computing contingent rental payments. _____
b. Existence and terms of renewal or purchase options and escalation clauses. _____
c. Restrictions imposed by leasing agreements such as on dividends, additional debt, and further leasing arrangements. _____

6. For reporting entities that engage in the purchase or sale of tax benefits under the leasing provisions of the Economic Recovery Tax Act of 1981 (tax leases), the accounting policies followed including the method of accounting for tax leases and the methods of recognizing revenue and allocating income tax benefits and asset costs to the current period and future periods. _____

P. Leases—Lessors

1. For sales-type and direct financing leases, disclose

   a. Components of the net investment in leases including the following:

      (1) Future minimum lease payments to be received with separate deductions for amount representing executory costs (including any profit thereon), and the accumulated allowance for uncollectible lease payments. _____
      (2) Unguaranteed residual values accruing to benefit of lessor. _____
      (3) For direct financing leases only, initial direct costs. _____
      (4) Unearned interest revenue. _____

   b. Future minimum lease payments to be received for each of the next five fiscal years. _____
   c. Total contingent rentals included in income for each period for which an income statement is presented. _____

2. For operating leases, disclose

   a. The cost and carrying amount (if different) of property leased or held for leasing, segregated by major classes of property according to function or nature, and the total amount of accumulated depreciation. _____
   b. Minimum rentals on noncancelable leases in the aggregate and for each of the next five fiscal years. _____
   c. Total contingent rentals included in income for each period for which an income statement is presented. _____

3. A general description of the lessor's leasing arrangements. _____
4. For an investment in leveraged leases recorded net of the nonrecourse debt, the net of the balances of following accounts shall represent the initial and continuing investment in leveraged leases:

   a. Rentals receivable, net of portion of rental applicable to principal and interest on nonrecourse debt. _____
   b. A receivable for amount of investment tax credit to be realized on transaction. _____
   c. Estimated residual value of leased asset. _____
   d. Unearned and deferred income consisting of

      (1) Estimated pretax income (or loss), after deducting initial direct costs, remaining to be allocated to income over the lease term. _____
      (2) Investment tax credit remaining to be allocated to income over lease term. _____

   e. For leverage leases, for each income statement presented, disclose

      (1) Pretax income from leveraged leases. _____
      (2) Tax effect of that pretax income. _____
      (3) Amount of investment tax credit recognized as income. _____

Q. Equity-Like Instruments Classified as Liabilities

1. Issuers of financial instruments within the scope of FAS 150 must disclose

   a. The nature and terms of the financial instruments. _____
   b. The rights and obligations embodied therein. _____
   c. Information about settlement alternatives, if any, in the contract. _____
   d. The entity that controls the settlement alternatives. _____

2. For all outstanding financial instruments and for each settlement alternative, issuers disclose

   a. The amount that would be paid, or the number and fair value of shares that would be issued, determined under the conditions specified in the contract, if the settlement were to occur at the reporting date. _____
   b. How changes in the fair value of the issuer's equity shares would affect those settlement amounts. _____
   c. The maximum amount that the issuer could be required to pay to redeem the instrument by physical settlement, if applicable. _____
   d. The maximum number of shares that could be required to be issued, if applicable. _____
   e. That a contract does not limit the amount that the issuer could be required to pay or the number of shares that the issuer could be required to issue, if applicable. _____
   f. For a forward contract or an option indexed to the issuer's equity shares, the forward price or option strike price, the number of issuer's shares to which the contract is indexed, and the settlement date or dates of the contract, as applicable. _____

3. For entities having no equity instruments outstanding but having financial instruments in the form of shares, all of which are mandatorily redeemable financial instruments required to be classified as liabilities, disclose the components of the liability that would otherwise be related to shareholders' interest and other comprehensive income (if any) subject to the redemption feature. _____

R. Stockholders' Equity

1. The following should be disclosed:

   a. The sources of capital supplied to the firm. _____
   b. The legal restrictions on the distribution of invested capital. _____
   c. The legal, contractual, managerial, and financial restrictions on the distribution of dividends to stockholders. _____
   d. The priorities of the classes of stockholders in a partial or final liquidation. _____

2. Capital stock and additional paid-in capital

   a. For each class of stock, disclose

      (1) Par, stated, or assigned value. _____
      (2) Number of shares authorized, issued, and outstanding. _____
      (3) Number of shares held in treasury. _____
      (4) Conversion terms of preferred, if applicable, including call prices, rates, and dates. Additionally, the amount of redemption requirements for all issues of stock that are redeemable at fixed or determinable prices on fixed or determinable dates must be disclosed for each of the five years following the date of the latest balance sheet presented. _____
      (5) Changes in the number of shares authorized, issued, and outstanding during the year and changes in the equity accounts. _____

(6) Liquidation values, if different than par, in the aggregate for preferred. _____
(7) For preferred classes of stock, any dividend preferences, special privileges, etc. _____
(8) Any unusual voting rights. _____

b. The amount of cumulative dividends in arrears, per share and in aggregate. _____
c. Aggregate securities issuable under rights or warrants, as well as their prices, and exercise and expiration dates. _____
d. Any discount on capital stock. _____
e. The amount of subscribed shares not yet issued. _____
f. Deferred compensation expense offset against the paid-in capital account, "Stock options outstanding." _____
g. Stock dividends distributable in total or at par or stated value with the excess included in additional paid-in capital. Also acceptable is deferment of their recording until issuance. However, disclosure is necessary in the notes. _____
h. The amount of capital stock issued in business combinations (purchase or pooling) or agreements to issue additional shares at a later date. _____
i. Transactions affecting equity subsequent to the date of the financial statements (recapitalization, sales of stock, etc.). _____
j. Additional paid-in capital, listed by source, along with any changes during the period. _____
k. Any changes in the capital accounts of partners or sole proprietors. _____

3. Retained earnings

a. Appropriation and segregation of retained earnings, as well as their nature, cause, and amount. Changes in these accounts should be disclosed. _____
b. Nature and dollar amounts of restrictions on retained earnings (treasury stock, lease covenants, etc.). _____
c. Date retained earnings for ten years following quasi reorganization. _____
d. Increase/decrease results from combination by pooling of interests (revenues, expenses, extraordinary items, and net income). _____
e. Prior period adjustments, net of tax and in gross. For correction of an error, in the period discovered, disclose

(1) Nature of the error on previous statements. _____
(2) Effect of correction on income before extraordinary items, net income, and related per share amounts. _____

4. Dividends

a. Dividends in aggregate and per share as well as the nature and extent of any restrictions on retained earnings limiting availability of dividends. _____
b. The amount of dividends in arrears, per share and in aggregate. _____
c. Dividends declared after balance sheet date, prior to opinion date, unless a long-established history of regular payment dates exists and the dividend is not abnormal in amount. _____
d. For stock dividends and stock splits, disclosure of the amounts capitalized, per share and in total. Historical presentations of earnings per share should be restated in an equivalent number of shares so the figures are presented on a comparable basis. _____

5. Treasury stock

a. If treasury stock is accounted for by the cost method, present total cost of treasury stock as a deduction from total stockholders' equity. Disclose number of shares held in treasury. _____

b. If treasury stock is accounted for by the par value method, present par value of treasury stock as a deduction from par value of issued shares of same class. Any related additional paid-in capital from treasury stock is netted with corresponding additional paid-in capital without separate disclosure. Disclose number of shares held in treasury. _____

c. If treasury stock is accounted for by the constructive retirement method, disclose number of shares held in treasury. _____

6. Share-based payment arrangements

NOTE: If the reporting entity grants equity or liability instruments under multiple share-based payment arrangements with employees, the information specified in a. through e. is to be provided separately for each different type of award to the extent that differences in the awards' characteristics make separate disclosure important to understanding the way the reporting entity uses share-based compensation.

a. Plan description, including general terms of awards such as requisite service period(s) and other substantive conditions including vesting requirements, maximum contractual term of equity (or liability) share options or similar instruments, the number of shares authorized for awards of equity share options or other equity instruments, and the method used to measure compensation cost under share-based payment arrangements with employees. _____

b. For the most recent year for which an income statement is provided _____

(1) The number and weighted-average exercise prices (or conversion ratios) for each of the groups of share options or share units

(a) Outstanding at the beginning of the year. _____
(b) Granted during the year. _____
(c) Exercised or converted during the year. _____
(d) Forfeited during the year. _____
(e) Expired during the year. _____
(f) Exercisable or convertible at the end of the year. _____
(g) Outstanding at the end of the year. _____

(2) The number and weighted-average grant-date fair value (or calculated value or intrinsic value when permitted to be used) of equity instruments not specified in (1) above (such as shares of nonvested stock) for each of the following groups of equity instruments:

(a) Nonvested at the beginning of the year. _____
(b) Granted during the year. _____
(c) Vested during the year. _____
(d) Forfeited during the year. _____
(e) Nonvested at the end of the year. _____

c. For each year for which an income statement is provided

(1) Weighted-average grant-date fair value (calculated value or intrinsic value for those reporting entities permitted to use those methods) of equity options or other equity instruments granted during the year. _____
(2) The total intrinsic value of options exercised (or share units converted), share-based liabilities paid, and the total fair value of shares vested during the year. _____

d. For fully vested share options (or share units) and share options expected to vest at the date of the latest balance sheet

(1) The number, weighted-average exercise price (or conversion ratio), the aggregate intrinsic value (except for nonpublic entities), and the weighted-average remaining contractual term of options (or share units) outstanding. _____

(2) The number, weighted-average exercise price (or conversion ratio), the aggregate intrinsic value (except for nonpublic entities), and the weighted-average remaining contractual term of options (or share units) currently exercisable (or convertible). _____

e. For awards not accounted for using the intrinsic value method, for each year for which an income statement is presented

(1) A description of the method used during the year to estimate the fair value (or calculated value) of awards under share-based payment arrangements. _____

(2) A description of the significant assumptions used during the year to estimate the fair value (or calculated value) of share-based compensation awards including, where applicable

(a) Expected term of share options and similar instruments, including a discussion of the method used to incorporate the contractual term of the instrument and the employees' expected exercise and postvesting employment termination behavior into the fair value (or calculated value) of the instrument. _____

(b) Expected volatility of the entity's shares and the method used to estimate it. _____

(c) If the entity uses a valuation method that employs different volatilities during the contractual term

1] The range of expected volatilities used. _____

2] The weighted-average expected volatility. _____

(d) If the entity is a nonpublic entity that uses the calculated value method

1] The reasons why it is not practicable for it to estimate the expected volatility of its share price. _____

2] The appropriate industry sector index it has selected and the reasons for selecting that particular index. _____

3] How it has calculated historical volatility using that index. _____

(e) Expected dividends and, if the entity uses a method employing different dividend rates during the contractual term, the range of expected dividends used and the weighted-average expected dividends. _____

(f) Risk-free rate(s) and, if the entity uses a method employing different risk-free rates, the range of risk-free rates used. _____

(g) The discount for postvesting restrictions and the method used to estimate it. _____

f. For each year for which an income statement is presented

(1) Total compensation cost for share-based payment arrangements recognized in income, the associated income tax benefit recognized, and the total compensation cost capitalized as part of the cost of an asset. _____

(2) A description of significant modifications, including the terms of the modifications, number of affected employees, and the total incremental compensation cost resulting from the modifications. _____

g. As of the latest balance sheet date presented, the total compensation cost related to nonvested awards not yet recognized and the weighted-average period over which it is expected to be recognized. _____
h. The amount of cash received from exercise of share options and similar instruments granted under share-based payment arrangements and the tax benefit realized from stock options exercised during the annual period. _____
i. The amount of cash used to settle equity instruments granted under share-based payment arrangements. _____
j. A description of the reporting entity's policy (if any) for issuing shares upon share option exercise (or share unit conversion), including the source of the shares (i.e., newly issued shares or treasury shares). If, as a result of this policy, the entity expects to repurchase shares in the following annual period, an estimate of the amount (or range, if more appropriate) of shares to be repurchased during that period. _____

7. Employee stock ownership plans (ESOP)

a. Description of the plan, including basis for determining contributions, groups covered, nature and effect of matters affecting comparability of information across periods. _____
b. The basis for releasing shares by leveraged and pension reversion ESOP. _____
c. Accounting policies pertinent to ESOP transactions. _____
d. Compensation cost recognized during the period. _____
e. Numbers of shares allocated, committed to be released, and held in suspense by the ESOP. _____
f. Fair value amount of unearned compensation at year-end. _____
g. Nature of any repurchase obligations and aggregate fair value thereof. _____

8. Contingently convertible securities

a. The significant terms of the conversion features in sufficient quantitative and qualitative detail to enable the financial statement reader to understand the nature and circumstances of the contingency and the potential impact of conversion including

(1) Events or changes in circumstances that would cause the contingency to be met. _____
(2) Features of the securities that significantly affect the conversion rights and their timing (e.g., the periods in which the contingency could potentially be met and the fact that the securities may be converted if the contingency is met). _____
(3) The conversion price and number of shares into which the security is potentially convertible. _____
(4) Events or changes in circumstance, if any, that could adjust or change the contingency, conversion price, or number of shares, including significant terms of those changes. _____
(5) The manner of settlement upon conversion and any alternative settlement methods (e.g., cash, shares, or a combination of both). _____

b. For companies required to report earnings per share (EPS): Whether the shares that would be issued upon conversion are included in diluted EPS and the reasons why or why not. _____
c. Information regarding derivative transactions entered into in connection with the issuance of the contingently convertible securities including the terms of the transactions including settlement, how the derivative transactions relate to the contingently convertible securities, and the number of shares underlying the derivatives. _____

9. The issuer of a registration payment arrangement shall disclose the following information about each registration payment arrangement or each group of similar arrangements. These disclosures are incremental to the disclosures that may be required under other applicable GAAP and are required even if the likelihood of the issuer having to make any payments under the arrangement is remote.
   a. The nature of the registration payment arrangement, including the approximate term of the arrangement, the financial instrument(s) subject to the arrangement, and the events or circumstances that would require the issuer to transfer consideration under the arrangement. _____
   b. Any settlement alternatives contained in the terms of the registration payment arrangement, including the party that controls the settlement alternatives. _____
   c. The maximum potential amount of consideration, undiscounted, that the issuer could be required to transfer under the registration payment arrangement (including the maximum number of shares that may be required to be issued). If the terms of the arrangement provide for no limitation to the maximum potential consideration (including shares) to be transferred, that fact shall be disclosed. _____
   d. The current carrying amount of the liability representing the issuer's obligations under the registration payment arrangement and the income statement classification of any gains or losses resulting from changes in the carrying amount of that liability. _____
10. For SEC only, disclose
    a. Dividend payout restrictions. _____
    b. Stock subscriptions. _____
    c. Redemption requirements on redeemable stock. _____
    d. Separate classification for redeemable preferred stock. _____

INCOME STATEMENT

A. Basic Disclosures

1. Revenues and related costs with the following categories separately stated, if applicable
   a. Product sales net of discounts, returns, and allowances. _____
   b. Rental revenues. _____
   c. Service revenues including billings for out-of-pocket costs. _____
   d. Other revenue. _____
2. Income or loss before extraordinary items. _____
3. Extraordinary items. _____
4. Income taxes. _____
5. Discontinued operations. _____
6. Depreciation. _____
7. Interest expense. _____
8. Gain or loss from extinguishment of debt. _____
9. Foreign currency realized gains and losses. _____
10. Marketable securities gains and losses. _____
11. Research and development expenses. _____
12. S Corporation election—No income tax effect. _____

B. Short-Term Investments

1. Proceeds from sales of available-for-sale securities and the gross realized gains and gross realized losses on those sales. _____
2. Basis on which cost was determined in computing realized gain or loss. _____

3. The gross gains and gross losses included in earnings from transfers of securities from the available-for-sale category into the trading category. _____
4. The change in net unrealized holding gain or loss on available-for-sale securities that has been included in other comprehensive income during the period. _____
5. The change in net unrealized holding gain or loss on trading securities that has been included in earnings during the period. _____

C. Income Taxes

1. State if entity is not subject to income taxes because income is taxed directly to owners. State the net difference between tax and book bases of assets and liabilities. _____
2. State amounts allocated to
   a. Current tax expense or benefit. _____
   b. Deferred tax expense or benefit (exclusive of the effects of other components listed below). _____
   c. Investment tax or other credits. _____
   d. Government grants (to the extent recognized as a reduction of income tax expense). _____
   e. The benefits of operating loss carryforwards. _____
   f. Tax expense that results from allocating certain tax benefits directly to contributed capital. _____
   g. Adjustments of a deferred tax liability or asset for enacted changes in tax laws or rates or a change in the tax status of the enterprise. _____
   h. Adjustments of the beginning-of-the-year balance of a valuation allowance because of a change in circumstances that causes a change in judgment about the realizability of the related deferred tax asset in future years. _____
3. Amounts allocated to
   a. Continuing operations. _____
   b. Discontinued operations. _____
   c. Extraordinary items. _____
   d. Cumulative effect of accounting changes. _____
   e. Prior period adjustments. _____
   f. Gains and losses included in comprehensive income but excluded from net income. _____
   g. Capital transactions. _____
4. Reconcile statutory tax rates to actual rates for significant items (nonpublic enterprises need only disclose the nature of significant reconciling items). _____
5. Amounts and expiration dates of operating loss and tax credit carryforwards for income tax purposes. _____
6. If consolidated return filed, separately issued financial statements should state
   a. Amount of current and deferred tax expense for each income statement. _____
   b. Tax-related balances due to or from affiliates for each balance sheet. _____
   c. The method of allocating consolidated amounts of current and deferred tax expense and effects of any change in that methodology. _____
7. Cumulative effect of change (similar to change in accounting principle) for earliest restated financial statements. _____
8. When a deferred tax liability is not recognized because of the exceptions to comprehensive recognition of deferred taxes, the following information shall be disclosed:
   a. A description of the types of temporary differences for which a deferred tax liability has not been recognized and the types of events that would cause those temporary differences to become taxable. _____

b. The cumulative amount of each type of temporary difference. _____
c. The amount of the unrecognized deferred tax liability for temporary differences related to investments in foreign subsidiaries and foreign corporate joint ventures that are essentially permanent in duration if determination of that liability is practicable or a statement that determination is not practicable. _____
d. The amount of the deferred tax liability for temporary differences other than those in c. above (i.e., undistributed domestic earnings, the bad-debt reserve for tax purposes of a US savings and loan association or other qualified thrift lender, the policyholders' surplus of a life insurance enterprise, and the statutory reserve funds of a US steamship enterprise) that is not recognized. _____

D. Extraordinary Items

1. Segregated and shown net of tax. _____
2. Adequate explanations of nature of extraordinary item(s). _____
3. Infrequent or unusual items shown separately although not extraordinary; not shown net of tax. _____
4. For adjustment of amounts reported in prior period that do not qualify as prior period adjustments, classify separately in same manner as original item, with year of origin, nature and amount. _____

E. Interim Financial Information

1. Provide, at a minimum, the captions and disclosures required when publicly traded entities report summarized interim financial information. These required disclosures are

a. Sales or gross revenues, provision for income taxes, extraordinary items, cumulative effect of a change in principle, net income, and comprehensive income. _____
b. Basic and diluted earnings per share for each period presented. _____
c. Seasonal revenues, costs, and expenses. _____
d. Significant changes in income tax estimates. _____
e. Disposal of a component of an entity and extraordinary, unusual, or infrequently occurring items. _____
f. Contingencies. _____
g. Effect of changes in accounting principles or estimates. _____
h. Significant changes in financial position. _____
i. Information regarding reportable operating segments including provisions related to restatement of segment information in previously issued financial statements.

(1) Revenues from external customers. _____
(2) Intersegment revenues. _____
(3) A measure of segment profit or loss. _____
(4) Total assets for which there has been a material change from the amount disclosed in the last annual report. _____
(5) A description of differences from the last annual report in the basis of segmentation or in the measurement of segment profit or loss. _____
(6) A reconciliation of the total of the reportable segments' measures of profit or loss to the enterprise's consolidated pretax income, extraordinary items, discontinued operations, and the cumulative effect of changes in accounting principles. _____
(7) The following information regarding defined benefit pension plans and other defined benefit postretirement benefit plans, disclosed for interim statements that include an income statement:

(a) The amount of the net periodic benefit cost recognized, for each period for which a statement of income is presented, separately showing the

1] Service cost component. _____
2] Interest cost component. _____
3] Expected return on plan assets for the period. _____
4] Gain or loss component. _____
5] Prior service cost or credit component. _____
6] Transition asset or obligation component. _____
7] Gain or loss recognized due to a settlement or curtailment. _____

(b) The total amount of the employer's contributions paid, and expected to be paid during the current fiscal year, if significantly different from amounts previously disclosed. Estimated contributions may be presented in the aggregate, combining contributions required by funding laws or regulations, discretionary contributions, and non-cash contributions. _____

(8) Information about the use of fair value to measure assets and liabilities recognized in the balance sheet as required by ASC 820. _____
(9) Information about derivative instruments required by FAS 161, *Disclosures about Derivative Instruments and Hedging Activities.* _____

2. When summarized financial information is reported on a regular quarterly basis, the above captions and disclosures included in 1a. through 1i. (7) are presented for the current quarter and the current year-to-date (or the preceding twelve months to date), along with comparable data for the preceding year. _____

F. Segment Data

1. General information on segments including

a. Factors used to identify the enterprise's reportable segments, including the basis of organization (e.g., whether management has chosen to organize the enterprise around differences in products and services, geographic areas, regulatory environments, or a combination of factors and whether operating segments have been aggregated). _____
b. Types of products and services from which each reportable segment derives its revenues. _____

2. The following about each reportable segment if the specified amounts are included in the measure of segment profit or loss reviewed by the chief operating decision maker:

a. Revenues from external customers. _____
b. Revenues from transactions with other operating segments of the same enterprise. _____
c. Interest revenue. _____
d. Interest expense. _____
e. Depreciation, depletion, and amortization expense. _____
f. Unusual items. _____
g. Equity in the net income of investees accounted for by the equity method. _____
h. Income tax expense or benefit. _____
i. Extraordinary items. _____

3. Disclose the following about each reportable segment if the specific amounts are included in the determination of segment assets reviewed by the chief operating decision maker:

a. The amount of investment in equity method investees. _____
b. Total expenditures for additions to long-lived assets other than financial instruments, long-term customer relationships of a financial institution, mortgage and other servicing rights, deferred policy acquisition costs, and deferred tax assets. _____

4. An explanation should be provided of the measurements of segment profit or loss and segment assets for each reportable segment; at a minimum, these shall include the following:

   a. The basis of accounting for any transactions between reportable segments. _____
   b. The nature of any differences between the measurements of the reportable segments' profits or losses and the company's consolidated income before income taxes, extraordinary items, discontinued operations, and the cumulative effect of changes in accounting principles (if not apparent from the reconciliations); for example, accounting policies and policies for allocation of centrally incurred costs that are necessary for an understanding of the reported segment information. _____
   c. The nature of any differences between the measurements of the reportable segments' assets and the company's consolidated assets (if not apparent from the reconciliations); for example, accounting policies and policies for allocation of jointly used assets that are necessary for an understanding of the reported segment information. _____
   d. The nature of any changes from prior periods in the measurement methods used to determine reported segment profit or loss and the effect, if any, of those changes on the measure of segment profit or loss. _____
   e. The nature and effect of any asymmetrical allocations to segments; for example, an enterprise might allocate depreciation expense to a segment without allocating the related depreciable assets to that segment. _____

5. Reconciliations of the totals of segment revenues, reported profit or loss, assets, and other significant items to corresponding company amounts, as follows:

   a. The total of the reportable segments' revenues to the enterprise's consolidated revenues. _____
   b. The total of the reportable segments' measures of profit or loss to the company's consolidated income before income taxes, extraordinary items, discontinued operations, and the cumulative effect of changes in accounting principles. _____
   c. The total of the reportable segments' assets to the company's consolidated assets. _____
   d. The total of the reportable segments' amounts for every other significant item of information disclosed to the corresponding consolidated amount. _____

6. Company-wide disclosures (required for all companies subject to ASC 280 including those companies that have a single reportable segment)

   a. Revenues from external customers for each product and service or each group of similar products and services unless it is impracticable to do so. (The amounts of revenues reported shall be based on the financial information used to produce the enterprise's general-purpose financial statements. If providing the information is impracticable, that fact shall be disclosed.) _____
   b. Revenues from external customers

      (1) Attributed to the enterprise's country of domicile. _____

(2) Attributed to all foreign countries in total from which the enterprise derives revenues unless it is impracticable to do so. (If revenues from external customers attributed to an individual foreign country are material, those revenues shall be disclosed separately. Also disclose the basis for attributing revenues from external customers to individual countries.) _____

c. Long-lived assets other than financial instruments, long-term customer relationships of a financial institution, mortgage and other servicing rights, deferred policy acquisition costs, and deferred tax assets

(1) Located in the enterprise's country of domicile. _____

(2) Located in all foreign countries in total in which the enterprise holds assets unless it is impractical to do so. (If assets in an individual foreign country are material, those assets shall be disclosed separately.) _____

d. If providing the geographic information is impracticable, that fact shall be disclosed. _____

7. Major customers

If revenues from transaction with a single external customer amount to ten percent or more of an enterprise's revenues, disclose that fact, the total amount of revenues from each such customer, and the identity of the segment or segments reporting the revenues. _____

8. Earnings before income tax disclosures

Depreciation and amortization expense for each reportable segment, when the chief operating decision maker evaluates the performance of its segments based on earnings before interest, taxes, depreciation, and amortization. _____

G. Development Stage Enterprises

1. The financial statements should be identified as those of a development stage company and should include a description of the nature of the development stage activities. _____
2. The financial statements for the first fiscal year in which the company is no longer considered to be in the development stage should disclose that in prior years it had been in the development stage. If financial statements for prior years are presented for comparative purposes, the cumulative amounts and other additional disclosures required below need not be shown. _____
3. On the balance sheet, any cumulative net losses should be reported with a descriptive caption such as "deficit accumulated during the development stage" in the stockholders' equity section. _____
4. Report the cumulative amounts of revenue and expenses since inception. _____
5. Report the cumulative amounts of sources and uses of cash since inception. _____
6. Present in the statement of stockholders' equity all transactions since inception. _____
7. Disclose the date of each stock issuance in the statement of changes in stockholders' equity. _____
8. Disclose the basis for stock issued for other than cash. _____

H. Long-Term Construction Contracts

1. The method of recognizing income (percentage-of-completion or completed-contract). _____
2. If the percentage-of-completion method is used, the method of computing percentage of completion (e.g., cost-to-cost, efforts-expended). _____
3. If the completed-contract method is used, the justification for its use should be indicated. _____
4. Length of the operating cycle; if greater than one year, the range of contract durations should be disclosed. _____

5. The basis of recording inventory. _____
6. The effect of changes in estimates. _____
7. The accounting for deferred costs. _____
8. The accounting for general and administrative expenses. _____
9. Criteria for determining substantial completion (e.g., compliance with specifications, acceptance by customer). _____
10. Information on revenues and costs arising from claims. _____

I. Research and Development

1. Expenditures. _____
2. R&D arrangements.
   a. Terms including royalties, purchase provisions, license agreements and funding. _____
   b. Amounts earned and costs incurred each period for which an income statement is presented. _____

J. Sales Where Collection Is Uncertain

1. Method and justification of accounting for installment basis sales. _____
2. Yearly gross profit rates. _____
3. Contractual terms such as interest and repossession provisions. _____
4. Average length of installment contracts. _____

K. Revenue Recognition

1. Basis for recognizing revenue and cost of sales for each material type of transaction. _____
2. If the company is a party to multiple-deliverable arrangements (MDA)
   a. The nature of the company's MDA. _____
   b. The company's accounting policies regarding recognition of revenue on MDA including provisions relative to performance, cancellation, termination, or refund. _____
   c. Whether deliverables are separable into units of accounting. _____
   d. The method of accounting for each element. _____
   e. The method used to determine each element and value it. _____
3. When a right of return exits
   a. Description of return privilege granted to customers. _____
   b. Length of time covered by the return privilege. _____
   c. Estimated amount of returns. _____
   d. Material changes in estimates of returns. _____

L. Other Reporting

1. Financing arrangements—Real estate and product financing. _____
2. Real estate sales. _____
3. Futures contracts. _____
4. Service sales transaction
   a. The revenue recognition method used and its justification. _____
   b. Information concerning unearned revenues. _____
   c. Information concerning deferred costs. _____
   d. Periods over which services are to be performed. _____
5. Time-sharing transactions
   a. The seller's policies regarding meeting the criteria for buyer's commitment and collectibility of sales price (ASC 360-20-40). _____

b. Maturities of notes receivable for each of the five years following the financial statement date, and in the aggregate for all years thereafter, with the total in agreement with notes receivable presented on the face of the balance sheet. _____
c. The weighted-average and range of stated interest rates on notes receivable. _____
d. The estimated cost to complete improvements and promised amenities. _____
e. The activity in the allowance for uncollectible accounts including

(1) Beginning allowance. _____
(2) Additions associated with current period sales. _____
(3) Amounts written off against the allowance. _____
(4) Changes in estimate associated with prior period sales. _____
(5) Ending allowance. _____

f. If the developer sells receivables with recourse, the seller is to provide the same disclosures regarding activity related to receivables sold. _____

M. Foreign Currency

1. Aggregate transaction gain or loss that is included in the entity's net income. _____
2. Analysis of changes in accumulated translation adjustments which are reported as other comprehensive income. At a minimum, the disclosures should include

a. Beginning and ending amounts of the translation adjustments account. _____
b. Aggregate adjustment for the period resulting from translation adjustments, and gains and losses from certain hedges and intercompany balances. _____
c. Amount of income taxes for the period allocated to translation adjustments. _____
d. Amounts transferred from the translation adjustments account and included in determining net income as a result of the (partial) sale or liquidation of the foreign operation. _____

3. Significant rate changes subsequent to the date of the financial statements including effects on unsettled foreign currency transactions. Rate changes subsequent to the balance sheet date are not incorporated into the financial statements for the period just ended. _____

N. Exit and Disposal Activities, and Discontinued Operations

1. For assets (or disposal groups) either sold or reclassified from held-and-used to held-for-sale during the period

a. The facts and circumstances leading to the expected disposal. _____
b. The expected manner and timing of the disposal. _____
c. If not separately presented on the face of the balance sheet, the carrying amounts of the major classes of assets and liabilities included as part of the disposal group. _____
d. Gain or loss recognized for initial or subsequent write-downs to fair value less cost to sell, and, if not separately stated, the income statement caption in which included. _____
e. Amounts of revenue and pretax profit or loss reported as discontinued operations, if applicable. _____
f. In the period of disposal, the actual gain or loss on disposal (either on the face of the income statement or in the notes to the financial statements). _____
g. For public companies, the segment in which the long-lived asset or disposal group is reported. _____

2. For assets (or groups) reclassified from held-for-sale to held-and-used during the period, including the removal of individual assets or liabilities from a disposal group to be sold

a. The facts and circumstances leading to the decision to change the plan to sell the long-lived asset (disposal group). _____
b. The effect of the changed decision on the results of operations for the period in which the decision was made and any prior periods presented. _____

3. If assets held-and-used meet the criteria for reclassification to held-for-sale after the date of the balance sheet but before issuance of the financial statements

   a. The facts and circumstances leading to the expected disposal. _____
   b. The expected manner and timing of the disposal. _____
   c. The carrying amount of the major assets and liabilities included as part of the disposal group. _____

4. In the period in which an exit or disposal activity is initiated and any subsequent period until the activity is completed, a description of the exit or disposal activity, including the facts and circumstances leading to the expected activity and the expected completion date. _____
5. For each major type of cost associated with the exit or disposal activity (for example, onetime termination benefits, contract termination costs, and other associated costs), disclose

   a. The total amount expected to be incurred in connection with the activity. _____
   b. The amount incurred in the period. _____
   c. The cumulative amount incurred to date. _____
   d. A reconciliation of the beginning and ending liability balances showing separately the changes during the period attributable to costs incurred and charged to expense, costs paid or otherwise settled, and any adjustments to the liability with an explanation of the reason(s) therefor. _____
   e. The line item(s) in the income statement or statement of activities in which the costs are aggregated. _____

6. For each reportable segment of a public company, the total amount of costs expected to be incurred in connection with the activity, the amount incurred in the period, and the cumulative amount incurred to date, net of any adjustments to the liability with an explanation of the reason(s) therefor. _____
7. If a liability for a cost associated with the exit or disposal activity is not recognized because its fair value cannot be reasonably estimated, disclose that fact and the reasons why the fair value cannot be reasonably estimated. _____
8. Discontinued operations

   a. For each discontinued operation that generates continuing cash flows

      (1) The nature of the activities from which the cash flows originate. _____
      (2) The period of time that the cash flows are expected to continue. _____
      (3) The principal factors that led to the conclusion that the expected continuing cash flows are not direct cash flows of the disposed component. _____

   b. For all periods presented, amounts of intercompany revenues and expenses that previously eliminated in consolidation for each discontinued operation which

      (1) The ongoing entity will engage in a continuation of activities with the disposed component after its disposal. _____
      (2) After the disposal transaction, amounts are presented in income from continuing operations that represent a continuation of revenues and expenses that were intercompany transactions prior to the disposal transaction. _____

   c. In a period in which operations are first classified as discontinued, the types of postdisposal continuing involvement that the entity is expected to have. _____

d. If amounts previously reported in discontinued operations directly related to the disposal of a component of an entity in a prior period are subsequently adjusted, those amounts are to be classified separately in the current period discontinued operations with disclosure in the notes to the financial statements of the nature and amount of the adjustments. _____

O. Earnings Per Share

1. For each income statement presented

   a. Reconciliation of the numerators and the denominators of the basic and diluted per share computations for income from continuing operations. _____
   b. Effect that has been given to preferred dividends in arriving at income available to common stockholders in computing basic EPS. _____
   c. Securities (including those issuable pursuant to contingent stock agreements) that could potentially dilute basic EPS in the future that were not included in the computation of diluted EPS because to do so would have been antidilutive for the period(s) presented. _____

2. Earnings per share amounts for income from continuing operations and net income, shown on the face of income statement for all periods presented. _____
3. If applicable, per share amounts for discontinued operations, extraordinary items, and cumulative effect of an accounting change, presented either on face of income statement or in notes to financial statements. _____
4. For latest income statement, provide a description of any transaction that occurs after end of the period but before issuance of financial statements that would have changed materially the number of common shares or potential common shares outstanding at end of period if transaction had occurred before end of period. _____
5. Amounts should be restated when stock dividends, splits, or reverses occur after close of period but before statements are issued with appropriate disclosure. _____
6. When operations of a prior period have been restated, earnings per share data also should be restated; the effect of the restatement, expressed in per share terms, should be disclosed in year of restatement. _____
7. Disclose EPS for income from continuing operations when there are discontinued operations of a segment of a business. _____

STATEMENT OF CASH FLOWS

A. Basis

1. Definition of cash and cash equivalents adopted. _____
2. Summarize noncash investing and financing activities. _____

B. Format

1. Reconcile net income to net cash flow. _____
2. If direct method used, display major categories of gross cash receipts and cash payments

   a. Cash receipts

      (1) Cash receipts from sale of goods or services. _____
      (2) Interest and dividends received. _____
      (3) Other operating cash receipts. _____

   b. Cash payments

      (1) Payments to employees and other suppliers of goods or services. _____
      (2) Income taxes paid. _____

(3) Interest paid. _____
(4) Other operating cash payments. _____

c. Reconcile net income or loss to net cash flow from operating activities. _____

3. If indirect method used

a. Present reconciliation of net income or loss to cash flow from operating activities, separately reporting all major items, either within the statement or in a separate schedule. _____
b. Disclose both interest and income taxes paid in a schedule following the statement or in the notes. _____

4. Report cash flows from purchases and sales or maturities of trading securities under operating activities. _____
5. Report cash flows from investing activities

a. Report separately cash inflows and outflows. _____
b. Report gross for each security classification in the statement of cash flows, the cash flows from purchases, sales and maturities of available-for-sale securities, and separately for held-to-maturity securities. _____

6. Report cash flows from financing activities

a. Report separately cash inflows and outflows. _____
b. Effect of exchange rate changes on cash balances held in foreign currencies shown separately on statement of cash flows. _____
c. Cash payments for debt issue costs. _____

STATEMENT OF COMPREHENSIVE INCOME

A. Format Options

1. Continuation of income statement (preferred by FASB). _____
2. Separate statement starting with net income. _____
3. Part of statement of stockholders' equity. _____

B. Disclosures

1. Total amount for comprehensive income. _____
2. Amounts of other comprehensive income by type. _____
3. Reclassification adjustment(s) for items included in net income also included in other comprehensive income in this period or prior period

a. Face of financial statement in which comprehensive income reported. _____
b. Notes to financial statements. _____
c. Gross display on face of financial statement or net display on face of financial statement and gross display in notes to financial statements except for minimum pension liability which does not have reclassification adjustments. _____

4. Cumulative amounts of other comprehensive income by type

a. Face of balance sheet. _____
b. Statement of changes in stockholders' equity. _____
c. Notes to financial statements. _____

APPENDIX B

INTERNATIONAL VS. US ACCOUNTING STANDARDS

The International Accounting Standards Committee was founded in 1973 by representatives of professional bodies in Australia, Canada, France, Germany, Japan, Mexico, the Netherlands, the United Kingdom, Ireland, and the United States, and grew to include representatives from ninety-one countries. From 1973—by coincidence, the birth year of the current US accounting standard setter, the FASB—until December 2000, the IASC's members had included all the professional accountancy bodies that are members of the International Federation of Accountants (IFAC). As of mid-2008, these comprised 157 member bodies in 123 countries, representing over two and one-half million professional accountants.

From its formation, the IASC endeavored to create a set of financial reporting standards that would receive truly worldwide recognition. It now appears to be on the verge of achieving that long-held goal, perhaps as early as 2011. Prior to IASC's transition into the IASB (discussed below), it had issued forty-one international accounting standards (IAS), of which, after a series of revisions, thirty remain in effect. Thirty-three Interpretations of these standards had also been issued by the former Standing Interpretations Committee (SIC) as of that transition date, of which eleven remain in force.

From its inception and for many years thereafter, IASC labored in relative obscurity, its pronouncements being viewed as of importance mainly to less developed nations lacking their own standard-setting capabilities. The organization itself was seen as something of a "debating society" which over time had the potential to reduce, but not fully eliminate, differences among the major financial reporting standards regimes established by national bodies. The best hope at the time was said to be that through its efforts there would come about a *harmonization* among the standards. A major impediment was (and remains) a lack of enforcement authority; unlike national bodies, which have the support of national auditing standard setters and securities regulatory bodies, which attempt to impose discipline on the preparer and auditor communities, the IASB has no such capabilities.

The IASC achieved a higher profile in the mid-1990s, when it undertook several major standards improvement programs, resulting in substantially reducing available alternative methods of recording identical economic transactions or events. The first of these, the *Comparability/Improvements Project*, culminated with the promulgation of ten revised standards that took effect in 1995. More importantly, IASC embarked on its *Comprehensive Core Set of Standards* program that year, motivated by a historic agreement with the International Organization of Securities Commissions (IOSCO), which committed IASC to revisions of the standards that IOSCO deemed essential for its consideration of possible endorsement of the IAS for purposes of cross-border securities registrations. IASC completed these changes and promulgation of the required new standards occurred at year-end 1998, with about eleven standards being revised or newly issued, setting forth important new rules dealing with financial instruments and hedging activities, which remain controversial today.

The completion of the core set of standards was a major achievement. IASC had hoped that, having essentially performed its part of the bargain, IOSCO would likewise deliver on its explicit and implied commitments—namely, full and unqualified support for cross-border registrations including financial statements compliant with IAS standards. The endorsement that came after several years' delay, however, was tentative and tepid. To an extent, this was a consequence of the rivalry between the IASC and the FASB, which opposed granting endorsement to what it claimed was an inferior set of standards that was the product of an inadequate standard-setting process. Many believe that FASB at the time harbored its own hopes of becoming the de facto worldwide standard setter.

The US SEC, arguably the most important member of IOSCO, permitted it to ratify the core set of standards, provided that "supplemental treatments," which could be imposed by national securities regulators, were defined. (IOSCO cannot mandate acceptability of IFRS-based financial reporting, but rather can only recommend this to the sovereign regulators, which are charged with protecting investors in their respective jurisdictions.) The supplemental treatments suggested included reconciliations, added disclosures, and interpretations. Scores of such reconciling items, expanded disclosures, and interpretive matters were identified, although it was not expected that any jurisdiction would mandate all or even most of these. It is clear now that little or nothing came of these recommendations, which became irrelevant as further developments unfolded.

IASB, the successor to the IASC, reached formal agreements with FASB in 2002 and 2006, committing both to a program of convergence of their respective sets of financial reporting standards. This late-2002 memorandum of understanding (the "Norwalk Agreement") had the two bodies pledging their best efforts to (1) make their existing financial reporting standards fully compatible as soon as is practicable, and (2) coordinate their future work programs to ensure that once achieved, compatibility is maintained. The 2006 *Memorandum of Understanding* restated this commitment and introduced a *roadmap* for the achievement of convergence. The SEC promised to consider accepting filings by foreign registrants reporting in accordance with IFRS, without the heretofore required reconciliation of key measure to US GAAP.

Meanwhile, largely as a consequence of widely reported financial reporting frauds and audit failures of the late 1990s and early 2000s, there arose a spirited debate over whether US GAAP-style rules-based accounting standards (i.e., with copious, detailed guidance on how implementation is to be effected) or IASB-style principles-based standards (setting forth only general guidance, leaving interpretation to the judgment of preparers and auditors) would be more effective in restraining financial reporting fraud. This debate was based on what seems to have been the misguided perception (largely promoted by IASB advocates) that the two sets of standards really are located at diametrically opposed positions on a continuum, which they are not. In fact, all valid standards are based on conceptual foundations and all standards, including IFRS, include some implementation guidance.

The debate about principles-based versus rules-based accounting standards seems destined to fade away without any resolution. The SEC, directed by Sarbanes-Oxley to study this matter, concluded that both rules and principles are necessary, and essentially endorsed a comprehensive compromise position, which it dubbed *objectives-based* standards. Standards promulgated under US GAAP since this debate arose show no signs of being any less prescriptive, but a number of former differences between US GAAP and IFRS have now been eliminated, with FASB now committed to completion of the convergence effort by 2011.

While a modest number of nominal differences between the IFRS and US GAAP currently persist, but any proposed listing of truly substantive discrepancies is much shorter. FASB published (first in 1996, then in revised form in 1999) a study setting forth over 250 of these apparent differences, motivated partly by its desire to forestall SEC acceptance, without reconciliation, of financial statements of foreign filers prepared in conformity with IFRS. A closer look, however, reveals that

1. The number of meaningful differences was then and remains much lower, and
2. In many instances where substantive differences do exist (e.g., permitting revaluations of long-lived assets to current value amount), the related disclosure requirements are extensive enough to minimize the risk that users could be misled.

In fact, with regard to some of the cited differences, it is arguable (e.g., in the case of accounting for certain financial instruments under IAS 39 vs. under ASC 815) that the IFRS approach is in fact superior to that under corresponding US standards.

As of mid-2008, the "convergence" of the major sets of financial reporting standards is an ongoing process, but the odds of US GAAP's supersession by IFRS within a very few years have increased substantially since mid-2007, making convergence less of an issue than it was only recently.

Following the Norwalk Agreement, the two boards began a "short-term convergence" project to remove as many impediments to convergence as possible, although new ones have managed to arise: witness IASB's amendment of IAS 2 to ban LIFO accounting for inventories, which FASB would be loathe to do unless the IRS' conformity rule were to be dropped, since a significant fraction of corporate taxpayers enjoy tax deferrals under LIFO. The organizations concurrently made a commitment to undertake longer-term projects for any remaining incompatibilities, among which were: accounting for disposal of noncurrent assets and presentation of discontinued operations; costs associated with exit or disposal activities; accounting for government grants; inclusion of costs of idle capacity and spoilage in inventory costs; presentation of accounting policy and estimate changes and corrections of errors; depreciation on assets held for disposal or otherwise idled; interperiod tax allocation methodology; accounting for long-term construction contracts; reporting under hyperinflationary conditions; and joint venture accounting (use of the proportionate consolidation method).

As to FASB's efforts to date, a number of convergence activities have been undertaken, mostly addressing rather detailed technical issues that have separated US GAAP from IFRS. At least one

change to US GAAP—requiring fair value accounting for nonmonetary exchanges of productive assets now recorded as book value swaps—was a clear admission of the superiority of the IASB's position on the issue, and the more recent adoption by FASB of IASB's "fair value option" is similarly an acknowledgement of the logic of IFRS's more comprehensive embrace of fair value accounting. On some matters, FASB has decided to maintain divergent positions, based on its perception that its current rules are superior to those adopted by IASB. On the whole, however, convergence appears to have been a process to which both boards were sincerely committed, and over a very short time many former differences have been eliminated, so that, as of mid-2008, while there are still two distinct sets of standards, they are rapidly losing the former sharp distinctions that separated them from each other. Still, some major hurdles (e.g., optional use of revalued amounts under IFRS for plant assets, prohibited under US GAAP) will have to be overcome for full convergence to ultimately transpire.

In 2006, FASB promulgated a comprehensive standard setting forth a hierarchy of fair value measurement strategies, and IASB has since proposed a very similar new standard. FASB and IASB are working together on major new pronouncements, including a conceptual framework and standards on consolidated financial statements and revenue recognition. These could well result in major changes to existing requirements under both FASB and IASB standards, effectively converging to new and different standards than either body has yet produced.

IASB has directed its staff to develop proposals that would serve to eliminate differences from FASB standards in the areas of impairment of property, plant, and equipment; intangible assets; liabilities and equity; purchase method accounting, consolidation of special-purpose entities; and accounting for income taxes (deferred taxes). Many of the IFRS standards published after 2003 (IFRS 2 through 8) have also, in effect, reflected convergence efforts, most recently with IFRS 8's adoption of US GAAP approach to segment disclosures.

The FASB has now completed a number of convergence projects and has, as of mid-2008, only a very few projects it has not completed. Major projects completed in 2008 relate to applications of the purchase accounting method, and accounting for noncontrolling (formerly, minority) interests. Still on the agenda are projects to address revenue recognition, distinguishing liabilities from equity, and several matters pertaining to financial instruments.

Developments favorable to wider use of IFRS. Several significant events have occurred over the past decade or so, the effect of which has been to improve the standing of IFRS and to raise the probability that full acceptance of IFRS-based financial reporting by international capital markets will ultimately be achieved. First, the European Commission's (EC) Single Market Commissioner announced in 1995 that the European Union had abandoned its previously expressed goal of developing unique European standards of accounting. This gave a clear boost to the IASB's efforts, by removing the specter of yet another layer of national and supranational accounting standards.

In 2000, the EU published *EU Financial Reporting Strategy: The Way Forward*, which stated that companies within the EU seeking listings on EU stock market would no longer have the free choice of preparing their consolidated financial statements in accordance with either their own national accounting standards or US GAAP. Beginning in 2005, these entities have been required to employ only IFRS, and the transition to IFRS-based reporting by some 7,000 companies received a great deal of attention and brought unprecedented interest in these standards. The proclamation of support for the IASB standards by the EU was regarded as a major breakthrough for the IASB. While it was necessary to make certain minor changes to the financial instruments standards to gain European acceptance, and the EU imposed two controversial "carve-outs," dealing with financial instruments, implementation has now been accomplished by all affected entities.

More recently, the US SEC in 2007 adopted a rule that permits foreign private issuers (i.e., non-US companies which have registered securities in the US), which formerly were permitted to use foreign GAAP or IFRS but were required to reconcile net income and stockholders' equity to parallel amounts under US GAAP, to no longer do so, provided that the financial statements conform to "full" IFRS (i.e., as promulgated by IASB). This is expected to facilitate cross-listing of shares, encourage wider adoption of IFRS (since filers using other national GAAP will not receive this exemption), and add to pressure for full convergence between US GAAP and IFRS. In response to this action by SEC, domestic private issuers asked the SEC for permission to elect to report under IFRS, instead of US GAAP. As of mid-2008, this is deemed quite likely to be accepted by the SEC, which will provide a substantial boost to the status of IFRS and add to the already significant pressure to adopt IFRS for at least public company reporting in the US.

Some of the most highly technical standards under IFRS (and, generally too, under US GAAP), are those addressing financial instruments, impairment of assets, business combinations, segment reporting, income taxes, earnings per share, and interim financial reporting. Convergence of certain of these may prove to be difficult because of the underlying subject matter and legitimately diverse philosophical beliefs (e.g., interim reporting can be viewed as integral to the full fiscal year of which they are a constituent part, or alternatively as stand-alone periods to be reported upon).

Other standards under IFRS (and, to an extent, under US GAAP) suffer from weak writing in the standards themselves. For example, the standards dealing with related-party disclosures, provisions and contingencies, and investments in associates all suffer from this flaw. The related-party disclosure standard (IAS 24, for which minor simplifications were proposed in 2007, which remain pending as of mid-2008) contains an essentially circular definition of "close members of the family," defined as: "those that may be expected to influence, or be influenced by, that person in their dealings with the enterprise." The standard on provisions, contingent liabilities, and contingent assets (IAS 37, for which substantial revisions were proposed in 2005, which remain outstanding) uses terms such as "probable outflow of resources" and "prejudicial to interest," which resist mechanical definition. The standard on accounting for investments in associates (IAS 28) prescribes the use of the "equity method" when there is "significant influence," which is evidenced by, for example, "participation in policy making processes" and "material transactions between the investor and investee."

Finally, under IFRS (but much less so under US GAAP) some standards offer radically different alternative methods of accounting that remain equally acceptable for financial reporting purposes. The standard on property, plant, and equipment allows either the use of historical cost or of "revaluation"—and there is substantial diversity in terms of frequency of updating values among enterprises which elect the revaluation option. (US GAAP prohibits revaluation.) Cash flow statements can use either the direct or indirect methods of presenting operating cash flows (the same choice is offered under US GAAP), and also gives the choice, regarding the presentation of interest and dividend income, of including this in operating or investing cash flows (no choice given in the US). Finally, investment property may be accounted for under the fair value or the cost model (again, no choice offered under US GAAP).

Thus, in reporting under IFRS, the concern must be not merely for the existing (but rapidly diminishing) differences between US GAAP and IFRS, per se, but also about the *methods elected* by the parent entity to report under IFRS. Of lesser concern, but still important, under IFRS there are often *optional* disclosure recommendations, in addition to the mandatory ones (under US GAAP, all disclosure requirements should be deemed mandatory). Finally, both US GAAP and IFRS are dynamic sets of standards, subject to refinement, revision, and supersession. Neither offers a fixed reference point over more than a short time horizon.

Wiley IFRS 2009 discusses all existing IFRS requirements in great detail, but given the great and growing interest in these matters, the following table sets forth a comparison between US GAAP and IFRS as it exists in mid-2008. The comparisons have been organized consistent with the chapters in this book.

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
1	Researching GAAP Matters (General guidance)	No comprehensive guide to statement presentation is offered; however, basic financial statements are the same under both sets of standards	Comprehensive guidance on presentation of financial statements provided; minimum line items identified for all financial statements
		FASB's *Conceptual Framework* is similar to IASB's *Framework for the Preparation and Presentation of Financial Statements*; convergence with IFRS is likely to occur as result of joint project to replace both sets of conceptual standards	FASB's *Conceptual Framework* is similar to IASB's *Framework for the Preparation and Presentation of Financial Statements*; latter is less detailed; convergence with US GAAP expected to occur
		Comparative financials urged, not mandatory (but required for SEC filings); greater specificity as to location of disclosures in body of statements or in notes	Comparative financials are required, including footnote data; disclosure can often be optionally in financials or in notes
		Formal GAAP hierarchy now defined by accounting standards, with changes forthcoming to simplify hierarchy and move to GAAP	No hierarchy established beyond IFRS
		Justification for GAAP departure previously was found in the auditing literature but was very rarely invoked; this has been eliminated under new GAAP hierarchy, FAS 162	"True and fair" override of IFRS permitted
		No special rules for small or medium-sized entities or nonpublicly held reporting entities, although this has been debated for many years	IFRS for SMEs proposal (actually for nonpublicly accountable entities) likely to be enacted by year-end 2008 with publication of self-contained set of simplified rules
2	Balance Sheet	Limited guidance on offsetting of assets and liabilities; classified balance sheet not required, but definition of current/noncurrent differs from IFRS somewhat	Specific guidance on offsetting of assets and liabilities; classified balance sheet required unless liquidity ordering is more meaningful, some difference from GAAP definitions of current/noncurrent
		Some differences from IFRS re: exclusion of long-term debt being refinanced, etc.	Some differences re: exclusion of long-term debt from current liabilities, etc.
		No offsetting of assets and liabilities with different counterparties; offsetting with same counterparties only permitted if intention is to settle "net" and right to offset is enforceable under law	Some offsetting of assets and liabilities with different counterparties permitted when legal provision exists
		Adjustment made for post-balance-sheet date events only if they bear upon existence or valuation at the balance sheet date; other material information relegated to disclosures	Conforms to US GAAP requirements
		GAAP does not specify the accounts to be presented in the balance sheet	Minimum balance sheet classifications are prescribed under IFRS

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
2	Balance Sheet	Joint project with IASB to require presentation of both beginning and ending balance sheets	Joint project on financial statement presentation with FASB ongoing
3	Statements of Income and Comprehensive Income	No required income statement captions, and either single-step or multiple-step format can be used	Minimum captions in income statement are prescribed under IFRS
		Little specific guidance as to form, but expenses are to be classed by function (e.g., cost of sales, administrative, etc.)	Expenses can be classed by function (e.g., selling) or by nature (e.g., salaries, cost of goods sold, etc.)
		Under FAS 141(R), noncontrolling interest's share in net income is displayed as a split-out of earnings "below the line" rather than as a deduction in arriving at net income	Same as current US GAAP
		Extraordinary items classification permitted under limited circumstances, with net-of-tax presentation, and unusual items can also be segregated within operating income (but not tax effected); will be revised to mirror IFRS	Extraordinary classification is no longer permitted, but unusual items can be segregated for display purposes, on a pretax basis
		Estimated operating results of a discontinuing operation are included in the measurement for the expected gain or loss on disposal; timing of segregation of discontinuing operations from continuing operations may differ from that under IFRS; direct continuing cash flows or involvement in operations preclude discontinuing operations display	Actual operating results of a discontinuing operation are reported as incurred; timing of recognition of gain or loss in discontinuance and income or loss from activities of the discontinuing operation may differ from US GAAP
		Broader definition of discontinued operations than under IFRS, either a reportable business or geographical segment, or reporting unit, subsidy, or asset group	Narrow definition of discontinued operations as being reportable business or geographical segment or major component
		Total comprehensive income and accumulated other comprehensive income can be reported in various ways; total comprehensive income can be presented in a statement combined with income statement, in separate statement, and in statement of changes in stockholders' equity	Total recognized income and expense can be presented in a statement of changes in equity, which would also include items that are recognized directly in equity; or, alternatively, a statement of recognized income and expense can be used, with other changes in equity relegated to disclosures in the notes (only)
		Restructuring costs recognized when there is little discretion to avoid costs; most costs are only recognized when later incurred	Restructuring costs recognized when announced or commenced, which is earlier than under US GAAP
		Joint financial reporting project with IASB in progress, which may require inclusion of changes in other comprehensive income in income statements	Join project with FASB; decision to require single statement of recognized income and expense, replacing two separate statements under current IFRS

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
4	Statement of Cash Flows	Required for most entities, but limited exemptions exist	Required for all reporting entities
		Direct and indirect methods for operating cash flows permitted, direct is urged but rarely seen	Direct and indirect methods for operating cash flows permitted
		Interest paid and dividends received must be classified as operating cash flows, and dividends paid must be classified as financing cash flows	Choice allowed in classifying 1. Dividends and interest paid or received as operating cash flows, or 2. Interest or dividends paid as financing cash flows and interest or dividends received as investing cash flows
		Overdrafts cannot be included in cash (show as financing source of cash)	Overdrafts can be included in cash under defined conditions
5	Accounting Policies, Changes and Restatements	A first-time adoption of US GAAP would normally require retrospective restatement	First-time application of IFRS requires retrospective restatement to standards effective as of beginning of current period
		Corrections of errors require retrospective restatement of prior periods' financials	Corrections of errors require retrospective restatement of prior periods' financials
		Changes in estimate accounted for prospectively	Changes in estimate accounted for prospectively
		Voluntary change in accounting policies require restatements of prior periods' financials	Voluntary change in accounting policies require restatements of prior periods' financials
6	Fair Value	Comprehensive standard established a three-level hierarchy of fair value methods, but does not dictate further application of fair value measures.	No comprehensive guidance issued by IASB, but current project promises ultimately the issuance of a standard very similar to US GAAP
7	Cash, Receivables and Prepaid Expenses	No specific guidance offered under US GAAP or IFRS	No specific guidance offered under either set of standards
		Industry specific guidance for acquired loans and receivables	Loans and receivables measured at amortized cost
		Accounting for pledging, factoring similar to that under IFRS	Accounting for pledging, factoring similar to that under US GAAP should be acceptable
8	Short-Term Investments and Financial Instruments	Stricter definition of "sales" resulting in more recognition of secured borrowing transactions	Slightly looser definition of "sales" of financial assets
		Basis adjustment arising from firm commitments and forecasted transactions may not be included in initial measurement of hedged item	Hedging gains and losses from cash flow hedges of firm commitments and of forecasted transactions can be included as part of the initial measurement of the cost basis of the related hedged item (basis adjustment)

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
8	Short-Term Investments and Financial Instruments	Nonderivative instruments can be used to hedge currency risk associated with net investment in foreign entity or a fair value hedge of unrecognized firm commitment	Nonderivative instruments can be used to hedge foreign currency risk
		Hedging of portion of cash flows of hedged item not permitted	Hedging of portion of cash flows of hedged item is permitted
		Hedging gains and losses on cash flow hedges recorded in other comprehensive income when they occur, then reclassify to income with hedged item	Similar to US GAAP
		Hedging for part of term of hedged item not permitted	Hedging for part of term of hedged item permitted if effectiveness can be shown
		Hedging effectiveness can be assumed in limited circumstances (using "shortcut method")	Hedging effectiveness must be demonstrable; new option to designate any financial asset or liability for measurement at fair value with changes in current income
		"Macrohedging" not permitted	"Macrohedging" is permitted
		Gain/loss on hedging net investment in foreign subsidiary taken to income upon complete liquidation of investment	Gain/loss on hedging net investment in foreign subsidiary taken to income upon partial or complete disposal or liquidation of investment
		Reclassifications to "trading" required under certain conditions, but reclassification from trading not permitted	Reclassifications to or from "trading" prohibited
		Derecognition of financial assets based on loss of control, which requires isolation from transferor, transferee ability to pledge or sell, and absence of repurchase obligation by transferor	Derecognition of financial assets based primarily on risks and rewards criterion; also, on loss of control, as a secondary test
9	Inventory	Allowable costing methods include FIFO, average cost, and LIFO	LIFO costing is now banned
		No special rules for biological inventory (e.g., growing crops, livestock)	IAS 41 on agriculture specifies use of fair value less estimated selling costs for biological assets, with changes in value reported in income
		Presentation at lower of cost or market required	Presentation at lower of cost or net realizable value
		Only in rare instances (mining of gold, etc.) is presentation at fair value in excess of cost permitted	Certain defined situations, including agricultural products, for reporting at fair value in excess of actual cost
		Certain costs (idle capacity, spoilage) cannot be added to overhead charge in inventory cost, conforming to IFRS rule	Certain costs (idle capacity, spoilage) cannot be added to overhead charge in inventory cost

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
9	Inventory	Lower of cost or market adjustments cannot be reversed	Lower of cost or market adjustments must be reversed under defined conditions
		Recognition in interim periods of inventory losses from market declines that reasonably can be expected to be restored in the fiscal year are not required	Recognition in interim periods of inventory losses from market declines that reasonably can be expected to be restored in the fiscal year is required; guidance in the areas of disclosure and accounting for inventories of service providers offered
10	Revenue Recognition—Evolving Principles and Specialized Applications	Conceptual framework offers guidance (major project in process to provide revised standard for revenue recognition based on balance sheet changes); specific guidance on limited matters (e.g., software development; construction)	Some specific guidance offered under IFRS (a separate standard on revenue recognition exists, unlike US GAAP); cooperating with FASB on project expected to result in exposure of new approach late 2008
		Generally must recognize revenue ratably over service period, no up-front recognition under GAAP	More possibility for up-front revenue recognition when some performance has occurred
		Revenue recognition deferred on delivered part of multielement contract if refund would be triggered by failure to deliver remaining elements	Revenue generally recognized on delivered part of multielement contract even if refund triggered by failure to deliver remaining elements, if delivery is probable
		Revenue-cost and gross-profit approaches to percentage-of-completion both allowed for long-term construction contracts; use of completed contract method under certain circumstances is required	If percentage cannot be reliably estimated, use of cost recovery method required; "revenue-cost" approach to percentage of completion mandatory; completed contract method banned
11	Long-Lived Assets (Tangible assets)	Cost components similar to IFRS except that hedging gain/loss from qualifying cash flow hedges are not includable	Cost components similar to US GAAP, but gain/loss from effective cash flow hedging can be added to basis of asset
		Change in depreciation method now handled prospectively	Change in method accounted for prospectively
		Mandatory capitalization of construction period interest costs, only interest costs are subject to capitalization (but no ancillary costs can be included)	Capitalization of construction period interest is now mandatory; ancillary costs also can be capitalized
		Costs of major overhauls generally expensed	Costs of major overhauls added to asset
		Cost basis required	Alternatively can use cost basis or revaluation to fair value (entire classes of assets must be accounted for under revaluation method)

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
11	Long-Lived Assets (Tangible assets)	Impairments recognized in current income	If cost method used, impairments are recognized in income; if revaluation employed, impairment treated as reversal of revaluation unless it exceeds former write-up, in which case excess impairment taken to current income
		Impairment suggested when book value exceeds gross expected future cash flows; second step prescribed to measure amount of impairment uses discounted present value of cash flows	Impairment suggested when book value exceeds greater of value in use (discounted cash flows) or fair value less cost to sell, single step to test and measure impairment
		Impairments, once recognized, cannot be reversed	Recognized impairments reversed under defined conditions
		Component-level depreciation expected; asset retirement obligations recognized as part of asset cost; changes in estimated amount of obligation effectively amortized over remaining term	IFRS has been brought into closer conformity with US GAAP as to component depreciation, accrual of asset retirement obligations, although IFRS guidance on retirement obligations is more general; changes in estimated amount of the obligation recognized over remaining term if cost model is used (if revaluation model, impact is immediately felt in earnings)
		Like-kind exchanges of productive assets measured at fair value, with gain or loss recognized, similar to procedures under IFRS	Like-kind exchanges measured at fair value, with gain or loss recognized
		Investment property must be carried at depreciated cost	Investment property can be carried at depreciated cost or fair value
		Segregate asset held for sale, write down to lower of amortized cost or fair value less estimated costs to dispose, cease depreciating assets; comparative balance sheet reclassified to report disposal group separately	Similar to US GAAP approach, except comparative balance sheet is not restated
11	Long-Lived Assets (Intangible assets)	Internally generated goodwill not recognized (although, implicitly, indirectly given recognition in limited circumstance of replacement for impaired acquired goodwill)	Internally generated goodwill not recognized
		Research and development expenditures all expensed as incurred, included in operating cash flows	Research costs expensed as incurred, but development costs capitalized and amortized, with portion capitalized in period included in investing cash flows
		Amortization required if identifiable intangibles have finite lives, with testing for impairment also required under defined circumstances	Similar to US GAAP

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
11	Long-Lived Assets (Intangible assets)	Measurement of impairment done with reference to fair value (often operationalized using discounted cash flows)	Measurement of impairment done with reference to higher of value in use or fair value less costs to sell
		Estimated residual often defined by present value of expected disposal proceeds	Estimated residual value defined by current net selling price assuming asset is age, condition as of expected end of useful life
		Measurement of goodwill impairment uses special method, requires first comparing fair value of cash generating unit to book value including goodwill, then comparing implied goodwill to carrying value; measured at level of business segment or one level below that	Measurement of goodwill impairment similar to other long lived assets, requires only single-step computation; measured at lowest level goodwill can be assigned (cash generating unit)
		Impairment testing at segment or lower level, except that indefinite life intangibles are tested separately from business unit	Impairments tested at cash generating unit level
		No reversals of impairments once recognized for intangible assets	Impairments of intangible, once recognized, can be reversed, under defined conditions, except for goodwill
		Revaluations never permitted (only amortized cost is permitted)	Revaluation of intangibles permitted under limited circumstances where prices from active markets are available
		Decommissioning (asset retirement) obligations not recomputed after initial computation, generally	Decommissioning (asset retirement) obligations recomputed at current risk-adjusted rate each balance sheet date
12	Investments (Passive)	Classification as trading, available-for-sale, or held-to-maturity limited to securities; equity method required for investee accounting	Classification as trading, available-for-sale, or held-to-maturity applies to all types of financial assets, not just to securities; choice of equity, cost, fair value methods for some investees
		US GAAP adopted "fair value option" similar to that available under IFRS	"Fair value option" allows any financial asset or liability to be designated at inception to be accounted for at fair value with changes reported in current earnings
		If held-to-maturity securities are sold, use of this category is prohibited thereafter	If held-to-maturity securities are sold, use of this category is prohibited for next two years
		Investment in unlisted securities valued at cost	Investments in unlisted securities can be valued at fair value, if reliable measure available
		Derecognition of financial assets based on risks-and-rewards analysis; partial derecognition prohibited; Qualifying SPEs permitted as vehicle for nonconsolidation if conditions met	Derecognition of financial assets based on risks-and-rewards and control analyses; partial derecognition permitted; no parallel to QSPE rules under US GAAP

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
12	Investments (Equity method and other)	Use of equity method based on significant influence being wielded by investor	Same as under US GAAP (but equity method investees are referred to as associates under IFRS)
		Extensive disclosures required of investees' balance sheet and income statement data	Extensive disclosures required of associates' balance sheet and income statement data
		Impairment of equity-method investment required when impairment is "other than temporary"	More complex consideration of impairment required; if certain criteria met, value in use (based on expected cash flows from earnings distributions and ultimate disposition) or recoverable amount, whichever is greater, is to be reported as lower carrying value than equity method amount
		Joint ventures generally accounted for by equity method, but some industries (e.g., construction) use proportional consolidation is traditional	Joint ventures accounted for by equity method or proportionate consolidation, but IASB is expected to ban proportionate consolidation and conform with US GAAP treatment
		No need to conform investor and investee accounting policies	Need to conform investor and investee accounting policies
		Investment property must be accounted for by cost (and depreciation) method	Investment property can be accounted for by cost (and depreciation) method, or by fair value method with changes reported in income
13	Business Combinations and Consolidated Financial Statements	Acquisition method required for all business combinations under FAS 141(R); consolidation rules effectively based on majority ownership criterion; closing date generally used for recognizing acquisitions	Acquisition method of accounting required by IFRS 3; consolidation rules based on control criterion; control date used for recognizing acquisitions; revised IFRS 3 closely follows FAS 141(R) except gross-up for 100% goodwill (i.e., including noncontrolling interest share) is optional, not required
		Special consolidation requirements apply to Variable Interest Entities (VIE), consolidation by primary beneficiary generally required	VIEs not yet addressed by IFRS, but Special Purpose Entities are consolidated under concept of control
		Recognize postacquisition obligations at fair value	Recognize postacquisition obligations only for provisions that had been recognized by acquired entity
		"Qualifying" SPEs to be consolidated if QSPE exceptions not satisfied, but elimination of QSPE accounting is under consideration	No concept of QSPE under IFRS
		Consolidation of majority owned subsidiaries required unless control is not exercised by parent	Consolidation required unless control is not exercised by parent, or unless control is temporary (to lapse within twelve months)

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
13	Business Combinations and Consolidated Financial Statements	Recognize all assets and liabilities at fair value, for both majority (controlling) and noncontrolling interests' shares	Assets and liabilities recorded at full fair value, including minority interest's share
		Acquiree deferred tax recognized only after date of acquisition (i.e., having full valuation allowance at acquisition date) used to offset goodwill, then offset intangible assets, finally to offset tax expense	Acquiree deferred tax recognized only after date of acquisition (i.e., having full valuation allowance at acquisition date) is effected as current period credit to tax expense and also goodwill adjustment as if adjustment occurred at acquisition date
		Subsequent creation of allowance for tax asset recognized in acquisition transaction effected via charge to tax expense	
		No promulgated rules governing "parent company only" financial statements, but use of equity method would be acceptable	In "parent company only" financials, the investment in subsidiaries, equity investees, and joint ventures may be presented at cost or under rules for investments in securities, but equity method cannot be used
		Not necessary to conform parent and subsidiary accounting policies if some entities use specialized industry practices	Need to conform parent and subsidiary accounting policies
		Noncontrolling interest in consolidated subsidiary must now (under FAS 141[R]) be presented in equity	Minority interest included in equity
		Acquired in-process R&D now to be capitalized; postacquisition-date expenditures on IPR&D are expensed	Purchased in-process R&D capitalized, and subsequent expenditures generally are also capitalized and amortized, if "development" costs
		Negative goodwill reported as gain, with no offsetting against acquired assets	Negative goodwill reported as gain, with no offsetting against acquired assets
		The fair value of contingent consideration and other contractual contingencies are now to be recognized at date of acquisition; noncontractual contingencies are recognized only if "more likely than not" threshold is met	Fair value of contingent consideration included in purchase price allocation process, if probable of occurrence and subject to reliable estimation
		Goodwill not amortized, but is annually tested for impairment	Similar to US GAAP, but different impairment testing procedures
		One year permitted to finalize purchase price allocation process, including resolution of preacquisition contingencies	Similar to US GAAP
		Combinations of entities under common control ("brother-sister" mergers) accounted for at book value, like former poolings of interest	No specific rules for "brother-sister" mergers, so either purchase accounting or book value (pooling) accounting is acceptable per parent entity's policy choice

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
13	Business Combinations and Consolidated Financial Statements	Revalue previous steps in acquisition to fair value at each step in acquisition process	Similar to US GAAP (would be affected by currently proposed changes to both US GAAP and IFRS)
		Expected restructuring or similar postacquisition costs, if not contractually obligated at acquisition date, are not accrued but are only recognized subsequently as period costs	Restructuring reserves generally not allowed, unless acquiree had recorded contingent liability before transaction.
14	Current Liabilities and Contingencies	Short-term debt refinanced before statement issuance date can often be shown as noncurrent	Short-term debt refinanced before balance sheet date can be shown as noncurrent; if later (but still before issuance of financials) disclosure only
		Contingent liabilities generally recognized only if deemed probable and subject to reasonable estimation	Similar to US GAAP, but threshold for recognition is somewhat lower, using "more likely than not" criterion
		Provisions (estimated liabilities) measured by reference to low end of range of amounts needed to settle, sometimes but not always discounted to present value	Provisions measured by reference to best estimate to settle (often the midpoint in range), discounted to present value
		Strict criteria must be met to accrue restructuring costs, and mere intent to incur such costs is not sufficient to justify accrual; must meet definition of a liability at balance sheet date	Somewhat more flexibility to accrue restructuring charges if plans have been announced and/or actions have been undertaken as of balance sheet date, even if definition of liability is not met
		Specific rules for certain provisions (e.g., for environmental liabilities)	Only general guidance provided under IFRS
		Contingent gains not recognized, although contingent assets acquired in business combination are recognized at fair value under FAS 141(R)	IFRS provides for some recognition of contingent gains
15	Long-Term Liabilities	Convertible debt classified as liability	Convertible debt assigned to both debt and equity based on relative fair values
		Embedded derivatives generally must be bifurcated and accounted for separately	Embedded derivatives generally must be bifurcated and accounted for separately
		Noncurrent presentation of defaulted debt if waiver granted before statement issuance date	Noncurrent presentation of defaulted debt if waiver granted before balance sheet date only
		Equity-like instruments giving holder right to demand cash settlement, or with defined cash settlement terms, must be classed as liabilities	Similar to US GAAP
		Joint project with IASB to address instruments with attributes of both liabilities and equity is ongoing	Joint project with FASB to address instruments with attributes of both liabilities and equity is ongoing

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
16	Leases	Capital lease accounting is required if one of four defined conditions are met; otherwise, operating lease	Similar to US GAAP; finance lease treatment if risks and rewards are transferred to lessee; also if property is special purpose for lessee use
		No additional factors that parallel those under IFRS for determination of financing (capital) treatment by lessor	If lessee to bear lessor's loss upon lease cancellation, or lessee will shoulder gain or loss from change in residual value of leased asset, or lessee has bargain renewal right, then lease may be deemed financing transaction for lessor
		Third-party guarantees cannot be included in minimum lease payments to determine whether capital lease criteria are met	Third-party guarantees must be included in minimum lease payments to determine whether capital lease criteria are met
		Present value of lease payments computed using incremental borrowing rate, unless practical to determine implicit rate that is lower than incremental borrowing rate	Present value of lease payments computed using implicit rate (if unknown, incremental rate can be used)
		More guidance provided on specialized topics; deferral of profit on sale-leasebacks is required	Only general guidance; profit recognition on sale-leasebacks permitted if fair value priced
		Separate accounting for land and building in combined lease depends on terms and materiality of land	Separation of land and building components of lease is mandatory under recent provisions
		Output contracts are leases	Output contracts are not leases
		Leasehold interest in land accounted for as prepayment	Leasehold interest in land can be accounted for as investment property, valued at fair value with changes reported in current earnings; or else as a prepayment
		Gain on sale/leaseback not recognized in current earnings, but deferred and amortized, unless seller retains use of much of asset, in which case gain is recognized (immediate recognition of loss also commonly required)	Gain on sale/leaseback amortized over term of financing lease, but recognized at once if operating leaseback
		Lease obligations disclosures more extensive than under IFRS	Lease obligations disclosures less than under GAAP
		Joint convergence project with IASB has now been limited to lessee issues	Same as US GAAP
17	Income Taxes	Comprehensive interperiod allocation using liability method (balance sheet orientation) required under US GAAP	Comprehensive interperiod allocation using liability method (balance sheet orientation) required under IFRS, very similar to US GAAP
		Exemptions from interperiod allocation rules found under IFRS not present under US GAAP	Exemptions provided for nontaxable goodwill, certain asset/liability acquisitions that are not business combinations and that do not immediately affect book or tax income, and permanent differences

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
17	Income Taxes	Tax effects of all temporary differences are recognized, subject to allowance for tax assets that are not "more likely than not" to be realized	Tax effects of all temporary differences are recognized, subject to allowances for tax assets that are not "more likely than not" to be realized
		Recognize effect of rate changes when enacted	Recognize effects of rate changes when "substantively enacted" which may precede US GAAP recognition
		Prohibits recognition of effects of temporary differences related to 1. Foreign currency nonmonetary assets when the reporting currency is the functional currency, and 2. Intercompany transfers of inventory or other assets remaining within the company	
		Deferred tax assets and liabilities are current or noncurrent based on related asset or liability, net current and net noncurrent amounts are displayed	Deferred tax assets and liabilities are noncurrent, and are to be reported net
		Post-business-combination recognition of deferred tax asset eliminates goodwill, then other intangible assets, with any excess taken to income	Post-business-combination recognition of deferred tax asset eliminates goodwill with any excess taken to income
		Several specific exemptions to general requirement to provide deferred tax on all temporary differences are set forth	No exceptions to general principle that all temporary differences in carrying amount of assets and liabilities require deferred taxes
		Recognize deferred tax asset in all cases, provide reserve when realization is not "more likely than not"	Recognize deferred tax asset when realization is probable, which means "more likely than not" per IFRS 3
		Effect of change in rates or change in assessed likelihood of realization on deferred tax related to item originally recognized in stockholders' equity must be reported in current earnings	Effect of change in rates or change in assessed likelihood of realization on deferred tax related to item originally recognized in stockholders' equity must be reported in equity using "backward tracing" (may soon be changed to conform with US GAAP method)
		Subsequent year realization of tax benefit from business combination reduces goodwill, then other tangible assts, and only then excess reported in current earnings	Subsequent year realization of tax benefit from business combination reduces goodwill, then excess reported in current earnings
		Rate reconciliation based on domestic federal rate time pretax profit from continuing operations only	Rate reconciliation based on applicable rates times accounting profit
		Tax effect of intercompany transactions recognized at seller entity's tax rate	Tax effect of intercompany transactions recognized at buyer entity's tax rate

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
17	Income Taxes	Benefit of uncertain tax positions can only be recognized to the extent that there is at least a 50% likelihood of being sustained on exam.	No specific guidance on uncertain tax positions (apply general approach for contingent losses) Convergence with FASB approach likely, with exposure document due in late 2008
18	Pensions and Other Postretirement Benefits	Defined benefit plans; use of projected unit credit method required to match expense to periods of service; smoothing is accomplished by deferred recognition of actuarial gains and losses, amortization of prior service costs, et al.	Methodology very similar to that under US GAAP, with deferred recognition of actuarial gains or losses. However, past service costs are recognized immediately, not deferred
		Past service costs amortized over service period or life expectancy of workers	Past service costs expensed immediately
		Actuarial gains and losses cannot be recognized in equity; are to be deferred and amortized to pension expense over expected term of plan participants to the extent that defined "corridor" is exceeded	Actuarial gains and losses can be recognized in equity rather than earnings under amendment to IAS 19 effective in 2006; if in earnings, either immediate recognition or amortization similar to US GAAP is permissible
		Recognition of a minimum liability on the balance sheet to at least the unfunded accumulated pension benefit obligation	No minimum liability to be reported in the balance sheet
		No limitation on recognition of pension assets	Limitation on recognition of pension assets
		Curtailment gains recognized only when employees terminate or plan suspension is adopted, computed differently than under IFRS	Curtailment gains or losses recognized when announced; computed differently than US GAAP
		Anticipating changes in the law that would affect variables such as state medical or social security benefits expressly prohibited	Anticipate changes in future postemployment benefits based on its expectations in the law
		Termination benefits expensed when employees accept and amount can be estimated, recognize contractual benefits when it is probable that employees will accept	Termination benefits expensed when employer is committed to pay these
		Expense recognition for certain types of equity compensation benefits; opposed to mandatory stock compensation expensing; prior service cost to be amortized over the expected service life of existing employees; contributions to multiemployer plans expenses	Expense for equity compensation benefits not recognized, but current agenda item; prior service cost related to retirees and active vested employees to be expensed; benefit obligation for multiemployer recognized
		No limitation on amount of pension plan asset (in connection with overfunding) that can be presented on balance sheet	Balance sheet asset recognition limited by complex rules

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
18	Pensions and Other Postretirement Benefits	Joint convergence project with IASB, with late-2007 discussion document promised, has many complex issues to be addressed.	Joint convergence project with FASB, with late-2007 discussion document promised, has many complex issues to be addressed.
19	Stockholders' Equity	Mandatorily redeemable preferred shown as liability with dividends deducted as expense	Mandatorily redeemable preferred shown as liability with dividends deducted as expense
		Fair value method required for share-based compensation plans; special simplified method prescribed for nonpublic companies	Mandatory income statement recognition of effect of stock-based compensation measured at fair value; no special rules for nonpublic entities
		Fair value measurement of goods and services acquired for stock from nonemployees using counterparty's commitment or actual performance date	Fair value measurement of goods and services acquired for stock from nonemployees using modified grant date method
		Income tax benefits related to share-based payment (measured by spread between current fair value and exercise price) credited to equity; any payroll taxes recognized in expense at time of exercise	Tax benefits related to share-based payments credited to equity only if in excess of compensation expense; any payroll taxes recognized in expense over same period as recognition of option plan cost (vesting period)
		Tax benefits related to share-based payments based on GAAP expense, later adjusted when actual tax effects are realized	Tax benefits related to share-based payments based on expected applicable tax deduction
		Modifications of awards require new measurement based on date of modification	Modifications do not trigger new measurement of fair value
		Joint project with IASB to address instruments with features of both liabilities and equity	Joint project with FASB to address instruments with features of both liabilities and equity
20	Earnings Per Share	Very similar to IFRS, but with more detailed guidance on calculations	Similar to US GAAP. Calculation of year-to-date EPS (versus previously reported interim date) varies from US GAAP
		Report basic and diluted EPS on continuing operations, discontinued operations, extraordinary items, cumulative effect of change in accounting and net income	Report basic and diluted EPS on continuing operations and net income
		For interim reporting, average the interim periods' incremental shares to compute EPS	For interim reporting, use treasury stock method on year-to-date results, unlike US GAAP approach
		Proposed changes would converge with IFRS	
21	Interim Reporting	Some timing differences in recognition of interim revenues and expenses vs. IFRS	Some timing differences in recognition of interim revenues and expenses vs. US GAAP

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
21	Interim Reporting	Basic principle is that interim period is integral to full year, but actual requirements depart from this in many instances; net result is mixed approach not unlike IFRS	Basic principle is that interim period is discrete period, but actual requirements depart from this in many instances; net result is mixed approach not unlike US GAAP
22	Segment Reporting	"Management approach" provides flexibility in defining segments; segment results using internal managerial approach OK, even if these differ from financial statements	Approach very similar to US GAAP recently adopted
		Disclosures based on primary classification (either geographic or product-based), with some additional "entity-wide" items (major customers, etc.)—not necessarily lines of business or geographical areas, however	Defines segments based on components of the entity that are businesses, having operating results reviewed by the chief operating decision maker, and having discrete financial information; these are reportable if one of three threshold criteria (sales, profit, or assets) are met
		No segment result definition given, no requirement for capital expenditures, liabilities disclosure by segments	Segment result defined, also require capital expenditures and liabilities segment disclosures; entity-wide and some geographic analyses are also required
23	Foreign Currency	Selection of functional currency is open to judgment, but in practice there is a greater emphasis on cash flows than on currency that influences pricing of output	Greater emphasis placed on the currency of the economy that influences sales prices for goods and services
		Choice of reporting (presentation) currencies, and if other than functional currency translate assets and liabilities at balance sheet date exchange rate, income and expense at rate at dates of transactions (or average for period, if not materially different)	Very similar to US GAAP
		Exchange losses to be expensed in all instances	Exchange losses on a liability for the recent acquisition of an asset invoiced in a foreign currency either as 1. Charge to expense, or 2. Add to the cost of the asset when the related liability cannot be settled and there is no practical means to hedge
		Current exchange rate use to translate all balance sheet items, including goodwill and fair value adjustments	Same as under US GAAP
		In highly inflationary economy (having cumulative three-year price change of 100%), parent's currency (US dollar) must be used as functional currency	In hyperinflationary economy, an entity cannot avoid restatement under IAS 29 by adopting stable currency (e.g., that of parent company) as functional currency

GAAP 2009 chapter	*Topic*	*US GAAP treatment*	*IFRS treatment*
23	Foreign Currency	Equity accounts are translated at historical rates	Translation of equity accounts not specified under IFRS
24	Personal Financial Statements	Current value reporting required	No published guidance
25	Specialized Industry GAAP	No primary guidance for government grants, agriculture, but there are specific requirements for certain industries, such as oil and gas	Guidance provided for government grants, agriculture, reporting by banks, extractive industries, insurance
		Specialized guidance on various industries, including insurance; banking and thrifts; motion pictures, computer software, and agricultural industries, and others, found in "secondary" GAAP sources such as AICPA Guides, SOP, etc.	No such guidance offered; there is no "secondary" source for GAAP guidance

Accounting

Your single, authoritative source to GAAP under the new Accounting Standards Codification (ASC) system

By mid-2009, the Financial Accounting Standards Board (FASB) is expected to release its Accounting Standards Codification™ (ASC), a new, clearer indexing system that is much easier to access and research. Though the Codification does not change U.S. generally accepted accounting principles (GAAP), it does reorganize the thousands of U.S. GAAP pronouncements from difficult-to-use chronological listings and multiple series of pronouncements into a single, easily accessible source conveniently organized by topic/subject.

Arriving at just the right time, *Wiley GAAP Codification Enhanced* contains complete coverage of all levels of GAAP, as well as integrated cross-references to the new ASC. In addition, *Wiley GAAP Codification Enhanced* renders GAAP more understandable and accessible for research and is designed to reduce the amount of time and effort you spend to solve accounting research issues.

Your authoritative guide to GAAP under the new codification system, this invaluable resource makes learning the new ACS system a breeze, with at-your-fingertips information that does the work for you. Practical and reliable, *Wiley GAAP Codification Enhanced* is your essential tool to navigate through these new, uncharted waters.

BARRY J. EPSTEIN is a partner with Chicago-based Russell Novak & Company, LLP, where he specializes in technical consultation on accounting and auditing matters and corporate governance, and serves as a consulting and testifying expert for various litigation matters.

RALPH NACH is a Vice President of AuditWatch, Inc., where he writes, teaches, and consults on a wide range of accounting, auditing, and financial reporting matters.

STEVEN M. BRAGG has been the chief financial officer or controller of four companies, as well as a consulting manager at Ernst & Young. He is the author of more than thirty Wiley titles.
