PREFACE

GAAP 09: Codification Edition provides analytical explanations and copious illustrations of all current generally accepted accounting principles. The book integrates principles promulgated by all the relevant standard-setting bodies—the FASB, including its Emerging Issues Task Force's consensus summaries and discussion issues and staff positions, and the AICPA's Accounting Standards Executive Committee (AcSEC),

With the completion and public release of the FASB's codification project, virtually all extant U.S. GAAP has been superseded by a unified, codified set of standards. All such guidance is now presented in a single, integrated set of materials, and former individual standards, interpretations, and other requirements are to be withdrawn. This book represents a complete integration of the new Accounting Standards Codification (ASC) references into the Wiley GAAP reference work that is now in its 25th annual edition.

The principal intended audience for the book is the practitioner, with the primary objective being to assist in resolving the myriad practical problems faced in applying GAAP. Accordingly, meaningful, realistic examples abound, guiding users in the application of GAAP to complex fact situations that must be dealt with in the real world practice of accounting In addition to this emphasis, a major strength of the book is that it does explain the theory of GAAP in sufficient detail to serve as a valuable adjunct to accounting textbooks. Much more than merely a reiteration of currently promulgated GAAP, it provides the user with the underlying conceptual bases for the rules, in order to facilitate the process of reasoning by analogy that is so necessary in dealing with the complicated, fast-changing world of commercial arrangements and transaction structures. It is based on the authors' belief that proper application of GAAP demands an understanding of the logical underpinnings of all its technical requirements.

Each chapter of this book, or major section thereof, provides an overview discussion of the perspective and key issues associated with the topics covered; a listing of the professional pronouncements which guide practice; and a detailed discussion of the concepts and the accompanying examples. A comprehensive disclosure checklist, following the main text, offers practical guidance to preparing financial statements in accordance with GAAP, with supplemental insights into SEC-mandated disclosures as needed. Also included is a comprehensive comparison of GAAP to International (IFRS) standards, increasingly the norm for entities reporting outside the US, and soon, for U.S.-based entities as well.

The authors' wish is that this book will serve preparers, practitioners, faculty, and students, as a reliable reference tool to facilitate their understanding of, and ability to apply, the complexities of the authoritative literature. Comments from readers, both as to errors and omissions and as to proposed improvements for future editions, should be addressed to Barry J. Epstein, c/o John Wiley & Sons, Inc., 155 N. 3rd Street, Suite 502, DeKalb, Illinois 60115.

ABOUT THE AUTHORS

Barry J. Epstein, PhD, CPA, is a partner with Chicago-based Russell Novak & Company, LLP, where he specializes in technical consultation on accounting and auditing matters and corporate governance, and maintains a national practice as a consulting and testifying expert for commercial and other litigation matters, including accountants' malpractice, contractual dispute resolution, damages modeling, and white-collar criminal defense. He has previously served in senior technical and litigation consulting positions with several regional and national CPA firms, and as a corporate finance executive and college professor. Dr. Epstein has authored or coauthored six books (including *Wiley IFRS Interpretation and Application*), hundreds of professional education courses, several articles in business or professional journals, and a weekly business column for an international newspaper. He has served on several state and national technical committees, including the AICPA's Board of Examiners, served as chair of the Illinois CPA Society's senior accounting technical committee, and held teaching positions at several universities. Dr. Epstein received his doctorate from the University of Pittsburgh, and also holds degrees from DePaul University and the University of Chicago. He is a member of the Illinois CPA Society, the AICPA, and the American Accounting Association.

Ralph Nach, CPA, is a Senior Consultant with AuditWatch, part of Thompson Reuters, for which he writes, teaches, and consults on a wide range of accounting, auditing, and financial reporting matters. He has been a practitioner for over thirty years, during which he has served in capacities including accountant, auditor, quality control director, peer reviewer, educator, chief learning officer, and consultant for several public accounting firms, including Arthur Anderson LLP. Most recently Mr. Nach served as a partner in the National Office of Audit and Accounting of McGladrey & Pullen, LLP. He is a former adjunct lecture in graduate accounting and finance at Northwestern University in Evanston, Illinois. Mr. Nach holds a BSBA with honors from the Walter E. Heller School of Business Administration of Roosevelt University in Chicago, and is a licensed CPA in Illinois. Mr. Nach has coauthored several other books and speaks nationally on accounting, auditing, and financial reporting topics. He is a member of the American Institute of Certified Public Accountants, the Information Systems Audit and Control Association (ISACA), the Illinois CPA Society, where he has served as a chairman and/or member of numerous committees, and an associate member of the Association of Certified Fraud Examiners.

Steven Bragg, CPA, CMA, CIA, CPIM, has been the chief financial officer or controller of four companies, as well as a consulting manager at Ernst & Young and auditor at Deloitte & Touche. He received a master's degree in finance from Bentley College, an MBA from Babson College, and a Bachelor's degree in Economics from the University of Maine. He is the author of 28 books, including *Accounting Best Practices*, *The Ultimate Accountants' Reference*, and *Controllership*. He has been the two-time president of the Colorado Mountain Club. He resides with his wife and two daughters in Centennial, Colorado. Sign up for his free accounting best practices newsletter at www.stevebragg.com.

DEVELOPMENT OF GAAP

What Is GAAP?

> *The phrase "generally accepted accounting principles" is a technical accounting term that encompasses the conventions, rules, and procedures necessary to define accepted accounting practice at a particular time. It includes not only broad guidelines of general application, but also detailed practices and procedures. Those conventions, rules, and procedures provide a standard by which to measure financial presentations.* Auditing Standards Board (ASB), AU Section 411

Generally accepted accounting principles (GAAP) are concerned with the measurement of economic activity, the time when such measurements are to be made and recorded, the disclosures surrounding this activity, and the preparation and presentation of summarized

economic information in the form of financial statements. GAAP develops when questions arise about how to best accomplish those objectives—measurement, timing of recognition, disclosure, or presentation. In response to those questions, GAAP is either prescribed in official pronouncements of authoritative bodies empowered to create it, or it originates over time through the development of customary practices that evolve when authoritative bodies fail to respond. Thus, GAAP is a reaction to and a product of the economic environment in which it develops. As such, the development of accounting and financial reporting standards has lagged the development and creation of increasingly intricate economic structures and transactions.

There are two broad categories of accounting principles—recognition and disclosure. Recognition principles determine the timing and measurement of items that enter the accounting cycle and impact the financial statements. These are quantitative standards that require economic information to be reflected numerically.

Disclosure principles deal with factors that are not always numeric. Disclosures involve qualitative information that is an essential ingredient of a full set of financial statements. Their absence would make the financial statements misleading by omitting information relevant to the decision-making needs of the reader. Disclosure principles complement recognition principles by explaining assumptions underlying the numerical information and providing additional information on accounting policies, contingencies, uncertainties, etc., which are essential to fully understand the performance and financial condition of the reporting enterprise.

Who Created GAAP?

From time to time, the bodies given responsibility for the promulgation of GAAP have changed, and indeed more than a single such body has often shared this responsibility. GAAP established by all earlier standard-setting bodies, to the extent not withdrawn or superseded, remains in effect at the present time. These bodies are described in the following paragraphs.

Committee on Accounting Procedure. The first serious attempt to create formalized generally accepted accounting principles began in 1930, primarily as a consequence of the stock market crash of 1929 and the widespread perception that an absence of uniform and stringent financial reporting requirements had contributed to the rampant stock market speculation of the preceding decade that culminated with that crash. (Previously, GAAP had largely been defined by academic writings and general industry practices.) The American Institute of Accountants, (which in 1957 was renamed the American Institute of Certified Public Accountants [AICPA]), created a special committee to work with the New York Stock Exchange toward the goal of establishing standards for accounting procedures. The special committee recommended five rules to the Exchange that were published in 1938 as Accounting Research Bulletin (ARB) 1 of the Committee on Accounting Procedure. The Committee subsequently published 51 such bulletins, including Accounting Research Bulletin 43, which consolidated and superseded Bulletins 142. The Committee also attempted to achieve uniformity in accounting terminology. However, the Committee's limited resources and lack of serious research efforts in support of its pronouncements were questioned in the late 1950s, particularly as a number of very complex controversial topics loomed on the horizon.

Accounting Principles Board. The profession's response was to substitute, under its auspices, the Accounting Principles Board (APB) for the Committee on Accounting Procedure. This was done to facilitate the development of principles, which were to be based primarily on the research of a separate division of the AICPA, the Accounting Research Division. Under this strategy, the Division was to undertake extensive research, publish its find-

ings, and then permit the Accounting Principles Board to take the lead in the discussions that would ensue concerning accounting principles and practices. The Board's authority was enforced primarily through prestige and Rule 203 of the AICPA Code of Professional Conduct. Furthermore, formal approval of Board issuances by the Securities and Exchange Commission (SEC) gave additional support to its activities.

During the Board's fourteen years of existence, it issued 31 authoritative opinions and 4 nonauthoritative statements. They dealt with amendments of Accounting Research Bulletins, opinions on the form and content of financial statements, and issuances requiring changes in both the recognition and disclosure principles of the profession. However, the Board did not make use of the efforts of the Accounting Research Division, which published fifteen research studies during its lifetime. Both the Board and the Division acted independently in selecting topics for their respective agendas. The Board issued pronouncements in areas where little research had been done, and the Division performed research studies without seeking to be all-inclusive or exhaustive in analysis. The Accounting Principles Board did not, ultimately, operate differently or more effectively than had the Committee on Accounting Procedure.

Financial Accounting Standards Board. As a result of these operational problems, in 1971 the AICPA appointed the "Wheat Study Group" chaired by Francis M. Wheat, a former SEC commissioner. The Wheat Study Group was charged with examining the standard-setting process and making recommendations regarding the form and structure of the standard-setting process as well as whether standard setting should reside in the government or in the private sector. Based on the recommendations of this group, the Financial Accounting Standards Board (FASB) was formed in 1972. The Board consists of seven full-time members; they have diverse backgrounds with three coming from public accounting, two from private industry, and one each from academia and from an oversight body. The Board is assisted by a staff of professionals who conduct research and work directly with the Board.

FASB is recognized as authoritative through Financial Reporting Release 1 of the Securities and Exchange Commission and through Rule 203 of the AICPA Code of Professional Conduct.

FASB is an independent body relying on the Financial Accounting Foundation for selection of its members and approval of its budgets. FASB is supported by the sale of its publications and by fees assessed on all public companies based on their market capitalizations. (The imposition of this fee was established by the Sarbanes-Oxley Act and replaces the voluntary private-sector contributions that previously supported the Foundation. The change was made to allay any public concerns about the FASB's perceived independence from contributors.) The Board of Trustees of the Foundation is composed of members of

American Accounting Association
American Institute of Certified Public Accountants
CFA Institute
Financial Executives International
Government Finance Officers Association
Institute of Management Accountants
National Association of State Auditors, Comptrollers, and Treasurers
Securities Industry Association

The Board issues several types of pronouncements.[1] The most important of these are Statements of Financial Accounting Standards and Interpretations, which are used to clarify or elaborate on existing Statements or pronouncements of predecessor bodies. Standards and Interpretations constitute category A GAAP, which also includes FASB staff positions—a relatively new form of guidance—and the Board's FAS 133 implementation issues. Technical Bulletins, which are category B GAAP, usually address issues not covered directly by existing standards and are primarily used to provide guidance where it is not expected to be costly or create a major change. Bulletins are discussed at Board meetings and subject to Board veto. Both Bulletins and Interpretations are designed to be responsive to implementation and practice problems on relatively narrow subjects (the last Bulletin was issued in 2001; that role will now apparently be filled by FASB staff positions, a substantial number of which have already been produced).

The FASB staff can issue implementation guides and staff positions, which are category D GAAP. In a question-and-answer format, implementation guides address specific questions that arise when a standard is initially issued. Staff positions are responses to questions on appropriate application of FASB literature that are expected to have widespread relevance. The questions addressed in implementation guides and staff positions are submitted by phone, letter, or through the FASB Web site's technical inquiry service. Implementation guides and staff positions are drafted by the staff and issued provided that a majority of the FASB Board members do not object. In addition, staff positions must be exposed on the FASB Web site for a 30-day comment period before issuance.

American Institute of Certified Public Accountants (AICPA). The Accounting Standards Executive Committee (AcSEC) is the senior technical committee at the AICPA. It is composed of fifteen volunteer members, representative of industry, academia, analysts, and both national and regional public accounting firms. All AcSEC members are CPAs and members of the AICPA.

AcSEC is authorized to set accounting standards and to speak for the AICPA on accounting matters. The accounting standards that AcSEC issues are prepared largely through the work of AICPA committees and task forces. AcSEC issues Statements of Position (SOPs) and industry audit and accounting guides, which are reviewed and cleared by the FASB and thus constitute category B GAAP. SOPs provide guidance on financial accounting and reporting issues. Industry audit and accounting guides provide guidance to auditors in examining and reporting on financial statements of entities in specific industries and provide standards on accounting problems unique to a particular industry. AcSEC Practice Bulletins (category C GAAP) usually provide guidance on very narrowly defined accounting issues. Until recently, the standards issued by AcSEC addressed topics broadly applicable to all industries in addition to industry-specific topics. Effective November 2002, FASB reclaimed the sole authority to promulgate general-purpose GAAP, relegating AcSEC to the issuance of industry-specific accounting and auditing standards.

---

[1] *To date, the FASB has issued 161 Statements on Financial Accounting Standards, 48 Interpretations, 51 Technical Bulletins, as well as over 60 Staff Positions and over 30 implementation compilations. In addition, FASB has devoted substantial time and resources toward developing a Conceptual Framework for Financial Accounting, which has resulted in the issuance of 7 Concepts Statements, 6 of which are still in effect and discussed later in this chapter. (FASB is currently pursuing a complete review of the Concepts Statements as part of its convergence efforts with IASB.) (Since a number of standards have been superseded or withdrawn, the number of standards, interpretations, etc., which remain in force are somewhat fewer than the total issued. The preponderance of currently effective GAAP is the product of the FASB, and not of its predecessors, although a number of such older standards remain in effect.)*

Emerging Issues Task Force (EITF). The Emerging Issues Task Force (EITF) was formed in 1984 by the FASB in order to assist the Board in identifying current or emerging issues and implementation problems before divergent practices become entrenched. The guidance provided is often on narrow issues that are of immediate interest and importance. Task Force members are drawn primarily from public accounting firms but also include individuals who would be aware of issues and practices that should be considered by the group. The Task Force meets every other month with nonvoting representatives of the SEC and the FASB attending for discussion purposes.

For each agenda item, an issues paper is developed by members, their firms, or the FASB staff. After discussion by the Task Force, a consensus may be reached on the issue, in which case the consensus is referred to the FASB for ratification at its next scheduled meeting. If no consensus is reached, the problem may end up on the Board agenda or be resolved by the SEC, or the issue will remain unresolved with no standard-setting organization currently considering it. These issues may be in especially narrow areas having little broad-based interest. Occasionally, FASB may include a narrow issue in the scope of a broader project and reaffirm or supersede the work of the Task Force.

FASB publishes a volume of EITF Abstracts, which are summaries of each issue paper and the results of Task Force discussion.

Although EITF pronouncements are technically category C GAAP, they are so specialized that generally there is no category A or B GAAP covering the respective topics. The SEC believes that a Task Force consensus is GAAP for public companies, and they will question any accounting that differs from it. In addition, the SEC believes that the EITF supplies a public forum to discuss accounting concerns and assist in providing advice. Thus, they are supportive of the Task Force's work.

The EITF also previously published Discussion Issues, which are FASB staff announcements and SEC staff announcements regarding technical matters that are deemed important by the FASB or SEC staff, but that do not relate specifically to a numbered EITF issue. These announcements were designed to help provide guidance on the application of relevant accounting pronouncements. It is anticipated that no further discussion issues will be issued by EITF, however.

Other sources. Not all GAAP has resulted from a deliberative process and the issuance of pronouncements by authoritative bodies. Certain principles and practices evolved into current acceptability without adopted standards. For example, depreciation methods such as straight-line and declining balance are both acceptable, as are inventory costing methods such as LIFO and FIFO. There are, however, no definitive pronouncements that can be found to state this. Furthermore, there are many disclosure principles that evolved into general accounting practice because they were originally required by the SEC in documents submitted to them. Among these are reconciling the actual rate with the statutory rate used in determining income tax expense, when not otherwise obvious from the financial statements themselves. Even much of the content of balance sheets and income statements has evolved over the years without adopted standards.

Following about five years' effort, FASB has completed its project to codify GAAP, which will eliminate the multilevel hierarchy in favor of a bifurcation between authoritative and nonauthoritative guidance. In early 2008, FASB initiated a one-year verification phase of this Codification, during which time its constituents were encouraged to provide feedback on whether its content accurately reflects existing US GAAP for nongovernmental entities. Following completion of this trial period, pending any final revisions, FASB intends to release this by mid-2009, at which time all existing authoritative literature will be withdrawn. This book is based on the structure of the Codification as it exists in late 2008, which is not anticipated to change much, if at all.

In the interim, the GAAP hierarchy, which had been defined for decades in the auditing literature, has been moved from SAS 69 to a new FASB standard, FAS 162. This was issued in May 2008, to become effective when the PCAOB, responsible for public company auditing rules, takes action to amend its version of SAS 69 (as of year-end 2008, this has not been done). The only changes from the present hierarchy made were to include within category A GAAP virtually all accounting principles that are issued after being subject to FASB's due process; EITF consensuses were not moved to category A, however.

According to the FASB, the new hierarchy was considered because of the complexity of the long-standing hierarchy set forth by SAS 69, because that hierarchy was directed to auditors rather than reporting entities, and because of the anomaly of ranking FASB concepts statements lower than industry practices, although the former are subject to due process while the latter are not. The new standard still relegates concepts statements to the lowest level in the five-level hierarchy, but gives these primacy over all others in that level.

A further provision of FAS 162 holds that financial statements that depart materially from principles set forth in the GAAP hierarchy could not be represented as being in conformity with GAAP. While this does not (and, as an accounting standard, could not) alter the auditing rule known as the "Rule 203 exception" which allows for rare situations where departure from GAAP actually is believed warranted in the interest of fair presentation of the reporting entity's financial position or results of operations, it probably makes it a near-certainty that the Rule 203 exception will never be invoked, as indeed it has almost never been used historically. (A similar "true and fair view" exception exists under IFRS.)

How Is GAAP Created?

The FASB and AICPA adhere to rigorous "due process" when creating new guidance in category A and category B GAAP. The goal is to involve constituents who would be affected by the newly issued guidance so that the standards created will result in information that reports economic activity as objectively as possible without attempting to influence behavior in any particular direction. Ultimately, however, the guidance is the judgment of the FASB or the AICPA, based on research, public input, and deliberation. The FASB's due process procedures are described below. The AICPA follows similar procedures in its projects.

The FASB receives requests for new standards from all parts of its diverse constituency, including auditors, industry groups, the EITF, and the SEC. Requests for action include both suggestions for new topics and suggestions for reconsideration of existing pronouncements. For each major project it adds to its technical agenda, the FASB begins by appointing an advisory task force of approximately fifteen outside experts. Care is taken to ensure that various points of view are represented on the task force. The task force meets with and advises the Board and staff on the definition and scope of the project and the nature and extent of any additional research that may be needed. The FASB and its staff then debate the significant issues in the project and arrive at tentative conclusions. As it does so, the FASB and its staff study existing literature on the subject and conduct or commission any additional research as needed. The task force meetings and the Board meetings are open to public observation and a public record is maintained. Many of these proceedings are also available by live or archived audio Webcast as well as via telephone.

If the accounting problem being considered by the Board is especially complex, the FASB will begin by publishing a Discussion Memorandum or another discussion document. The discussion document generally sets forth the definition of the problem, the scope of the project, and the financial accounting and reporting issues; discusses research findings and relevant literature; and presents alternative solutions to the issues under consideration and the arguments and implications relative to each. It is distributed to interested parties by request

and is available on the FASB Web site. The document is prepared by the FASB staff with the advice and assistance of the task force. It specifies a deadline for written comments and often contains an invitation to present viewpoints at a public hearing.

Any individual or organization may request to speak at the public hearing, which is conducted by the FASB and the staff assigned to the project. Public observers are welcome. After each individual speaks, the FASB and staff ask questions. Questions are based on written material submitted by the speakers prior to the hearing as well as on the speaker's oral comments. In addition to the hearing, the staff analyzes all the written comments submitted. The FASB members study this analysis and read the comment letters to help them reach conclusions. The hearing transcript and written comments become part of the public record.

After the comment letters and oral presentations responding to the discussion document are considered, formal deliberations begin. (If the accounting problem is not as complex and no discussion document was issued, the due process begins at this point.) The FASB deliberates at meetings that are open to public observation, although observers do not participate in the discussions. The agenda for each meeting is announced in advance. Prior to each Board meeting, the staff presents a written analysis and recommendations of the issues to be discussed. During the meeting, the staff presents orally a summary of the written materials and the Board discusses each issue presented. The Board meets as many times as is necessary to resolve the issues.

When the Board has reached tentative conclusions on all the issues in the project, the staff prepares an Exposure Draft. The Exposure Draft sets forth the Board's conclusions about the proposed standards of financial accounting and reporting, the proposed effective date and method of transition, background information, and an explanation of the basis for the Board's conclusions. The Board reviews, and if necessary, revises, the Exposure Draft. Then, a vote is taken about whether the Exposure Draft can be published for public comment. A majority of the Board members must vote to approve an Exposure Draft for issuance for comment. If four votes are not obtained, the FASB holds additional meetings and redrafts the Exposure Draft.

Any individual or organization can provide comments about the conclusions in the Exposure Draft during the exposure period, which is generally sixty days or more. The Board may also decide to have a public hearing to hear constituents' views. At the conclusion of the comment period, all comment letters and oral presentations are analyzed by the staff, and the Board members read the letters and the staff analysis. Then, the Board is ready to redeliberate the issues, with the goal of issuing final accounting standards.

As in the earlier process, all Board meetings are open to the public. During these meetings, the Board considers the comments received and may revise their earlier conclusions. If substantial modifications are made, the Board will issue a revised Exposure Draft for additional public comment. If so, the Board also may decide that another public hearing is necessary. When the Board is satisfied that all reasonable alternatives have been adequately considered, the staff drafts a final pronouncement for the Board's vote. Four votes are required for adoption of a pronouncement. Once issued, the standards become GAAP after the effective date stated in the pronouncement.

The Hierarchy of GAAP

Under GAAP as it has been constituted over a number of decades, a number of standard-setting and standard-interpreting bodies (including, as of early-2009, FASB, AICPA's AcSEC, and EITF) issue pronouncements which have, to varying degrees, the force of requirements that financial statement preparers must follow. The multiplicity of standard-setting entities made it necessary to set forth a hierarchy, so that preparers and auditors

would have a set of behavioral rules to follow in selecting from overlapping or seemingly contradictory rules. This hierarchy was first set forth by the auditing literature, but has been replaced by an interim accounting standard (FAS 162) and, shortly thereafter, will be made moot by the promulgation of the codification of GAAP. Under the forthcoming codification, all extant standards will be incorporated into a single document, and former distinctions among levels of the GAAP hierarchy will be eliminated. Future GAAP pronouncements will be styled as modifications to or replacements of existing portions of this codification, and will not exist as freestanding standards, interpretations, amendments, or staff positions. This will represent a very fundamental change to the structure of the body of GAAP, and will require substantial changes to how preparers and others undertake to stay abreast of evolving GAAP.

Under precodification GAAP, the determination of which accounting principle is applicable under a particular set of conditions requires an appreciation of the hierarchy of GAAP. The hierarchy was developed to assist the researcher in identifying the different sources of GAAP and to provide a means of resolving potential conflicts between standards by providing differing levels of authority. In FAS 162, FASB has identified the following as the sources of established generally accepted accounting principles:

A. Accounting principles promulgated by a body designated by the AICPA Council to establish such principles, pursuant to rule 203 [ET section 203.01] of the AICPA Code of Professional Conduct.
B. Pronouncements of bodies, composed of expert accountants, that deliberate accounting issues in public forums for the purpose of establishing accounting principles or describing existing accounting practices that are generally accepted, provided those pronouncements have been exposed for public comment and have been cleared by a body referred to in category A.
C. Pronouncements of bodies, organized by a body referred to in category A and composed of expert accountants, that deliberate accounting issues in public forums for the purpose of interpreting or establishing accounting principles or describing existing accounting practices that are generally accepted, or pronouncements referred to in category B that have been cleared by a body referred to in category A but have not been exposed for public comment.
D. Practices or pronouncements that are widely recognized as being generally accepted because they represent prevalent practice in a particular industry, or the knowledgeable application to specific circumstances of pronouncements that are generally accepted.

Compliance with accounting pronouncements included in category A is mandatory. Auditors are not to express an unqualified opinion on financial statements if the financial statements contain a material departure from category A pronouncements unless, due to unusual circumstances, adherence to the pronouncements would make the statements misleading. Rule 203 implies that application of officially established accounting principles almost always results in fair presentation in conformity with generally accepted accounting principles, but this is not an absolute prohibition of departures from promulgated GAAP.

If an accounting treatment is not specified by a pronouncement covered by Rule 203, accountants and auditors are required to progress through the hierarchy to categories B, C, or D, in that sequence, and use the treatment specified by the source in the highest category. If an accounting pronouncement in category B, C, or D is relevant to the circumstances, accountants or auditors must follow that pronouncement or be able to justify the conclusion that another treatment is generally accepted.

Departures from promulgated GAAP justified as being necessary in order for the financial statements to not be misleading (the so-called "Rule 203 exception") have been very rarely observed in practice, but are clearly permitted under current standards. As of mid-2008, survival of this exception is in doubt, since the proposed FASB statement on the GAAP hierarchy would eliminate this exception. That is, departures from promulgated GAAP would cause financial statements to be deemed not in conformity with GAAP and, if the effect of the departure is material, not worthy of an unqualified auditors' opinion. Note that there are two reasons for the likely removal of this option. First, it pertains to the auditors' expression of an opinion, and not, as currently constituted, to the preparers' selection among accounting principles or methods. Second, in order for US GAAP to converge with IFRS (which does not have an exact equivalent to this exception), it was deemed necessary to eliminate it.

For financial statements of entities other than governmental entities[2]

a. Category A, officially established accounting principles, consists of Financial Accounting Standards Board (FASB) Statements of Financial Accounting Standards (denoted as FAS in this book) and Interpretations (denoted as FIN), Accounting Principles Board (APB) Opinions, and AICPA Accounting Research Bulletins (ARB). As discussed later in this chapter, FASB has proposed that its FASB Staff Positions (FSP) and Derivatives Implementation Group Issues (DIG) also be classified in Category A.
b. Category B consists of FASB Technical Bulletins (FTB) and, if cleared by the FASB, AICPA Industry Audit and Accounting Guides and AICPA Statements of Position (SOP).
c. Category C consists of AICPA Accounting Standards Executive Committee (AcSEC) Practice Bulletins (PB) that have been cleared by the FASB and consensus positions of the FASB Emerging Issues Task Force (EITF).
d. Category D includes AICPA accounting interpretations (AIN), implementation guides (Qs and As) published by the FASB staff, and practices that are widely recognized and prevalent either generally or in the industry.

If financial statement preparers are unable to locate relevant guidance using one of the above sources of established accounting principles, other accounting literature may be con-

---

[2] *The description of a governmental entity, which was agreed to in a joint meeting of the FASB and GASB Boards in 1996, states*

> *Public corporations and bodies corporate and politic are governmental organizations. Other organizations are governmental organizations if they have one or more of the following characteristics:*
>
> a. *Popular election of officers or appointment (or approval) of a controlling majority of the members of the organization's governing body by officials of one or more state or local governments;*
> b. *The potential for unilateral dissolution by a government with the net assets reverting to a government; or*
> c. *The power to enact and enforce a tax levy.*
>
> *Furthermore, organizations are presumed to be governmental if they have the ability to issue directly (rather than through a state or municipal authority) debt that pays interest exempt from federal taxation. However, organizations possessing only that ability (to issue tax-exempt debt) and none of the other governmental characteristics may rebut the presumption that they are governmental if their determination is supported by compelling relevant evidence.*

This publication does not describe GAAP for governmental entities. Readers interested in learning more should consult the publication ***Wiley GAAP for Governments****.*

sidered. These sources include FASB Statements of Financial Accounting Concepts, AICPA Issues Papers, International Financial Reporting Standards of the International Accounting Standards Board and of its predecessor, the International Accounting Standards Committee, Governmental Accounting Standards Board (GASB) Statements, Interpretations and Technical Bulletins, Federal Accounting Standards Advisory Board (FASAB) Statements, Interpretations, and Technical Bulletins, pronouncements of other professional associations or regulatory agencies, Technical Information Service Inquiries and Replies included in AICPA Technical Practice Aids, and accounting textbooks, handbooks and articles. The use of those other sources depends upon their relevance to the particular circumstances, the specificity of the guidance, and the general recognition of the author or issuing organization as an authority. This would mean that FASB publications in this category are to be considered more influential in establishing an acceptable accounting practice than an accounting textbook. Relying on guidance in this category requires the exercise of professional judgment and a broader search of literature sources than would be true in the other four categories.

Note, in particular, that the FASB Concepts Statements are not included in the levels A-D of the GAAP hierarchy, at present. Thus, the guidance in those statements do not take precedence over the various promulgated GAAP. Nonetheless, SAS 69 (current source of the hierarchy) identifies the Concepts Statements as the first of the group of other literature that should be consulted to guide practice in the absence of definitive guidance from a source explicitly cited in the hierarchy. The proposed adoption of a GAAP hierarchy by FASB, superseding that found in the current auditing literature, would effectively elevate the Concepts Statements to level A GAAP. (Note further that FASB is currently reviewing the six extant Concepts Statements with the announced intention of producing a new conceptual framework document.)

Readers should pay close attention to both the relocation of the GAAP hierarchy from the auditing to the accounting literature, and to the replacement of the GAAP hierarchy by the codification. If (as expected) the codification is approved by FASB, all GAAP references will change, not merely for new pronouncements, but for the entire extant body of GAAP. Future editions of this book will reflect such changes when they become official.

Materiality

Materiality as a concept has great significance in understanding, researching, and implementing GAAP. Each Statement of Financial Accounting Standards (FAS) issued by the FASB concludes by stating that the provisions of the statement are not applicable to immaterial items.

Materiality is defined by the FASB as the magnitude of an omission or misstatement in the financial statements that makes it probable that a reasonable person relying on those financial statements would have been influenced by the omitted information or made a different judgment if the correct information had been known. However, due to its inherent subjectivity, the definition does not provide definitive guidance in distinguishing material information from immaterial information. The individual accountant must exercise professional judgment in evaluating information and concluding on its materiality. Materiality as a criterion has both quantitative and qualitative aspects, and items should not be deemed *immaterial* unless all potentially applicable quantitative and qualitative aspects are given full consideration and found not relevant.

Quantitatively, materiality has been defined in relatively few pronouncements, which is a testament to the great difficulty of setting precise measures for materiality. For example, in FAS 131, *Disclosures about Segments of an Enterprise and Related Information*, a material segment or customer is defined as representing 10% or more of the reporting entity's revenues (although, even given this rule, qualitative considerations may cause smaller segments

to be deemed reportable). The Securities and Exchange Commission has in various of its pronouncements defined materiality as 1% of total assets for receivables from officers and stockholders, 5% of total assets for separate balance sheet disclosure of items, and 10% of total revenue for disclosure of oil and gas producing activities.

Although materiality judgments have traditionally been primarily based on quantitative assessments, the nature of a transaction or event can affect a determination of whether that transaction or event is material. For example, a transaction that, if recorded, changes a profit to a loss or changes compliance with ratios in a debt covenant to noncompliance would be material even if it involved an otherwise immaterial amount. Also, a transaction that might be judged immaterial if it occurred as part of routine operations may be material if its occurrence helps meet certain objectives. For example, a transaction that allows management to achieve a target or obtain a bonus that otherwise would not become due would be considered material, regardless of the actual amount involved.

Another factor in judging materiality is the degree of precision that may be attained when making an estimate. For example, accounts payable can usually be estimated more accurately than a possible loss from the incurrence of an asset retirement obligation. An error that would be material in estimating accounts payable might be acceptable in estimating the retirement obligation.

Certain events or transactions may be deemed material because of their nature, regardless of the dollar amounts involved, and thus require disclosure under any circumstances. Offers to buy or sell assets for more or less than book value, litigation proceedings against the company pursuant to price-fixing or antitrust allegations, and active negotiations regarding their settlement can have a material impact on the enterprise's future profitability and, thus, are all examples of items that would not be capable of being evaluated for materiality based solely upon numerical calculations.

It is clear that materiality, as traditionally defined by the accounting and auditing establishment, may no longer align with the definition implicitly applied by financial statement users, including the SEC and other regulatory authorities. Given the epidemic of financial reporting frauds in the late 1990s and early 2000s, it became clear that a more nuanced and complex definition of materiality was probably required. In general, a decision regarding the application of GAAP (e.g., the choice of a nonstandard costing or revenue recognition method for a particular transaction) should be viewed as being immaterial only if all conceivable effects, such as the impact on common financial statement ratios or trends, are expected to be truly immaterial. A strict application of a quantitative threshold—say, 5% of net income—should be avoided, and once a materiality level is established, it should be strictly maintained in the face of identified errors or warranted adjustments in amounts greater than what had been defined.

The SEC, in its Staff Accounting Bulletin 99 (SAB 99), provides a useful discussion of this issue. Although not strictly applicable to nonpublic preparers of financial statements, this guidance is worthy of consideration by all accountants and auditors. Among other things, SAB 99 notes that deliberate application of nonacceptable accounting methods cannot be justified merely because the impact on the financial statements is deemed to be immaterial. SAB 99 also usefully reminds preparers and others that materiality has both quantitative and qualitative dimensions, which must both be given full consideration. More recently, Staff Accounting Bulletin 108 (SAB 108) has added to the literature of materiality with its discussion of considerations applicable to prior period restatements. (See discussion in Chapter 5.)

The Crisis of Confidence Regarding GAAP

Over approximately the past decade, GAAP as a body of standards, and the standard-setting process itself, have increasingly come under attack. A notable string of accounting scandals unfolded in the late 1990s and early 2000s, and as one consequence the entire US financial reporting system was put under the microscope by the nation's leaders, the international financial community, the media, and the general public. What resulted was not only landmark legislation in the form of the Sarbanes-Oxley Act, but also a thorough and ongoing self-examination undertaken by all accountants—from CEOs to auditors to regulators to standard setters.

In 2001, Enron Corp., one of the world's biggest companies at the time, publicly acknowledged that it had failed to comply with existing accounting requirements in at least two areas—sales of stock to special-purpose entities (SPE) and nonconsolidation of certain SPE. This noncompliance caused material overstatements of assets, shareholders' equity, and net income, and the concealment of substantial debt obligations for several years. As a result, Enron's stock price fell to under twenty-five cents per share. As the ensuing events unfolded, public policy discussions and media criticisms of GAAP, of standard setting in the private sector, and of the accounting profession reached unprecedented levels. The criticisms centered primarily on the failure of financial statements to warn investors of the impending collapse of Enron, and on the lack of independence and objectivity of a self-regulating profession that offers both consulting and auditing services to its clients.

Numerous other high-profile business failures and accounting scandals also occurred or came to light during this period. Many involved aggressive accounting by large, formerly well-regarded entities. A watershed event was the revelation of massive $11 billion fraud by WorldCom, which led directly to the enactment of the far-reaching Sarbanes-Oxley Act.

The Sarbanes-Oxley Act of 2002. The result of these business failures and accounting scandals was the Sarbanes-Oxley Act, which included among its provisions the following sweeping changes:

1. Established the Public Company Accounting Oversight Board (PCAOB), to oversee the audits of public companies that are subject to the securities laws of the United States (referred to as "issuers") and to establish auditing, quality control, ethics, independence, and other standards relating to the auditing of the financial statements of issuers. Three of the five PCAOB members cannot be and must not have been certified public accountants.
2. Placed severe limits on an audit firm's ability to provide nonaudit services to its issuer audit clients.
3. Established a requirement that the CEO and the CFO of each issuer certify in each periodic report to the SEC
   a. The appropriateness of the financial statements and disclosures and
   b. That those financial statements and disclosures fairly present, in all material respects, the operational and financial condition of the issuer.
4. Required the SEC to conduct a study of off-balance-sheet transactions and the use of special-purpose entities, and to report its recommendations to Congress.
5. Required the GAO to conduct a study regarding the consolidation of public accounting firms since 1989, including the present and future impact of the consolidation, and the solutions to any problems it discovers.

Another important provision of the Sarbanes-Oxley Act, set forth in Section 404, increases corporate management's responsibility for assessing the effectiveness of internal control over financial reporting. Operational management, as well as financial management, must be more cognizant of their joint responsibility for quality financial reporting. Manage-

ment's methods for assessing internal control will, and should, vary from company to company. Corporate management must assess the risk of material financial statement misstatement along two dimensions: (1) Inherent risk—the susceptibility of one or more financial statement assertions to a material misstatement, and (2) Fraud risk—the risk of material misstatement due to fraudulent financial reporting or theft of assets.

The principal regulatory focus of the Sarbanes-Oxley Act is on auditors and corporate management, which is appropriate because the Enron, WorldCom, and other scandals were primarily the result of management fraud and audit failures, rather than faulty accounting standards. However, there are several requirements of the Act that have the possibility of affecting GAAP and its standards setters.

First, the Act defines the required characteristics of an accounting standards-setting body. For the time being, standards will continue to be set by FASB, as the SEC reaffirmed in 2003 that it will continue to acknowledge FASB's pronouncements as being generally accepted. However, FASB is expected to announce some changes to demonstrate that it "has adopted procedures to ensure prompt consideration, by majority vote of its members, of changes to accounting principles necessary to reflect emerging accounting issues and changing business practices" and "considers, in adopting accounting principles. . . the extent to which international convergence on high quality accounting standards is necessary or appropriate."

Second, the Act requires that the SEC conduct a study on the adoption by the United States financial reporting system of a principles-based accounting system. The study

> *shall include an examination of—(i) the extent to which principles-based accounting and financial reporting exists in the United States; (ii) the length of time required for change from a rules-based to a principles-based financial reporting system; (iii) the feasibility of and proposed methods by which a principles-based system may be implemented; and (iv) a thorough economic analysis of the implementation of a principles-based system.*

That study was released in 2003 and can be found on the Special Studies section of the SEC's Web site (www.sec.gov). Briefly, it found that the oft-cited distinction between rules-based and principles-based standards was largely illusory, inasmuch as high-quality financial reporting standards must be (and have generally been) based on sound principles, but that a pure, principles-only set of standards, without practical guidance, would not serve the public interest.

Principles-based standards. Some have suggested that rules-based accounting standards contributed to the Enron, WorldCom and other collapses. It is true that certain detailed rules found under US GAAP (e.g., capital lease requirements such as the 90% test) have encouraged carefully constructed evasions (e.g., 89% leases), which often provoke even more detailed rules, followed by yet more "engineered" transactions and reporting stratagems. Some observers suggested that the answer to the problems of "gaming the rules" and the ever-increasing complexity of resulting standards might have been found in embracing a principles-based, as opposed to a rules-based, approach to standards setting. To some (limited) extent, the standards published by the International Accounting Standards Board exhibited that characteristic, and some therefore argued that a movement toward principles-based standards might be facilitated by the convergence of US GAAP and international standards.

The idea of a principles-based approach to US standard setting is not new. FASB's conceptual framework, summarized later in this chapter, contains the body of principles that underlies US accounting and reporting. The FASB has used the conceptual framework in developing its accounting standards for more than twenty years. However, FASB has sometimes bowed to pressure to provide exceptions to its principles in order to achieve "desired" accounting results (e.g., to limit the volatility of reported earnings, as with current pension

accounting requirements under FAS 87). Indeed, it is probably the existence of multiple exceptions to the promulgated standards, more than any failure to ground these in general principles, that has opened the door to various reporting practices that, in certain circumstances, permitted the conduct of financial reporting frauds.

If a principles-based approach were implemented by FASB, accounting standards would continue to be developed from the conceptual framework (which is currently under revision), but the principles would apply more broadly than under existing standards. That is, there would be fewer exceptions to the principles in the standards. In addition, FASB, EITF, and AICPA would provide less interpretive and implementation guidance for applying the standards because the overall principle would ostensibly provide the necessary foundation for the answer with such guidance being considered superfluous. Exceptions would be extremely limited under a principles-based approach. In addition, a principles-based approach requires accountants to exercise good professional judgment and to resist the urge to seek specific answers and rulings on every implementation issue. It also would require that the SEC and users of financial information accept the consequences of applying professional judgment, which means there would undoubtedly be some divergence in practice, resulting in some loss of comparability of the financial statements of reporting enterprises.

FASB issued for public comment a proposal for a principles-based approach to US standard setting in 2002, followed by a public roundtable meeting with respondents to the proposal. Many respondents agreed on the need for standards that emphasize principles over detailed rules and report the economic substance of transactions or events. However, many concluded that complex rules are primarily driven by increasingly complex economic transactions (e.g., the explosive growth in the use of hedging and financial derivatives), and that there is no way to return to a simpler time or to simpler GAAP. Also, many respondents expressed concern about using principles-based standards in the current legal and regulatory environment. The well-known penchant for litigation means that, as former Federal Reserve Board Chairman Paul Volcker observed, "(T)he American tradition is to have clear and definite rules, so firms can defend themselves from the hoards of lawyers who stand ready to sue auditors for making a bad judgment."

As of early-2009, it appears that the debate over rules- or principles-based standards may be implicitly resolved by either the full convergence of US GAAP with IFRS or, in what was formerly thought to be unlikely but which is now deemed to be a very real possibility, having IFRS supersede US GAAP. The fact that well over 100 other nations have opted to endorse IFRS (at least for publicly held companies' financial reporting), with as many as another 50 taking steps to have IFRS supersede their respective national GAAP regimes, coupled with the possible granting of permission for IFRS-based reporting by US companies registered with the SEC, makes this further development increasingly probable, in the authors' view.

Standards overload. The recent criticisms of rules-based standards join earlier criticisms about the complexity of accounting standards. Some accountants complain about "standards overload," saying that there are too many accounting standards, which are individually too complex to be understood and implemented, and that too many organizations (SEC, FASB, EITF, AICPA, etc.) are empowered to issue these pronouncements. Complaints regarding standards overload are not new, and with about 163 FASB Statements and myriad other standards (including hundreds of EITF Issues), these complaints must be given credence. However, the solution, if there is one, is not obvious. Nor is it clear that financial reporting frauds, audit failures, or other such phenomena have been the result of this overload. Overwhelmingly, frauds result from the deliberate misapplication of GAAP, and not from an inability on the part of preparers and auditors to comprehend the requirements of the standards.

Some say that a solution would be to reduce and simplify GAAP, especially for entities having characteristics suggesting that the risk of misleading the users of the financial statements might be low. For example, some recommend a size test, with smaller entities following a subset of the standards that are mandated for larger entities (a system now used in the UK, and being proposed by IASB as well). Even this simple suggestion has complications, however; size could arguably be determined by assets, revenues, net worth, or number of owners. Others recommend that public entities, regardless of size, follow a more comprehensive set of standards than privately owned businesses.

Those who disagree say that differing standards would reduce the quality of financial reporting. For example, if decisions about which entities should follow which standards were made using a single criterion for all standards (such as size or ownership), some entities that engage heavily in a certain type of transaction (e.g., derivative financial instruments) might not be subject to the standards for that transaction—even though the recognition, measurement, and disclosure of those transactions was critical to understanding the financial condition and results of operations of the entity. To solve that problem, criteria would need to be based in some way on the underlying subject matter of the standard, which would result in an accountant having to examine each standard to determine if it would apply to a particular entity. That could compound the standards overload problem rather than solve it.

This so-called "big GAAP vs. little GAAP" debate has raged off and on for many decades. When advocates of differential standards are challenged, however, they typically have been unable to identify alternative recognition or measurement principles for large (or public) entities vs. those for smaller (or privately held) entities. Generally, at best, certain disclosures are cited as candidates for slimming down in financial statements of the smaller or private companies. The proposed IASB standard for nonpublicly accountable reporting entities (inaccurately being referred to as smaller and medium-sized entities) would eliminate some alternative but acceptable practices, but would nonetheless allow those entities access to the full range of acceptable practices if so desired. In short, there may be less than meets the eye to this entire controversy.

In fact, the FASB has endeavored in recent years to offer somewhat differentiated standards for disclosures. FAS 126 exempts nonpublic companies from certain financial instrument disclosures if the entity's total assets are less than $100 million and the entity has not held or issued any derivative financial instruments. Nonpublic companies also are not required to disclose earnings per share (FAS 128), segment information (FAS 131), or certain pension and postretirement information (FAS 132R). These exemptions have not, however, been widely hailed as representing significant progress against the perceived problem of standards overload.

To obtain better insight into these issues, in early 2004, the AICPA formed a Private Company Financial Reporting Task Force and charged it with conducting empirical research on the needs of preparers and users of private company financial statements and how well GAAP was meeting those needs, and developing recommendations based upon the results of the study.

The results of its research were mixed. As should have been expected, there were significant perceptual differences between the owner/managers of reporting entities, independent CPA practitioners, and external users. For example, when asked if they would consider it useful for GAAP reporting to be different in certain respects for small companies, the owner/managers' "yes" responses averaged between 57% and 62% (depending on size of their companies), the practitioners' responses between 73% and 77%, the sureties 44%, investors/venture capital firms 46%, and lender/creditors 69%. These results show the tension that exists in the marketplace between financial statement users' voracious needs for information provided for their decision-making purposes on the one hand, and the expense borne

by the reporting entities responsible for preparing those financial statements and for obtaining independent assurance on them on the other hand.

The results of the Task Force's research indicated a moderately high to high rating regarding the overall value of GAAP financial statements to users (primarily lenders, sureties, and equity investors). However, many GAAP accounting or disclosure requirements were rated low by all of the constituents with respect to relevance or usefulness in decision making. These included such topics as pension and postretirement plans; variable interest entities, and share-based payments (FAS123[R] had not yet become effective when the survey was conducted). Based on this and other data revealed by their study, the Task Force concluded that these particular requirements were not meeting the needs of the various constituents of private company reporting and that this would support the need for development of differential GAAP.

In the authors' opinion, this conclusion is based on incomplete information, and we believe that if a similar research study were conducted by polling preparers, auditors, and users of large and public company financial statements, most or all of these same GAAP requirements would be identified as being of limited relevance and usefulness. That is, the authors believe the fundamental problem to be more universal than just "big GAAP/little GAAP." A more holistic reexamination of the GAAP reporting model is necessary in the light of an environment that includes such rampant abuses as earnings manipulation and many other visible failures of GAAP financial statements to fully and truthfully inform stakeholders about the precariousness of their investments.

In addition to the recommendation regarding differential GAAP, the Task Force also recommended changes to the standard-setting model to address the needs of private companies and offered alternatives such as

- Changing the composition of FASB and the Financial Accounting Foundation (FAF) to increase participation from the private company financial statement community
- FAF establishment of a private company standards setter under its jurisdiction
- Creation of a private company standards setter outside the jurisdiction of the FAF

In early 2008, certain of these changes came to fruition, when FAF announced that, as of mid-2008, membership of FASB was to be reduced to five from seven, with simple majority voting being retained. The issue of greater involvement by the financial statement community has been dealt with, in a fashion, by requiring that board members possess investment experience broadly defined. The membership of the oversight body, FAF, is to be optionally increased, and the number and breadth of organizations invited to nominate their trustees will be expanded.

FASB initiatives. In 2002, FASB embarked on a multiple-year, phased initiative to simplify and codify GAAP and make it more easily searchable and retrievable. As noted above, this effort has resulted in a draft codification being made available for user testing in 2008, with implementation now promised for mid-2009.

In another part of the project, FASB has attempted to reduce the complexity of accounting standards by reducing the number of standard-setting bodies that issue authoritative accounting pronouncements. FASB changed the process of the EITF to give FASB more direct involvement with its agenda, deliberations, and conclusions. Two FASB board members were added to the EITF Agenda Committee and FASB is now required to ratify each EITF consensus at a public board meeting before the consensus officially becomes GAAP. Also, FASB and the AICPA agreed that AcSEC would cease issuing Statements of Position that create broadly applicable GAAP, instead limiting its work to specialized industry accounting standards. FASB intends to collaborate with representatives from the EITF, AICPA, and SEC to develop a model for deciding if additional authoritative standards are necessary on a

given topic and then how to most effectively segregate duties among those bodies with respect to issuing those standards.

FASB also wants to more thoroughly assess the cost-benefit relationships of proposed standards; presumably, complex standards are more costly to implement, and thus the costs are more likely to outweigh the expected benefits to users. If so, enactment would be less probable. To understand the costs of a proposed standard, FASB intends to actively engage its constituents in a discussion of the costs as a formal step in the Board's due process. To understand more fully the benefits of a proposed standard, FASB has created a User Advisory Council, a group of forty professionals representing a variety of investment and analytical disciplines, which will be consulted on specific projects as well as helping the Board formulate its overall agenda. During 2004, FASB also established a Small Business Advisory Committee (SBAC) in order to obtain additional needed input from its small business constituents.

In 2005, the FASB and AICPA separately issued Exposure Drafts proposing to move the nongovernmental GAAP Hierarchy, discussed earlier in this chapter, from the auditing literature to the accounting literature. In connection with this change, the Exposure Drafts also designated FASB Staff Positions (FSP) and Derivatives Implementation Group Issues (DIG) as "Level A" GAAP. This resulted in FAS 162, issued in May 2008.

FASB acknowledged that this standard is only transitional in nature. Its long-range plan is to reduce the number of levels in the hierarchy to just two, authoritative and nonauthoritative, and this will be achieved when the codification is finally promulgated. In addition, at the conclusion of its current projects on codification and retrieval and on its conceptual framework, FASB expects to address any inconsistencies in guidance that make the current four-tier structure necessary and to address the role of its Statements of Financial Accounting Concepts in the hierarchy.

Although these FASB initiatives are viewed by many as a step in the right direction, it remains to be seen whether they successfully answer criticisms of standards overload. The financial environment is increasingly complex and litigious, which makes a lessening of the burden of GAAP unlikely in the near term.

IASB initiatives. While the debate in the US continues over the need for simplified "small GAAP," the international standard setter, IASB, has proposed a comprehensive standard that would (much like an earlier, and apparently successful, UK GAAP initiative) capture the key guidance for entities having no public reporting responsibilities (of whatever size), streamlining some existing standards and culling alternatives that are deemed, for whatever reason, nonapplicable to these nonpublic reporting entities. A controversial proposal, the Exposure Draft (available at www.iasb.org/Current+Projects/IASB+Projects/Small+Mediumsized+Entities/Exposure+Drafts+forSmall+Mediumsized+Entities.htm) was open for comments until October 1, 2007, and is still being debated as of early-2009. It is highly likely that the SME proposal, or a close approximation thereof, will be enacted before year-end 2009. The strongest argument against this (or any similar) proposal is that it is the natures of the business transactions (e.g., those involving derivatives, guarantees, compound instruments having attributes of debt and equity) that should dictate the required accounting, and that even smaller or nonpublic entities engaging in such transactions should be bound by proper financial reporting standards. On the other side of the argument are those who claim that modern GAAP has become too complex for preparers, auditors, and users, particularly when addressing financial statements of smaller, less-sophisticated companies, thus justifying the use of streamlined standards.

The AICPA and its diminished influence. In the aftermath of the various financial reporting scandals previously discussed, many in the business and accounting communities criticized the AICPA for not proactively and forthrightly acknowledging systematic short-

comings in both the financial reporting and auditing realms and for not taking a visible leadership role in developing proposed solutions regarding their remediation. This perception that the AICPA was "sitting on the sidelines" as these scandals unfolded undoubtedly contributed to the creation, by the Sarbanes-Oxley Act, of the Public Company Accounting Oversight Board and its charge to oversee the auditing profession with respect to the audits of issuers. The PCAOB assumed the AICPA's previous responsibilities for ethics, independence, quality control, continuing professional education, peer review, and auditing standards as they relate to auditors of public company issuers.

Under these circumstances, the AICPA was (and still is) in danger of being rendered irrelevant as a standard setter and, no less, as a standard bearer for the profession. Its auditing standards board (ASB) has continued to issue pronouncements that are binding on auditors of nonissuers while the PCAOB has diverged from the AICPA's auditing standards by issuing its own standards. This provides fodder for debate regarding the advisability of "big GAAS, little GAAS." To the detriment of the auditing profession, the ultimate resolution of this conflict might be left to the judiciary if, as is quite conceivable, a nonissuer audit failure is alleged to have occurred that the plaintiff alleges might have been prevented had the auditor followed the PCAOB standards instead of the Auditing Standards Board standards.

Alleged harmful effects of standards. In general, reporting entities have not welcomed proposals for new standards, since these inevitably involve change, costs of implementation, and, perhaps, a period of confusion while the marketplace assimilates the new information. In addition, the business community often claims that FASB does not understand the economic impact of new standards on their businesses. It complains that the implementation of certain accounting standards will harm business' ability to compete in the global marketplace and will impede its ability to raise debt or equity capital on favorable terms.

Two early examples of such resistance were the issuance of FAS 43 (compensated absences) and FAS 106 (postretirement benefits). In both cases, the business community said that the new standard would force it to reduce benefits to employees—and in some cases it did just that. The counterargument was perhaps more impressive, however: as a consequence of formerly failing to fully account for the actual economics of promises made or benefits granted, companies were misled regarding their true financial condition, which, once exposed, resulted in changes in behavior that were arguably long overdue. Managers were harmed by their former ignorance and by the delay; they were not hurt by the truth. (Proposed changes to accounting for pensions and other postemployment benefits, discussed in Chapter 16, will inevitably also trigger much anguish and again, quite possibly, reductions in promised benefits).

In two recent cases, dissatisfaction with proposed standards escalated to the point where the business community asked the federal government to intervene. When, in the mid-1990s, FASB proposed that the value of stock options granted to employees be reflected as an expense in the financial statements, the business community, and particularly technology firms, loudly claimed that the proposed recognition would have a dramatic and negative economic effect. First, the argument went, it would force them to discontinue issuing stock options, which would prevent the companies from compensating valuable employees. Second, to the extent options were granted and reflected in expense, it would cause the firms' costs of capital to increase significantly because of lower levels of reported profitability. Finally, it would put US firms at a competitive disadvantage to foreign companies that did not have to expense the value of stock options (or were not offering this benefit to employees).

Before that battle ended, "sense of the House" and "sense of the Senate" resolutions had been introduced, objecting to FASB's tentative conclusions, and a bill had been introduced that would have, if enacted, precluded the recognition of the value of stock options as an

expense as a matter of law. This debate threatened not only the stock-based compensation standard, but also the future of accounting standard setting in the private sector itself. That concern contributed to FASB's decision to issue FAS 123 with only a requirement for disclosure of the value of stock options, with recognition and measurement optionally continuing under prior (APB 25) rules. Not surprisingly, virtually all publicly held companies continued to utilize the "implicit value" approach of APB 25, even though FAS 123 clearly stated that the "fair value" approach was preferable GAAP. (Interestingly, after the Enron and WorldCom scandals, and the resulting Sarbanes-Oxley legislation, some companies began to voluntarily expense options, and FASB responded by issuing an Exposure Draft in March 2004, later finalized as FAS123(R), that requires companies to expense share-based compensation.

Later, when FASB was pursuing its derivative financial instruments project, the business community again approached the Congress with a request for it to intercede in the debate. Although the federal government was not as quick to intervene in this instance, FASB was again criticized by several members of Congress and by their staff. To have been thus criticized and, in part, thwarted by influential government officials twice in a span of five years might have proved to be detrimental as the Congress considered legislation in response to the collapse of Enron Corp. However, standard setting in the private sector, and the supremacy of FASB in the standard-setting role, appear to have survived those challenges, at least for the immediate future. It remains to be seen how, if at all, convergence with—or possible supersession by—IFRS might be responded to by those who wish to see a more prominent role by government in the financial reporting standard-setting sphere.

The Business Reporting Research Project

Beginning in 1998, FASB undertook research on business reporting (which has been defined to include both financial and nonfinancial information), with the goal of identifying the types of information businesses were already voluntarily providing, and the means used to deliver it.

FASB produced four reports setting forth results of this project as follows:

1. *Update of Electronic Distribution of Business Reporting Information—Survey of Business Reporting Research Information on Companies' Internet Sites (May 2002)*, an update of the report issued in 2000, which describes the reporting of business information over the Internet and identifies notable practices.
2. *Improving Business Reporting: Insights into Voluntary Disclosures* (January 2001), which identifies the kinds of business information that corporations in eight selected industries are reporting outside of their financial statements.
3. *GAAPSEC Disclosure Requirements* (March 2001), which identifies redundancies between GAAP and SEC disclosure requirements and ways to eliminate them.
4. *Business and Financial Reporting: Challenges from the New Economy* (April 2001), which examines the perceived "disconnect" between information provided in financial statements ("old economy" financial reporting) and the information needs of investors and creditors ("new economy" financial reporting).

The FASB business reporting research project appears, as of early-2009, to no longer be an active undertaking.

Other projects and proposals have followed, produced by accounting standards-related bodies and others, including a number of private-sector and academic proposals worthy of attention. Most recently, a far-reaching set of changes to financial reporting has been proposed by the CFA Institute (*A Comprehensive Business Reporting Model: Financial Reporting for Investors* [draft, October 2005], which, among other things, strongly endorses

universal use of fair value information). However, to this date, there have been no fundamental changes in financial reporting requirements or expectations. Perhaps the most promising currently ongoing effort is FASB's *Financial Statement Presentation* (originally, *Financial Performance Reporting*) project, preliminary views on which are expected to be unveiled in late 2008. A joint undertaking with the International Accounting Standards Board (IASB), this is intended to establish standards for the presentation of information in financial statements that would improve the usefulness of that information in assessing the financial performance of an entity.

This project is to focus on form and content, classification and aggregation, and display of specified items and summarized amounts on the face of the financial statements. That includes determining whether to require the display of certain items determined to be key measures or necessary for the calculation of key measures. The project will not address management discussion and analysis (MD&A found in SEC filings) or the reporting of pro forma earnings in press releases or other communications outside financial statements. Also, it will not address segment information or matters of recognition or measurement of items in financial statements. As of mid-2008, a number of tentative decisions have been made by FASB and IASB, but much work remains to be done on this project.

This project is discussed in somewhat more detail in Chapter 3.

RESEARCHING GAAP PROBLEMS

The research procedures presented here are intended to serve as a general model for approaching research on accounting issues or questions you may have. These procedures are only intended as an illustration of the process, not as a "cookbook" approach. These procedures should be refined and adapted to each individual fact situation.

Research Procedures

Step 1: Identify the Problem

It has been observed that the act of defining a problem provides a large fraction of the solution to the problem. This certainly applies to the domain of researching financial reporting issues, as well. Most often it is found that incorrect answers (e.g., regarding the proper way to report revenue-producing activities) flow from improper definition of the actual question to be resolved. Provisional definitions of problems should be vigorously challenged *before* attempting to search for solutions. The process to be employed is to

- Gain an understanding of the problem or question.
- Challenge the tentative definition of the problem and revise, as necessary.
- Problems and research questions can arise from new authoritative pronouncements, changes in a firm's economic operating environment, or new transactions, as well as from the realization that the problem had not been properly defined in the past.
- It is important to remember that research can be performed before or after the critical event has occurred. However, if proposed transactions and potential economic circumstances are anticipated, more deliberate attention can be directed at finding the correct solution, and certain proposed transactions having deleterious reporting consequences might be avoided altogether or structured more favorably.
- If little is known about the subject area, it may be useful to consult general reference sources (e.g., *Journal of Accountancy, CPA Journal, Business Week*) to become more familiar with the topic and build up some "economic horse sense" in the area (i.e., the basic what, why, how, when, who, where). Web-based research vastly expands the ability to gather useful information.

- If you are a preparer/auditor, ensure that you have sufficiently determined whether the issue you are researching is a GAAP issue or an auditing issue so that your search is directed to the appropriate literature.
- With the ongoing process of convergence with IFRS (and possible IFRS adoption) a reality, it will be wise to consider not merely short-term implications under US GAAP, but longer-term potential ramifications if changes are made to existing GAAP.

Step 2: Analyze the Problem

- Identify critical factors, issues, and questions that relate to the research problem.
- What are the options? Brainstorm possible alternative accounting treatments. Note that alternatives continue to narrow both under US GAAP and also due to ongoing efforts to converge to IFRS.
- What are the goals of the transaction? Are these goals compatible with full and transparent disclosure and recognition? Evolving GAAP and IFRS will both place greater emphasis on "transparency" in financial reporting.
- What is the economic substance of the transaction, irrespective of the manner in which it appears to be structured?
- What limitations or factors can impact the accounting treatment?

Step 3: Refine the Problem Statement

- Clearly articulate the critical issues in a way that will facilitate research and analysis.

Step 4: Identify Plausible Alternatives

- Plausible alternative solutions are based upon prior knowledge or theory.
- Additional alternatives may be identified as steps 5-7 are completed.
- The purpose of identifying and discussing different alternatives is to be able to respond to key accounting issues that arise out of a specific situation.
- The alternatives are the potential methods of accounting for the situation from which only one will ultimately be chosen.
- Exploring alternatives is important because many times there is no single cut-and-dried financial reporting solution to the situation.
- Ambiguity often surrounds many transactions and related accounting issues and, accordingly, the accountant and business advisor must explore the alternatives and use professional judgment in deciding on the proper course of action.
- Remember that other accountants may reasonably disagree with the judgment used or conclusions made, but this does not necessarily mean they are right.

Step 5: Develop a Research Strategy

- Determine which authorities or literature need to be searched. Often it will be necessary to search all authoritative literature (FASB, EITF, SEC, AICPA, etc.) as well as current reporting practices (e.g., annual reports).
- Generate keywords or phrases that will form the basis of an electronic search.
- Consider trying a broad search to
  - Assist in developing an understanding of the area,
  - Identify appropriate search terms, and
  - Identify related issues and terminology.
- Consider trying very precise searches to identify if there is authoritative literature directly on point.

Step 6: Search Authoritative Literature (described in additional detail below)

- This step involves implementation of the research strategy through searching, identifying, and locating applicable information.
  - Research published GAAP.
  - Research using *Wiley GAAP*.
  - Research other literature.
  - Research practice.
  - Use theory.
  - Find analogous events and/or concepts that are reasonably similar.

Step 7: Evaluation

- Analyze and evaluate all of the information obtained.
- This evaluation should lead to the development of a solution or recommendation. Again it is important to remember that steps 3-7 describe activities that will interact with each other and lead to a more refined process in total, and a more complete solution. These steps may involve several iterations.

Search Authoritative Literature (Step 6) —Further Explanation

The following sections discuss in more detail how to search authoritative literature as outlined in Step 6.

Researching authoritative sources of GAAP. Begin with the publications that set forth the accounting standards in the GAAP hierarchy—the FASB, the AICPA, and the EITF (and for public companies, the SEC).

FASB publishes both loose leaf and bound sets of books, as well as CDROMs, of the *Current Text* and the *Original Pronouncements*. The former integrates all of the currently recognized category A GAAP alphabetically in topic order (e.g., Accounting Changes, Business Combinations, etc.). The AICPA Research Bulletins, APB Opinions, and FASB Statements and Interpretations have been combined in this integrated document. Supplemental guidance from the AICPA Accounting Interpretations and FASB Technical Bulletins is also incorporated. All these materials have been edited down from the original pronouncements and thus may lack the precision that can be obtained only from the unedited version. Each paragraph in the *Current Text* is referenced to the pronouncement from which it is drawn, which is useful for research or follow-up. The first volume of the *Current Text* deals with general standards, while the second contains standards for specialized industries. Descriptive materials, including reasons for conclusions, are absent from the *Current Text*.

The *Original Pronouncements* contains all of the AICPA Accounting Research Bulletins, APB Opinions, the FASB Standards, Interpretations, Concepts Statements, and Technical Bulletins. Paragraphs containing accounting principles that have been superseded or dropped are shaded to alert the user. All changes are identified in detail on a status page placed at the beginning of each pronouncement, which can also assist the user in finding other relevant materials.

Generally, if a quick answer to a specific question is needed, the *Current Text* can be accessed readily. If a fuller understanding of the answer and the reasons underlying it are required, the *Original Pronouncements* may be preferable. In many cases, both sources should be consulted.

FASB also publishes the *EITF Abstracts* (category C GAAP). Each EITF issue discussed by the Task Force is included in the book, regardless of whether a consensus was reached, in the order in which they were added to the EITF agenda. A status section at the end of each issue indicates whether the consensus has been superseded or remains relevant and whether any additional EITF discussion is planned. Many issues are discussed a number

of times, and in some cases consensuses are withdrawn or modified in subsequent considerations of a given issue. Accordingly, care must be exercised because, unlike FASB Statements, for example, issues addressed in EITF consensuses can evolve without adequate notice that they have been affected by subsequently issued standards.

EITF Abstracts also includes EITF Discussion Issues, which are FASB or SEC staff announcements of positions taken on issues that have yet to be resolved, or even addressed, by the EITF or other standard-setting bodies. While not within the GAAP hierarchy, these do represent current thinking on the particular topic and should be given due consideration in resolving practice problems. The more important of these are covered in this book.

FASB staff issues application guidance (like that found in FASB Staff Implementation Guides and EITF Discussion Issues) through FASB Staff Positions (which it intends to belong to category A GAAP). The staff positions are initially communicated through the FASB Web site (www.fasb.org) and remain there until incorporated into printed FASB literature. FASB staff positions are answers to questions about appropriate application of FASB literature expected to be of widespread relevance to constituents and for which the FASB staff believes that there is only one acceptable answer. The more important of these are covered in this book.

The AICPA publishes all its outstanding Statements of Position and Practice Bulletins in *AICPA Technical Practice Aids.* That book is organized in a manner similar to FASB's *Original Pronouncements*, with the SOP and Practice Bulletins included in the order in which they were issued. There are 26 audit and accounting guides, which are listed at the front of this publication following the AICPA Statements of Position. These publications are available in soft-cover, loose-leaf binder, and electronically on the Internet or CD-ROM.

There are also several commercial services that provide electronic Web-based access to all promulgated GAAP. The great advantage of electronic access is that information can be randomly accessed, so a search by topic will yield a plethora of potentially useful leads. The "fuzzy search" option is quite forgiving of poorly articulated search terms, most often leading the researcher to relevant materials even when the seeker is not clear about what is actually being sought.

Researching using *Wiley GAAP Codification Edition*. This publication can assist in researching generally accepted accounting principles for the purpose of identifying technical answers to specific inquiries. You can begin your search in one of two ways: by using the contents page at the front of this book to determine the chapter in which the answer to your question is likely to be discussed, or by using the index at the back of this publication to identify specific pages of the publication that discuss the subject matter relating to your question. The path chosen depends in part on how specific the question is; an initial reading of the chapter or relevant section thereof will provide a broader perspective on the subject. For example, if one wanted to know how to account for receivables pledged as collateral, it would be best to start with Chapter 5. However, if one's interest was limited to securitizations of credit card portfolios, it might be better to search the index, because securitizations are a very specialized type of transaction involving receivables, addressed in only a few pages of the text.

Each chapter in this publication is organized in the following manner:

- A chapter table of contents on the first page of the chapter
- Perspective and Issues, providing an overview of the chapter contents and noting any current controversy or proposed GAAP changes affecting the chapter's topics
- Definition of Terms, defining any specialized terms unique to the chapter's subject matter
- Concepts, Rules, and Examples, setting forth the detailed guidance and examples

After reading the relevant portions of this publication, the Sources of GAAP box can be used to find the authoritative pronouncements related to the topic so that these can be appropriately understood and cited in documenting your research findings and conclusions. Upon identifying these pronouncements, refer to the Authoritative Accounting Pronouncements section preceding this chapter, which lists all authoritative pronouncements currently in effect in numerical order. The listed pronouncements are referenced both to the *Current Text* published by FASB and to pages in this publication. Using this list, one can crossreference to or from this publication to both the original pronouncements and/or the *Current Text*. Likewise, the reader familiar with the professional literature can use the listing of authoritative accounting pronouncements to quickly locate the pages in this publication relevant to each specific pronouncement. The reader can therefore locate more detail on each topic covered in this publication, and also be aware of those few, highly specialized topics and pronouncements not covered within this publication.

The current status of each EITF Issue is indicated—that is, whether superseded, resolved, or consensus reached by the EITF, or whether further discussion is pending. Explanations of EITF Issues are integrated in the chapter text to facilitate a logical flow, enhance readability, and increase the likelihood that the researcher will find the information relevant to his or her issue logically grouped together in the most easily retrievable manner.

Researching nonpromulgated GAAP. Researching nonpromulgated GAAP consists of reviewing pronouncements in areas similar to those being researched, reading accounting literature mentioned in the GAAP hierarchy as "other sources" to be used when sources at levels A through D do not exist, and careful reading of the relevant portions of the FASB Conceptual Framework summarized later in this chapter. Understanding concepts and intentions espoused by accounting experts can give the essential clues to a logical formulation of alternatives and conclusions regarding problems that have not yet been addressed by the standard-setting bodies.

Both the AICPA and FASB publish a myriad of nonauthoritative literature. FASB publishes the documents it uses in its due process: Discussion Memorandums, Invitations to Comment, Exposure Drafts, and Preliminary Views as well as minutes from its meetings. It also publishes research reports, newsletters, and implementation guidance. The AICPA publishes its Exposure Drafts, as well as Technical Practice Aids, Issues Papers, comment letters on proposals of other standard-setting bodies, and the monthly periodical, *Journal of Accountancy*. Technical Practice Aids are answers published by the AICPA Technical Information Service to questions about accounting and auditing standards. AICPA Issues Papers are research documents about accounting and reporting problems that the AICPA believes should be resolved by FASB. They provide information about alternative accounting treatments used in practice. These two AICPA publications, which are not approved by FASB, have no authoritative status, but those who depart from their guidance should be prepared to justify that departure based upon the facts and circumstances of the particular situation. Listings of FASB and AICPA publications are available at their Web sites. (A list of Web site addresses is located at the end of this chapter.)

The Securities and Exchange Commission issues Staff Accounting Bulletins and makes rulings on individual cases that come before it, which create and impose accounting standards on those whose financial statements are to be submitted to the Commission. The SEC, through acts passed by Congress, has been given broad powers to prescribe accounting practices and methods for all statements filed with it.

The International Accounting Standards Board (IASB) publishes its standards, interpretations, the *Framework for the Preparation and Presentation of Financial Statements*, and project archives. Summaries of the standards and interpretations and the project archives are

available at the Board's Web site, along with instructions for purchasing the complete standards, interpretations, and other materials.

The American Accounting Association (AAA) is an organization consisting primarily of accounting educators. It is devoted to encouraging research into accounting theory and practice. The issuances of the AAA tend to be normative, that is, prescribing what GAAP ought to be like, rather than explaining current standards. However, the monographs, committee reports, and *The Accounting Review* published by the AAA may be useful sources for research into applicable accounting standards.

Governmental agencies such as the Government Accountability Office, the Federal Accounting Standards Advisory Board, and the Cost Accounting Standards Board have certain publications that may assist in researching written standards. Also, industry organizations and associations may be other helpful sources.

Certain publications are helpful in identifying practices used by entities that may not be promulgated as standards. The AICPA publishes an annual survey of the accounting and disclosure policies of many public companies in *Accounting Trends and Techniques* and maintains a library of financial statements that can be accessed through a computerized search process (NAARS). EDGAR (Electronic Data Gathering, Analysis, and Retrieval) publishes the SEC filings of public companies, which includes the companies' financial statements. Through selection of keywords and/or topics, these services can provide information on how other entities resolved similar problems.

Internet-based research sources. There has been and continues to be an information revolution affecting the exponential growth in the volume of materials, authoritative and nonauthoritative, that are available on the Internet. A listing of just a small cross-section of these sources follows:

Accounting Web sites

AICPA Online	http://www.aicpa.org	Includes accounting news section; CPE information; section on professional ethics; information on relevant Congressional/Executive actions; online publications, such as the *Journal of Accountancy*; Accounting Standards Executive Committee; also has links to other organizations; includes links to authoritative standards for nonissuers including auditing standards, attestation standards, and quality control standards
American Accounting Association	http://www.aaahq.org	Accounting news; publications; faculty information; searchable; links to other sites
FASB	http://www.fasb.org	Information on FASB; includes list of new Pronouncements/Statements; summaries of selected projects; summaries/status of all FASB Statements. Due to funding provided by PCAOB, FASB now posts its statements, interpretations, staff positions, and newly issued EITF issues on its Web site.
FASB Codification	http://asc.fasb.org/home	Searchable database using the new accounting codification; includes cross-referencing and tutorials

GASB	http://www.gasb.org	Information on GASB; new GASB documents; summaries/status of all GASB statements; proposed Statements; Technical Bulletins; Interpretations
International Accounting Standards Board (IASB)	http://www.iasb.org.uk	Information on the IASB; lists of Pronouncements, Exposure Drafts, project summaries, and conceptual framework
NASBA	http://www.nasba.org	National State Boards of Accountancy; includes listings of registered CPE sponsors and links to state boards of accountancy as well as standards governing continuing professional education that it jointly issues with the AICPA
PCAOB	http://www.pcaobus.org	Sections on rulemaking, standards (including the interim auditing, attestation, quality control, ethics, and independence standards), enforcement, inspections and oversight activities
Rutgers Accounting Web	http://www.accounting.rutgers.edu	Includes links to journals and publications, software, publishers, educational institutions, government agencies, and information regarding continuous auditing initiatives
SEC	http://www.sec.gov	SEC digest and statements; EDGAR searchable database; information on current SEC rulemaking; links to other sites
WebCPA	http://www.webcpa.com	Breaking news regarding the profession, links to regulators, taxing agencies, associations, and agencies

Example of how to solve a GAAP problem. As an example of how to solve a GAAP problem, let us examine how the FASB and its staff approached a question raised by the Edison Electric Institute (EEI) in the project that eventually led to FAS 143, *Asset Retirement Obligations*.

The EEI requested that the FASB add a project to its agenda to determine the appropriate accounting for removal costs, such as the costs of nuclear decommissioning and similar costs affecting other industries. At the time this was raised, the existing accounting practices for removal costs were inconsistent as to the criteria used for recognition, measurement, and the presentation of the obligation in the financial statements. Some entities did not recognize any obligations for removal costs until actually incurred. Other entities estimated the cost of retiring the asset and accrued a portion of that amount each period as an expense, with an offsetting liability, so that when the asset was retired a liability for the full amount of the removal costs would already be on the ledger. Still others recognized the expense but displayed the credit side of the entry as a contra asset rather than a liability.

FASB looked for an analogous situation and found one in FAS 19, *Financial Accounting and Reporting by Oil and Gas Producing Companies*. Paragraph 37 of that standard states that "estimated dismantlement, restoration, and abandonment cost shall be taken into account in determining amortization and depreciation rates." The effect of that paragraph was that the credit side of the entry was to accumulated depreciation, which could result in an accumulated depreciation amount that exceeded the cost of the asset. There was no recognition of an obligation to dismantle and restore the property (a liability). Instead the focus was on achieving a particular pattern of expense recognition. Because the amount of the obligation that the entity had incurred was not a central concern under FAS 19, the FASB (which em-

braced a balance sheet orientation in its conceptual framework, which was issued after FAS 19 was promulgated) rejected it and sought another solution.

FASB considered the definition of a liability in paragraphs 36-40 of CON 6 to determine whether nuclear decommissioning and similar asset retirements could be considered liabilities of the entities owning the assets. Since the first characteristic of a liability—that an entity has "a present duty or responsibility to one or more other entities that entails settlement by probable future transfer or use of assets at a specified or determinable date, on occurrence of a specified event, or on demand"—would be met when an entity is required by current laws, regulations, or contracts to settle an asset retirement obligation upon retirement of the asset, FASB concluded that accounting for this liability would be the central goal of the new standard.

In some situations, the duty or responsibility to remove the asset is created by an entity's own promise. In other situations, the duty or responsibility is created by circumstances in which an entity finds itself bound to perform, and others are justified in relying on the entity to perform. Thus, in its initial deliberations, the FASB decided that entities should report both legal and constructive obligations in their financial statements. Paragraph 36 of CON 6, which defines the essential characteristics of a liability, recognizes both types of obligations. It states

> *...although most liabilities rest generally on a foundation of legal rights and duties, existence of a legally enforceable claim is not a prerequisite for an obligation to qualify as a liability if for other reasons the entity has the duty or responsibility to pay cash, to transfer other assets, or to provide services to another entity.*

Paragraph 40 of CON 6 provides further insight. It states

> *Liabilities stemming from equitable or constructive obligations are commonly paid in the same way as legally binding contracts, but they lack the legal sanction that characterizes most liabilities and may be binding primarily because of social or moral sanctions or custom. An equitable obligation stems from ethical or moral constraints rather than from rules of common or statute law....*

During its due process, FASB heard from constituents that without improved guidance for determining whether a constructive obligation exists, inconsistent application of the final standard would result. After further consideration of the qualitative characteristics of reliability and comparability found in CON 2, and the recognition characteristic of reliability in CON 5, the FASB decided to confine recognition only to legal obligations, including legal obligations created under the doctrine of promissory estoppel.

FASB also considered the second characteristic of a liability, that "the duty or responsibility obligates a particular entity, leaving it little or no discretion to avoid the future sacrifice." It concluded that an asset retirement obligation had that characteristic.

FASB considered the third and final characteristic of a liability, that "the transaction or other event obligating the entity has already happened." It concluded that an entity must look to the nature of the duty or responsibility to assess whether the obligating event has occurred. FASB provides the example of a nuclear power facility: although the operator assumes responsibility for decontamination upon receipt of a license, it is not until the facility is operated and contamination occurs that there is an obligating event.

When contemplating the manner in which the asset retirement obligation could be measured, FASB was guided by CON 7. In that concepts statement, FASB concluded that "the only objective of present value, when used in accounting measurements at initial recognition and fresh-start measurements, is to estimate fair value." Based on this, FASB determined that an asset retirement obligation should be measured at fair value, but in the (typical) absence of quoted market prices or prices for similar liabilities, entities should use present value techniques to measure the liability.

In deciding upon the appropriate designation of the debit offsetting the entry recording the obligation, FASB first made reference to the definition of an asset under CON 6. FASB concluded that capitalized asset retirement costs would not qualify for presentation as a separate asset because no separate future economic benefit flows from these costs. Thus, asset retirement costs do not meet the definition of an asset in paragraph 25 of CON 6. However, FASB observed that current accounting practice includes in the historical-cost basis of an asset all the costs that are necessary to prepare the asset for its intended use. FASB concluded that the requirement for capitalization of the asset retirement cost as part of the historical cost of the asset and then depreciating that asset both (1) obtains a measure of cost that more closely reflects the entity's total investment in the asset, and (2) permits the allocation of that cost to expense in the periods over which the related asset would be expected to provide benefits.

Thus, in this actual situation, by reasoning from analogous situations and applying established accounting concepts, FASB was able to develop an important new standard. In a like manner, solutions to GAAP practice problems can be reached. Those solutions will serve the reporting entity in achieving GAAP-compliant financial reporting until a standards-setting body resolves the problem by issuing authoritative guidance.

The Conceptual Framework

FASB has issued seven pronouncements (six of which remain extant) called Statements of Financial Accounting Concepts (CON) in a series designed to constitute a foundation of financial accounting standards. This conceptual framework is designed to prescribe the nature, function, and limits of financial accounting and to be used as a guideline that will lead to consistent standards. These conceptual statements do not establish accounting standards or disclosure practices for particular items. They are not enforceable under the AICPA Code of Professional Conduct.

FASB's conceptual framework is intended to serve as the foundation upon which the Board can construct standards that are both sound and internally consistent. The fact that the framework was intended to guide FASB in establishing standards is embodied in the preface to each of the Concepts Statements. The preface to CON 6 states

> *The Board itself is likely to be the most direct beneficiary of the guidance provided by the Statements in this series. They will guide the Board in developing accounting and reporting standards by providing the Board with a common foundation and basic reasoning on which to consider merits of alternatives.*

The conceptual framework is also intended for use by the business community to help understand and apply standards and to assist in their development. This goal is also mentioned in the preface to each of the Concepts Statements, as this excerpt from CON 6 shows.

> *However, knowledge of the objectives and concepts the Board will use in developing standards also should enable those who are affected by or interested in financial accounting standards to understand better the purposes, content, and characteristics of information provided by financial accounting and reporting. That knowledge is expected to enhance the usefulness of, and confidence in, financial accounting and reporting. The concepts also may provide some guidance in analyzing new or emerging problems of financial accounting and reporting in the absence of applicable authoritative pronouncements.*

The FASB Special Report, *The Framework of Financial Accounting Concepts and Standards* (1998), states that the conceptual framework should help solve complex financial accounting or reporting problems by

- *Providing a set of common premises as a basis for discussion;*
- *Providing precise terminology;*
- *Helping to ask the right questions;*

- *Limiting areas of judgment and discretion and excluding from consideration potential solutions that are in conflict with it; and*
- *Imposing intellectual discipline on what traditionally has been a subjective and ad hoc reasoning process.*

Of the seven CON, the fourth, *Objectives of Financial Reporting by Nonbusiness Organizations*, is not covered here due to its specialized nature.

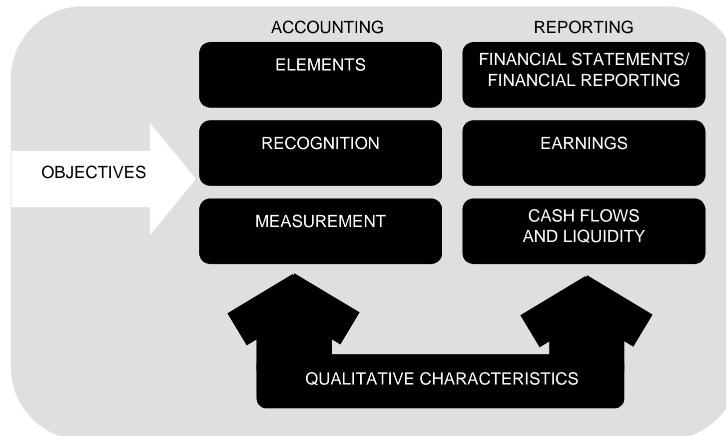
Components of the conceptual framework. The components of the conceptual framework for financial accounting and reporting include objectives, qualitative characteristics, elements, recognition, measurement, financial statements, earnings, funds flow, and liquidity. The relationship between these components is illustrated in the following diagram reproduced from a FASB Invitation to Comment, *Financial Statements and Other Means of Financial Reporting.*

In the diagram, components to the left are more basic and those to the right depend on components to their left. Components are closely related to those above or below them.

The most basic component of the conceptual framework is the objectives. The objectives underlie the other phases and are derived from the needs of those for whom financial information is intended. The qualitative characteristics are the criteria to be used in choosing and evaluating accounting and reporting policies.

Elements of financial statements are the components from which financial statements are created. They include assets, liabilities, equity, investments by owners, distributions to owners, comprehensive income, revenues, expenses, gains, and losses. In order to be included in financial statements, an element must meet criteria for recognition and possess a characteristic that can be reliably measured.

Conceptual Framework
for Financial Accounting and Reporting



Reporting or display considerations is concerned with what information should be provided, who should provide it, and where it should be displayed. How the financial statements (financial position, earnings, and cash flow) are presented is the focal point of this part of the conceptual framework project.

A Statement of Financial Accounting Concepts (CON) does not establish GAAP. Since GAAP may be inconsistent with the principles set forth in the conceptual framework, the FASB expects to reexamine existing accounting standards. Until that time, a CON does not require a change in existing GAAP. CON do not amend, modify, or interpret existing GAAP, nor do they justify departing from GAAP based upon interpretations derived from them.

FASB is currently pursuing several projects affecting the conceptual framework and the GAAP hierarchy. As to the latter, FASB expects to revise the existing hierarchy, now consisting of four levels or categories (plus a catchall fifth level of nonpromulgated guidance, such as from textbooks or scholarly writings, but also including the concepts statements) to a dichotomy between authoritative and nonauthoritative guidance. In the near term, FASB intends to elevate concepts statements to "level A" GAAP. This is indicative of a greater awareness of the relevance of the concepts statements as guidance for making accounting decisions. As numerous older accounting standards have evolved and been superseded by new requirements, such as mandates for the wider use of fair value information within the financial statements, the principles espoused in CON no longer seem as divergent from actual practice, and may more usefully serve as actual, authoritative guides to practice.

CON 1: Objectives of Financial Reporting by Business Enterprises

CON 1 identifies the objectives (purposes) of financial reporting and indicates that these objectives apply to all financial reporting; they are not limited to financial statements. Financial reporting includes the financial statements and other forms of communication that provide accounting information (corporate annual reports, prospectuses, annual reports filed with the Securities and Exchange Commission, news releases, and management forecasts).

CON 1 identifies three objectives of financial reporting. The first objective is to provide information that is useful in making business and economic decisions. Users of financial information are divided into internal and external groups. Internal users include management and directors of the business enterprise. Internal reports tend to provide information that is more detailed than the information available to or used by external users. External users include both individuals who have or intend to have a direct economic interest in a business and those who have an indirect interest because they advise or represent those individuals with a direct interest. These users include owners, lenders, suppliers, potential investors and creditors, employees, customers, financial analysts and advisors, brokers, underwriters, stock exchanges, lawyers, economists, taxing authorities, regulatory authorities, legislators, financial press and reporting agencies, labor unions, trade associations, business researchers, teachers, students, and the public. CON 1 is directed at general-purpose external financial reporting by a business enterprise as it relates to the ability of that enterprise to generate favorable cash flows. External users' needs are emphasized because these users lack the authority to obtain the financial information they want and need from an enterprise. Thus, external users must rely on the information provided to them by management.

The second objective of financial reporting is to provide understandable information that will aid investors and creditors in predicting the future cash flows of a firm. Investors and creditors want information about cash flows because the expectation of cash flows affects a firm's ability to pay interest and dividends, which in turn affects the market price of that firm's stocks and bonds.

The third objective of financial reporting is to provide information relative to an enterprise's economic resources, the claims to those resources (obligations), and the effects of transactions, events, and circumstances that change resources and claims to resources. A description of these informational needs follows:

- **Economic resources, obligations, and owners' equity.** This information provides the users of financial reporting with a measure of future cash flows and an indication of the firm's strengths, weaknesses, liquidity, and solvency.
- **Economic performance and earnings.** Past performance provides an indication of a firm's future performance. Furthermore, earnings based upon accrual accounting provide a better indicator of economic performance and future cash flows than do current

cash receipts and disbursements. Accrual basis earnings are a better indicator because a charge for recovery of capital (depreciation/amortization) is made in determining these earnings. The relationship between earnings and economic performance results from matching the costs and benefits (revenues) of economic activity during a given period by means of accrual accounting. Over the life of an enterprise, economic performance can be determined by net cash flows or by total earnings since the two measures would be equal.

- **Liquidity, solvency, and funds flows.** Information about cash and other funds flows from borrowings, repayments of borrowings, expenditures, capital transactions, economic resources, obligations, owners' equity, and earnings may aid the user of financial reporting information in assessing a firm's liquidity or solvency.
- **Management stewardship and performance.** The assessment of a firm's management with respect to the efficient and profitable use of the firm's resources is usually made on the basis of economic performance as reported by periodic earnings. Because earnings are affected by factors other than current management performance, earnings may not be a reliable indicator of management performance.
- **Management explanations and interpretations.** Management is responsible for the efficient use of a firm's resources. Thus, it acquires knowledge about the enterprise and its performance that is unknown to the external user. Explanations by management concerning the financial impact of transactions, events, circumstances, uncertainties, estimates, judgments, and any effects of the separation of the results of operations into periodic measures of performance enhance the usefulness of financial information.

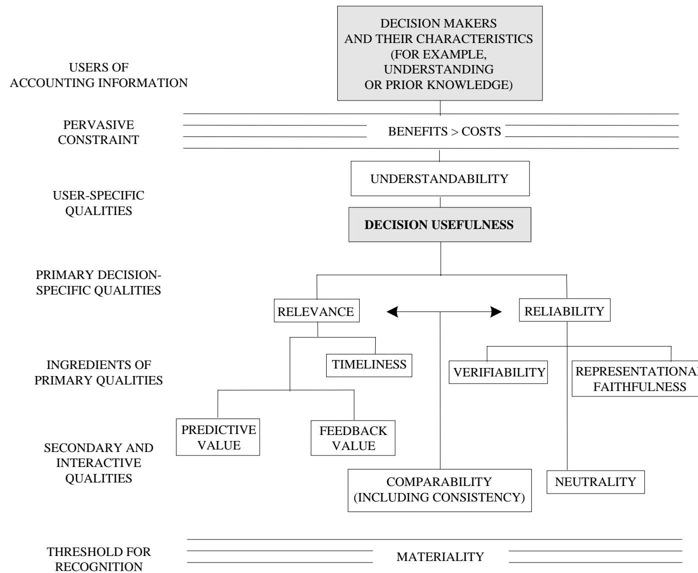
CON 2: Qualitative Characteristics of Accounting Information

The purpose of financial reporting is to provide decision makers with useful information. When accounting choices are to be made by individuals or by standard-setting bodies, those choices should be based upon the usefulness of that information to the decision-making process. This CON identifies the qualities or characteristics that make information useful in the decision making process. It also establishes a terminology and set of definitions to provide a greater understanding of the characteristics. The diagram below from CON 2 summarizes the qualitative characteristics of accounting information.

Usefulness for decision making. This is the most important characteristic of information. Information must be useful to be beneficial to the user. To be useful, accounting information must be both relevant and reliable. Both of these characteristics are affected by the completeness of the information provided.

Relevance. Information is relevant to a decision if it makes a difference to the decision maker in his/her ability to predict events or to confirm or correct expectations. Relevant information will reduce the decision maker's assessment of the uncertainty of the outcome of a decision even though it may not change the decision itself. Information is relevant if it provides knowledge concerning past events (feedback value) or future events (predictive value) and if it is timely. Disclosure requirement information is relevant because it provides information about past events and it improves the predictability of future events. The predictive value of accounting information does not imply that such information is a prediction. The predictive value refers to the utility that a piece of information has as an input into a predictive model. Although timeliness alone will not make information relevant, information must be timely to be relevant. It must be available before it loses its ability to influence the decision maker.

A Hierarchy of Accounting Qualities



Reliability. Financial statements are an abstraction of the activities of a business enterprise. They simplify the activities of the actual firm. To be reliable, financial statements must portray the important financial relationships of the firm itself. Information is reliable if it is verifiable and neutral and if users can depend on it to represent that which it is intended to represent (representational faithfulness).

Information may not be representationally faithful if it is biased. Bias is the tendency for an accounting measure to be consistently too high or too low. Bias may arise because the measurer does not use the measurement method properly or because the measurement method does not represent what it purports to represent.

Verifiability means that several independent measures will obtain the same accounting measure. An accounting measure that can be repeated with the same result (consensus) is desirable because it serves to detect and reduce measurer bias. Cash is highly verifiable. Inventories and depreciable assets tend to be less verifiable because alternative valuation methods exist. The direct verification of an accounting measure would serve to minimize measurer bias and measurement bias. The verification of the procedures used to obtain the measure would minimize measurer bias only. Finally, verifiability does not guarantee representational faithfulness or relevance.

The characteristic of neutrality means that accounting information should serve to communicate without attempting to influence behavior in a particular direction. This does not mean that accounting should not influence behavior or that it should affect everyone in the same way. It means that information should not favor certain interest groups.

To be useful, accounting information should be comparable. The characteristic of comparability allows the users of accounting information to assess the similarities and differences either among different entities for the same time period or for the same entity over different time periods. Comparisons are usually made on the basis of quantifiable measurements of a common characteristic. Therefore, to be comparable, the measurements used must be reliable with respect to the common characteristic. Noncomparability can result from the use of different inputs, procedures, or systems of classification. Noncomparability can also arise when the data measurements lack representational faithfulness.

The characteristic of consistency also contributes to information usefulness. Consistency is an interperiod comparison that requires the use of the same accounting principles from one period to another. Although a change of an accounting principle to a more preferred method results in inconsistency, the change is acceptable if the effect of the change is disclosed. Consistency does not insure comparability. If the measurements used are not representationally faithful, comparability will not be achieved.

Trade-offs. Although it is desirable that accounting information contain the characteristics that have been identified above, not all of these characteristics are compatible. Often, one characteristic may be obtained only by sacrificing another. The trade-offs that must be made are determined on the basis of the relative importance of the characteristics. This relative importance, in turn, is dependent upon the nature of the users and their particular needs.

Constraints. The qualitative characteristics of useful accounting information are subject to two constraints: the materiality and the relative cost benefit of that information. An item of information is material and should be reported if it is significant enough to have an effect on the decision maker. Materiality requires judgment. It is dependent upon the relative size of an item, the precision with which the item can be estimated, and the nature of the item. No general standards of materiality are provided (although an appendix to CON 2 lists several guidelines that have been applied).

Accounting information provides the user with certain benefits. Associated with this benefit, however, is the cost of using that information and of providing it to the user. Information should be provided only if its benefits exceed its cost. Unfortunately, it is difficult to value the benefit of accounting information. It is also difficult to determine whether the burden of the cost of disclosure and the benefits of such disclosure are distributed fairly.

Role of conservatism. Conservatism is a reaction to uncertainty. For many years, accountants have been influenced by conservatism. Conservatism in accounting may mislead users if it results in a deliberate understatement of net assets and net income. Such understatement is undertaken to minimize the risk of uncertainty to outside lenders. Unfortunately, such understatements often lead to overstatements in subsequent years, produce biased financial statements, and conflict with the characteristics of representational faithfulness, neutrality, and comparability.

CON 3: Elements of Financial Statements of Business Enterprises

CON 3 was replaced by CON 6. CON 6 carried forward essentially all of the concepts in CON 3, then added the elements unique to the financial statements of not-for-profit organizations.

CON 5: Recognition and Measurement in Financial Statements of Business Enterprises

CON 5 indicates that financial statements are the principal means of communicating useful financial information. A full set of such statements contains

- Financial position at end of the period
- Earnings for the period
- Comprehensive income for the period
- Cash flows during the period
- Investments by and distributions to owners during the period

Financial statements result from simplifying, condensing, and aggregating transactions. Therefore, no one financial statement provides sufficient information by itself and no one item or part of each statement can summarize the information.

A statement of financial position provides information about an entity's assets, liabilities, and equity. Earnings is a measure of entity performance during a period. It is similar to net income but excludes accounting adjustments from earlier periods such as cumulative effect changes in accounting principles. Comprehensive income comprises all recognized changes in equity other than those arising from investments by and distributions to owners. A statement of cash flows reflects receipts and payments of cash by major sources and uses including operating, financing, and investing activities. The investments by and distributions to owners reflect the capital transactions of an entity during a period.

Income is determined by the concept of financial capital maintenance which means that only if the money amount of net assets increases during a period (excluding capital transactions) is there a profit. For recognition in financial statements, subject to both cost benefit and materiality constraints, an item must meet the following criteria:

1. Definition—Meet the definition of an element in financial statements
2. Measurability—Have a relevant attribute measurable with sufficient reliability
3. Relevance
4. Reliability

Items reported in the financial statements are based on historical cost, replacement cost, market value, net realizable value, and present value of cash flows. Price level changes are not recognized in these statements and conservatism guides the application of recognition criteria.

CON 6: Elements of Financial Statements

CON 6 defines ten interrelated elements that are used in the financial statements of business enterprises.

1. Assets—Probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events
2. Liabilities—Probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events
3. Equity (net assets) —The residual interest in the assets that remains after deducting its liabilities. In a business enterprise, equity is the ownership interest.
4. Revenues—Inflows or other enhancements of assets of an entity or settlement of its liabilities (or a combination of both) from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major and central operations
5. Expenses—Outflows or other using up of assets or incurrences of liabilities (or a combination of both) from delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major and central operations
6. Gains—Increases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity except those that result from revenues or investments by owners
7. Losses—Decreases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity except those that result from expenses or distributions to owners
8. Comprehensive income—The change in equity of a business enterprise during a period from transactions and other events and circumstances from sources other than investments by owners or distributions to owners

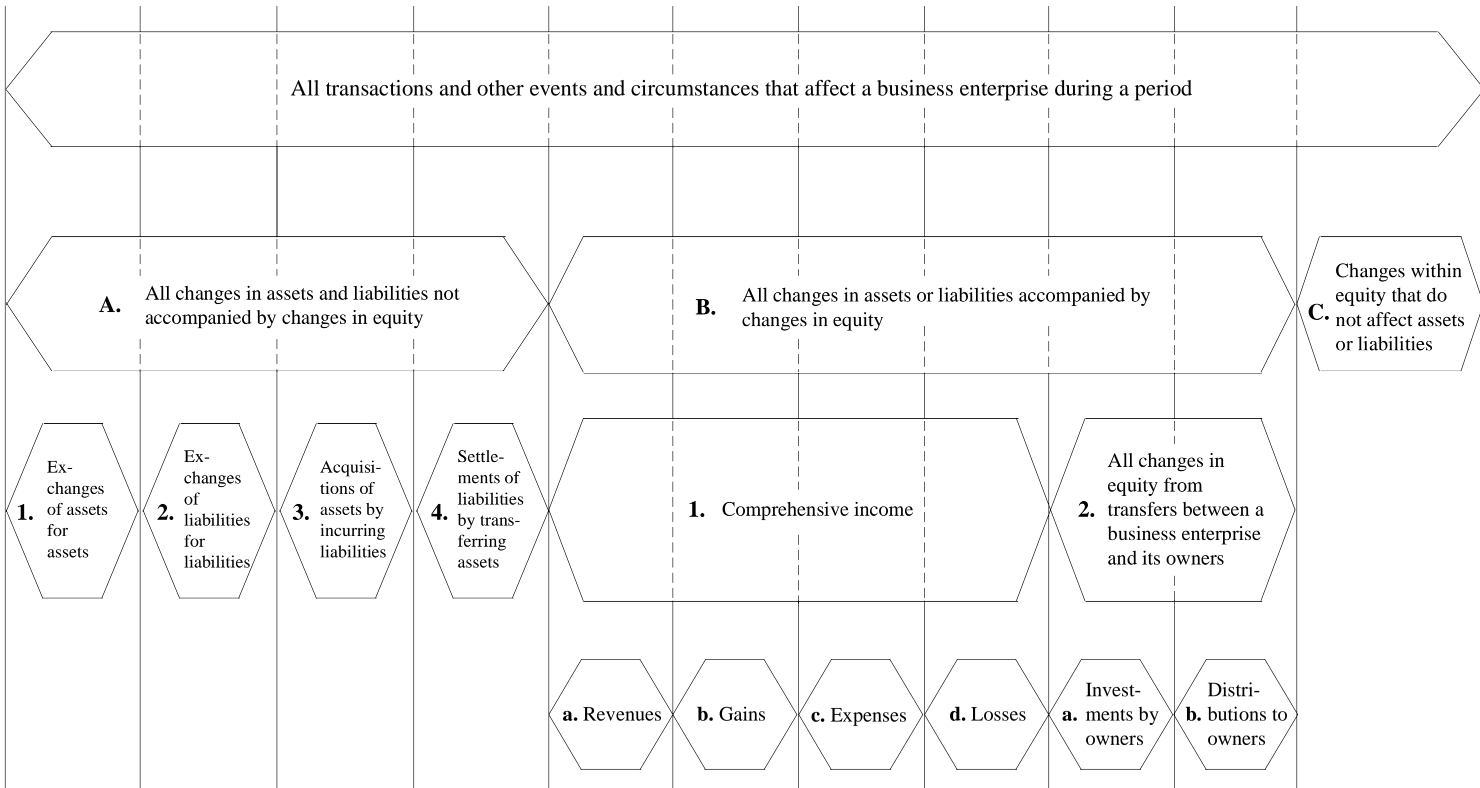
9. Investments by owners—Increases in equity of a particular business enterprise resulting from transfers to it for the purpose of increasing ownership interests
10. Distributions to owners—Decreases in the equity of a particular business enterprise resulting from transferring assets, rendering services, or incurring liabilities to owners

The various elements articulate; that is, a change in one element causes an offsetting change in another item of the same type or causes another element to change by the same amount. For example, a purchase of a building for cash and a mortgage note increases an asset (building), decreases another asset (cash), and increases a liability (mortgage note). A diagram from CON 6 that illustrates the articulation of the elements is included below.

In this publication, assets, liabilities, and equity are described more fully in Chapter 2. Revenues, expenses, gains, losses, and comprehensive income are described in Chapter 3. Investments by owners and distributions to owners are described in Chapter 17.

CON 6 also defines several significant financial accounting and reporting terms that are used in the Concepts Statements (and FASB pronouncements issued after the Concepts Statements). An event is a happening of consequence to an entity. It can be an internal event (the use of raw materials) or an external event with another entity (the purchase of labor) or with the environment in which the business operates (a technological advance by a competitor). A transaction is a particular kind of event. It is an external event that involves transferring something of value to another entity. Circumstances are a condition, or set of conditions, that create situations that might otherwise have not occurred and might not have been anticipated. Accrual accounting attempts to record the financial effects on a entity of transactions and of other events and circumstances that have consequences for the entity in the periods in which those transactions, events, and circumstances occur rather than in the periods in which cash is received or paid by the entity. Thus, accrual accounting is based not only on cash transactions but also on credit transactions, bartering, changes in prices, changes in the form of assets or liabilities, and other transactions, events and circumstances that involve no current cash transfers but will have cash consequences in the future. Accrual is the accounting process of recognizing the effects of future cash receipts and payments in the current period. Deferral is the accounting process of recognizing a liability resulting from a current cash receipt or an asset resulting from a current cash payment. Realization is the process of converting noncash assets into cash. Recognition is the process of formally incorporating a transaction or other event into the financial statements. Matching is the simultaneous recognition of the revenues and expenses that result directly and jointly from the same transaction or other event. Allocation is the process of assigning expenses to periods when the transactions or events that cause the using up of the benefits cannot be identified or when the cause can be identified but the actual amount of benefit used up cannot be reliably measured.

CON 6 also discusses the elements used in the financial statements of not-for-profit organizations. Of the ten elements, seven are used by not-for-profit organizations. The three elements omitted are investments by owners, distributions to owners, and comprehensive income. They are omitted because not-for-profit organizations do not have owners. The seven remaining elements are defined for not-for-profit organizations the same as they are for business enterprises. The net assets (equity) of not-for-profit organizations is divided into three classes—unrestricted, temporarily restricted, and permanently restricted—based on the existence or absence of donor-imposed restrictions. A portion of Chapter 24 describes the accounting and reporting of not-for-profit organizations.



All transactions and other events and circumstances that affect a business enterprise during a period
A. All changes in assets and liabilities not accompanied by changes in equity
B. All changes in assets or liabilities accompanied by changes in equity
C. Changes within equity that do not affect assets or liabilities
1. Exchanges of assets for assets
2. Exchanges of liabilities for liabilities
3. Acquisitions of assets by incurring liabilities
4. Settlements of liabilities by transferring assets
1. Comprehensive income
2. All changes in equity from transfers between a business enterprise and its owners
a. Revenues
b. Gains
c. Expenses
d. Losses
a. Investments by owners
b. Distributions to owners

CON 7: Using Cash Flow Information and Present Value in Accounting Measurements

CON 7 provides a framework for using estimates of future cash flows as the basis for accounting measurements either at initial recognition or when assets are subsequently remeasured at fair value (fresh-start measurements). It also provides a framework for using the interest method of amortization. It provides the principles that govern measurement using present value, especially when the amount of future cash flows, their timing, or both are uncertain. However, it does not address recognition questions, such as which transactions and events should be valued using present value measures or when fresh-start measurements are appropriate.

Fair value is the objective for most measurements at initial recognition and for fresh-start measurements in subsequent periods. At initial recognition, the cash paid or received (historical cost or proceeds) is usually assumed to be fair value, absent evidence to the contrary. For fresh-start measurements, a price that is observed in the marketplace for an essentially similar asset or liability is fair value. If purchase prices and market prices are available, there is no need to use alternative measurement techniques to approximate fair value. However, if alternative measurement techniques must be used for initial recognition and for fresh-start measurements, those techniques should attempt to capture the elements that when taken together would comprise a market price if one existed. The objective is to estimate the price likely to exist in the marketplace if there were a marketplace—fair value.

CON 7 states that the only objective of using present value in accounting measurements is fair value. It is necessary to capture, to the extent possible, the economic differences in the marketplace between sets of estimated future cash flows. A present value measurement that fully captures those differences must include the following elements:

1. An estimate of the future cash flow, or in more complex cases, series of future cash flows at different times
2. Expectations about possible variations in the amount or timing of those cash flows
3. The time value of money, represented by the risk-free rate of interest
4. The risk premium—the price for bearing the uncertainty inherent in the asset or liability
5. Other factors, including illiquidity and market imperfections

How CON 7 measures differ from previously utilized present value techniques. Previously employed present value techniques typically used a single set of estimated cash flows and a single discount (interest) rate. In applying those techniques, adjustments for factors 2. through 5. described in the previous paragraph are incorporated in the selection of the discount rate. In the CON 7 approach, only the third factor listed (the time value of money) is included in the discount rate; the other factors cause adjustments in arriving at risk-adjusted expected cash flows. CON 7 introduces the probability-weighted, expected cash flow approach, which focuses on the range of possible estimated cash flows and estimates of their respective probabilities of occurrence.

Previous techniques used to compute present value used estimates of the cash flows most likely to occur. CON 7 refines and enhances the precision of this model by weighting different cash flow scenarios (regarding the amounts and timing of cash flows) by their estimated probabilities of occurrence and factoring these scenarios into the ultimate determination of fair value. The difference is that values are assigned to the cash flows other than the most likely one. To illustrate, a cash flow might be $100, $200, or $300 with probabilities of 10%, 50%, and 40%, respectively. The most likely cash flow is the one with 50% probability, or $200. The expected cash flow is $230 [=($100 × .1) + ($200 × .5) + ($300 × .4)].

The CON 7 method, unlike previous present value techniques, can also accommodate uncertainty in the timing of cash flows. For example, a cash flow of $10,000 may be received in one year, two years, or three years with probabilities of 15%, 60%, and 25%, respectively. Traditional present value techniques would compute the present value using the most likely timing of the payment—two years. The example below shows the computation of present value using the CON 7 method. Again, the expected present value of $9,030 differs from the traditional notion of a best estimate of $9,070 (the 60% probability) in this example.

Present value of $10,000 in 1 year discounted at 5%	$9,523	
Multiplied by 15% probability		$1,428
Present value of $10,000 in 2 years discounted at 5%	$9,070	
Multiplied by 60% probability		5,442
Present value of $10,000 in 3 years discounted at 5%	$8,638	
Multiplied by 25% probability		2,160
Probability weighted expected present value		$9,030

Measuring liabilities. The measurement of liabilities involves different problems from the measurement of assets; however, the underlying objective is the same. When using present value techniques to estimate the fair value of a liability, the objective is to estimate the value of the assets required currently to (1) settle the liability with the holder or (2) transfer the liability to an entity of comparable credit standing. To estimate the fair value of an entity's notes or bonds payable, accountants look to the price at which other entities are willing to hold the entity's liabilities as assets. For example, the proceeds of a loan are the price that a lender paid to hold the borrower's promise of future cash flows as an asset.

The most relevant measurement of an entity's liabilities should always reflect the credit standing of the entity. An entity with a good credit standing will receive more cash for its promise to pay than an entity with a poor credit standing. For example, if two entities both promise to pay $750 in three years with no stated interest payable in the interim, Entity A, with a good credit standing, might receive about $630 (a 6% interest rate). Entity B, with a poor credit standing, might receive about $533 (a 12% interest rate). Each entity initially records its respective liability at fair value, which is the amount of proceeds received—an amount that incorporates that entity's credit standing.

Present value techniques can also be used to value a guarantee of a liability. Assume that Entity B in the above example owes Entity C. If Entity A were to assume the debt, it would want to be compensated $630—the amount that it could get in the marketplace for its promise to pay $750 in three years. The difference between what Entity A would want to take the place of Entity B ($630) and the amount that Entity B receives ($533) is the value of the guarantee ($97).

Interest method of allocation. CON 7 describes the factors that suggest that an interest method of allocation should be used. It states that the interest method of allocation is more relevant than other methods of cost allocation when it is applied to assets and liabilities that exhibit one or more of the following characteristics:

a. The transaction is, in substance, a borrowing and lending transaction.
b. Period-to-period allocation of similar assets or liabilities employs an interest method.
c. A particular set of estimated future cash flows is closely associated with the asset or liability.
d. The measurement at initial recognition was based on present value.

Accounting for changes in expected cash flows. If the timing or amount of estimated cash flows changes and the asset or liability is not remeasured at a fresh-start measure, the

interest method of allocation should be altered by a catch-up approach. That approach adjusts the carrying amount to the present value of the revised estimated future cash flows, discounted at the original effective interest rate.

Application of present value tables and formulas.

Present value of a single future amount. To take the present value of a single amount that will be paid in the future, apply the following formula; where *PV* is the present value of $1 paid in the future, *r* is the interest rate per period, and *n* is the number of periods between the current date and the future date when the amount will be realized.

$$PV = \frac{1}{(1+r)^n}$$

In many cases the results of this formula are summarized in a present value factor table.

(n) Periods	2%	3%	4%	5%	6%	7%	8%	9%	10%
1	0.9804	0.9709	0.9615	0.9524	0.9434	0.9346	0.9259	0.9174	0.9091
2	0.9612	0.9426	0.9246	0.9070	0.8900	0.8734	0.8573	0.8417	0.8265
3	0.9423	0.9151	0.8890	0.8638	0.8396	0.8163	0.7938	0.7722	0.7513
4	0.9239	0.8885	0.8548	0.8227	0.7921	0.7629	0.7350	0.7084	0.6830
5	0.9057	0.8626	0.8219	0.7835	0.7473	0.7130	0.6806	0.6499	0.6209

Example

Suppose one wishes to determine how much would need to be invested today to have $10,000 in 5 years if the sum invested would earn 8%. Looking across the row with n = 5 and finding the present value factor for the r = 8% column, the factor of 0.6806 would be identified. Multiplying $10,000 by 0.6806 results in $6,806, the amount that would need to be invested today to have $10,000 at the end of 5 years. Alternatively, using a calculator and applying the present value of a single sum formula, one could multiply $10,000 by $1/(1+.08)^5$, which would also give the same answer—$6,806.

Present value of a series of equal payments (an annuity). Many times in business situations a series of equal payments paid at equal time intervals is required. Examples of these include payments of semiannual bond interest and principal or lease payments. The present value of each of these payments could be added up to find the present value of this annuity, or alternatively a much simpler approach is available. The formula for calculating the present value of an annuity of $1 payments over *n* periodic payments, at a periodic interest rate of *r* is

$$\text{PV Annuity} = \frac{\left(1 - \frac{1}{(1+r)^n}\right)}{r}$$

The results of this formula are summarized in an annuity present value factor table.

(n) Periods	2%	3%	4%	5%	6%	7%	8%	9%	10%
1	0.9804	0.9709	0.9615	0.9524	0.9434	0.9346	0.9259	0.9174	0.9091
2	1.9416	1.9135	1.8861	1.8594	1.8334	1.8080	1.7833	1.7591	1.7355
3	2.8839	2.8286	2.7751	2.7233	2.6730	2.6243	2.5771	2.5313	2.4869
4	3.8077	3.7171	3.6299	3.5460	3.4651	3.3872	3.3121	3.2397	3.1699
5	4.7135	4.5797	4.4518	4.3295	4.2124	4.1002	3.9927	3.8897	3.7908

Example

Suppose four annual payments of $1,000 will be needed to satisfy an agreement with a supplier. What would be the amount of the liability today if the interest rate the supplier is charging is 6% per year? Using the table to get the present value factor, the n = 4 periods row, and the 6% column, gives you a factor of 3.4651. Multiply this by $1,000 and you get a liability of $3,465.10 that should be recorded. Using the formula would also give you the same answer with r = 6% and n = 4.

Caution must be exercised when payments are not to be made on an annual basis. If payments are on a semiannual basis n = 8, but *r* is now 3%. This is because *r* is the periodic interest rate, and the semiannual rate would not be 6%, but half of the 6% annual rate. Note that this is somewhat simplified, since due to the effect of compound interest 3% semiannually is slightly more than a 6% annual rate.

Example of the relevance of present values. A measurement based on the present value of estimated future cash flows provides more relevant information than a measurement based on the undiscounted sum of those cash flows. For example, consider the following four future cash flows, all of which have an undiscounted value of $100,000:

1. Asset A has a fixed contractual cash flow of $100,000 due tomorrow. The cash flow is certain of receipt.
2. Asset B has a fixed contractual cash flow of $100,000 due in twenty years. The cash flow is certain of receipt.
3. Asset C has a fixed contractual cash flow of $100,000 due in twenty years. The amount that ultimately will be received is uncertain. There is an 80% probability that the entire $100,000 will be received. There is a 20% probability that $80,000 will be received.
4. Asset D has an *expected* cash flow of $100,000 due in twenty years. The amount that ultimately will be received is uncertain. There is a 25% probability that $120,000 will be received. There is a 50% probability that $100,000 will be received. There is a 25% probability that $80,000 will be received.

Assuming a 5% risk-free rate of return, the present values of the assets are

1. Asset A has a present value of $99,986. The time value of money assigned to the one-day period is $14 [$100,000 × .05/365 days]
2. Asset B has a present value of $37,689 [$\$100,000/(1 + .05)^{20}$]
3. Asset C has a present value of $36,181 [$(100,000 \times .8 + 80,000 \times .2)/(1 + .05)^{20}$]
4. Asset D has a present value of $37,689 [$(\$120,000 \times .25 + 100,000 \times .5 + 80,000 \times .25)/(1 + .05)^{20}$]

Although each of these assets has the same undiscounted cash flows, few would argue that they are economically the same or that a rational investor would pay the same price for each. Investors require compensation for the time value of money. They also require a risk premium. That is, given a choice between Asset B with expected cash flows that are certain and Asset D with cash flows of the same expected amount that are uncertain, investors will place a higher value on Asset B, even though they have the same expected present value. CON 7 says that the risk premium should be subtracted from the expected cash flows before applying the discount rate. Thus, if the risk premium for Asset D was $500, the risk-adjusted present values would be $37,500 {$[(\$120,000 \times .25 + 100,000 \times .5 + 80,000 \times .25) - 500]/(1 + .05)^{20}$}.

Practical matters. Like any accounting measurement, the application of an expected cash flow approach is subject to a cost-benefit constraint. The cost of obtaining additional information must be weighed against the additional reliability that information will bring to the measurement. As a practical matter, an entity that uses present value measurements often

has little or no information about some or all of the assumptions that investors would use in assessing the fair value of an asset or a liability. Instead, the entity must use the information that is available to it without undue cost and effort when it develops cash flow estimates. The entity's own assumptions about future cash flows can be used to estimate fair value using present value techniques, as long as there are no contrary data indicating that investors would use different assumptions. However, if contrary data exist, the entity must adjust its assumptions to incorporate that market information.

Conducting Research through the FASB Codification Web site

As noted previously in this chapter, the FASB has completed its project to codify GAAP, thereby eliminating the multilevel hierarchy in favor of a single, centralized database of authorized documentation. The FASB has compiled this Codification into a Web site, which is located at http://asc.fasb.org/home. The site is intended to be easily searchable for research purposes. This section provides an overview of the site's contents and search functionality.

On all pages of the site, all categories of the Codification are listed down the vertical menu bar on the left side of the page, revealing the following primary topics, and the numbering series for each one:

- *Presentation (200).* Covers the reporting aspects of GAAP, such as the balance sheet, income statement, and segment reporting.
- *Assets (300).* Contains GAAP for all types of assets, such as receivables, investments, and intangibles.
- *Liabilities (400).* Contains GAAP for all types of liabilities, such as commitments, contingencies, and guarantees.
- *Equity (500).* Covers GAAP for such topics as stock, stock dividends, and treasury stock.
- *Revenue (600).* Includes all revenue topics, including product revenue, services revenue, and a great deal of industry-specific topics.
- *Expenses (700).* Clusters all types of expense-related GAAP into five broad categories, which are cost of goods sold, research and development, compensation, income taxes, and other expenses.
- *Broad Transactions (800).* Contains the major transactional topics, such as business combinations, derivatives, and foreign currency matters.
- *Industry (900).* Itemizes GAAP for specific industries, such as entertainment, real estate, and software.
- *Master Glossary.* Includes a compilation of terminology assembled from the multitude of original GAAP source documents.

The numbering series indicated next to each bullet point above shows the three-digit number assigned to each topic. For example, the Presentation topic contains a number of subtopics, all indexed with numbers in the 200 range; the Balance Sheet subtopic is numbered 210, while the Interim Reporting subtopic is numbered 270. These index numbers become more apparent while perusing the submenus attached to each primary topic. For example, the submenu for the Presentation topic reveals 14 subcategories, numbered from 205 (for Presentation of Financial Statements) to 280 (for Segment Reporting). The entire numbering system is noted in Appendix C.

At the most granular level of detail, the Codification has a two-digit numerical code for a standard set of categories, which follow:

- *Overview and background (05).* Provides overview and background material.
- *Scope and scope exceptions (15).* Outlines the transactions, events, and other occurrences to which the subtopic guidance does or does not apply.

- *Glossary (20).* Contains definitions for terms found within the subtopic guidance.
- *Recognition (25).* Defines the criteria and timing for recording an item in the financial statements.
- *Initial measurement (30).* Provides guidance on the criteria and amounts used to measure a transaction at the initial date of recognition.
- *Subsequent measurement (35).* Provides guidance on the subsequent measurement and recognition of an item.
- *Other presentation matters (45).* A catchall category providing guidance not included in the preceding sections.
- *Disclosure (50).* Provides guidance regarding disclosure in the notes to or on the face of the financial statements.
- *Implementation guidance and illustrations (55).* Contains illustrations of the guidance provided in the preceding sections.
- *Relationships (60).* Contains links to guidance that may be helpful to the reader of the subtopic.
- *SEC Materials (S99).* Contains selected SEC content for use by public companies.

By drilling down through the various topics and subtopics in the sidebar, a researcher can eventually locate the relevant GAAP information. However, there are three other ways to access GAAP information through the Codification site that may prove to be easier.

- *Cross-referencing.* If the researcher knows the reference number of an original GAAP source document, such as an EITF consensus or a FASB Staff Position, then she can enter this information through the Cross-Reference tab, which is located at the top center of the Codification home page. A By Standard search box will appear, where the researcher can select from a drop-down menu containing three-digit abbreviations for all of the various GAAP source documents. For example, FTP represents the FASB Staff Positions, while APB represents the Accounting Principles Board Opinions. After making a selection from this menu, the available list of all corresponding documents will appear next to it, in the Standard Number drop-down menu. Selecting a document from this list will bring up the corresponding topic, subtopic, section, and paragraph number in the Codification, as well as a hyperlink to the underlying text.
- *Codification search.* If the researcher is searching for specific words or phrases, then the best search tool is the Codification search bar, which is located in the upper right corner of any page on the site. To use it for a precision search, enter quotes around the search text; for a less precise search that returns individual words within the search text, do not use quotes. If the resulting set of links are too voluminous, then use the Narrow by Topic option on the right side of the page. This option allows the researcher to reduce the number of selections to only certain topic areas. For example, to determine the appropriate presentation of cash on the balance sheet, search on the word Cash, and then narrow the selection to just the Presentation topic, and then narrow further to just the Balance Sheet subtopic.
- *Advanced search.* The most detailed researching method is the Advanced Search option, which is located below the search bar in the upper right corner of any site page. The resulting search page reveals a combination of options; the researcher can use text, Codification numbers, document titles, and topics to prepare a more refined search.

The simplified structure of the Codification makes it a much simpler database than the old GAAP hierarchy for researching purposes, which is also enhanced by the Codification Web site's excellent search tools.

PERSPECTIVE AND ISSUES

Balance sheets (also known as statements of financial position) present information about assets, liabilities, and owners' equity (depending on the type of reporting enterprise, this is referred to as shareholders' equity, net assets, members' equity, or partners' capital) and their relationships to each other. They reflect an enterprise's resources (assets) and its financing structure (liabilities and equity) in conformity with generally accepted accounting principles. The balance sheet reports the aggregate effect of transactions at a point in time, whereas the statements of income, retained earnings, comprehensive income, and cash flows all report the effect of transactions occurring during a specified period of time such as a month, quarter, or year.

For years, users of financial statements put more emphasis on the income statement than on the balance sheet. Investors' main concern was the short-run maximization of earnings per share. During the late 1960s and early 1970s, the future prospects of business enterprises were largely judged based on measures of earnings growth. But the combination of inflation and recession during the 1970s and the emphasis in FASB's Conceptual Framework Project on the asset-liability approach to accounting theory brought about a rediscovery of the balance sheet. This shift toward emphasis on the balance sheet has marked a departure from the traditional transaction-based concept of income toward a capital maintenance concept espoused by economists. Under this approach to income measurement, the amount of beginning net assets would be compared to the amount of ending net assets, and the difference

would be adjusted for dividends and capital transactions. Only to the extent that an enterprise maintained its net assets (after adjusting for capital transactions) would income be earned. By using a capital maintenance concept, it was asserted that investors would theoretically be better able to predict the overall profit potential of the reporting enterprise.

The balance sheet is studied in order to assess the enterprise's liquidity, financial flexibility, ability to pay its debts when due, and to distribute cash to its investors to provide an acceptable rate of return. An enterprise's liquidity refers to the extent to which it holds cash or cash equivalents in the normal course of operating its business. The concept of financial flexibility is broader than the concept of liquidity. Financial flexibility is a company's ability to take effective actions to alter the amounts and timing of its cash flows so it can respond to unexpected needs and opportunities. Financial flexibility includes the ability to raise new equity capital or to borrow additional amounts by, for example, utilizing unused lines of credit.

The rights of the shareholders and other suppliers of capital (bondholders and other creditors) of an enterprise are many and varied. The disclosure of these rights is an important objective in the presentation of financial statements. The rights of shareholders and creditors are mutually exclusive claims against the assets of the enterprise, and the rights of creditors (liabilities) take precedence over the rights of shareholders (equity). Both sources of capital are concerned with two basic rights: the right to share in the cash or property disbursements (interest and dividends) and the right to share in the assets in the event of liquidation.

Although a balance sheet presents an enterprise's financial position, it does not purport to report its value. It cannot for reasons that include

- The values of certain assets, such as human resources, secret processes, and competitive advantages are not included in a balance sheet despite the fact that they have value and will generate future cash flows.
- The values of other assets are measured at historical cost, rather than market value, replacement cost, or specific value to the enterprise. For example, property and equipment are measured at original cost reduced by depreciation, but the underlying assets' value can significantly exceed that adjusted cost and the assets may continue to be productive even though fully depreciated in the accounting records.
- The values of most liabilities are measured at the present value of cash flows at the date the liability was incurred rather than at the current market rate. When market rates increase, the increase in value of a liability payable at a fixed interest rate that is below market is not recognized in the balance sheet. Conversely, when interest rates decrease, the loss in value of a liability payable at a fixed rate in excess of the market rate is not recognized.

In recent years, FASB standards have increasingly employed fair value as the relevant measure for items presented in the balance sheet. For example, ASC 320, *Investments—Debt and Equity Securities,* changed the relevant measure for most investments in securities to fair value from the lower of cost or market. ASC 815, *Derivatives and Hedging,* requires derivative financial instruments, whether asset or liabilities, to be reported at fair value which, prior to that pronouncement, were not reported on the balance sheet at all. ASC 820, *Fair Value Measurements and Disclosures,* improves the consistency and comparability of the fair value measurements appearing in the balance sheet. Measuring more assets and liabilities at fair value enhances the ability of a balance sheet to report a measure that more closely approximates the enterprise's value.

In many industries, it is common for the balance sheet to be divided into classifications based on the length of the enterprise's operating cycle. Assets are classified as "current" if

they are reasonably expected to be converted into cash, sold, or consumed either within one year or within one operating cycle, whichever is longer. Liabilities are classified as "current" if they are expected to be liquidated through the use of current assets or incurring other current liabilities. The excess or deficiency of current assets over or under current liabilities, which is referred to as net working capital, identifies, if positive, the relatively liquid portion of the enterprise's capital that is potentially available to serve as a buffer for meeting unexpected obligations arising within the ordinary operating cycle of the business.

In some industries, the concept of working capital has little importance and the balance sheet is not classified. Such industries include broker-dealers, investment companies, real estate companies, and utilities. Personal financial statements are unclassified for the same reason.

DEFINITIONS OF TERMS

Assets. Probable future economic benefits obtained or controlled by a particular enterprise as a result of past transactions or events (CON 6).

The following three characteristics must be present for an item to qualify as an asset:

1. The asset must provide probable future economic benefit that enables it to provide future net cash inflows.
2. The enterprise must be able to receive the benefit and restrict others' access to it.
3. The event that provides the enterprise with the right to receive the benefit has occurred.

All three characteristics must be present for an item to meet the definition of an asset. Assets have other characteristics, but those characteristics are not essential to the definition. For example, most assets are exchangeable, legally enforceable, or tangible. But an item can still be an asset even if it cannot be exchanged, provided that the enterprise that owns it can use it in a manner that generates future cash flows or other benefits. Similarly, rights to an item need not be legally enforceable if the rights can be enforced in other ways, such as by

using social or moral persuasion. Finally, assets need not be tangible. Securities, patents, and similar ownership rights are assets despite the fact that they cannot be touched or seen.

The characteristic possessed by all assets is service potential (also called future economic benefit); the ability to directly or indirectly provide services or benefits to the owner of the asset, usually in the form of future cash inflows. Once recognized, an asset remains on the balance sheet until it is exchanged for another asset, used to settle a liability, its future economic benefits are used up, or it no longer is expected to provide future benefits (e.g., obsolescence of inventory or impairment of long-lived assets).

Liabilities. Probable future sacrifices of economic benefits arising from present obligations of an enterprise to transfer assets or provide services to others in the future as a result of past transactions or events (CON 6).

The following three characteristics must be present for an item to qualify as a liability:

1. A liability requires that the enterprise settle a present obligation by the probable future transfer of an asset on demand, when a specified event occurs, or at a particular date.
2. The obligation cannot be avoided.
3. The event that obligates the enterprise has occurred.

Liabilities usually result from transactions in which enterprises obtain economic resources. For example, trade accounts payable result from purchasing raw materials; salaries and wages payable result from employees providing services, and notes payable result from borrowing cash from a lender. Other liabilities may arise from nonreciprocal transfers such as the declaration of dividends payable to the owners of the enterprise or the pledging of assets as a contribution to a charitable organization. An enterprise may incur a liability involuntarily. A liability may be imposed on the enterprise by government or by the court system in the form of taxes, fines, or levies. A liability may arise from changes in prices or interest rates.

Liabilities are imposed by agreement, by law, by court, by equitable or constructive obligation, and by business ethics and custom. Liabilities may be legally enforceable or they may be equitable obligations that arise from social, ethical, or moral requirements.

Liabilities are reflected on the balance sheet until the enterprise is no longer responsible for discharging them. Most liabilities are discharged either by transferring an asset or incurring another liability. However, some liabilities simply expire. For example, warranty liabilities are estimates of goods that will be returned for repair or replacement or cash that will have to be paid to a dissatisfied customer. At the end of the warranty period, any remaining liability simply is removed from the balance sheet.

Some financial instruments that have historically been reported as equity are now reported as liabilities. These include mandatorily redeemable financial instruments issued in the form of shares, a financial instrument that includes an obligation to repurchase the issuer's equity shares, and obligations requiring issuance of equity shares based on various limiting criteria. This change has been quite controversial, and indeed certain provisions of the standard (ASC 480) have been indefinitely postponed as to effective date (see Chapter 19 for discussion).

Equity. Equity is the residual interest in the assets of the enterprise that remains after deducting its liabilities. In a business enterprise, as distinguished from a not-for-profit organization or governmental unit, the equity represents the interest of its owners (CON 6).

Equity is increased by owners' investments and by comprehensive income, and it is reduced by distributions to the owners. Equity of a business enterprise is the source of its distributions to the owners; all such distributions of enterprise assets to owners are voluntary. Because equity is a residual (the net amount of assets less liabilities), equity is affected by all

transactions and events that increase or decrease assets without increasing or decreasing liabilities by the same amount.

A diagram reproduced from CON 6 that appears in the "Researching GAAP Problems" section of Chapter 1 illustrates this relationship. For example, issuing a bond does not change equity because the increase in the asset (cash) is the same as the increase in the liability (bonds payable). Paying interest on the bond does change equity. The decrease in the asset (cash) is not offset by a corresponding decrease in the liability (bonds payable).

In practice, the distinction between equity and liabilities may be difficult to ascertain. Securities such as convertible debt and preferred stock may have characteristics of both equity (residual ownership interest) and liabilities (nondiscretionary future sacrifices). For such items, the objective of accounting standards is to ensure that transactions that are similar in substance are reported in a similar manner by different enterprises, irrespective of their form.

Valuation allowance. The valuation allowance is a separate item on a balance sheet (or disclosed in the notes to the financial statement) that reduces or increases the carrying amount of an asset or a liability. It is neither an asset nor a liability in its own right; it is merely a mechanism used to adjust the carrying amount of the related asset or liability. For example, an estimate of uncollectible amounts reduces the carrying amount of an account receivable, while a bond premium increases the carrying amount of bonds payable.

CONCEPTS, RULES, AND EXAMPLES

Limitations of a Balance Sheet

Although a balance sheet shows an enterprise's *financial position* at a point in time, it does not purport to report the value of the enterprise at that date. There are several reasons why this is so. One limitation of the balance sheet is that many assets and liabilities are reported at historical transaction prices (referred to as "historical cost"), that are used because they are objective and capable of being independently verified. Historical costs, however, will only equal fair value at the time of the actual transaction; thereafter, the two will almost always differ.

Many accountants and analysts believe that the balance sheet would be more useful if the assets were restated to reflect current values. These current values might or might not be market related, and might simply be presented as historical cost adjusted for the changing value of the dollar due to inflation. However, for some assets and liabilities, cost already closely approximates current fair value. The cost of monetary assets such as cash, short-term investments, and receivables closely approximates their current fair values. The cost of current liabilities, which are liabilities that require either a current asset or another current liability to liquidate, is payable in a short period and closely approximates current values. If they were to be discounted to their present value, any discount amount would likely be immaterial because of the short time period before payment is due.

For other assets and liabilities, cost can significantly differ from current value. Productive assets such as property, plant, equipment, and amortizable intangibles are reported at cost net of accumulated depreciation, depletion, or amortization. Those amounts may differ from their current values to the enterprise (value in use) or to others (exit or net realizable values). Long-term liabilities are recorded as the discounted value of future payments to be made under contract. On the issuance date of fixed-rate debt, the interest rate equals the market rate and current value equals balance sheet cost. However, as time passes and the market interest rate fluctuates, the recorded cost will differ from the current value.

Although assets are often stated at historical cost, if events or changes in circumstances indicate a permanent and material decline in fair value, generally accepted accounting prin-

ciples usually require immediate recognition of the economic loss. In contrast, appreciation in fair value is normally recognized for accounting purposes only when actually realized in an arm's-length transaction (e.g., a sale). However, the recent trend in newly issued financial accounting standards has been to reflect increases as well as decreases in the fair values of assets and liabilities in the financial statements. ASC 320 and ASC 815 require that debt securities, most equity securities, and derivative financial instruments be reported at fair value. Reporting liabilities at fair value is less common under current GAAP, but there are certain exceptions, including mandatorily redeemable preferred stock, which is classified as debt per ASC 480 and measured initially and subsequently at fair value.

Another limitation of the balance sheet is that, with respect to the presentation of certain assets and liabilities, it ignores the effects of the time value of money. Although certain receivables and payables may be discounted (ASC 835), most assets and liabilities are stated at carrying amounts that are not determined by reference to the expected timing of the related cash inflows or outflows that will ultimately occur.

In the historical cost balance sheet, estimates are frequently used to determine the carrying/book values of many of the assets. Estimates are used in determining the collectibility of receivables, salability of inventory, and useful lives of long-term assets. All of these estimates affect the amount presented in the balance sheet; for example, estimated uncollectible accounts are deducted from accounts receivable to reflect the estimated net realizable value displayed in the balance sheet. While estimates are necessary in order to record the effects of economic events in the appropriate accounting period, these estimates require informed, good-faith judgments for which there is little practical guidance provided in authoritative accounting literature.

A final limitation of the balance sheet is that it ignores items that are of financial value to the enterprise but that cannot be objectively determined. For example, internally generated goodwill, a skilled and trained workforce, and secret processes are potential sources of substantial financial value sometimes, in our knowledge-based economy, far exceeding the recorded value of recognized assets. However, because these values are not objectively and verifiably measurable, current accounting principles and practices prohibit their presentation on the balance sheet. Presently, only assets obtained in market transactions are recorded in the accounting records of an enterprise.

Form of Balance Sheet

The format of a balance sheet is not specified by any authoritative pronouncement. Instead, formats and titles have developed as a matter of tradition and, in some cases, through industry practice.

Two basic formats are used.

1. The balanced format, in which the sum of the amounts for liabilities and equity are added together on the face of the statement to illustrate that assets equal liabilities plus equity
2. The less frequently presented equity format, which shows totals for assets, liabilities, and equity but no sums illustrating that assets less liabilities equals equity

Those two formats can take one of two forms.

1. The account form, presenting assets on the left-hand side of the page and liabilities and equity on the right-hand side
2. The report form, which is a top-to-bottom or running presentation

The three elements customarily displayed in the heading of a balance sheet are

1. The legal name of the enterprise whose financial position is being presented

2. The title of the statement (e.g., balance sheet or statement of financial position)
3. The date of the statement (or statements, if multiple dates are presented for comparative purposes)

The enterprise's legal name appears in the heading exactly as specified in the document that created it (e.g., the certificate of incorporation, partnership agreement, LLC operating agreement, etc.). The legal form of the enterprise is often evident from its name when the name includes such designations as "incorporated," "LLP," or "LLC." Otherwise, the legal form is either captioned as part of the heading or disclosed in the notes to the financial statements. A few examples are as follows:

ABC Company
(a general partnership)

ABC Company
(a sole proprietorship)

ABC Company
(a division of DEF, Inc.)

The use of the titles "balance sheet," "statement of financial position," or "statement of financial condition" infer that the statement is presented using generally accepted accounting principles. If, instead, some other comprehensive basis of accounting, such as income tax basis or cash basis is used, the financial statement title must be revised to reflect this variation. The use of a title such as "Statements of Assets and Liabilities—Income Tax Basis" is necessary to differentiate the financial statement being presented from a GAAP balance sheet.

The last day of the fiscal period is used as the statement date. Usually, this is a month-end date unless the enterprise uses a fiscal reporting period always ending on a particular day of the week such as Friday or Sunday. In these cases, the balance sheet would be dated accordingly (i.e., December 26, October 1, etc.).

Balance sheets generally are uniform in appearance from one period to the next with consistently followed form, terminology, captions, and patterns of combining insignificant items. If changes in the manner of presentation are made when comparative statements are presented, the prior year's information is to be restated to conform to the current year's presentation.

Assets

Assets, liabilities, and shareholders' equity are separated in the balance sheet so that important relationships can be shown and attention can be focused on significant subtotals.

Current assets. Per the Master Glossary, current assets are cash and other assets that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. When the normal operating cycle is less than one year, a one-year period is used to distinguish current assets from noncurrent assets. When the operating cycle exceeds one year, the operating cycle will serve as the proper period for purposes of current asset classification. When the operating cycle is very long, the usefulness of the concept of current assets diminishes. The following items are classified as current assets:

1. **Cash and cash equivalents** include cash on hand consisting of coins, currency, undeposited checks; money orders and drafts; demand deposits in banks; and certain short-term, highly liquid investments. Any type of instrument accepted by a bank for deposit would be considered to be cash. Cash must be available for withdrawal on demand. Cash that is restricted as to withdrawal, such as certificates of deposit, would not be included with cash because of the time restrictions. Also, cash must

be available for current use in order to be classified as a current asset. Cash that is restricted in use would not be included in cash unless its restrictions will expire within the operating cycle. Cash restricted for a noncurrent use, such as cash designated for the purchase of property or equipment, would not be included in current assets. Per the Master Glossary, cash equivalents include short-term, highly liquid investments that (1) are readily convertible to known amounts of cash and (2) are so near their maturity (maturities of three months or less from the date of purchase by the enterprise) that they present negligible risk of changes in value because of changes in interest rates. US Treasury bills, commercial paper, and money market funds are all examples of cash equivalents. Chapter 7 discusses cash in more detail.

2. **Short-term investments** are readily marketable securities acquired through the use of temporarily idle cash. To be classified as current assets, management must be willing and able to sell the security to meet current cash needs or the investment must mature within one year (or the operating cycle, if longer). These securities are accounted for under ASC 320. Securities classified as trading securities under ASC 320 must be reported as current assets. Securities classified as held-to-maturity or available-for-sale are reported as either current or noncurrent depending upon management's intended holding period, the security's maturity date (if any), or both. It is not necessary to show the ASC 320 classification on the face of the balance sheet. Short-term investments can be combined into a single line if the classification details appear in the notes to the financial statements. The balance sheet presentation might be as follows:

Marketable securities	$xxx

Chapter 8 discusses short-term investments in more detail.

3. **Receivables** include accounts and notes receivable, receivables from affiliated enterprises, and officer and employee receivables. The term "accounts receivable" is generally understood to represent amounts due from customers arising from transactions in the ordinary course of business (sometimes referred to as "trade receivables"). Valuation allowances, if any, are to be clearly stated. Estimates of needed allowances for uncollectibility may be based on historical correlations of bad debt experience as a percentage of sales or based on a direct credit quality analysis of the receivables. Valuation allowances to reflect the time value of money (discounts) are reported with the related receivable. If material, the different components that comprise receivables are to be separately stated. Receivables pledged as collateral are to be disclosed in the notes to the financial statements. The receivables section of a balance sheet might be presented as follows:

Receivables:	
Accounts	$xxx
Notes	xxx
	xxx
Less allowance for uncollectible accounts	(xxx)
	xxx
Affiliated companies	xxx
Officers and employees	xxx
	$xxx

Chapter 7 discusses receivables in more detail.

4. **Inventories** are goods on hand and available for sale. The basis of valuation and the method of pricing are to be disclosed. One form of presentation is as follows:

Inventories—at the lower of cost or market (specific identification)	$xxx

In the case of a manufacturing concern, raw materials, work in process, and finished goods are stated separately on the balance sheet or disclosed in the notes to the financial statements. Customarily, the components of manufacturing inventories are stated in order of their readiness for sale and ultimate conversion to cash—that is, finished goods are ready for sale, work in process is closer to being finished than raw materials and, of course, raw materials have not yet been placed into production. A sample form of presentation is as follows:

Inventories:	
Finished goods	$xxx
Work in process	xxx
Raw materials	xxx
	$xxx

Chapter 9 discusses inventories in more detail.

5. **Prepaid expenses** are amounts paid in advance to secure the use of assets or the receipt of services at a future date. Prepaid expenses will not be converted to cash, but they are classified as current assets because, if not prepaid, they would have required the use of current assets during the coming year (or operating cycle, if longer). Prepaid rent and prepaid insurance are the most common examples of prepaid expenses. Chapter 7 discusses prepaid expenses in more detail.

Noncurrent assets. Excluded from the classification of current assets are assets that will not be realized in cash during the next year (or operating cycle, if longer). The following assets would be classified as noncurrent assets:

1. **Long-term investments** are investments that are intended to be held for an extended period of time (longer than one operating cycle). The following are the three major types of long-term investments:

   a. **Debt and equity securities** are stocks, bonds, and long-term notes receivable. Securities that are classified as available-for-sale or held-to-maturity investments under ASC 320 would be classified as long-term if management intended to hold them for more than one year. Under ASC 320, the categories of these securities (held-to-maturity versus available-for-sale) need not be reported on the face of the balance sheet if they are reported in the notes to the financial statements. The securities section of the balance sheet could be presented as follows:

Long-term investments:		
Investments in A company common stock		$xxx
Notes receivable	$ xxx	
Less discount on notes receivable	(xxx)	xxx
Investment in B company bonds		xxx
		$xxx

   b. **Tangible assets** not currently used in operations (e.g., land purchased as an investment and held for sale).

   c. **Investments held in special funds** (e.g., sinking funds, pension funds, amounts held for plant expansion, and cash surrender values of life insurance policies).

   Chapter 12 describes investments in more detail.

2. **Property, plant, and equipment** are assets of a durable nature that are used in the production or sale of goods, sale of other assets, or rendering of services rather than being held for sale (e.g., machinery and equipment, buildings, furniture and fixtures, natural resources, and land). These are disclosed with related accumulated depreciation/depletion as follows:

Property, plant, and equipment	$xxx
Less accumulated depreciation	(xxx)
	$xxx
or	
Property, plant, and equipment (net of $xxx accumulated depreciation)	$xxx

Accumulated depreciation may be shown in total or by major classes of depreciable assets. In addition to showing this amount on the balance sheet, the notes to the financial statements are to disclose the amounts of major classes of depreciable assets, by nature or function, at the balance sheet date. Assets under capital leases are separately disclosed. A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets (ASC 360-10-50) is also to be included in the notes to financial statements. Chapter 11 discusses property, plant, and equipment and Chapter 16 discusses capital leases in more detail.

3. **Intangible assets** include legal and/or contractual rights that are expected to provide future economic benefits and purchased goodwill. The technical definition of goodwill is that it represents the excess of the cost of an acquired enterprise over the net of the fair values assigned to its identifiable assets and liabilities. Practically, goodwill represents the amount by which the acquirer believes the acquiree enterprise's fair value as a whole exceeds the net fair value of its assets and liabilities. Goodwill is only recognized as an asset when acquired in a business combination; internally generated goodwill is not recognized. Patents, copyrights, logos, and trademarks are examples of rights that are recognized as intangible assets. Intangible assets with finite useful lives are amortized to expense over those lives. Generally, the amortization of an intangible asset is credited directly to the recorded amount of the asset although it is acceptable to use an accumulated amortization valuation allowance. Intangible assets with indefinite economic useful lives are tested for impairment at least annually. Chapter 13 discusses goodwill in more detail. Chapter 11 discusses other intangible assets.
4. **Other assets.** Other assets is an all-inclusive heading which incorporates assets that do not fit neatly into any of the other asset categories (e.g., long-term prepaid expenses, deposits made to purchase equipment, deferred income tax assets (net of any required valuation allowance), bond issue costs, noncurrent receivables, and restricted cash).

Liabilities

Liabilities are displayed on the balance sheet in the order of expected payment. The distinction between current and noncurrent assets and liabilities generally rests upon both the ability and intent of the enterprise to liquidate or not to liquidate within the traditional one-year time frame or the operating cycle, if longer.

Current liabilities. Per ASC 210-10-45, obligations are classified as current if their liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets or to create other current obligations. Obligations that are due on demand or that are callable at any time by the lender are classified as current regardless of the intent of the enterprise or lender. The following items are classified as current liabilities:

1. **Accounts payable.** Accounts payable is normally comprised of amounts due to suppliers (vendors) for the purchase of goods and services used in the ordinary course of running a business.
2. **Trade notes payable** are also obligations that arise from the purchase of goods and services. They differ from accounts payable because the supplier or vendor fi-

nances the purchase on terms longer than the customary period for trade payables. The supplier or vendor generally charges interest for this privilege. If interest is not charged, it is imputed in accordance with ASC 835. (Imputed interest is discussed further in Chapter 15.) A valuation allowance is used to reduce the carrying amount of the note for the resulting discount as follows:

Notes payable, net of imputed interest of $xx		$ xxx
or		
Notes payable	$ xxx	
Less discounts	(xxx)	$ xxx

3. **Dividends payable** are obligations to distribute cash or other assets to shareholders that arise from the declaration of dividends by the enterprise's board of directors.
4. **Advances and deposits** are collections of cash or other assets received in advance to ensure the future delivery of goods or services. Advances and deposits are classified as current liabilities if the goods and services are to be delivered within the next year (or the operating cycle, if longer). Advances and deposits include such items as advance rentals and customer deposits. Certain advances and deposits are sometimes captioned as deferred or unearned revenues.
5. **Agency collections and withholdings** are liabilities that arise because the enterprise acts as an agent for another party. Employee tax withholdings, sales taxes, and wage garnishments are examples of agency collections.
6. **Current portion of long-term debt** is the portion of a long-term obligation that will be settled during the next year (or operating cycle, if longer) by using current assets. Generally, this amount includes only the payments due within the next year under the terms of the underlying agreement. However, if the enterprise has violated a covenant in a long-term debt agreement and, as a result, the investor is legally entitled to demand payment, the entire debt amount is classified as current unless the lender formally (in writing) waives the right to demand repayment of the debt for a period in excess of one year (or one operating cycle, if longer). In two cases, obligations to be paid in the next year are not classified as current liabilities. Debt expected to be refinanced through another long-term issue and debt that will be retired through the use of noncurrent assets, such as a bond sinking fund, are treated as noncurrent liabilities because the liquidation does not require the use of current assets or the creation of other current liabilities.
7. **Accrued expenses** represent estimates of expenses incurred on or before the balance sheet date that have not yet been paid and that are not payable until a succeeding period within the next year. Examples of accrued expenses include salaries, vacation pay, interest, and retirement plan contributions.

Chapter 14 discusses current liabilities in more detail.

Noncurrent liabilities. Obligations that are not expected to be liquidated within one year (or the current operating cycle, if longer) are classified as noncurrent. The following items would be classified as noncurrent:

1. **Notes and bonds payable** are obligations that will be paid in more than one year (or one operating cycle, if longer). Most notes and bonds require periodic payments of interest, and some require periodic payments of principal. If the stated rate of interest on a note or bond is different than the market rate on the day the note or bond is issued, the proceeds from issuance will differ from the face amount of the note or bond. If the market rate is higher than the stated rate, the bonds will be issued at a discount, which means that the proceeds are less than the face amount. If the market rate is lower than the stated rate, the bonds will be issued at a premium,

which means that the proceeds exceed the face amount. Valuation allowances are used to adjust the carrying value of the debt to reflect the resulting discount or premium, as shown below.

Notes payable, including premium of $xx		$xxx
or		
Notes payable	$xxx	
Plus premium	$xxx	$xxx

Discounts and premiums are amortized using the effective-interest-rate method, which results in a constant interest rate over the life of the debt. Chapter 15 discusses notes and bonds payable in more detail.

2. **Capital lease obligations** are contractual obligations that arise from obtaining the use of property or equipment via a capital lease contract. Chapter 16 discusses lease obligations.
3. **Written put options on the option writer's (issuer's) equity shares and forward contracts to purchase an issuer's equity shares that require physical or net cash settlement** are classified as liabilities on the issuer's balance sheet. The obligation is classified as noncurrent unless the date at which the contract will be settled is within the next year (or operating cycle, if longer). These contracts are discussed further in Chapter 15.
4. **Certain financial instruments that embody an unconditional obligation to issue a variable number of equity shares and financial instruments other than outstanding shares that embody a conditional obligation to issue a variable number of equity shares** are classified as a liability in the issuer's balance sheet. The obligation is classified as noncurrent unless the date at which the financial instrument will be settled is within the next year (or operating cycle, if longer). Chapter 15 discusses these financial instruments.
5. **Contingent obligations** are recorded when it is probable that an obligation will occur as the result of a past event. In most cases, a future event will eventually confirm the amount payable, the payee, or the date payable. Examples of contingent obligations are lawsuits that have not been settled, product warranty obligations, guarantees of indebtedness (other than the obligation to stand ready to perform, which is a noncontingent liability), and agreements to repurchase an asset or make future payments. The classification of a contingent liability as current or noncurrent depends on when the confirming event will occur and how soon afterwards payment must be made. Contingencies are discussed further in Chapter 14.
6. **Mandatorily redeemable shares** are recorded as liabilities per ASC 480. A mandatory redemption clause requires common or preferred stock to be redeemed (retired) at a specific date(s) or upon occurrence of an event which is uncertain as to timing although ultimately certain to occur. This feature is in contrast to callable preferred stock, which may be redeemed at the issuing corporation's option and which is appropriately categorized as equity. The obligation is classified as noncurrent unless the date at which the shares must be redeemed is within the next year (or operating cycle, if longer). See Chapters 15 and 19 for additional discussion of these securities.
7. **Other noncurrent liabilities** include defined benefit pension obligations, postemployment obligations, and postretirement obligations. These reflect the long-term obligations of the enterprise to provide future retirement, insurance, or other benefits to employees as a result of their past service. Those obligations are described in more detail in Chapter 18. Deferred income taxes are liabilities to pay income taxes

in the future that result from differences between the carrying amounts of assets and liabilities for income tax and financial reporting purposes. Chapter 17 discusses deferred income taxes.

Offsetting Assets and Liabilities

In general, assets and liabilities are not permitted to be offset against each other unless certain specified criteria are met. ASC 210-20-45 permits offsetting only when all of the following conditions are met that constitute a right of setoff:

1. Each of the two parties owes the other determinable amounts (although they may be in different currencies and bear different rates of interest).
2. The enterprise has the right to set off the amount it owes against the amount owed to it by the other party.
3. The enterprise intends to set off the two amounts.
4. The right of setoff is legally enforceable.

In particular cases, state laws or bankruptcy laws may impose restrictions or prohibitions against the right of setoff. Furthermore, when maturities differ, only the party with the nearest maturity can offset, because the party with the later maturity must settle in the manner determined by the party with the earlier maturity.

The offsetting of cash or other assets against a tax liability or other amounts due to governmental bodies is acceptable only under limited circumstances. When it is clear that a purchase of securities is in substance an advance payment of taxes payable in the near future and the securities are acceptable for the payment of taxes, amounts may be offset. Primarily this occurs as an accommodation to governmental bodies that issue tax anticipation notes in order to accelerate the receipt of cash from future taxes.

For forwards, interest rate swaps, currency swaps, options, and other conditional or exchange contracts, the conditions for the right of offset must exist or the fair value of contracts in a loss position cannot be offset against the fair value of contracts in a gain position. Nor can accrued receivable amounts be offset against accrued payable amounts. If, however, there is a master netting arrangement, then fair value amounts recognized for forwards, interest or currency swaps, options, or other such contracts may be offset without being subject to the conditions previously specified.

ASC 210-20-45 permits the offset of amounts recognized as payables in repurchase agreements against amounts recognized as receivables in reverse repurchase agreements with the same counterparty. If certain conditions are met, an enterprise may, but is not required to, offset the amounts recognized. The additional conditions are

1. The repurchase agreements and the reverse repurchase agreements must have the same explicit settlement date.
2. The repurchase agreements and the reverse repurchase agreements must be executed in accordance with a master netting agreement.
3. The securities underlying the repurchase agreements and the reverse repurchase agreements exist in "book entry" form.
4. The repurchase agreements and the reverse repurchase agreements will be settled on a securities transfer system that transfers ownership of "book entry" securities, and banking arrangements are in place so that the enterprise must only keep cash on deposit sufficient to cover the net payable.
5. The same account at the clearing bank is used for the cash inflows of the settlement of the reverse repurchase agreements and the cash outflows in the settlement of the repurchase agreements.

Stockholders' Equity

Owners' equity represents the residual interest in the assets of the enterprise after liabilities are subtracted from assets. In a corporation, shareholders' equity arises from three sources: contributed (paid-in) capital, retained earnings, and accumulated other comprehensive income. Shareholders' equity is discussed further in Chapter 19.

Contributed capital. Contributed, or paid-in capital is the amount of equity invested in a corporation by its owners. It consists of capital stock and additional paid-in capital. Contributed capital arises from the issuance of common and preferred stock to investors, from transactions by the corporation in its own stock (for example, treasury stock, stock dividends, conversion of convertible bonds) and from the donation of assets or services.

Capital stock. Capital stock is the par or stated value of preferred and common shares. In the past, capital stock was the legal capital of the corporation—the amount that could not be distributed to shareholders so that the interest of creditors would be protected. In recent years, some states have changed their laws so that legal capital includes additional paid-in capital (i.e., in those states the distinction between the capital stock and additional paid-in capital is not recognized). The face of the balance sheet often provides information about the type of issues, the par or stated value per share, and the number of shares authorized, issued, and outstanding. For preferred stock, the liquidation preferences and features (e.g., whether participating, cumulative, convertible, or callable) are also shown, as follows:

6% cumulative preferred stock, $100 par value, callable at $115, 10,000 shares authorized and outstanding, aggregate liquidation preference in liquidation of $xxx	$xxx
Common stock, $10 par value per share, 2,000,000 shares authorized, 1,500,000 shares issued and outstanding	$xxx

Additional paid-in capital. There are two major categories of additional paid-in capital.

1. Paid-in capital in excess of par/stated value, which is the difference between the actual issue price of the shares and the shares' par/stated value. Amounts in excess are disclosed separately for common stock and each issue of preferred stock as follows:

Additional paid-in capital—6% preferred stock	$xxx
Additional paid-in capital—common stock	$xxx

2. Paid-in capital from other transactions, which includes treasury stock, retirement of stock, stock dividends recorded at market, lapse of stock purchase warrants, conversion of convertible bonds in excess of the par value of the stock, and any other additional capital from the company's own stock transactions.

Retained earnings. Retained earnings are the cumulative net income of the corporation from the date of its inception (or reorganization) to the date of the financial statements, less the cumulative distributions to shareholders either directly (dividends) or indirectly (treasury stock).

In the past, the board of directors of a corporation would appropriate (set aside) a portion of retained earnings for a special purpose and indicate on the face of the balance sheet or in the notes to the financial statements that the appropriated amount was unavailable for dividends. That practice is uncommon today.

Accumulated other comprehensive income. Other comprehensive income is the change in equity of a business enterprise during a period that arises from sources other than net income and transactions with its owners. Under current accounting standards, its accumulated components include net unrealized holding gains and losses on investments classified as available-for-sale securities (ASC 320), the effective portion of the gain or loss on

derivative instruments designated and qualified as either cash-flow hedges or hedges of forecasted foreign-currency-denominated transactions (ASC 815), the excess of minimum pension liability over unrecognized prior service cost (ASC 715-30), and unrealized gains (losses) on foreign currency translations (ASC 830). The components of accumulated other comprehensive income are shown either in the statement of changes in shareholders' equity or in the shareholders' equity section of the balance sheet, as follows:

Accumulated other comprehensive income		
Foreign currency translation adjustments	$xxx	
Pension liability adjustment	xxx	
Unrealized gains on securities	xxx	xxx

Treasury stock. Treasury stock represents shares of the corporation's stock that have been issued, repurchased by the corporation, and that have not been retired or canceled. These shares have no voting rights and are not entitled to receive dividends. Treasury stock is traditionally shown as the last item (a deduction) within the shareholders' equity section. (In very limited circumstances involving employee compensation plans, treasury stock can be shown as an asset.) The number of shares and the method of valuation are generally shown, as follows:

Treasury stock, 1,000 shares at cost	$ xxx

Partners' Capital

Partnership balance sheets are the same as corporate entities except for the equity section. In a partnership, this section is usually referred to as partners' capital. Although each individual partner's capital need not be displayed, the totals for each class of partner, general or limited, are separately presented. Loans to or from partners are displayed as assets and liabilities of the partnership and not as reductions of or additions to partners' capital. Payments of interest to partners on loans are properly classified as expenses on the income statement. Payments to partners representing a distribution of partnership earnings computed, in accordance with the partnership agreement, as a percentage of the partner's capital are analogous to corporate dividends and are therefore reflected as distributions of capital rather than as interest. Similarly, because a partner is not an employee of the partnership, amounts allocated to that partner in exchange for services rendered are considered capital distributions rather than expenses. However, in an attempt to emulate corporate financial reporting, some partnerships, with adequate disclosure, do display such payments as expenses.

Members' equity. A limited liability company (LLC) presents its equity using the caption "members' equity." In accordance with ASC 272, the equity attributable to each class of member is to be separately stated on the face of the balance sheet or disclosed in the notes to the financial statements. Notwithstanding the legal limits on the members' liability, in the event that the LLC's cumulative losses and distributions exceed its members' collective capital investment, a deficit in members' equity is to be reflected. ASC 272 permits presentation by the LLC of components of members' equity that are similar to those of corporate entities such as accumulated undistributed earnings (analogous to retained earnings).

Alternative Balance Sheet Segmentation

Besides classifying balance sheets into current and noncurrent assets and liabilities, there are other segmentation schemes that GAAP requires for various reporting purposes, depending upon the circumstances. Since these requirements do not utilize a common taxonomy, the following explanation will be referenced throughout *Wiley GAAP*.

Classification of assets (and sometimes liabilities also) may be required for the presentation of segment information under ASC 280. This requirement only applies to publicly held entities, although nonpublic companies may also elect to make segment disclosures. Under ASC 280, it will be necessary to identify operating segments and reportable segments of the business. (Terms are defined below.)

A different classification strategy is required for purposes of testing for impairment of goodwill, under ASC 350. This standard created the concept of the reporting unit as a basis for making an impairment evaluation.

Yet another term, a business, was defined in the Master Glossary and was often used as a threshold criterion of what could not be considered a special-purpose entity (as addressed in various standards, including ASC 860).

Finally, another classification system is invoked under ASC 360 in assessing the realizability of long-lived assets for the purpose of determining whether those assets are impaired. This standard established the concepts of asset groups and disposal groups.

The graphic below has been developed to illustrate how these different classification schemes overlap. It is possible that a given enterprise, if it reports segment data and if it has goodwill from a business combination on its balance sheet, may be required to apply most or all of these taxonomies in meeting its financial reporting obligations—to disclose segment information, to test for goodwill impairment, and to test for impairment of long-lived assets other than goodwill.

Definitions (with references to professional standards and the chapter of *Wiley GAAP* that addresses the associated topic).

Operating segment (ASC 280, Chapter 22)—A component of an enterprise engaged in business activity for which it may earn revenues and incur expenses, about which separate financial information is available that is evaluated regularly by the chief operating decision makers in deciding how to allocate resources and in assessing performance.

Reportable segment (ASC 280, Chapter 22)—A segment is considered to be reportable if it is significant to the enterprise as a whole. A segment is regarded as significant if it satisfies any one of the three quantitative tests prescribed by ASC 280.

Reporting unit (ASC 350, Chapter 11)—A reporting unit is an operating segment or one level below an operating segment (referred to as a component). A component of an operating segment is a reporting unit if the component constitutes a business for which discrete financial information is available and segment management regularly reviews the operating results of that component. However, two or more components of an operating segment are to be aggregated and deemed a single reporting unit if the components have similar economic characteristics. An operating segment is deemed to be a reporting unit if all of its components are similar, if none of its components is a reporting unit, or if it comprises only a single component.

Business (ASC 805, Chapter 13)—A *business* is an integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing a return in the form of dividends, lower costs, or other economic benefits directly to investors or other owners, members, or participants.

Asset group (ASC 360, Chapter 11)—The lowest level of assets to be held and used, for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities.

Disposal group (ASC 360, Chapters 3 and 11)—Assets to be disposed of together as a group in a single transaction and the liabilities directly associated with those assets that will be transferred in the transaction.

Disclosures

In addition to the measurement accounting principles that guide the values placed on the elements included in the balance sheet, there are accounting principles specifying the informative disclosures that are necessary because, without the information they provide, the financial statements would be misleading.

The following five disclosure techniques are used in varying degrees in contemporary financial statements:

1. Parenthetical explanations
2. Notes to the financial statements
3. Cross-references
4. Valuation allowances (sometimes referred to as "contra" amounts)
5. Supporting schedules

Parenthetical explanations. Information is sometimes disclosed by means of parenthetical explanations appended to the appropriate balance sheet caption. For example

Common stock ($10 par value, 200,000 shares authorized, 150,000 issued)	$1,500,000

Parenthetical explanations have an advantage over both notes to the financial statements and supporting schedules. Parenthetical explanations place the disclosure prominently in the body of the statement instead of in a note or schedule where it is more likely to be overlooked.

Notes to financial statements. If the information cannot be disclosed in a relatively short and concise parenthetical explanation, a note disclosure is used. For example

Inventories (see note 1)	$2,550,000

The notes to the financial statements would contain the following:

Note 1: Inventories are stated at the lower of cost or market. Cost is determined using the first-in, first-out (FIFO) method.

Cross-references. Cross-referencing is used when there is a direct relationship between two accounts on the balance sheet. For example, among the current assets, the following might be shown if $1,500,000 of accounts receivable were pledged as collateral for a $1,200,000 bank loan:

Accounts receivable pledged as collateral on bank loan payable	$1,500,000

Included in the current liabilities would be the following:

Bank loan payable—collateralized by accounts receivable	$1,200,000

Valuation allowances. Valuation allowances are used to reduce or increase the carrying amounts of certain assets and liabilities. Accumulated depreciation reduces the carrying value of property, plant, and equipment, and a bond premium (discount) increases (decreases) the face value of a bond payable as shown in the following illustrations:

Equipment	$18,000,000	
Less accumulated depreciation	(1,625,000)	$16,375,000
Bonds payable	$20,000,000	
Less discount on bonds payable	(1,300,000)	$18,700,000
Bonds payable	$20,000,000	
Add premium on bonds payable	1,300,000	$21,300,000

Supporting schedules. A supporting schedule might be used to provide additional detail about an item in the financial statements. For example, consolidating schedules might be included in addition to the basic consolidated financial statements or a five-year summary of

selected financial data might be included. In general, supporting schedules are not used to provide information required by GAAP because those schedules are not part of the basic financial statements and are typically subjected to only limited procedures by auditors.

Accounting policies. There are many different methods of valuing assets, recognizing revenues, and assigning costs. Financial statement users must be aware of the accounting policies used by enterprises so that sound economic decisions can be made. Per ASC 235, the disclosures are to identify and describe the accounting principles followed by the enterprise and methods of applying those principles that materially affect the determination of financial position, changes in cash flows, or results of operations. The accounting policies disclosure is to encompass those accounting principles and methods that involve the following:

1. Selection from acceptable alternatives
2. Principles and methods peculiar to the industry
3. Unique applications of GAAP

The accounting policies disclosure need not duplicate information provided elsewhere in the financial statements. The accounting policies usually appear in a separate section called "Summary of Significant Accounting Policies" or as the first note of the notes to the financial statements.

Related parties. According to ASC 850, *Related-Party Disclosures*, financial statements are required to disclose material related-party transactions other than compensation arrangements, expense allowances, or other similar items that occur in the ordinary course of business.

A related party is essentially any party that controls or can significantly influence the management or operating policies of the company to the extent that the company may be prevented from fully pursuing its own interests. Related parties include affiliates, investees accounted for by the equity method, trusts for the benefit of employees, principal owners, management, and immediate family members of owners or management.

Transactions with related parties are to be disclosed even if there is no accounting recognition made for such transactions (e.g., a service is performed without payment). Disclosures are not permitted to assert that the terms of related-party transactions were essentially equivalent to arm's-length dealings unless those claims can be substantiated. If the financial position or results of operations of the reporting enterprise could change significantly because of common control or common management, disclosure of the nature of the ownership or management control is required, even if there were no transactions between the entities.

The disclosures are to include

1. The nature of the relationship
2. A description of transactions and the effects of those transactions reflected in the financial statements for each period for which an income statement is presented
3. The dollar amount of transactions for each period for which an income statement is presented and the effects of any change in the terms of such transactions as compared to the terms used in prior periods
4. Amounts due to and from related parties as of the date of each balance sheet presented, together with the terms and manner of settlement

Comparative statements. In order to increase the usefulness of financial statements, many enterprises include financial statements for one or more prior years in their annual reports. Some also include five- or ten-year summaries of condensed financial information. These comparative financial statements allow investment analysts and other interested readers to perform comparative analysis of pertinent information. ASC 205-10-45 states the

presentation of comparative financial statements in annual reports enhances the usefulness of such reports and brings out more clearly the nature and trends of current changes affecting the enterprise. That presentation emphasizes the fact that the statements for a series of periods are far more significant than those for a single period and that the accounts for one period are but an installment of what is essentially a continuous history. (Note that, while comparative financial statements are presently required under US GAAP, it is highly likely that this will become a requirement as the FASB moves to converge its standards with those of IASB, the international standard setter.)

Subsequent events. The balance sheet is dated as of the last day of the fiscal period, but a period of time usually elapses before the financial statements are issued. During this period, significant events or transactions may have occurred that materially affect the company's financial position. These events and transactions are called subsequent events. The omission of disclosure of significant events occurring between the balance sheet date and issuance date of the financial statements could mislead the reader who is otherwise unaware of those events.

There are two types of subsequent events (which, curiously, are defined not in the accounting standards, but in the auditing literature, by SAS 1, *Subsequent Events*). The first type are events that provide additional evidence about conditions that existed at the date of the balance sheet and which affect the estimates inherent in the process of preparing financial statements. The second type are events that provide evidence with respect to conditions that did not exist at the date of the balance sheet but arose subsequent to that date. The first type results in adjustments of the financial statements. The second type does not require adjustment of the financial statements but may require disclosure in order to keep the financial statements from being misleading. Disclosure can be made in the form of explanatory notes, sometimes supplemented with pro forma statements.

Examples of subsequent events

1. A loss on an uncollectible trade account receivable that results from a customer's deteriorating financial condition, which led to bankruptcy subsequent to the balance sheet date, would be indicative of conditions existing at the balance sheet date, thereby calling for adjustment of the financial statements before their issuance. On the other hand, a loss on an uncollectible trade account receivable resulting from a customer's major casualty, such as a fire or flood subsequent to the balance sheet date, would not be indicative of conditions existing at the balance sheet date, and the adjustment of the financial statements would not be appropriate. However, if the amount is material, disclosure would be required.
2. A settlement of a lawsuit would require adjustment of the financial statements if the event that gave rise to the claim occurred prior to the balance sheet date. However, only disclosure is required if the event that gave rise to the claim occurred after the balance sheet date, and then only if the amount involved were expected to be material.
3. The second type of events (those not existing at the balance sheet date) that require disclosure but not adjustment include the following:

   a. Sale of a bond or capital stock issue
   b. Purchase of a business
   c. Loss of plant or inventories as a result of fire or flood
   d. Gains or losses on certain marketable securities

Contingencies. A contingency is defined in ASC 450 as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain or loss. The uncertainty will ultimately be resolved when one or more future events occur or fail to occur. Resolution of the uncertainty may confirm the acquisition of an asset, the reduction of a liability, the loss or impairment of an asset, or the incurrence of a liability.

If it is probable that an asset has been impaired or that a liability has been incurred at the date of the financial statements and the amount of that loss can be reasonably estimated, the loss is accrued by a charge to earnings and the recognition of a liability. Contingencies requiring accrual are discussed more fully in Chapter 14.

However, if it is only reasonably possible that a future event will confirm that an asset was impaired or a liability had been incurred at the balance sheet date, an enterprise must disclose the contingency if the amount involved could have a material effect on the financial statements. The disclosure is to include the nature of the contingency and either an estimate of the amount of the loss or the range of possible losses. If an estimate of loss cannot be made, that fact must be disclosed.

If the likelihood is remote that a loss has been incurred, no disclosure is necessary in most circumstances. However, guarantees of the indebtedness of others, guarantees to repurchase receivables or other assets, and obligations of commercial banks under standby letters of credit are always disclosed, irrespective of the likelihood of future performance on the part of the enterprise. The required disclosure is to include the nature and amount of the guarantee.

ASC 460, *Guarantees,* explains that guarantees actually embody two separate obligations, (1) the contingent obligation to perform under the guarantee in the event of nonperformance by the party whose obligation is guaranteed, and (2) an obligation to be ready to perform, referred to as a standby obligation, during the period that the guarantee is in effect. As a result of this bifurcation of the obligation, many guarantees are now required to be recognized as liabilities on the balance sheet. Discussion of the recognition and disclosure of guarantees is included in Chapter 14.

An estimated gain from a gain contingency usually is not reflected in the balance sheet or income statement because doing so might recognize revenue prior to its realization. Adequate disclosure of the gain contingency is to be made, but care must be taken to avoid misleading implications as to the likelihood of realization. For example, if the enterprise may be able to recover some portion of an incurred loss by proceeding against a third party, that fact might be disclosed.

Commitments. All significant contractual commitments are to be disclosed in the notes to the financial statements. For example, lease contract provisions, pension obligations, requirements contracts, bond indenture covenants, commitments to purchase or construct new facilities, and employee share-based compensation plans are to be clearly disclosed in the notes.

Risks and Uncertainties

ASC 275-10-50, *Risks and Uncertainties*, requires disclosure in financial statements about risks and uncertainties existing as of the date of those statements that could significantly affect the amounts reported in the near term. Near term is defined as a period of time not to exceed one year from the date of the financial statements. The four areas of disclosure required by ASC 275-10-50 are risks and uncertainties relating to the nature of the enterprise's operations, use of estimates in the preparation of financial statements, certain significant estimates, and vulnerability due to certain concentrations.

Nature of operations. ASC 275-10-50 requires that enterprises disclose the major products or services that they sell or provide, the principal markets that they serve, and the location of those markets.

If an enterprise operates in more than one industry, it must disclose all industries it is operating within as well as the relative importance of each industry. The basis for determining the relative importance of each industry (assets, revenue, or earnings) is also to be dis-

closed. Quantification is not required in disclosures about the nature of operations. Comparisons of relative importance for enterprises operating in more than one business can be conveyed by the use of words such as predominantly, equally, or major.

Use of estimates in the preparation of financial statements. Financial statements must include an explanation that the preparation of financial statements in accordance with GAAP requires the use of estimates by management. The purpose of this disclosure is to clearly alert users to the pervasiveness of estimates.

Certain significant estimates. ASC 275-10-50 requires disclosures regarding estimates used in valuing assets, liabilities, or gain or loss contingencies if both of the following conditions are met:

1. It is at least reasonably possible that the estimate of the effect on the financial statements of a condition, situation, or set of circumstances that existed at the date of the financial statements will change in the near term due to one or more future confirming events.
2. The effect of the change would be material to the financial statements.

For the purposes of determining materiality, it is not the amount of an estimate that determines whether an item is material and must be disclosed, but rather the effect of using a different estimate that determines materiality.

The disclosure is to indicate the nature of the uncertainty and that it is reasonably possible that the estimate will change in the near term. ASC 275-10-50 is separate from and does not change ASC 450, *Contingencies*. If an estimate is covered under ASC 450 as a loss contingency, the disclosure also is to include an estimate of the possible range of loss, or state that an estimate cannot be made. Disclosure of any factors that would make an estimate sensitive to change is encouraged but not required.

Many enterprises use risk-reduction techniques to mitigate losses. If the effect of a change in the estimate is unlikely to be material because of risk-reduction techniques, the enterprise is encouraged, but not required, to disclose the uncertainty as well as the relevant risk-reduction techniques.

Examples of items that may be based on estimates that are particularly sensitive to change in the near term (ASC 275-10-50)

1. Inventory subject to rapid technological obsolescence
2. Specialized equipment subject to technological obsolescence
3. Valuation allowances for deferred income tax assets based on future taxable income
4. Capitalized motion picture film production costs
5. Capitalized computer software costs
6. Deferred policy acquisition costs of insurance enterprises
7. Valuation allowances for commercial and real estate loans
8. Environmental remediation-related obligations
9. Litigation-related obligations
10. Contingent liabilities for guarantees of other enterprises' obligations
11. Amounts reported for long-term obligations, such as amounts reported for pensions and postemployment benefits
12. Net proceeds recoverable, the provisions for expected loss to be incurred, or both, on disposition of a business or assets
13. Amounts reported for long-term contracts

Current vulnerability due to concentrations. Vulnerability from concentrations occurs when enterprises fail to diversify in order to mitigate risk. Financial statements must disclose such concentrations if management knows prior to issuance of the financial statements that all of the following conditions exist (ASC 275-10-50):

1. The concentration exists at the date of the financial statements.
2. The concentration makes the enterprise vulnerable to the risk of a near-term severe impact.
3. It is at least reasonably possible that the events that could cause the severe impact will occur in the near term.

Examples of concentrations that require disclosure (ASC 275-10-50)

1. Concentrations in the volume of business transacted with a particular customer, supplier, lender, grantor, or contributor
2. Concentrations in revenue from particular products, services, or fundraising events
3. Concentrations in the available sources of supply of materials, labor, services, or of licenses or other rights used in the enterprise's operations
4. Concentrations in the market or geographic area in which an enterprise conducts its operations

The potential for severe impact can occur as the result of the total or partial loss of a business relationship, price or demand changes, loss of patent protection, changes in the availability of a resource or right, or the disruption of operations in a market or geographic area. For purposes of ASC 275-10-50, it is always considered reasonably possible in the near term that any customer, grantor, or contributor will be lost and that operations located outside an enterprise's home country will be disrupted.

For concentrations of labor subject to collective bargaining agreements and concentrations of operations outside an enterprise's home country, the following additional disclosures are required (ASC 275-10-50):

1. For labor subject to collective bargaining agreements, disclosure is to include both the percentage of the labor force covered by collective bargaining agreements and the percentage of the labor force covered by collective bargaining agreements that will expire within one year.
2. For operations located outside the enterprise's home country, disclosure is to include the carrying amounts of net assets and the geographic areas in which they are located.

Forthcoming Changes to Financial Statement Presentation Standards

While the set of basic financial statements that have been mandated under GAAP—with the adoption of the cash flow statement requirement in the late 1980s being the last major change—is not likely to change, *per se*, it is quite possible that the form and content of the financial statements may be altered as a result of an ongoing FASB/IASB joint project expected to come to fruition in the next year or so. This is partly in response to proposals offered by the user community, in particular from financial analysts, who have argued that more meaningful information could be displayed by a more comprehensive use of the "operating-investment-financing" trichotomy already familiar from its usage in the cash flow statement.

The FASB project, *Financial Statement Presentation*, which has been ongoing since 2001, has, as of early 2009, reached a number of important, albeit tentative, conclusions. The project has been divided into several phases, only the first of which has thus far been completed. A discussion document for the second phase was issued in October 2008 with a comment period ending April 14, 2009.

The conclusions expressed thus far include the following:

1. That a complete set of financial statements be required to display balance sheets at both the beginning and the end of the reporting period (beginning balance sheets are not currently required).

2. That a statement that shows (for the reporting period) the changes in assets and liabilities other than those arising from transactions with owners in their capacity as owners and that includes display of the currently required subtotal net income be made a requirement. Such a statement would be referred to as a statement of earnings and comprehensive income (see commentary in Chapter 3).
3. That there be a required statement that shows the changes in assets and liabilities arising from transactions with owners in their capacity as owners, which would be referred to as a statement of changes in equity (see commentary in Chapter 3).
4. That a statement of cash flows continue to be required (see Chapter 4).

Another tentative decision reached is to require comparative financial statements—which has long been encouraged, since single period financial statements are deemed to be less readily interpreted by users. However, in conjunction with the tentative decision to require both beginning and ending balance sheets, this means that a basic set of financial statements, should this proposal be enacted, would require at least three balance sheets.

The proposed change in the presentation requirements for financial statements would have as a key objective the separating of the reporting entity's financing activities from its business and other activities, and the further separating of the entity's financing activities into transactions with owners, in their capacity as owners, from all of its other financing activities. It would thus expand upon the typology of cash flows first imposed by ASC 230 (described in Chapter 4), although the implications of such a distinction for the balance sheet are perhaps less obvious than for the "flow" statements (notably, the income statement). According to FASB, the financing section in the statement of financial position would include financial assets and financial liabilities that management deems to be part of the financing of the entity's business activities. Amounts relating to financing liabilities would be presented in the financing liabilities category and amounts relating to financing assets would be presented in the financing assets category in each of the financial statements.

In determining whether an asset or liability would be included in the financing section of the balance sheet, a reporting entity would consider whether the item is interchangeable with other sources of financing and whether the item could be characterized as independent of specific business activities. Thus, for nonfinancial institution reporting entities, financing section display of cash, bank loans, available-for-sale financial instruments, bonds, and leases, plus financial instruments held to hedge any of these items, would generally be appropriate.

Reportedly, the current thinking is that there would be a newly devised *equity* section in the statement of cash flows to report changes in items displayed in the equity section of the balance sheet, although this preliminary conclusion could well change before a final standard is enacted.

Regarding the investing category in a revamped balance sheet, this would include assets and liabilities that would not be related to financing the entity's business activities that management views as integral to its main business activities. All the changes to investing assets and liabilities would be presented in the investing category in the statement of comprehensive income and the statement of cash flows. For example, available-for-sale investments and instruments used to hedge these investments would require investing classification under the contemplated rules.

The operating category of the redesigned balance sheet would include assets and liabilities related to the core operations of the reporting entity. The accounting policies note to the financial statements would be used to define the basis for classification of the assets and liabilities, and any change in that basis would be deemed a change in accounting policy, to be implemented by means of retroactive application.

Expanded information regarding liquidity may also be mandated by a new standard on financial statement presentation, if the FASB and IASB maintain their current views during the remainder of deliberations. It is unclear whether this will result in new or revised informative disclosures, or in requirements that directly impact the balance sheet and other financial statements.

The second phase of the financial statement presentation project addresses more fundamental issues for presentation of information on the faces of financial statements. According to FASB, topics being dealt with include

1. Developing principles for aggregating and disaggregating information in each financial statement
2. Defining the totals and subtotals to be reported in each financial statement (which might include categories such as business and financing)
3. Deciding whether components of other comprehensive income should be recycled/reclassified to profit or loss and, if so, the characteristics of the transactions and events that should be recycled and when recycling should occur
4. Reconsidering ASC 230, *Statement of Cash Flows* (as well as the corresponding international standard, IAS 7), including whether to require the use of the direct or indirect method

FASB issued a discussion stage document to address the aforementioned issues. Comments on the discussion paper are to be submitted to FASB by April 14, 2009, for consideration.

The final phase of the FASB's project, still in the very preliminary stage, will address the presentation and display of interim financial information in US GAAP (and IASB may reconsider its corresponding rule, IAS 34), and will reportedly include

1. Which, if any, financial statements should be required in an interim financial report
2. Whether entities should be allowed to present the financial statements in an interim financial report in a condensed format; if so, whether the Boards should provide guidance on how to condense the information
3. What comparative periods, if any, should be required or allowed in interim financial reports, and when, if ever, should twelve-month-to-date financial statements be required or allowed in interim financial reports
4. Whether guidance for nonpublic companies should differ from guidance for public companies

Any new pronouncements regarding financial statement presentation will (at least in the near term) apply only to business entities (both public and nonpublic ones), but will not apply to nonbusiness entities (not-for-profit organizations or defined benefit plans). Both FASB and the international standard setter, IASB, are currently attempting to develop a principles-based standard that will apply equally to all business entities. They will also potentially consider whether the standard should include different presentation provisions for a limited scope of entities (e.g., financial institutions).

It will address the organization and presentation of financial information on the face of the financial statements but will not address recognition or measurement guidance provided in other standards for individual assets, liabilities, or transactions.

Furthermore, it will address all the financial statements that constitute a complete set of financial statements.

It will address the necessity for totals and subtotals in the financial statements, including the net income/profit or loss subtotal, and will assess whether to change the mechanism of recycling used today.

It will not, however, include a comprehensive review of the notes to the financial statement, albeit it may necessitate certain amendments to existing disclosure requirements. On the other hand, if FASB and IASB are unable to achieve stated objectives by making changes to the face of financial statements, they may choose to develop new disclosure requirements.

The financial statement presentation project will not address management discussion and analysis or management commentary (i.e., the narratives commonly accompanying financial statements, as required for SEC registrants). Neither is it currently planned that this project will address pro forma measures; segment reporting requirements; financial ratios (except earnings per share [EPS] and other per-share amounts); forecasts of information; nonfinancial ratios or other nonfinancial information; nor financial statements for specific industries (except for considering how the decisions in the project may affect the financial statements of financial institutions).

Example of Balance Sheet Classification and Presentation

The classification and presentation of information in a balance sheet may be highly aggregated, highly detailed, or anywhere in between. In general, highly aggregated balance sheets are used in annual reports and other presentations provided to the public. Highly detailed balance sheets are used internally by management. The following highly aggregated balance sheet includes only a few line items. The additional details required by generally accepted accounting principles are found in the notes to the financial statements. Note that both of the following examples reflect current financial reporting standards, and have not been modified to incorporate any of the proposed changes suggested in the current FASB/IASB deliberations.

ABC Corporation
Balance Sheet
December 31, 2009

Assets	
Current assets	xxx
Long-term investments	xxx
Property, plant, and equipment, net	xxx
Deferred income tax assets	xxx
Goodwill	xxx

Total liabilities and shareholders' equity	xxx

The following comprehensive balance sheet includes more line items (for details about specific assets and liabilities) than are found in most balance sheets.

ABC Corporation
Balance Sheet
December 31, 2009

Assets			
Current assets:			
Cash and bank deposits:			
Restricted to current bond maturity	$xxx		
Unrestricted	xxx	$xxx	
Short-term investments:			
Marketable equity securities (trading)		xxx	
Marketable debt securities (available-for-sale)		xxx	
Refundable income taxes		xxx	
Receivables from affiliates		xxx	
Accounts receivable	xxx		
Less allowance for uncollectible accounts	(xxx)	xxx	
Notes receivable due in 2010	xxx		
Less discounts on notes receivable	(xxx)	xxx	
Installment notes receivable due in 2010		xxx	
Interest receivable		xxx	
Creditors' accounts with debit balances		xxx	
Advances to employees		xxx	
Inventories (carried at the lower of cost or market using FIFO):			
Finished goods	xxx		
Work in process	xxx		
Raw materials	xxx	xxx	
Deferred income taxes (net of valuation allowance of $xxx)			
Prepaid expenses:			
Prepaid rent	xxx		
Prepaid insurance	xxx	xxx	
Total current assets			$xxx
Long-term investments:			
Investments in equity securities (available-for-sale)		xxx	
Investments in bonds (held-to-maturity)		xxx	
Investments in equity securities (at cost, plus equity in undistributed net earnings since acquisition)		xxx	
Investments in unused land and facilities		xxx	
Cash surrender value of officers' life insurance policies		xxx	
Sinking fund for bond retirement		xxx	
Plant expansion fund		xxx	
Total long-term investments			$xxx
Property, plant, and equipment:			
Land		$xxx	
Buildings (including capitalized interest of $xxx)		xxx	
Machinery and equipment		xxx	
Furniture and fixtures		xxx	
Assets under capital leases		xxx	
Leasehold improvements		xxx	
Less accumulated depreciation and amortization		(xxx)	
Total property, plant, and equipment			xxx
Intangible assets net of amortization:			
Goodwill of acquired businesses		$xxx	
Patents		xxx	
Trademarks		xxx	
Total intangible assets, net			xxx
Other assets:			
Installment notes due after 2010		$xxx	
Unamortized bond issue costs		xxx	
Deferred income taxes (net of valuation allowance of $xxx)			xxx
Total other noncurrent assets			xxx
Total assets			$xxx

Liabilities and Shareholders' Equity			
Current liabilities:			
Current maturities of long-term debt		$xxx	
Current maturities of capital lease obligations		xxx	
Commercial paper and other short-term notes payable		xxx	
Accounts payable		xxx	
Accrued salaries, wages, and commissions		xxx	
Payroll taxes withheld and accrued		xxx	
Employee 401(k) contributions withheld		xxx	
Accrued rent		xxx	
Income taxes payable		xxx	
Sales taxes payable		xxx	
Dividends payable		xxx	
Rent revenue collected in advance		xxx	
Other advances from customers		xxx	
Deferred income taxes		xxx	
Short-term portion of accrued warranty costs		xxx	
Other accrued liabilities		xxx	
Total current liabilities			$xxx
Noncurrent liabilities:			
Notes payable due after 2010	$xxx		
Plus unamortized note premium	xxx	$xxx	
Long-term bonds:			
10% debentures due 2018	xxx		
9 1/2% collateralized obligations maturing serially to 2011	xxx		
8% convertible subordinated debentures due 2022	xxx		
Less unamortized discounts net of premiums	(xxx)	xxx	
Accrued pension cost		xxx	
Capital lease obligations		xxx	
Asset retirement obligations (net of accumulated accretion of $xxx)		xxx	
Deferred income taxes		xxx	
Long-term portion of accrued warranty costs		xxx	
Total noncurrent liabilities			xxx
Total liabilities			$xxx
Shareholders' equity:			
Capital stock:			
$12.50 convertible preferred stock, $100 stated value, 200,000 shares authorized, 175,000 outstanding	$xxx		
12% cumulative preferred stock, $100 stated value, callable at $115, 100,000 shares authorized and outstanding	xxx		
Common stock, $10 stated value, 500,000 shares authorized, 450,000 issued, 15,000 held in treasury	xxx		
Common stock subscribed 10,000 shares	xxx		
Less: Subscriptions receivable	(xxx)	$xxx	
Additional paid-in capital:			
From 12% cumulative preferred	xxx		
From common stock	xxx		
From treasury stock transactions	xxx		
From stock dividends	xxx		
From expiration of share options	xxx		
Warrants outstanding	xxx	xxx	
Retained earnings		xxx	
Accumulated other comprehensive income:			
Net unrealized loss on available-for-sale securities	(xxx)		
Unrealized loss from foreign currency translation	(xxx)		
Excess of minimum pension liability over unrecognized prior service cost	(xxx)	(xxx)	
Less: Treasury stock at cost		(xxx)

PERSPECTIVE AND ISSUES

A primary focus of financial reporting is to provide information about an entity's performance that is useful to present and potential investors, creditors, and others when they are making financial decisions. In financial reporting, performance is primarily measured by net income and its components, which are provided in the income statement. Although information in the income statement is information about past performance, investors, creditors, and others use that information to predict future performance.

In contrast to the balance sheet, which provides information about an entity at a point in time, an income statement provides information about a period of time. It reflects information about the transactions and other events occurring within the period. Most of the weaknesses of an income statement are a result of its periodic nature. Entities are continually creating and selling goods and services, and at any single point in time some of those processes will be incomplete. Thus, measurement of net income for a period involves estimates. The degree of completion of inventories, the amounts of inventories that have been manufactured or purchased but ultimately will not be sold, and the amounts of goods and services that have been sold but ultimately will not result in cash receipts are just of few of the many estimates that must be made in order to present an income statement. The entity's ability (or inability) to make these estimates is reflected in the performance measure for the period.

Historically, performance was measured only by the income statement. During the 1990s, a second performance measure was introduced—comprehensive income—which was a concept first set forth in CON 3 in 1980 (which was superseded by CON 6 in 1985). Com-

prehensive income is a more inclusive notion of performance than net income. It includes all recognized changes in equity that occur during a period except those resulting from investments by owners and distributions to owners. Thus, included in comprehensive income but excluded from net income are foreign currency adjustments, unrealized changes in the fair value of available-for-sale securities, the effective portion of the gain or loss on derivative instruments designated and qualified as either a cash-flow hedging item or a hedge of a forecasted foreign-currency-denominated transaction, and minimum pension liability adjustments. Because comprehensive income includes the effects on an entity of economic events largely outside of its management's control, some have said that net income is a measure of management's performance and comprehensive income is a measure of entity performance.

The requirement to report comprehensive income in addition to net income is another step in the movement toward the capital maintenance concept of income mentioned in Chapter 2. Under that concept of income, income is earned only if the entity's net assets at the end of the period exceed its net assets at the beginning of the period after excluding the effects of transactions with owners. A capital maintenance concept of income is more consistent with investors' expectations that an investment should generate more financial resources than were invested, although, unless all assets and liabilities were reported at their respective fair values, this is at best an imperfect approximation of true economic income.

Instead of, or in addition to, net income or comprehensive income, some companies are using "pro forma earnings" and other measures to report corporate performance. The practice has generated debate and confusion because companies calculate and report those "earnings" using definitions that vary from company to company (and sometimes even within the same company from quarter to quarter). In response to growing concerns about this practice, and as a proximate result of the enactment of the Sarbanes-Oxley Act of 2002, in January 2003, the SEC adopted a new disclosure regulation, Regulation G, that requires public companies that disclose or release non-GAAP financial measures (all of which have been loosely referred to as pro forma earnings) to include in that same disclosure or release a presentation of the most directly comparable GAAP financial measure, along with a reconciliation of the disclosed non-GAAP measure to the most directly comparable GAAP financial measure. FASB and its international equivalent, IASB, are conducting a joint project on financial performance reporting to improve the usefulness of this information and converge US GAAP and IFRS (discussed in this chapter).

DEFINITIONS OF TERMS

Component of an entity. The operations and cash flows that can be clearly distinguished, operationally and for financial reporting purposes, from the rest of the entity. All of the following are components of an entity:

1. A reportable segment, which is a segment considered to be significant to an enterprise's operations; a segment that has passed one of three 10% tests (assets, revenues, or operating profit or loss) or has been identified as being reportable through other criteria (ASC 280)
2. An operating segment, which is a component of an enterprise that may earn revenues and incur expenses, and about which separate financial information is available that is evaluated regularly by the chief operating decision maker in deciding how to allocate resources and in assessing performance (ASC 280)
3. A reporting unit, which is an operating segment or one level below an operating segment (ASC 350)
4. A subsidiary
5. An asset group, which is the lowest level for which identifiable cash flows are largely independent of the cash flows of other groups of assets and liabilities (ASC 360)

Comprehensive income. The change in equity of a business enterprise during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period, except those resulting from investments by owners and distributions to owners (CON 6).

Development stage enterprise. An entity that is devoting substantially all its efforts to establishing itself as a new business and either its principal operations have not commenced or its principal operations have commenced but have not generated a significant amount of revenue.

Distribution to owners. Decreases in net assets of a particular enterprise resulting from the entity transferring assets, rendering services, or incurring liabilities to owners.

Distributions to owners reduce the ownership interest of the receiving owners in the entity and reduce the net assets of the entity by the amount of the distribution. Such transactions are displayed in the statement of changes in equity.

Expenses. Decreases in assets or increases in liabilities during a period resulting from delivery of goods, rendering of services, or other activities constituting the reporting entity's central operations (CON 6).

Extraordinary item. Events and transactions that are distinguished by their unusual nature and by the infrequency of their occurrence (ASC 225).

Gains. Increases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity during a period except those that result from revenues or investments by owners (CON 6).

Investments by owners. Increases in net assets of a particular enterprise resulting from transfers to it of something valuable to obtain or increase ownership interests (or equity) in it.

Investments by owners may be in the form of assets, services, or the payment of entity liabilities. These investments are displayed in the statement of changes in equity. The pur-

chase of an ownership interest from another owner is not a net investment because such a transfer does not increase the net assets of the entity.

Losses. Decreases in equity (net assets) from peripheral or incidental transactions of an entity from all other transactions and other events and circumstances affecting the entity during a period except those that result from expenses or distributions to owners (CON 6).

Realization. The process of converting noncash resources and rights into money or, more precisely, the sale of an asset for cash or claims to cash (CON 6).

Recognition. The process of formally recording or incorporating an item in the financial statements of an entity (CON 6).

Revenues. Increases in assets or decreases in liabilities during a period from delivering goods, rendering services, or other activities constituting the enterprise's central operations (CON 6).

CONCEPTS, RULES, AND EXAMPLES

Limitations of the Income Statement

Economists have generally adopted a wealth maintenance concept of income. Under this concept, income is the maximum amount that can be consumed during a period and still leave the enterprise with the same amount of wealth at the end of the period as existed at the beginning. Wealth is determined with reference to the current market values (fair values) of the net productive assets at the beginning and end of the period. Therefore, the economists' definition of income would fully incorporate market value changes (both increases and decreases in wealth) in the determination of periodic income.

Accountants, on the other hand, have generally defined income by reference to specific events that give rise to recognizable elements of revenue and expense during a reporting period. The events that produce reportable items of revenue and expense are a subset of economic events that determine economic income. Many changes in the market values of wealth components are deliberately excluded from the measurement of accounting income, but are included in the measurement of economic income.

The discrepancy between accounting and economic measures of income is primarily the result of accountants' concerns for reliability and measurability. Those concerns have traditionally served to prevent revenue and gains from being recognized until an acceptable level of assurance is obtained about the existence and amount of those revenues and gains. In general, accountants do not recognize revenues or gains until they are realizable—convertible into known amounts of cash or claims to cash.

However, some gains are realizable but are still not reported in net income. Holding gains on certain debt and equity investments are readily convertible into known amounts of cash. Those gains are currently excluded from net income for two reasons. First, many consider net income to be a measure of management's performance, and holding gains and losses result from market fluctuations that are outside the control of management. To report holding gains and losses in net income decreases the ability to use that measure to judge management performance. Second, many entities that purchase large amounts of investments finance those investments with liabilities, earning money from the spread (the difference between the investment return and the borrowing costs). Including in net income unrealized holding gains and losses on only the investments, and not the related liabilities, could cause volatility in earnings that is not representative of how those entities are impacted by economic events.

Notwithstanding the traditional adherence to historical cost bases for most assets and almost all liabilities, FASB is currently working on a project that could lead to reporting certain liabilities at fair value. If this approach ultimately is accepted, future changes in ac-

counting standards may eliminate this as a point of distinction between accounting and economic measures of income.

Another reason for the discrepancy between accounting and economic measures of income is the periodic nature of the income statement. Both accountants and economists realize that the earnings process occurs throughout the various stages of production, sales, and final delivery of the product. However, the difficulty in measuring the precise rate at which this earnings process is taking place has led accountants to conclude that income should normally be recognized only when it is fully realized. *Realization* generally implies that the enterprise producing the item has completed all of its obligations relating to the product and that collection of the resulting receivable is assured beyond reasonable doubt. A system of revenue recognition based on realization provides a way of dealing with the periodic nature of the income statement.

The economic measure of income would be relatively simple for an entity to apply on a life-cycle basis. Economic income would be measured by the difference between its wealth at the termination point versus its wealth at the origination date, plus withdrawals or other distributions and minus additional investments over the course of the entity's life. However, applying the same measurement strategy to discrete fiscal periods, as accountants do, is substantially more difficult. Allocating earnings to individual years, quarters, or months requires both estimates and use of judgment. Consequently, accountants have preferred that there be unambiguous guidelines for revenue recognition. These have generally permitted revenue recognition only at the completion of the earnings cycle, with a notable exception for long-term construction-type contracts.

Accountants have moved closer to an economic measure of income by introducing the measure "comprehensive income" into the financial statements. Comprehensive income is the change in equity resulting from all sources other than distributions to owners and investments by owners. Thus, its definition is similar to economic income. However, because of the realization and recognition concerns discussed earlier, comprehensive income remains a subset of economic income.

Whether economic income, comprehensive income, net income, or some other measure is the appropriate measure of income is partially dependent upon the perspective of the party doing the measuring. From the perspective of the outside investors taken as a whole, income might be defined as earnings before any payments to those investors, including bondholders and preferred stockholders as well as common shareholders. On the other hand, from the perspective of the common shareholders, income might better be defined as earnings after payments to other investors, including creditors and preferred shareholders. Analysts regularly use earnings before interest, income taxes, depreciation, and amortization (known as EBITDA) as a surrogate measure for economic income, although this can easily be criticized. Perhaps the best accounting can do is provide the broadest possible measure (comprehensive income) and include in the financial statements information that allows each reader to compute the measure that is most meaningful to him or her.

Recognition and Measurement

Revenues. Revenues represent actual or expected cash inflows that result from an entity's central operations. Revenues are generally recognized at the culmination of the earnings process—when the entity has substantially completed all it must do to be entitled to future cash inflows (or to retain cash already transferred). Most often, an exchange transaction indicates that revenues have been earned. Merchandise is delivered or services are rendered to a customer, resulting in the receipt of cash or the right to receive cash in the future. Revenues are generally measured by the values of the assets exchanged (or liabilities incurred).

When, as is typically the case, the entity generating revenue is responsible for collecting sales or other taxes from the customers, to be later paid to the governmental authorities, these taxes may either be reported as part of gross revenue (and also as expense), or the taxes may be omitted from the income statement altogether (i.e., reporting revenues net of tax). ASC 605-45-50 clarifies that this is a choice between acceptable accounting principles, to be applied consistently. Chapter 10 discusses revenue recognition in more detail.

Revenues are commonly distinguished from gains for three reasons. Revenues result from an entity's central operations; gains result from incidental or peripheral activities of the entity. Revenues are usually earned; gains result from nonreciprocal transactions (such as winning a lawsuit or receiving a gift) or other economic events for which there is no earnings process. Revenues are reported gross; gains are reported net.

The existence of an exchange transaction generally is critical to the accounting recognition of revenue. However, an exchange transaction is viewed in a broader sense than the legal concept of a sale. Whenever an exchange of rights and privileges takes place, an exchange transaction is deemed to have occurred. For example, interest revenue and interest expense are earned or incurred ratably over a period without a discrete transaction taking place. Accruals are recorded periodically in order to reflect the interest realized by the passage of time. In a like manner, the percentage-of-completion method recognizes revenue based upon the measure of progress on a long-term construction project. The earnings process is considered to occur simultaneously with the measure of progress (e.g., the incurrence of costs).

The timing of revenue recognition also varies based on the realizability of the future cash flows. For example, the production of certain commodities takes place in an environment in which the ultimate realization of revenue is so assured that revenue can be recognized upon the completion of the production process. At the opposite extreme is the situation in which an exchange transaction has taken place, but significant uncertainty exists as to the ultimate collectibility of the amount. For example, in certain sales of real estate, where the down payment percentage is extremely small and the security for the buyer's notes is minimal, revenue is often not recognized until the time collections are actually received.

The revenue recognition system that is based on realization has worked reasonably well over the years. However, new types of transactions, products, and services have challenged that system. In most recent years, revenue recognition issues top the list of reasons for financial reporting restatements, or closely trail improper use of reserves for that dubious honor. In 2002, FASB added a major revenue recognition project to its agenda. That project may lead to a new accounting standard on revenue recognition generally and also might involve amending the related guidance on revenues and liabilities in certain of the Board's Concepts Statements.

As of mid-2008, preliminary views document was being promised by FASB, which it states will describe a single contract-based revenue recognition model that has two different measurement approaches. The expectation is that this will be a convergent approach with IASB. Chapter 10 provides more information about FASB's project and about revenue recognition under special circumstances.

Expenses. Expenses represent actual or expected cash outflows that result from an entity's central operations. Expenses are generally recognized when an asset either is consumed in an entity's central operations or is no longer expected to provide the level of future benefits expected when that asset was recognized.

Expenses are commonly distinguished from losses for three reasons. Expenses result from an entity's central operations; losses result from incidental or peripheral activities of the entity. Expenses are often incurred during the earnings process; losses often result from non-

reciprocal transactions (such as thefts or fines) or other economic events unrelated to an earnings process. Expenses are reported gross; losses are reported net.

Although many cash outflows are recognized directly as expenses, this accounting is often done for expediency since most expenses are first assets, if only for a brief moment. Measuring the consumption of assets is done by one of three pervasive measurement principles: associating cause and effect, systematic and rational allocation, or immediate recognition.

Some costs, such as materials and direct labor consumed in the manufacturing process, are relatively easy to identify with the related revenue elements. The matching principle requires that all expenses incurred in the generation of revenue should be recognized in the same accounting period as the related revenues are recognized. Thus, those cost elements are included in inventory and expensed as cost of sales when a product is sold and revenue from the sale is recognized. That process is associating cause and effect.

Other costs are more closely associated with specific accounting periods. In the absence of a cause and effect relationship, the asset's cost should be allocated to the accounting periods benefited in a systematic and rational manner. This form of expense recognition involves assumptions about the expected length of benefit and the relationship between benefit and cost of each period. Depreciation of plant, property, and equipment, amortization of intangibles, and allocation of rent and insurance are examples of costs that are recognized by the use of a systematic and rational method.

The costs of advertising are expensed either as costs are incurred or the first time the advertising takes place (e.g., when the television advertisement is aired or printed copy is published), if later (720-35-25). However, there are two exceptions

1. Direct-response advertising
   a. Whose primary purpose is to elicit sales to customers who could be shown to have responded specifically to the advertising, and
   b. That results in probable future economic benefits; and
2. Expenditures for advertising costs that are made subsequent to recognizing revenues related to those costs.

Expenditures for direct-response advertising are deferred if both of the conditions listed above are met. The future benefits to be received are the future revenues arising as a direct result of the advertising. The company is required to provide entity-specific persuasive evidence that there is a linkage between the direct-response advertising and these future benefits. These costs are then amortized over the period in which the future benefits are expected to be received.

Advertising expenditures are sometimes made subsequent to the recognition of revenue (such as in "cooperative advertising" arrangements with customers). In order to achieve proper matching, these costs are to be estimated, accrued, and charged to expense when the related revenues are recognized.

All other costs are normally expensed in the period in which they are incurred. This includes costs for which no clear-cut future benefits can be identified, costs that were recorded as assets in prior periods but for which no remaining future benefits can be identified, and costs for which no rational allocation scheme can be devised.

The general approach for recognizing expenses is first to attempt to match costs with the related revenues. Next, a method of systematic and rational allocation should be attempted. If both of those measurement principles are inappropriate, the cost should be immediately expensed.

Expenses do not include distributions to owners. Expenses of a corporation are easily identified and separated from distributions to stockholders. In both the sole proprietorship and partnership form of entity, the identification process can be more difficult. Items such as interest or salaries paid to partners or owners may be thought of as distributions of profits rather than expenses. However, many entities adopt the philosophy that financial reporting should be the same regardless of legal form (economic substance takes precedence over legal form). Under the corporate form of business, interest on stockholder loans and salaries paid to stockholders are clearly classified as expenses and not as distributions. Accordingly, these items may be treated as expenses for both partnerships and sole proprietorships. However, full disclosure and consistency of financial reporting treatment would be required. Circumstances may involve treating certain payments, such as guaranteed salaries, as expenses while classifying other "salaries" as profit distributions.

Gains and losses. Gains are increases in equity resulting from transactions and economic events other than those that generate revenues or are investments from owners. Losses are decreases in equity resulting from transactions and economic events other than those that generate expenses or are distributions to owners. Gains and losses result from an entity's peripheral transactions (e.g., sale of used equipment), from economic events outside of the control of management (e.g., holding gains on securities), or from nonreciprocal transactions (e.g., lawsuit settlements, fines, and thefts).

Gains and losses are often described in financial statements by their sources, for example, realized gains (losses) on sale of securities or earthquake loss. They are usually measured at net amounts. For example, gains (losses) from sales of assets are measured by subtracting the unexpired cost of the asset from the proceeds, and holding gains (losses) are measured by subtracting the value at the beginning of the period from the value at the end of the period.

Gains often result from transactions and other events that involve no earnings process; therefore, in terms of recognition, it is more significant that the gain be realized or realizable than earned. Losses are recognized when it becomes evident that future economic benefits of a previously recognized asset have been reduced or eliminated, or that a liability has been incurred without associated economic benefits.

Other comprehensive income. Comprehensive income is the change in equity that results from revenue, expenses, gains, and losses during a period, as well as any other recognized changes in equity that occur for reasons other than investments by owners and distributions to owners.

Other comprehensive income (comprehensive income less net income) is defined to include the effects of foreign currency translation, minimum pension liability adjustments, the effective portion of the gain or loss on derivative instruments designated and qualified as either a cash-flow hedging item or a hedge of a forecasted foreign-currency-denominated transaction, and unrealized gains and losses on certain investments in debt and equity securities. Other comprehensive income is recognized and measured in accordance with the accounting pronouncement that deems it part of other comprehensive income. Thus, foreign currency adjustments are recognized and measured in accordance with ASC 830 (Chapter 23); additional pension liabilities are recognized and measured in accordance with ASC 715 (Chapter 18); hedges are recognized and measured in accordance with ASC 815 (Chapter 8) and unrealized gains and losses are recognized and measured in accordance with ASC 320 (Chapter 12). In general, those items are recognized and measured whenever a complete set of financial statements is prepared.

Format of Statements of Income and Comprehensive Income

The basic order of presentation of information in an income statement (or statement of income and comprehensive income) is defined by a series of accounting pronouncements, as shown by the diagram below. Other than in the section "income from continuing operations," the display of revenues, expenses, gains, losses, and other comprehensive income is predetermined by authoritative pronouncement. Only within income from continuing operations does tradition and industry practice determine the presentation.

The sections containing information about other comprehensive income and comprehensive income, shown in the shaded area on the diagram, can be presented in a combined statement of income and comprehensive income. Alternatively, that information can be reported in a stand-alone statement of comprehensive income or in an expanded statement of changes in stockholder's equity. In ASC 220, FASB encourages the use of either a combined statement in which other comprehensive income appears below net income or a stand-alone statement that begins with net income. Regardless of the reporting location chosen, totals for net income, other comprehensive income, and comprehensive income must appear in the statement, and the statement must be of the same prominence as other financial statements. Information about other comprehensive income cannot be presented only in the notes to financial statements. For ease of reading, this publication uses the term "income statement" to include a combined statement of income and comprehensive income.

Statement of Income and Comprehensive Income	*Report net of tax?*	*Reference*
Income from continuing operations	No	ASC 225
Sales or service revenues		
Costs of goods sold		
Operating expenses		
Remaining excess of fair value over cost of acquired net assets in a business combination		ASC 805
Gains and losses		
Other revenues and expenses		
Items that are unusual or infrequent, but not both		
Income tax expense related to continuing operations		
Results from discontinued operations	Yes	ASC 360, ASC 250
Income (loss) from operations of a discontinued component		
Gain (loss) from disposal of a discontinued component		
Extraordinary items	Yes	ASC 225, ASC 980-20, ASC 225-20
Items that are both unusual and infrequent		
Investor's share of an equity method investee's extraordinary item		
Net income		
Other comprehensive income	Optional	ASC 220, ASC 815
Foreign currency adjustments		
Unrealized gains (losses) on securities		
Minimum pension liability		
Gains/losses on cash-flow hedging items		
Gains/losses on hedges of forecasted foreign-currency-denominated transactions		
Income tax related to other comprehensive income (if components are not shown net of tax)		
Comprehensive income		
Earnings per share information		ASC 260

NOTE: Alternatively, information in the shaded area can be presented as a separate statement or in a statement of changes in stockholders' equity.

The three items that are shown in the heading of an income statement are

1. The name of the entity whose results of operations is being presented
2. The title of the statement
3. The period of time covered by the statement

The entity's legal name should be used and supplemental information could be added to disclose the entity's legal form as a corporation, partnership, sole proprietorship, or other form if that information is not apparent from the entity's name. The use of the titles "Income Statement," "Statement of Income and Comprehensive Income," "Statement of Operations," or "Statement of Earnings" denotes preparation in accordance with generally accepted accounting principles. If another comprehensive basis of accounting were used, such as the cash or income tax basis, the title of the statement would be modified accordingly. "Statement of Revenue and Expenses—Income Tax Basis" or "Statement of Revenue and Expenses—Modified Cash Basis" are examples of such titles.

The date of an income statement must clearly identify the time period involved, such as "Year Ending March 31, 2009." That dating informs the reader of the length of the period covered by the statement and both the starting and ending dates. Dating such as "The Period Ending March 31, 2009" or "Through March 31, 2009" is not useful because of the lack of precision in those titles. Income statements are rarely presented for periods in excess of one year but are frequently seen for shorter periods such as a month or a quarter. Entities whose operations form a natural cycle may have a reporting period end on a specific day (e.g., the last Friday of the month). These entities should head the income statement "For the 52 Weeks Ended March 27, 2009" (each week containing seven days, beginning on a Saturday and ending on a Friday). Although that fiscal period includes only 364 days (for most years), it is still considered an annual reporting period.

Income statements generally should be uniform in appearance from one period to the next. The form, terminology, captions, and pattern of combining insignificant items should be consistent. If comparative statements are presented, the prior year's information should be restated to conform to the current year's presentation if changes in presentation are made.

Aggregation of items should not serve to conceal significant information, such as netting revenues against expenses or combining dissimilar types of resources, expenses, gains, or losses. The category "other or miscellaneous expense" should contain, at maximum, an immaterial total amount of aggregated insignificant items. Once this total approaches 10% of total expenses, some other aggregations with explanatory titles should be selected.

Income from Continuing Operations

The section "income from continuing operations" includes all revenues, expenses, gains, and losses that are not required to be reported in other sections of an income statement.

There are two generally accepted formats for the presentation of income from continuing operations: the single-step and the multiple-step formats.

In the single-step format, items are classified into two groups: revenues and expenses. The operating revenues and other revenues are itemized and summed to determine total revenues. The cost of goods sold, operating expenses, and other expenses are itemized and summed to determine total expenses. The total expenses (including income taxes) are deducted from the total revenues to arrive at income from continuing operations.

Example of single-step format for income from continuing operations

Revenues:		
Sales (net of discounts and returns and allowances)	$xxx	
Gain on sale of equipment	xxx	
Interest income	xxx	
Dividend income	xxx	$xxx

Expenses:		
Cost of goods sold	$xxx	
Selling expenses	xxx	
General and administrative expenses	xxx	
Interest expense	xxx	xxx
Income from continuing operations		xxx

Some believe that a multiple-step format enhances the usefulness of information about an entity's performance by reporting the interrelationships of revenues and expenses, using subtotals to report significant amounts. In a multiple-step format, operating revenues and expenses are separated from nonoperating revenues and expenses to provide more information concerning the firm's primary activities. This format breaks the revenue and expense items into various intermediate income components so that important relationships can be shown and attention can be focused on significant subtotals. Some examples of common intermediate income components are as follows:

1. **Gross profit (margin)**—The difference between net sales and cost of goods sold.
2. **Operating income**—Gross profit less operating expenses.
3. **Income before income taxes**—Operating income plus any other revenue items and less any other expense items.

Example of a multiple-step format for income from continuing operations

Sales:			
Sales			$xxx
Less: Sales discounts		$xxx	
Sales returns and allowances		xxx	(xxx)
Net sales			$xxx
Cost of goods sold			xxx
Gross profit			$xxx
Operating expenses:			
Selling expenses			
Sales salaries	$xxx		
Commissions	xxx		
Advertising expense	xxx		
Delivery expense	xxx		
Selling supplies expense	xxx		
Depreciation of store furniture and equipment	xxx	$xxx	
General and administrative expenses			
Officers' salaries	$xxx		
Office salaries	xxx		
Bad debts expense	xxx		
Office supplies expense	xxx		
Depreciation of office furniture and fixtures	xxx		
Depreciation of building	xxx		
Insurance expense	xxx		
Utilities expense	xxx	xxx	
Total operating expense			(xxx)
Operating income			$xxx
Other revenues:			
Dividend income		$xxx	
Gain on business acquisition ("bargain purchase")		xxx	
Interest income		xxx	xxx
Other expenses:			
Interest expense			(xxx)
Income from continuing operations			$xxx

The following items of revenue, expense, gains, and losses are included within income from continuing operations:

1. **Sales or service revenues** are charges to customers for the goods and/or services provided during the period. This section should include information about discounts, allowances, and returns in order to determine net sales or net revenues.
2. **Cost of goods sold** is the cost of the inventory items sold during the period. In the case of a merchandising firm, net purchases (purchases less discounts, returns, and allowances plus freight-in) are added to beginning inventory to obtain the cost of goods available for sale. From the cost of goods available for sale amount, the ending inventory is deducted to obtain the cost of goods sold.

Example of calculation of cost of goods sold of a merchandising company

Beginning inventory			$xxx
Add: Purchases		$xxx	
Freight-in		xxx	
Cost of purchases		xxx	
Less: Purchase discounts	$xx		
Purchase returns and allowances	xx	(xxx)	
Net purchases			xxx
Cost of goods available for sale			xxx
Less: Ending inventory			(xxx)
Cost of goods sold			$xxx

A manufacturing company computes the cost of goods sold in a slightly different way. This requires that the company first computes the costs of goods manufactured, which can be computed as follows:

Example of computation of cost of goods manufactured

Direct materials inventory, beginning of period	$xxx	
Purchases of materials (including freight-in and deducting purchase discounts)	xxx	
Total direct materials available	$xxx	
Direct materials inventory, end of period	(xxx)	
Direct materials used		$xxx
Direct labor		xxx
Factory overhead:		
Depreciation of factory equipment	$xxx	
Utilities	xxx	
Indirect factory labor	xxx	
Indirect materials	xxx	
Other overhead items	xxx	xxx
Manufacturing cost incurred during the period		$xxx
Add: Work in process, beginning of period		xxx
Less: Work in process, end of period		(xxx)
Cost of goods manufactured during the period		$xxx

Once the cost of goods manufactured has been calculated, the cost of goods sold can be computed. The cost of goods manufactured is added to the beginning inventory to arrive at cost of goods available for sale. The ending inventory is then deducted from the cost of goods available for sale to determine the cost of goods sold.

Example of computation of cost of goods sold of a manufacturing company

Finished goods inventory, beginning of period	$xxx
Add: Cost of goods manufactured during the period	xxx
Cost of goods available for sale	$xxx
Less: Finished goods inventory, end of period	(xxx)
Cost of goods sold during the period	$xxx

3. **Operating expenses** are primary recurring costs associated with central operations (other than cost of goods sold) that are incurred in order to generate sales. Operating expenses are normally reported in the following two categories:

   a. Selling expenses
   b. General and administrative expenses

   Selling expenses are those expenses directly related to the company's efforts to generate sales (e.g., sales salaries, commissions, advertising, delivery expenses, depreciation of store furniture and equipment, and store supplies). General and administrative expenses are expenses related to the general administration of the company's operations (e.g., officers and office salaries, office supplies, depreciation of office furniture and fixtures, telephone, postage, accounting and legal services, and business licenses and fees).
4. **Gains and losses** result from the peripheral transactions of the entity. If immaterial, they are usually combined and shown with the normal, recurring revenues and expenses. If they are individually material, they should be disclosed on a separate line. Examples are write-downs of inventories and receivables, effects of a strike, gains and losses on the disposal of equipment, and gains and losses from exchange or translation of foreign currencies. Holding gains on available-for-sale securities are included in other comprehensive income rather than income from continuing operations.
5. **Other revenues and expenses** are revenues and expenses not related to the central operations of the company (e.g., interest revenues and expenses, and dividend revenues).
6. **Unusual or infrequent** items are items that are either unusual or infrequent, but not both. They should be reported as a separate component of income from continuing operations. Under ASC 805, the excess of the fair value net assets acquired in a business combination over the fair value of consideration given will henceforth be recognized immediately in net income. The standard is not explicit regarding the location in the income statement where this is to be reported, but it is no longer to be reported as an extraordinary item, suggesting that it should be included in other income from continuing operations.
7. **Goodwill impairment losses** are presented as a separate line item in the income from continuing operations section of the income statement. ASC 350-20-35 prohibits the amortization of goodwill and instead requires that goodwill be tested for impairment at least annually. If goodwill is found to be impaired, it is to be written down to fair value. The resultant loss must be included in the operations section of the income statement. However, if a goodwill impairment loss is associated with a discontinued operation, the loss is included (on a net-of-tax basis) within the results of discontinued operations.
8. **Exit or disposal activity costs** are included in income from continuing operations before income taxes. Exit or disposal activities are restructurings and other activities that materially change the scope of business undertaken by an entity or the manner in which a business is conducted. If a subtotal such as "income from operations" is presented, the costs of exit or disposal activities will normally be included in that subtotal. However, if the costs are associated with exit or disposal activities that involve a discontinued operation, they are to be included in the results of discontinued operations (see below). If an entity's responsibility to settle the liability associated with an exit or disposal activity is removed or discharged, the related costs are reversed through the same line item(s) in the income statement that

were used when those costs were initially recognized. (Exit or disposal activities are discussed in more detail later in this chapter.)

9. **Income tax expense** related to continuing operations is that portion of the total income tax expense applicable to continuing operations.

The section ends in a subtotal that varies depending upon the existence of discontinued operations and extraordinary items. The effects of changes in accounting principles are now (under ASC 250, addressed in Chapter 5) to be dealt with by *retrospective application* to all prior periods being presented. For example, the subtotal is usually titled "income from continuing operations" only when there is a section for discontinued operations in one of the years presented. If there is only a section for extraordinary items, the subtotal is usually titled "income before extraordinary items." The titles are adjusted accordingly if more than one of the sections are necessary. If there are no discontinued operations or extraordinary items, the subtotal is titled "net income."

Examples of the format for presentation of various income statement items

Discontinued operations and an extraordinary item

Income (loss) from continuing operations		$ xxx
Discontinued operations		
Income (loss) from operations of Division Z, less applicable income taxes of $xxx	$xxx	
Income (loss) on disposal of Division Z, less applicable income taxes of $xxx	xxx	xxx
Income (loss) before extraordinary item		$ xxx
Extraordinary item, less applicable income taxes of $xxx (Note __)		xxx
Net income		$ xxx
Per share of common stock*		
Income (loss) from continuing operations		$x.xx
Net income		$x.xx

Discontinued operations only

Income (loss) from continuing operations		$ xxx
Discontinued operations		
Income (loss) from operations of Division Z, less applicable income taxes of $xxx	$xxx	
Income (loss) on disposal of Division Z, less applicable income taxes of $xxx	xxx	xxx
Net income		$ xxx
Per share of common stock*		
Income (loss) from continuing operations		$x.xx
Net income		$x.xx

Extraordinary item only

Income (loss) before extraordinary item	$ xxx
Extraordinary item, less applicable income taxes of $xxx (Note _)	xxx
Net income	$ xxx
Per share of common stock*	
Income (loss) before extraordinary item	$x.xx
Net income	$x.xx

* *These examples assume that per share amounts of discontinued operations and extraordinary items are shown in the notes.*

Results from Discontinued Operations

ASC 360 has changed the standards on reporting for long-lived assets to be disposed of, as well as the qualifying conditions for reporting discontinued operations. Reporting of discontinued operations was originally set forth by ASC 225.

ASC 225 required that a discontinued operation be a segment of the business in order to qualify for the special financial statement presentation afforded to such operations. By contrast, under ASC 360 the reporting requirements apply to a "component of an entity." A component of an entity is distinguishable from the rest of the entity because it has its own operations and cash flows. A component may be a reportable segment, an operating segment, a reporting unit, a subsidiary, or an asset group. Refer to the discussion of alternative balance sheet segmentation and the accompanying diagram in Chapter 2 for further guidance.

If a component of an entity is either classified as held-for-sale or has been disposed of during the period, the results of its operations are reported in discontinued operations, if *both* of the following conditions are met:

1. The operations and cash flows of the component have been or will be removed from the ongoing operations of the entity as a result of the disposal transaction, *and*
2. The entity will have no significant continuing involvement in the operations of the component after the disposal transaction.

The conditions that must be met for a component to be classified as held-for-sale are set forth in Chapter 11.

ASC 205-20-55 provides guidance in applying these two criteria. The determination of whether the operations and cash flows of a disposed component have been or will be eliminated from the ongoing operations of the entity depends on (1) whether continuing cash flows have been or are expected to be recognized and, if so, (2) whether those continuing cash flows are direct or indirect. Continuing cash flows are cash inflows or outflows that are recognized by the ongoing entity and are associated with activities involving a disposed component. If continuing cash flows are recognized, the determination as to whether those continuing cash flows are direct or indirect is based on their nature and significance. If any continuing cash flows are determined to be direct, the cash flows have not been eliminated and the operations of the component are not to be presented as a discontinued operation.

ASC 205-20-55 also concluded that continuing involvement in the operations of the disposed component would provide the ongoing entity with the ability to influence the operating and (or) financial policies of the disposed component. The retention of risk or the ability to obtain benefits associated with the ongoing operations for the disposed component might indicate that the ongoing entity has the ability to influence the operating and (or) financial policies of the disposed component, resulting in a finding of continuing involvement. The determination as to whether the continuing involvement is significant would be based on quantitative and qualitative assessments from the perspective of the disposed component. The assessment is to consider all types of continuing involvement, individually and in the aggregate.

The assessment period commences when the component initially meets the criteria for classification as held for sale or is actually disposed of. The assessment period ends one year from the date of the actual disposal. During this assessment period, each time it issues financial statements, management of the ongoing entity is to consider whether any significant events or circumstances had occurred that might cause its original assessment with respect to whether both criteria for classification as discontinued operations are expected to be met. If a significant event or circumstance occurs during the assessment period that results in management assessing that both criteria are no longer expected to be met by the end of the assessment period, the operations of the component are not to be presented as discontinued operations. Consequently, it is possible that, during the assessment period, amounts may be classified into and out of discontinued operations based upon reassessments necessitated by the occurrence of events or circumstances.

Examples of determination of whether to report discontinued operations

Software Solutions Plus develops and sells software for several markets. It has a children's educational line, a children's game line, a business office line, and a desktop publishing line. The product line is the lowest level at which the operations and cash flows can be clearly distinguished by management. Thus, each product line is an operating segment and a component of the entity.

Case 1

Software Solutions Plus decides to exit the game business and commits to a plan to sell the children's game line. The assets and liabilities of the product line are classified as held-for-sale at that date. Software Solutions Plus will have no continuing involvement with the children's game software after the sale is closed. In addition, Software Solutions Plus has decided that it will not develop any new computer games for the children's market. In this case, the conditions are met to report the children's game line as a discontinued operation.

Case 2

Instead of exiting the children's game business entirely as in Case 1, Software Solutions Plus decides to keep its game programmers on its staff and have them develop new children's games. However, instead of selling the games to the home market via distributors as it had been doing, each existing and newly developed game will be marketed and sold to other software game companies. Software Solutions Plus will not provide technical support for any particular game software after it is sold. In this case, although Software Solutions Plus will not have any continuing involvement with the games after they are sold, it will continue to have revenues and expenses related to the children's game product line. Thus, the first of the two conditions required for discontinued operations treatments is not met. The change in the manner of marketing the line cannot be reported in discontinued operations.

Case 3

Software Solutions Plus decides to discontinue developing and selling its graphics drawing program product, which is part of the desktop publishing product line. In this case, because the graphics drawing program product is not a component of the entity on its own, but instead is part of the component desktop publishing product line, the sale of the graphics drawing program cannot be reported in discontinued operations.

Case 4

Software Solutions Plus commits to a plan to sell the desktop publishing line to another software company. The assets and liabilities of the product line are classified as held-for-sale at that date. As part of the sales agreement, Software Solutions Plus will receive a sizable royalty for each program sold and will provide technical support to the buyer's programming staff and to customers for the next three years. In this case, because Software Solutions Plus will continue to receive cash flows from the product line and will continue to have significant involvement with the product line after the product line is sold, the sale of the desktop publishing product line cannot be reported in discontinued operations. In the third year after the sale, Software Solutions Plus should reassess whether the conditions necessary to report the activity in discontinued operations have been met.

In the period in which a component of an entity is either classified as held-for-sale or has been disposed of, the results of operations of that component and any gain or loss recognized on disposal is reported as a separate component of income, before extraordinary items and the cumulative effect of accounting changes (if any). The income statements of any prior periods being presented should be restated to also reflect the results of operations of the component as discontinued operations. All amounts should be reported less applicable income taxes (benefits), as shown in the example below.

Example of income statement presentation for discontinued operations

	2009	*2008*
Income from continuing operations before income taxes	$ 598	$ 583
Income taxes	239	233
Income from continuing operations	359	350
Discontinued operations (Note ___)		
Loss from operations of discontinued component	1,165	1,045
Loss on disposal of discontinued component	167	
Income tax benefit	(532)	(418)
Loss on discontinued operations	800	627
Net income	$ (441)	$ (282)

This example shows the loss on disposal on the face of the income statement. Alternatively, the amount can be shown in the notes to the financial statements, as long as the disclosure identifies the caption in the income statement in which the loss is included.

General corporate overhead may not be allocated to discontinued operations. Interest expense, however, is to be allocated to discontinued operations if, as a result of a disposal transaction, the buyer assumes debt of the seller/reporting entity or, as a result of the disposal transaction, the reporting entity is required to repay debt (ASC 205-20-45). Allocation to discontinued operations of other consolidated interest is permitted but not required. If the corporation decides to allocate other consolidated interest, ASC 205-20-55 provides guidance regarding the maximum amount and methods of allocation.

Computing the gain or loss on disposal. To compute the loss (or gain) on disposal, the entity must first compute the fair value of the component; less the cost to sell it. Costs to sell are the incremental direct costs to transact the sale. In other words, costs to sell result directly from the decision to sell the component, are essential to the sales transaction, and would not have been incurred by the entity absent the decision to sell the component. Examples of costs to sell are broker commissions, legal fees, title transfer fees, and closing costs. In the limited situations in which the sale will occur more than one year after the component is classified as held-for-sale, the costs to sell should be discounted to present value. (For more information about long-lived assets held for sale, see Chapter 11.)

Next, the entity must compute the carrying value of the component. The carrying amounts of assets (other than long-lived assets) and liabilities are first adjusted in accordance with GAAP, and any adjustments are excluded from the gain or loss from disposal. For example, if trade accounts receivable are being sold as part of a component, the adequacy of the valuation allowance would be assessed as of the date the component is classified as held-for-sale, and any adjustment needed to bring the allowance to the proper balance would be included in bad debt expense. Similarly, if the sale of the component includes assumption of bonds payable, the accumulated amortization of any premium or discount on those bonds would be brought up to date, and this adjustment would be included in interest expense.

The gain or loss on disposal is computed by comparing the total carrying amount to the fair value net of costs to sell. A loss is recognized in the period in which the component is classified as held-for-sale if the total carrying amount exceeds the fair value less costs to sell. On the other hand, if the fair value less costs to sell exceeds the carrying amount (that is, there is a gain on disposal), the gain is not recognized until the actual sale occurs. Fair value, as defined in ASC 820, is essentially the price the seller would receive on the open market for a product.

Under ASC 360, losses from operations of the component subsequent to the date the component is classified as held-for-sale are to be recognized in the period in which they are incurred. That is, expected future losses are not accrued prior to being incurred, since doing so would result in the creation of a liability (reserve) which fails to meet the definition in CON 6.

Example of computing the gain or loss on disposal

Today's Telecommunications has decided to close its pager division, which is a component of the reporting entity. It has committed to a plan to sell the assets and liabilities of the division and has properly reclassified the division as held-for-sale at that date. The following conditions apply:

- The division has incurred $1,750 losses from operations from the beginning of the year to the date it was reclassified as held-for-sale.
- The fair value of the assets and liabilities of the division are $10,775.
- Brokers' commissions and other costs to sell are estimated to be $1,650.
- The carrying value of the assets and liabilities of the division is $12,525 before the GAAP adjustments (depreciation, amortization, adjustment of valuation accounts, and similar periodic adjustments) are made.
- The GAAP adjustments reduce the carrying value of the assets and liabilities by $125.
- Losses from operations of the division from the date it is classified as held-for-sale to the end of the fiscal year are $580. (This loss does not include the GAAP adjustments noted above.)
- Anticipated future losses from operations of the division from the end of this fiscal year to the expected sales date are $1,999.
- The tax rate is 40%.

The income statement presentation of discontinued operations would be

Discontinued operations (Note ___)	
Loss from operations of discontinued division, net of tax of $982	$1,473
Loss on disposal of discontinued division, net of tax of $1,310	1,965
Loss on discontinued operations	$3,438

The loss from operations of the discontinued pager division is the sum of the $1,750 loss incurred prior to the date the assets and liabilities were classified as held-for-sale, plus the $125 GAAP adjustments that were recorded, plus the $580 loss incurred from the date the division was classified as held-for-sale to the end of the fiscal year. The sum ($2,455) less the tax effects of $982 ($2,455 × 40%) is the loss from operations of $1,473.

The loss on disposal is the difference between the carrying value of the division and its fair value less costs to sell. The carrying value of the division is $12,400 ($12,525 less the GAAP adjustments of $125). The fair value of the division less costs to sell is $9,125 ($10,775 fair value less costs to sell of $1,650). The difference of $3,275 less the tax effects of $1,310 ($3,275 × 40%) is the loss on disposal of $1,965. The anticipated future losses from operations of the division will be reported in discontinued operations in the future period in which they occur. They are not included in the loss on disposal in the current fiscal year.

Future periods. Subsequent to the fiscal year in which the assets and liabilities of a component are classified as held-for-sale, the discontinued operations section of an income statement includes

1. Results of operations of the discontinued component
2. Certain adjustments that are directly related to the disposal of a component of an entity, such as
   a. Resolution of contingencies associated with the terms of the disposal transaction, such as purchase price adjustments and indemnification issues with the purchaser
   b. Resolution of contingencies associated with the operations of the component prior to its disposal, such as environmental or product warranty obligations retained by the seller
   c. Settlement of employee benefit plan obligations directly associated with the disposal transaction that occur no later than one year after the disposal transac-

tion. (See the discussion of settlements and curtailments of plan liabilities in Chapter 18.)

When adjustments of this nature occur, they should be classified separately in discontinued operations of the current period and the notes to the financial statements should disclose the nature and amount of these adjustments.

Example of discontinued operations in a future period

Continuing the previous example, the sale of Today's Telecommunications' pager division, which is a component of the entity, closed in the year subsequent to the fiscal year in which the assets and liabilities were classified as held-for-sale.

- The actual sales price less costs to sell was $9,725.
- The net carrying value of the assets and liabilities on the date of sale was $12,225.
- The loss from operations from the end of the fiscal year to the date of sale was $2,045.
- The tax rate is 40%.

The income statement presentation of discontinued operations would be

Discontinued operations (Note ___)	
Loss from operations of discontinued division, net of tax of $818	1,227
Gain on disposal of discontinued division, net of tax of $310	465
Loss on discontinued operations	762

The loss from operations of the discontinued pager division is the $2,045 less the tax effects of $818 ($2,045 × 40%).

The loss on disposal is the difference between the carrying value of the division and its sales price less the loss recognized in the prior period. The carrying value of the division was $12,225; the sales price less costs to sell was $9,725, for an actual loss of $2,500. The loss recognized in the prior period was $3,275, so an adjustment of $775 ($2,500 less $3,275) is necessary. The tax effects on the adjustment are $310 ($775 × 40%), so the net adjustment is a gain of $465 ($775 – $310).

Extraordinary Items

An event or transaction should be presumed to be an ordinary and usual activity (and thus, not to be described as extraordinary) unless the event or transaction is both of an unusual nature and infrequent in its occurrence.

Unusual nature. To meet this criterion, the underlying event or transaction should possess a high degree of abnormality and be of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the reporting entity, taking into account the environment in which it operates.

In determining whether an event or transaction is of an unusual nature, the following special characteristics of the reporting entity are considered:

1. Type and scope of operations
2. Lines of business
3. Operating policies
4. Industry (or industries) in which the reporting entity operates
5. Geographic locations of its operations
6. Nature and extent of government regulation

An event that is of an unusual nature for one reporting entity can be an ordinary and usual activity of another because of the above characteristics. Whether an event or transaction is beyond the control of management is irrelevant in the determination of whether it is of an unusual nature.

Infrequency of occurrence. To satisfy this requirement, the underlying event or transaction should be of a type that would not reasonably be expected to recur in the foreseeable future, again taking into account the environment in which the reporting entity operates.

Items specifically included or excluded from extraordinary items. Accounting pronouncements have specifically required the following items to be presented as extraordinary, irrespective of whether they meet the criteria stated above:

1. The investor's share of an investee's extraordinary item when the investor uses the equity method of accounting for the investee (ASC 323-10-45).
2. The net effect of adjustments relating to the discontinuation of the application of ASC 980 by a public utility or other reporting entity with regulated operations.
3. The remaining excess of the fair value of acquired net assets over their cost pursuant to ASC 805. Chapter 13 provides additional information about the excess over cost in a business combination transaction.
4. Estimated losses recognized due to obligations under the Coal Industry Retiree Health Benefit Act of 1992 (ASC 930-715-25).

Material gains and losses from the extinguishment of debt and gains from troubled debt restructurings previously were items specifically required to be classified as extraordinary. ASC 470-50-45 rescinded that requirement, so those gains and losses are now evaluated using the unusual and infrequent criteria described above. In addition, ASC 815-30-35 clarifies that, by analogy, these same criteria are to be used to evaluate the classification of gains or losses arising from adjustments to the carrying amount of debt required by the hedge accounting requirements of ASC 815.

The following items are, by definition, *not* extraordinary items:

1. Write-down or write-off of receivables, inventories, equipment leased to others, or intangible assets
2. Foreign currency gains and losses
3. Gains and losses on the disposal of a segment of a business
4. Gains and losses from sale or abandonment of property, plant, or equipment used in operations
5. Effects of a strike
6. Adjustments of accruals on long-term contracts
7. Losses and costs incurred as a result of the September 11, 2001 terrorist attacks

Per ASC 225-20-55, neither the cost incurred by a company to defend itself from a takeover attempt nor the cost incurred as part of a "standstill" agreement meet the criteria for extraordinary classification as discussed in ASC 225-20.

Presentation. Extraordinary items should be segregated from the results of ordinary operations and be shown net of taxes in a separate section of the income statement, following "discontinued operations." If more than one extraordinary item occurs during a period, they should be reported separately or details should be included in the notes to the financial statements.

Example of the income statement presentation for extraordinary items

An extraordinary item would be presented as follows:

Income before extraordinary items	$xxx
Extraordinary items (less applicable income taxes of $__) (Note __)	xxx
Net income	$xxx

Accounting Changes

A change in accounting principle results from adoption of a generally accepted accounting principle different from the one previously used for reporting purposes. The term ac-

counting principle includes not only accounting principles and practices, but also the methods of applying them. Changes in accounting principles (or the method of applying them) must be justified by those who make the change (the entity's management), unless they are made in order to comply with a FASB position.

Prior to the adoption of ASC 250, which was part of the FASB's efforts to converge US GAAP to IFRS, many accounting changes were to be accounted for by including in the income statement, in the period of change, a special charge or credit for the cumulative effect of the change on retained earnings, due to applying the new method implicitly to all prior periods' earnings. ASC 250 requires instead that the new method be retrospectively applied, so that all prior periods' financial statements being presented (i.e., comparative financial statements) be restated. The cumulative effect on years prior to the first comparative period is an adjustment to opening retained earnings. See Chapter 5 for a detailed discussion of accounting changes.

Other Comprehensive Income

Under current accounting standards, other comprehensive income includes foreign currency adjustments, unrealized changes in the fair value of available-for-sale securities, the effective portion of the gain or loss on derivative instruments designated and qualified as either a cash flow hedge or a hedge of a forecasted foreign-currency-denominated transaction, and minimum pension liability adjustments. ASC 220 requires that the components of other comprehensive income along with totals for net income, other comprehensive income, and comprehensive income must appear in a statement of the same prominence as other financial statements. (However, an entity that has no items of other comprehensive income in any period presented is required to report only net income.) Presenting those required amounts in a combined statement of income and comprehensive income is only one of three permissible methods. The other two are discussed later in this chapter.

Some items impact other comprehensive income in one period and then affect net income in the same or a later period. For example, an unrealized holding gain on an available-for-sale security is included in other comprehensive income in the period in which the market fluctuation occurs. Later, perhaps years later, the security is sold and the realized gains are included in net income. An adjustment to the unrealized holding gain component of other comprehensive income is necessary to avoid double counting the gain—once in net income in the current year and also in other comprehensive income in the earlier period. Adjustments of that type are called reclassification adjustments. The process of including in net income an item previously reported in other comprehensive income is often referred to as "recycling."

Usually, a sale triggers the need for a reclassification adjustment. The sale of an available-for-sale security in the current period triggers the need for an adjustment for the gains (losses) that had been included in other comprehensive income in a prior period. Likewise, the sale of an investment in a foreign entity triggers an adjustment for foreign currency items that had been included in other comprehensive income previously (i.e., accumulated translation gains or losses). Amounts accumulated in other comprehensive income from cash flow hedges are reclassified into earnings in the same period(s) in which the hedged forecasted transactions (such as a forecasted sale) affects earnings. If it becomes probable that the forecasted transaction will not occur, the net gain or loss in accumulated other comprehensive income must be immediately reclassified. An adjustment is also necessary upon the complete (or substantially complete) liquidation of an investment in a foreign entity. Only minimum pension liabilities will not require reclassification adjustments (because they will not be reported in net income in any future period).

Reclassification adjustments can be presented on the face of the statement with the components of other comprehensive income or can be netted against the related component and with details of the reclassification being provided in the notes to the financial statements.

The tax effects of items reported in other comprehensive income must also be included in other comprehensive income. The items of other comprehensive income can be reported either net of related tax effects on the face of the statement or gross with the tax effects related to all components reported on a single, separate line. If gross reporting is used, the notes to the financial statements must disclose the tax effects related to each component (if there is more than one component). The following examples illustrate the two presentations.

Example of the "net of tax" presentation

Hypothetical Corporation
Statement of Income and Comprehensive Income
For the Year Ended December 31, 2009
($000 omitted)

Sales		$395,400
(details omitted)		
Net earnings		83,250
Other comprehensive income		
Foreign currency translation adjustment, net of $5,100 tax		11,900
Unrealized gain on securities:		
Unrealized holding gains arising during period, net of $7,500 tax	17,500	
Less: Reclassification adjustment, net of $1,500 tax, for gain included currently in net income	(3,500)	14,000
Cash flow hedges		
Net derivative losses arising during the period, net of $4,800 tax	(11,200)	
Less: Reclassification adjustment for losses included currently in net income, net of $7,762 tax	18,113	6,913
Minimum pension liability adjustment, net of $1,950 tax		(4,550)
Other comprehensive income		28,263
Comprehensive income		$111,513

Example of the "gross of tax" presentation

Hypothetical Corporation
Statement of Income and Comprehensive Income
For the Year Ended December 31, 2009
($000 omitted)

Sales		$395,400
(details omitted)		
Net earnings		83,250
Other comprehensive income		
Foreign currency translation adjustment		17,000
Unrealized gains on securities:		
Unrealized holding gains arising during period	25,000	
Less: Reclassification adjustment for gain included currently in net income	(5,000)	20,000
Cash flow hedges		
Net derivative losses arising during the period	(16,000)	
Less: Reclassification adjustment for losses included currently in net income	25,875	9,875
Minimum pension liability adjustment		(6,500)
Tax effects of items included in other comprehensive income		(12,112)
Other comprehensive income		28,263
Comprehensive income		$111,513

If the "gross" approach illustrated above were utilized, it would also be necessary to present in the notes to the financial statements details regarding the allocation of the tax effects to the several items included in other comprehensive income. An example of that note disclosure follows.

Note X: Income Taxes

The tax effects of items included in other comprehensive income for the year ended December 31, 2009, are as follows:

	Before-tax amount	*Tax expense (benefit)*	*Net-of-tax amount*
Foreign currency translation adjustments	$17,000	$ 5,100	$11,900
Unrealized gains on securities:			
Unrealized holding gains arising during period	25,000	7,500	17,500
Reclassification adjustment	(5,000)	(1,500)	(3,500)
Net unrealized holding gains	20,000	6,000	14,000
Cash flow hedges:			
Net derivative losses arising during the period	(16,000)	4,800	(11,200)
Reclassification adjustment	25,875	(6,913)	18,113
Net effects of cash flow hedges	9,875	(2,113)	6,913
Minimum pension liability adjustment	(6,500)	(1,950)	(4,550)
Other comprehensive income	$40,375	$12,112	$28,263

Earnings Per Share

Earnings per share (EPS) is a measure often used in evaluating a firm's stock price and in assessing the firm's future earnings and ability to pay dividends. Because of the importance of earnings per share, the profession has concluded that it should be disclosed on the face of the income statement.

Earnings per share is a very compact indicator of a company's performance. In order to assess quality of earnings, ASC 260 requires presentation of *basic earnings per share* on the face of the income statement for public-market issued common stock or potential common stock (such as options, warrants, convertible securities or contingent stock agreements). Shares outstanding are determined by the weighted-average method. Earnings are defined as both income from continuing operations and net income available to common stockholders. Thus, dividends declared on preferred stock and dividends for the period on cumulative preferred stock, whether or not earned or paid, are deducted from both income from continuing operations and net income before computing per share amounts.

Diluted earnings per share is computed similarly to basic earnings per share but the number of shares outstanding is adjusted to include the number of additional common shares that would be issued if the potentially dilutive shares had been issued.

Entities with simple capital structures, that is, only common stock, should display basic earnings per share for both continuing operations and net income on the face of the income statement. All other entities are required to display both basic and diluted per share amounts for both continuing operations and net income. For discontinued operations, extraordinary items, or cumulative effect of an accounting change, basic and diluted per share amounts may be either reported on the face of the income statement or disclosed in the notes. More details on the per share calculations can be found in Chapter 20.

Example of the presentation and computation of earnings per share

Assume that 100,000 shares were outstanding throughout the year.

ABC Company
Income Statement
For the Year Ended December 31, 2009

Sales	$2,000,000
Cost of goods sold	750,000
Gross profit	$1,250,000
Selling and administrative expenses	500,000
Income from operations	$ 750,000
Other revenues and expense	

Interest income	$40,000	
Interest expense	(30,000)	10,000
Income before unusual or infrequent items and income taxes		$ 760,000
Unusual or infrequent items:		
Loss from permanent impairment of value of manufacturing facilities		(10,000)
Income from continuing operations before income taxes		$ 750,000
Income taxes		300,000
Income from continuing operations		$ 450,000
Discontinued operations:		
Loss from operations of Division X, including loss on disposal of $100,000 and income tax benefit of $20,000		$30,000
Income before extraordinary item		$ 420,000
Extraordinary item—loss from earthquake less applicable income tax benefit of $38,000		(72,000)
Net income		$ 348,000
Basic EPS computation		
Income from continuing operations ($450,000/100,000)		$ 4.50
Extraordinary items* ($72,000/100,000)		(0.72)
Discontinued operations* ($30,000/100,000)		(0.30)
Net income available for common stockholders		$ 3.48

* *May be shown in the notes to the financial statements.*

Prior Period Adjustments

Traditionally there has been a concern that unless all income and expense items first being recognized are included in the current period's income statement, financial statement users would be inclined to place unjustifiably low emphasis on the matter. Put another way, the fear was that the use of prior period adjustments would offer preparers a means of effectively concealing what might be important events or changes in estimates from users. For that reason, current GAAP strictly limits the use of prior period adjustments.

ASC 250 defines a prior period adjustment and clearly states that only the following items are to be excluded from the determination of net income for the current period:

1. The correction of an error in the financial statements of a prior period
2. Adjustments that result from realization of income tax benefits of preacquisition operating loss carryforwards of purchased subsidiaries

ASC 250 specifies the recording and presentation of a prior period adjustment. When prior period adjustments are recorded, the resulting effects on the net income of prior periods shall be disclosed in the year in which the adjustments are made. The adjustments are reported at both their gross amount and net of applicable income taxes. If the statements are presented for only a single period, then the beginning balance of retained earnings is restated to reflect the effects of the correction or change. When comparative statements are presented, adjustments should be made of the amounts of net income (and the components thereof) and retained earnings balance (as well as other affected balances) for all of the periods included in the financial statements.

ASC 805 has limited the circumstances under which revisions to deferred tax benefit recognition can be effected following a business acquisition, as described in Chapter 13. Within the newly defined limit, however, adjustment of a prior period's financial statements may still occur.

ASC 250 addresses corrections of errors and establishes that use of the term "restatement" now is only appropriate for corrections of errors. An example of the accounting presentation for a prior period adjustment appears in Chapter 5.

Statement of Income and Retained Earnings

An acceptable practice is to combine the income statement and the statement of retained earnings into a single statement called the Statement of Income and Retained Earnings. The income statement is prepared in the normal manner. The beginning balance in retained earnings is added to the net income (loss) figure. Declared dividends are deducted to obtain the retained earnings ending balance.

Example of a statement of income and retained earnings

Baker, Inc.
Statement of Income and Retained Earnings
For the Year Ended December 31, 2009

Sales		$2,482
Cost of goods sold		1,489
Gross margin on sales		$ 993
Operating expenses		
Selling expenses	$ 220	
Administrative expenses	255	475
Income from operations		$ 518
Other revenues/gains (expenses/losses)		
Interest revenue (expense)—net	$ (40)	
Gain on sale of investment in ABC Company	100	
Gain on translation of foreign currencies	20	80
Income before unusual or infrequent items		$ 598
Unusual or infrequent items:		
Write-down of property and equipment	$ (20)	
Loss from permanent impairment of value of distributing facility	(50)	(70)
Income from continuing operations before provision for income taxes		$ 528
Provision for income taxes		211
Income from continuing operations		$ 317
Discontinued operations:		
Loss from operations of discontinued Division Z (less applicable taxes of $466)	$ (699)	
Loss on disposal of Division Z (less applicable taxes of $67)	(100)	(799)
Loss before extraordinary items		$ (482)
Extraordinary loss from earthquake (less applicable income tax benefit of $70)		(165)
Net loss		$ (647)
Retained earnings, January 1, 2009	$1,900	
Prior period adjustment:		
Correction of depreciation error (less applicable income taxes of $28)	(42)	
Adjusted retained earnings, January 1, 2009		1,858
Deduct dividends:		
Preferred stock	$ (40)	
Common stock	(30)	(70)
Retained earnings, December 31, 2009		$1,141
Per share amounts (100 shares)*		
Income from continuing operations		$ 3.17
Net loss		$ (6.47)

* *Assumes other per share amounts are included in notes to financial statements.*

Reporting Comprehensive Income in a Statement other than a Combined Statement of Income and Comprehensive Income

Entities are not required to present information about comprehensive income in a combined statement of income and comprehensive income. Instead, they need only to present the components of other comprehensive income along with totals for net income, other comprehensive income, and comprehensive income in a statement of the same prominence as other financial statements. Thus, two other alternatives are available.

1. In an expanded statement of changes in stockholder's equity, or
2. In a stand-alone statement of comprehensive income

In ASC 220, FASB encourages the use of either a combined statement of income and comprehensive income or a stand-alone statement that begins with net income. In practice, the expanded statement of changes in stockholder's equity is also widely used.

Example of presentation of comprehensive income in the statement of changes in stockholders' equity

If comprehensive income is reported in the statement of changes in stockholders' equity, there are several formats that can be employed to accomplish this goal. Each of these modes of presentation is somewhat cumbersome, primarily because one element of comprehensive income (earnings) must be added to retained earnings while another (comprehensive income) is not.

Consider the case of Leisuretime Industries, which has preferred and common shares outstanding, and also has two classes of other comprehensive income. If Leisuretime Industries chooses to report comprehensive income in the statement of changes in stockholders' equity (rather than in either a freestanding statement of comprehensive income or combined statement of earnings and comprehensive income), one of two formats might be selected. These are illustrated below.

Leisuretime Industries
Statement of Changes in Stockholders' Equity
For the Year Ended December 31, 2009
($000 omitted)

	Preferred stock	*Common stock*	*Comprehensive income*	*Retained earnings*	*Accumulated other comprehensive income*	*Total*
Balances, January 1, 2009	$500,000	$4,500,000		$715,600	$ (5,950)	$5,709,650
Comprehensive income						
Net income			$66,760	66,760		
Other comprehensive income:						
Foreign currency translation adjustments, net of tax			3,000			
Unrealized gains on securities:						
Unrealized holding gains arising during period, net of tax			23,000			
Less: reclassification adjustment, net of tax, for gain included in net income			(5,500)			
Other comprehensive income			20,500		20,500	
Comprehensive income			$87,260			87,260
Proceeds from issuance of shares	50,000	200,000				250,000
Dividends paid				(24,825)		(24,825)
Balances, December 31, 2009	$550,000	$4,700,000		$757,535	$14,550	$6,022,085

Leisuretime Industries
Statement of Changes in Stockholders' Equity
For the Year Ended December 31, 2009
($000 omitted)

	Preferred stock	*Common stock*	*Retained earnings*	*Foreign currency translation*	*Unrealized gains on securities*	*Total*
Balances, January 1, 2009	$500,000	$4,500,000	$715,600	$(9,275)	$ 3,325	$5,709,650
Comprehensive income						
Net income			66,760			66,760
Other comprehensive income:						
Foreign currency translation adjustments, net of tax				3,000		3,000
Unrealized gains on securities:						
Unrealized holding gains arising during period, net of tax					23,000	23,000
Less: reclassification adjustment, net of tax, for gain included in net income					(5,500)	(5,500)
Other comprehensive income						20,500
Comprehensive income						87,260
Proceeds from issuance of shares	50,000	200,000				250,000
Dividends paid			(24,825)			(24,825)
Balances, December 31, 2009	$550,000	$4,700,000	$757,535	$(6,275)	$20,825	$6,022,085

Pro Forma Earnings

During the late 1990s and early 2000s, companies increasingly made reference in press releases and published materials to an alternative measure of performance, loosely (if inaccurately) referred to as "pro forma earnings." (The term "pro forma" more properly suggests that amounts that are not actual historical results are being cast in the form of a report on historical performance—e.g., when after a midyear business acquisition the full year's results are presented as if the merger had occurred on January 1. This is not, however, the case with the more controversial recent usage of this term.) This practice has generated controversy and confusion because there is no standard definition for "pro forma earnings." Different reporting entities can, and have, defined pro forma earnings on a wide range of ad hoc bases, and sometimes a given entity fails even to consistently define this amount from period to period.

The reporting of pro forma earnings proliferated over the years preceding the enactment of Sarbanes-Oxley and the subsequent promulgation of Regulation G by the SEC. Often, even when GAAP-basis earnings are stated in the same announcement as the pro forma measure, it is the latter which receives most of the attention. In a number of instances, pro forma earnings have been based on very aggressive exclusions of operating costs and, sometimes, the inclusion of onetime gains. Such practices ultimately came to be widely recognized as being misleading and inappropriate, and popular sentiment turned against employment of such devices.

Some companies defended their use of pro forma calculations as merely responding to the marketplace's need for a measure that gives insight into the company's future performance. Pro forma earnings, they said, were necessary to compensate for deficiencies in GAAP. Because GAAP-basis net income is affected by various noncash charges and credits, as well as by nonrecurring gains and losses, some argued that this traditional measure may not provide investors with the most meaningful and accurate guide to the entity's future results of operations. They held that investors needed access to a number that measures only

the performance of the reporting entity's ongoing "normalized" operations. As with many arguments, there was probably an element of truth to this assertion.

However, assuming for the moment that GAAP-basis net income is a flawed indicator of future performance, their argument would have had greater validity if a standardized pro forma measure had been promulgated by the accounting profession or uniformly applied by the investment community. Such a standard definition does not exist, however. Despite the lack of standardization, there has been an increasing willingness on the part of investors to accept the pro forma expressions without understanding what they are or how they have been computed.

For reporting entities, part of the allure of pro forma earnings is that it can be defined to exclude some or all of a range of "unusual" items. Not surprisingly, most of the excluded items have been charges, such as those for worker layoffs, restructurings, assets impairments, and inventory obsolescence. Even if truly not expected to recur annually, many of these charges are quite normal and may be anticipated to recur at irregular intervals in the life of a given business. Furthermore, many such charges can be viewed as "catch-ups" for under-recognition of expenses in earlier periods, and since those charges would have been fully reflected in current earnings, the subsequent period's catch-up should, logically, also be included in the current period measure of operating results.

A further practice, which is improper but unfortunately has not been uncommon, has been for reporting entities to opportunistically charge off an exaggerated loss in the current period, perhaps in connection with such randomly occurring events as discontinued operations. The loss is then excluded from pro forma earnings. The excess reserves (sometimes referred to as "cookie jar reserves") then become available to be drawn down in future periods, as the provided-for expenses fail to materialize in the amounts reserved. The draw-downs of the excess reserves increase net income in future periods, but those draw-downs will not be excluded from pro forma earnings the way the original loss had been. The result will be to boost both GAAP-basis net income and pro forma earnings in future years. (This is not, however, to suggest that all companies that announce pro forma earnings use "cookie jar reserves" to commit financial fraud. However, investors' acceptance of undefined measures of earnings increases the temptation to engage in irregularities that misstate the results of operations, and surveys have found consistently that misapplication of reserve accounting has been either the most, or second-most, common reason for subsequently announced restatements of previously announced results of operations.)

The SEC adopted Regulation G to curtail the use of pro forma earnings statements. Regulation G states that a public company, or a person acting on its behalf, is not to make public a non-GAAP financial measure that, taken together with the information accompanying that measure, either contains an untrue statement of a material fact or omits a material fact that would be necessary to make the presentation of the non-GAAP financial measure not misleading. Further, Regulation G requires a public company that discloses or releases a non-GAAP financial measure to include in that disclosure or release a presentation of the most directly comparable GAAP financial measure and a reconciliation of the disclosed non-GAAP measure to that directly comparable GAAP financial measure.

The regulations also prohibit certain non-GAAP measures from inclusion in SEC filings. Public companies must not

1. Exclude from non-GAAP liquidity measures charges or liabilities that required, or will require, cash settlement, or would have required cash settlement absent an ability to settle in another manner. However, earnings before interest and taxes (EBIT) and earnings before interest, taxes, depreciation, and amortization (EBITDA) are permissible.

2. Create a non-GAAP performance measure that eliminates items identified as nonrecurring, infrequent, or unusual if the nature of the excluded item is such that it is (a) reasonably likely to recur within two years or (b) similar to a charge or gain that occurred within the prior two years.
3. Present non-GAAP financial measures on the face of the registrant's financial statements prepared in accordance with GAAP or in the accompanying notes.
4. Present non-GAAP financial measures on the face of any pro forma financial information required to be disclosed by Article 11 of Regulation S-X (e.g., business combinations or disposals).
5. Use titles or descriptions of non-GAAP financial measures that are the same as, or confusingly similar to, titles or descriptions used for GAAP measures.

The SEC's action has served to curb the abuse of pro forma earnings measures, but it does little to standardize the measures in use. Others, however, have proposed approaches to standardize the computation of pro forma earnings. For example, the rating agency Standard & Poors (S&P) has introduced a measure that it will use in its COMPUSTAT database, in its US equity indices, and in its financial statement analysis. It has denoted this measure as "core earnings." S&P defines core earnings as net income, as defined by GAAP, specifically *including* these items

- Employee stock option grant expenses
- Restructuring charges from ongoing operations
- Write-downs of depreciable or amortizable operating assets
- Pension costs
- Purchased research and development

And specifically *excluding* these items

- Discontinued operations
- Extraordinary items
- Impairment of goodwill charges
- Gains and losses from asset sales
- Pension gains
- Unrealized gains and losses from hedging activities
- Merger and acquisition fees
- Litigation settlements

S&P's definition may help investors and also serve to reverse, or at least constrain, the expanding use of subjectively defined, alternative income measures. Although there may be a demand for a performance measure other than net income or comprehensive income, such a measure will not be useful unless it is standardized so that comparisons can be confidently made among different entities or within the same entity over time.

The FASB's *Financial Statement Presentation* project (originally, *Reporting Financial Performance*), discussed in Chapter 2 and below, may eventually serve to further reduce the abuses inherent in the use of alternative measures of performance commonly known as "pro forma."

Development Stage Enterprises

ASC 915 indicates that development stage enterprises should prepare their financial statements in accordance with the same GAAP applicable to established operating entities. ASC 915 indicated that specialized accounting practices are unacceptable and that accounting treatment should be governed by the nature of the transaction rather than the age of the

entity. ASC 915 also provided that a development stage enterprise should disclose certain additional information that would alert readers to the fact that the company is in the development stage. Disclosure requirements include

1. All disclosures applicable to operating entities
2. Identification of the statements as those of a development stage enterprise
3. Disclosure of the nature of development stage activities
4. A balance sheet that, in the equity section, includes the cumulative net losses since inception
5. An income statement showing current period revenue and expense as well as the cumulative amount from the inception of the entity
6. A statement of cash flows showing cash flows for the period as well as those from inception
7. A statement of stockholders' equity showing the following from the enterprise's inception:
    a. For each issuance, the date and number of equity securities issued for cash or other consideration
    b. For each issuance, the dollar amounts (per share and in total) assigned to the consideration received for equity securities
    c. For each issuance involving noncash consideration, the nature of the consideration and the basis used in assigning the valuation
8. For the first period in which an enterprise is no longer a development stage enterprise, it shall disclose that in prior periods the entity was a development stage enterprise. If comparative statements are presented, the foregoing disclosure presentations (2-7) need not be shown.

ASC 915-810 allows parent or equity method investor companies to capitalize or defer some development stage company costs that would have to be expensed by the development stage company. Costs may be deferred if recoverable within the entire entity.

Reporting on the Costs of Start-Up Activities

ASC 720-15 provides guidance on financial reporting of start-up costs and organization costs and requires such costs to be expensed as incurred. Start-up costs are defined as one-time activities related to opening a new facility, introducing a new product or service, conducting activities in a new territory, pursuing a new class of customer, initiating a new process in an existing facility, or some new operation. Those costs are variously referred to as preopening costs, preoperating costs, organization costs, and start-up costs. Routine ongoing efforts to improve existing quality of products, services, or facilities are not start-up costs. Other costs, related to specific activities listed below, are excluded from the SOP and should be accounted for in accordance with other existing authoritative literature. These include

1. Costs of acquiring or constructing long-lived assets and getting them ready for their intended uses. (However, the costs of using long-lived assets that are allocated to start-up activities [for example, depreciation of equipment] are within the scope of the standard.)
2. Costs of acquiring or producing inventory
3. Costs of acquiring intangible assets. (However, the costs of using intangible assets that are allocated to start-up activities [for example, amortization of a purchased patent] are within the scope of the standard.)

4. Costs related to internally developed assets (for example, internal-use computer software costs). (However, the costs of using those assets that are allocated to start-up activities are within the scope of the standard.)
5. Costs that are within the scope of ASC 730, *Research and Development*, and ASC 980, *Regulated Operations*
6. Costs of fund-raising incurred by not-for-profit organizations
7. Costs of raising capital
8. Costs of advertising
9. Costs incurred in connection with existing contracts as stated in ASC 605-35, *Construction-Type and Production-Type Contracts*.
10. Costs of merger or acquisition activities
11. Costs of ongoing customer acquisition, such as policy acquisition costs and loan origination costs

Exit and Disposal (Restructuring) Costs

Restructuring costs have received a good deal of attention in recent years because of revelations of abuses that have characterized these charges as "big bath" write-offs but which have been used to create "cookie jar" reserves later employed to smooth future earnings.

Restructuring charges are costs that are incurred or will be incurred in connection with a plan of action that will materially change the scope of business undertaken by an entity or the manner in which a business is conducted. They typically include costs such as employee benefits, costs associated with product line elimination or relocation, costs for new systems development or acquisitions, retraining costs, and losses on asset impairment and dispositions. Several standards address the costs commonly recognized in restructurings. They are

1. ASC 840, which discusses the accounting for a termination of a capital lease (Chapter 16).
2. ASC 715, which discuss an employer's accounting for pension plans (Chapter 18).
3. ASC 715-60, which discusses an employer's accounting for postretirement benefits other than pensions (Chapter 18).
4. ASC 712, which discusses an employer's accounting for postemployment benefits (Chapter 18).
5. ASC 360, which discusses the accounting for long-lived assets that will be disposed of, including discontinued operations (Chapter 11).
6. ASC 420, which discuss costs in anticipation of a business combination (Chapter 13).
7. ASC 420, which discusses the accounting for certain onetime termination benefits, costs to terminate contracts other than capital leases, and costs to consolidate facilities or relocate employees (this chapter).

Employee termination benefits. ASC 420, *Exit or Disposal Cost Obligations,* applies to termination benefits provided to current employees that are involuntarily terminated under the terms of a benefit arrangement that applies for a specified termination event or for a specified future period. Those benefits are referred to as onetime termination benefits. If an entity has a history of providing similar benefits to employees involuntarily terminated in earlier events, the benefits are presumed to be part of an ongoing benefit arrangement (rather than a onetime benefit arrangement) unless there is evidence to the contrary.

Specifically excluded from consideration are employee termination benefits

1. Paid pursuant to the terms of an ongoing employee benefit plan, regardless of whether the plan was preexisting or is newly created

2. Paid under the terms of an individual deferred compensation agreement

A onetime benefit arrangement first exists at the date the plan of termination meets *all* of the following criteria:

1. Management approves and commits to the termination plan.
2. The termination plan specifies the number of employees to be terminated, their job classifications or functions, and their locations, as well as the expected completion date.
3. The termination plan establishes the terms of the benefit arrangement in sufficient detail that employees are able to determine the type and amount of benefits that they will receive if they are involuntarily terminated.
4. Actions required to complete the plan indicate that significant changes to the plan are unlikely.
5. The terms of the plan have been communicated to employees (the communication date).

The timing of recognition of the liability for onetime termination benefits depends on whether the employees are required to render service beyond a minimum retention period. The minimum retention period is the notification period that an entity is required to provide to employees in advance of a termination event as a result of law, statute, or contract, or in the absence of a legal notification period, the minimum retention period cannot exceed sixty days.

If employees are entitled to receive the termination benefits regardless of when they leave or if employees will not be retained to render service beyond the minimum retention period, the liability for the termination benefits is recognized and measured at its fair value at the communication date.

If employees are required to render service until they are terminated in order to receive the termination benefit and will be retained beyond the minimum retention period, the liability for the termination benefits is measured at its fair value at the communication date and recognized ratably over the service period.

Examples of the determination of the minimum retention period and recognition

Master Mobile Communications announces that it will close its Donnybrook plant and terminate all 120 employees there. The terms of the plan meet the criteria above. There are three major groups of employees: management, union workers, and nonunion workers. Management is required to stay and render service until the plant's closing, which is four months from now, and each of the twelve management employees will receive $10,000. The union workers' contract states that they must be notified ninety days in advance before they can be terminated. The union workers will be terminated in ninety days. The termination benefit for each of the fifty union employees is one week per every six months of employment. The nonunion workers can leave at any time within the next three months and still collect the termination benefit. Each of the fifty-eight nonunion employees will receive a termination benefit of $1,000 for each year of service. There is no state statute specifying a notification period.

Case 1: Management

Management is required to work until termination, so it is necessary to determine whether the service period is beyond the minimum retention period. There is no state statute specifying a notification period, but the Worker Adjustment and Retraining Act, which applies to entities with over 100 employees, requires a sixty-day notification period for this plant's closing. Thus, the minimum retention period is sixty days. Management must work beyond the minimum retention period, so the $120,000 liability (12 × $10,000) is recognized at $30,000 per month for the next four months. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

Case 2: Union employees

The union employees' contract requires a ninety-day notification period, so the minimum retention period for these employees is ninety days. The union workers will be terminated at the end of the ninety-day period, so they will not be required to work beyond the minimum retention period. If the total of the termination benefits for the fifty union employees is $142,500, a liability of $142,500 is recognized at the communication date. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

Case 3: Nonunion workers

Nonunion workers are not required to work until the termination date to collect the termination benefit. Therefore, it is not necessary to determine the minimum retention period for these employees. If the 58 nonunion employees have 230 years of service among them, a liability of $230,000 is recognized at the communication date. Present value techniques are not necessary to measure the liability because the discount period is so short that the face amount would not differ materially from the fair value.

If subsequent to the communication date there are changes in either the timing or amount of the expected termination benefit cash flows, the cumulative effect of the change should be computed and reported in the same line item(s) in the income statement in which the costs were initially reported. If present value techniques were used to measure the initial liability, the same credit-adjusted risk-free rate should be used to remeasure the liability.

Changes in the liability due to the passage of time (accretion) are recognized as accretion expense in the income statement. If employees are not required to provide services or are required to provide services only during the minimum retention period, accretion expense is charged for the passage of time after the communication date. If employees are required to provide services beyond the minimum retention period, accretion expense is charged for the passage of time after the termination date. Accretion expense should not be titled interest expense or be considered interest costs subject to capitalization.

According to ASC 420-10-55, if newly offered benefits represent a revision to an ongoing arrangement that is not limited to a specified termination event or to a specified future period, the benefits represent an enhancement to an ongoing benefit arrangement.

If a plan of termination changes, and employees that were expected to be terminated within the minimum retention period are retained to render service beyond that period, the liability amount should be recomputed as though it had been known at the initial communication date that those employees would be required to render services beyond the minimum retention period. The cumulative effect of the change is recognized as a change in the liability and reported in the same line item(s) in the income statement in which the costs were initially reported. The remainder of the liability is recognized ratably from the date of change to the termination date.

If a plan of termination includes both voluntary and involuntary termination benefits, a liability for the involuntary benefits is recognized as described above. A liability for the incremental voluntary benefits (the excess of the voluntary benefit amount over the involuntary benefit amount) is recognized in accordance with ASC 715-30 (Chapter 18). That is, if the benefits are special termination benefits offered only for a short period of time, the liability is recognized when the employees accept the offer and the amount can be reasonably estimated. If, instead, the voluntary termination benefits are contractual termination benefits (for example, required by a union contract or a pension contract) the liability is recognized when it is probable that employees will be entitled to benefits and the amount can be reasonably estimated.

Contract termination and other costs to exit an activity. In addition to employee termination costs, an entity may incur contract termination costs, relocation costs, plant consolidation costs, and other costs associated with the exit or disposal activity. ASC 420 sets forth the following standards for recognition.

A liability for the costs to terminate a contract before the end of its term is recognized and measured at its fair value when the entity actually terminates the contract in accordance with the contractual term (e.g., by written notice).

A liability for the costs that will continue to be incurred under a contract for its remaining term without economic benefit to the entity is recognized and measured at its fair value when the entity ceases using the right conveyed by the contract (the cease-use date). If the contract is an operating lease, the fair value of the liability should be determined based on the remaining lease rentals, reduced by estimated sublease rentals, even if the entity does not intend to find a sublease. However, remaining operating lease payments should not be reduced to an amount less than zero by the estimated sublease payments.

A liability for other costs associated with the exit or disposal activity should be recognized when the liability is incurred, which is generally when the goods or services associated with the activity are received. The liability should not be recognized before it is incurred even if the costs are incremental and a direct result of the exit or disposal plan.

Reporting and disclosure. The costs of exit or disposal activities must be included in income from continuing operations before income taxes. If the subtotal "income from operations" is presented, the costs must be included in that subtotal. If the costs are associated with exit or disposal activities that involve a discontinued operation, they are included in the results of discontinued operations. If an entity's responsibility to settle the liability associated with an exit or disposal activity is removed or discharged, the related costs are reversed through the same line item(s) in the income statement that were used when those costs were initially recognized.

The following information should be disclosed in the period in which an exit or disposal plan is initiated, and in each period until the activity is completed:

1. A description of the activity and the expected completion date.
2. For each of the major categories of costs (e.g., onetime termination benefits, contract termination costs, and other costs), the amount expected to be incurred, the amount incurred during the period, and the cumulative amount incurred to date, in total for the entity and for each reportable segment (Chapter 22).
3. For each of the major categories of costs, a reconciliation of the beginning and ending liability balances, showing separately the costs incurred during the period, the costs paid or otherwise settled during the period, and any adjustments.
4. The reasons for any adjustments to the liability amounts.
5. The line items(s) in the income statement in which the exit or disposal costs are aggregated.
6. If a liability for a cost associated with the exit or disposal activity is not recognized because the amount cannot be reasonably estimated, that fact and the reasons therefor.

Forthcoming Changes to Financial Statement Presentation Standards

FASB has been pursuing a project on a topic—now referred to as *financial statement presentation*, but previously known as *financial performance reporting*—for several years. It focuses on form and content, classification and aggregation, and display of specified items and summarized amounts on the face of the financial statements. The scope includes determining whether to require the display of certain items determined to be key measures or nec-

essary for the calculation of key measures. Of interest are all display matters, not limited to those conveying information about the entity's income or expense. This project is being pursued in cooperation with the IASB, and one central objective of this joint effort is to converge the two standard-setters' financial statement display requirements.

The project does not address the management discussion and analysis materials often found (and required under SEC rules), or the reporting of so-called pro forma earnings in press releases or other communications outside financial statements. Neither does it include consideration of segment information or matters of recognition or measurement of items in financial statements.

Among the issues likely to be resolved by this project, tentative conclusions reached as of early 2008 are as follows:

1. That a single statement of comprehensive income that includes a subtotal similar to the existing subtotal "net income from continuing operations" would be mandated under US GAAP. Tentatively, this statement of earnings and comprehensive income would report the changes in assets and liabilities other than those arising from transactions with owners in their capacity as owners, and which would include the currently required subtotal *net income*.
2. That each financial statement would need to be given the same degree of prominence as all others. By requiring that a single statement of earnings and comprehensive income be presented, the current choice among three means of presenting comprehensive income, as illustrated earlier in this chapter, would be eliminated.
3. That comparative information consisting at a minimum of a complete set of financial statements for two annual periods (the current and prior annual period) would be required. FASB has also tentatively determined that it will allow (but not provide guidance on) voluntary presentation of financial information beyond the required minimum (i.e., beyond a complete set of financial statements for two annual periods).
4. To continue to require presentation of per share information within the financial statements. It has been concluded by FASB, preliminarily, that presentation of basic and diluted earnings per share (EPS) on the face of the statement of earnings and comprehensive income will continue to be the only required per share measure, and that disclosure of basic and diluted comprehensive income per share in notes to financial statements will continue to be permitted but not required. Furthermore, disclosure of the weighted-average number of shares used as the denominator in calculating per share metrics in notes to financial statements will continue to be required.
5. It is also likely that extraordinary item presentation (which in recent years has been quite narrowly defined and thus increasingly infrequently observed) will be fully eliminated, although there would still be identification of extraordinary items, albeit not permitted to be displayed as "below the line" special items.
6. The definition of discontinued operations will be narrowed somewhat, and financial statement display will no longer be on a "net of tax" basis in the income statement. In the revamped statement of cash flows, discontinued operations will become a stand-alone major caption, as will income taxes.

The proposed requirement for a combined statement of earnings and comprehensive income appears to be the most significant of the likely new mandates, but the need for a "beginning balance sheet" would also be a marked departure from current GAAP. Indeed, it is more commonly observed that there are a greater number of "flow statements" (e.g., the income statement) presented than "stock" statements (the balance sheet), as that follows from

SEC rules (e.g., non–small business filers report two years' balance sheets and three years' income statements). If the tentative conclusions on the FASB project hold firm, this situation will in fact be reversed (but not for SEC filings unless its rules are changed).

In addition to the foregoing matters, described by FASB as being intended to address narrow differences between existing US GAAP and IFRS (the international standards), FASB is addressing more substantive matters pertaining to financial statement presentation, including the following:

1. Developing consistent principles for aggregating and disaggregating information in each financial statement.
2. Defining the totals and subtotals to be reported in each financial statement (which might involve establishing new, definitive categories, such as business and financing).
3. Determining whether components of other comprehensive income should be recycled to profit or loss (the current practice) and, if so, the characteristics of the transactions and events that should be recycled and when recycling should occur.
4. Reconsideration of ASC 230, including whether to require the use of the direct or indirect method. (See Chapter 4.)
5. Which financial statements, if any, should be required to be presented in an interim financial report.
6. Whether condensed presentation of financial statements required in an interim financial report should be permitted, and whether FASB should provide guidance related to how the information may be condensed.
7. What comparative periods, if any, should be permitted in interim financial reports and whether twelve-months-to-date (rolling twelve months) financial statements should be required or permitted.
8. Whether guidance for nonpublic companies should differ from that for public companies.

Regarding these latter matters, FASB has tentatively concluded that a single standard that would apply broadly to all business entities should be developed. It plans to first develop a reporting model that would apply broadly to all for-profit entities other than financial institutions, then to address reporting by financial institutions. It has also concluded, tentatively, that a financing category should be included on the face of the statement of earnings and comprehensive income, and that the definition for a financing category should be developed before any other category, such as operating. This definition will be applicable to all entities, excluding financial institutions.

See further details about the FASB financial statement presentation project in Chapter 2.

Preparation of the Statement 115
Statement of Cash Flows for Consolidated Entities 122
Forthcoming Changes to Financial Statement Presentation Standards 122

PERSPECTIVE AND ISSUES

ASC 230 establishes standards for cash flow reporting. A statement of cash flows is a required part of a complete set of financial statements for business enterprises and not-for-profit organizations. Only defined benefit plans, certain other employee benefit plans, and highly liquid investment companies that meet specified conditions are not required to present the statement.

The primary purpose of the statement of cash flows is to provide information about cash receipts and cash payments of an entity during a period. A secondary purpose is to provide information about the entity's investing and financing activities during the period.

Specifically, the statement of cash flows helps investors and creditors assess

1. Ability to generate future positive cash flows
2. Ability to meet obligations and pay dividends
3. Reasons for differences between net income and net cash receipts and payments
4. The cash and noncash aspects of investing and financing transactions on an entity's financial position

CON 1 states that "financial reporting should provide information that is useful to present and potential investors, creditors, and other users for making rational investment and credit decisions." Since the ultimate objective of investment and credit decisions is the maximization of net cash inflows, information for assessing the amounts, timing, and uncertainty of prospective cash flows is needed. CON 5 concludes that financial statements must show cash flows during the period in order to be complete.

Cash flows involving trading securities are to be classified based on the nature of, and purpose for which, the financial assets or liabilities are acquired or incurred.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Presentation	
230	Statement of Cash Flows
Industry	
958-230	Not-for-Profit Entities—Statement of Cash Flows
962-205	Plan Accounting—Defined Contribution Benefit Plans—Presentation

DEFINITIONS OF TERMS

Cash equivalents. Short-term, highly liquid investments that (1) are readily convertible to known amounts of cash and (2) are so near their maturity (maturity of three months or less from the date of purchase by the enterprise) that they present negligible risk of changes in value because of changes in interest rates. Treasury bills, commercial paper, and money market funds are all examples of cash equivalents.

Direct method. A method which derives the net cash provided by operating activities from the components of operating cash receipts and payments as opposed to adjusting net income for items not affecting cash.

Financing activities. The transactions a firm engages in to acquire and repay capital (e.g., borrowings, sale of capital stock, repayments, etc.).

Indirect (reconciliation) method. A method which derives the net cash provided by operating activities by adjusting net income for revenue and expense items not resulting from cash transactions.

Investing activities. The transactions the firm engages in which affect its investments in noncurrent assets (e.g., purchase or sale of plant, property, and equipment).

Operating activities. The transactions not classified as financing or investing activities, generally involving producing and delivering goods or providing services.

CONCEPTS, RULES, AND EXAMPLES

Cash Focus

The statement of cash flows includes only inflows and outflows of cash and cash equivalents. Cash equivalents include any short-term highly liquid investments (see definition for criteria) used as a temporary investment of idle cash. The effects of investing and financing activities that do not result in receipts or payments of cash are to be reported in a separate schedule immediately following the statement or in the notes to the financial statements. The reasoning for not including noncash items in the statement of cash flows and placing them in a separate schedule is that it preserves the statement's primary focus on cash flows from operating, investing, and financing activities. Thus, if a transaction is part cash and part noncash, only the cash portion is reported in the body of the statement of cash flows.

Classification of Cash Receipts and Disbursements

The statement of cash flows requires classification of cash receipts and cash disbursements into three categories.

Investing activities include the acquisition and disposition of (1) long-term productive assets or (2) securities held in available-for-sale or held-to-maturity portfolios that are not considered cash equivalents. Investing activities also include the lending of money and the collection on loans.

ASC 230-10-45 requires classification to be determined with reference to the nature of, and purpose for which, the related financial assets and financial liabilities were acquired or

incurred. In other words, it is necessary to evaluate the facts and circumstances of each situation, rather than applying a mechanical prescription.

Financing activities result from transactions with owners and lenders that provide financial resources to the reporting entity or return or repay those resources to those owners and lenders. The financing activities of not-for-profit organizations also include receiving contributions from donors that require the resources to be used for long-term purposes, such as an endowment restricted for the purchase of long-lived assets.

Operating activities include all transactions that are not classified as investing or financing activities. Operating activities include delivering or producing goods for sale and providing services. Most income tax-related cash flows are classified as operating activities. Certain cash flows relating to the portion of income tax expense associated with share-based compensation are classified as financing activities. ASC 718 is discussed in Chapter 19 and its income tax provisions are discussed in Chapter 17.

The following are examples of the classification of cash inflows and outflows within the statement of cash flows:

	Operating	*Investing*	*Financing*
Cash Inflows	• Receipts from sale of goods or services	• Principal collections from loans and sales of other entities' debt instruments*	• Proceeds from issuing stock (or other ownership interests)
	• Sale of loans, debt, or equity instruments carried in a trading portfolio	• Sale of equity instruments* of other enterprises and from returns of investment in those instruments	• Proceeds from issuing debt (short-term or long-term)
	• Returns on loans (interest) • Returns on equity securities (dividends)	• Sale of property, plant, and equipment	• Not-for-profits' donor-restricted cash gifts that are limited to long-term purposes
			• Income tax benefits received due to increases in the fair value of equity instruments issued in share-based payment arrangements
Cash Outflows	• Payments for inventory	• Loans made and acquisitions of other entities' debt instruments*	• Payment of dividends
	• Payments to employees and other suppliers	• Purchase of equity instruments* of other enterprises	• Repurchase of entity's stock

Operating	*Investing*	*Financing*
• Payments of income taxes including cash that would have been paid for income taxes if the reporting entity had not received an income tax benefit due to increases in the fair value of equity instruments issued in share-based payment arrangements • Payments of interest • Purchase of loans, debt, or equity instruments carried in trading portfolio • Payments of asset retirement obligations (ASC 230-10-45-17)	• Purchase of property, plant, and equipment	• Repayment of debt principal, including capital lease obligations

* *Held in available-for-sale or held-to-maturity portfolios*

Disclosure of the following noncash investing and financing activities may be appended to the statement or reported in the accompanying notes:

- Acquiring an asset through a capital lease or by incurring long-term debt
- Conversion of debt to equity
- Exchange of noncash assets or liabilities for other noncash assets or liabilities
- Issuance of ownership shares to acquire assets
- Obtaining an investment asset or a building by receiving a contribution

The following example reveals the classification of cash receipts and disbursements into the investing and financing activities of a statement of cash flows (though without detail of the required operating activities section):

Liquid Corporation
Statement of Cash Flows
For the Year Ended December 31, 2009

Net cash flows from operating activities		$ xxx
Cash flows from investing activities:		
Purchase of property, plant, and equipment	$(xxx)	
Sale of equipment	xx	
Collection of notes receivable	xx	
Net cash used in investing activities		(xx)
Cash flows from financing activities:		
Sale of common stock	xxx	
Repayment of long-term debt	(xx)	
Reduction of notes payable	(xx)	
Net cash provided by financing activities		xx
Effect of exchange rate changes on cash		xx
Net increase (decrease) in cash		$ xxx
Cash and cash equivalents at beginning of year		xxx
Cash and cash equivalents at end of year		$xxx
Schedule of noncash financing and investing activities:		
Conversion of bonds into common stock		$ xxx
Property acquired under capital leases		xxx
		$ xxx

Operating Activities Presentation

Direct vs. indirect. The operating activities section of the statement of cash flows can be presented under the direct or indirect method. However, the FASB has expressed a pref-

erence for the direct method of presenting net cash from operating activities. Despite frequently voiced preferences of the user community for the direct method presentation, the indirect method has always been vastly preferred by preparers. An ongoing FASB project on financial statement presentation by business enterprises may very well eliminate, at long last, the acceptability of the indirect method, as noted later in this chapter.

The *direct method* shows the items that affected cash flow. Cash received and cash paid are presented, as opposed to converting accrual-basis income to cash flow information. At a minimum, entities using the direct method are required to report the following classes of operating cash receipts and payments:

1. Cash collected from customers
2. Interest and dividends received
3. Other operating cash receipts
4. Cash paid to employees and other suppliers
5. Interest paid
6. Income taxes paid including separate identification of the cash that would have been paid if the reporting entity had not received an income tax benefit resulting from increases in the fair value of its shares associated with share-based compensation arrangements.
7. Other operating cash payments

The direct method allows the user to clarify the relationship between the company's net income and its cash flows. For example, payments of expenses are shown as cash disbursements and are deducted from cash receipts. In this way, the user is able to recognize the cash receipts and cash payments for the period. The information needed to prepare the operating activities section using the direct method can often be obtained by converting information already appearing in the balance sheet and income statement. Formulas for conversion of various income statement amounts for the direct method of presentation from the accrual basis to the cash basis are summarized below.

Accrual basis		Additions		Deductions		Cash basis
Net sales	+	Beginning A/R	–	Ending A/R AR written off	=	Cash received from customers
Cost of goods sold	+	Ending inventory Beginning A/P	–	Manufacturing depreciation and amortization Beginning inventory Ending A/P	=	Cash paid to suppliers
Operating expenses	+	Ending prepaid expenses Beginning accrued expenses	–	Sales and administrative depreciation and amortization Beginning prepaid expenses Ending accrued expenses payable Bad debts expense	=	Cash paid for operating expenses

When the direct method is used, a separate schedule reconciling net income to net cash flows from operating activities must also be provided. That schedule reports the same information as the operating activities section prepared using the indirect method. Therefore, a firm must prepare and present both the direct and indirect methods when using the direct method for reporting cash from operating activities.

The *indirect method* is the most widely used presentation of cash from operating activities, primarily because it is easier to prepare. It focuses on the differences between net income and cash flows. The indirect format begins with net income, which is obtained directly from the income statement. Revenue and expense items not affecting cash are added or deducted to arrive at net cash provided by operating activities. For example, depreciation and amortization would be added back because they reduce net income without affecting cash.

The statement of cash flows prepared using the indirect method emphasizes changes in the components of most current asset and current liability accounts. Changes in inventory, accounts receivable, and other current accounts are used to determine the cash flow from operating activities. It is important to note that the change in accounts receivable should be calculated using the balances net of the allowance account in order to ensure that write-offs of uncollectible accounts are treated properly. Other adjustments under the indirect method include changes in the account balances of deferred income taxes and the income (loss) from investments reported using the equity method. However, short-term borrowing used to purchase equipment would be classified as a financing activity.

The following diagram may facilitate understanding of the adjustments to net income necessary for converting accrual-based net income to cash-basis net income when using the indirect method. The diagram is simply an expanded balance sheet equation.

	*Current assets**	–	*Noncurrent assets*	=	*Current liabilities*	+	*Long-term liabilities*	+	*Income*	*Accrual income adjustment to convert to cash flow*
1.	Increase			=					Increase	Decrease
2.	Decrease			=					Decrease	Increase
3.				=	Increase				Decrease	Increase
4.				=	Decrease				Increase	Decrease

* *Other than cash and cash equivalents*

For example, using Row 1, a credit sale would increase accounts receivable and accrual-basis income but would not affect cash. Therefore, its effect must be removed from the accrual income in order to convert to cash income. The last column indicates that the increase in a current asset balance must be deducted from income to obtain cash flow. Using Row 2, a decrease in a current asset, such as prepaid rent, indicates that net income was decreased by rent expense, without a cash outflow in the current period. Thus, the decrease in prepaid rent would be added back to convert to cash income.

Similarly, using Row 3, an increase in a current liability must be added to income to obtain cash flows (e.g., accrued wages are on the income statement as an expense, but they do not require cash; the increase in wages payable must be added back to remove this non-cash expense from accrual-basis income). Using Row 4, a decrease in a current liability, such as accounts payable, indicates that cash was used but the expense was incurred in an earlier period. Thus, the decrease in accounts payable would be subtracted to include this disbursement in cash income.

If the indirect method is chosen, then the amount of interest and income tax paid must be included in the related disclosures.

The major drawback to the indirect method involves the user's difficulty in comprehending the information presented. This method does not show the sources or uses of cash. Only adjustments to accrual-basis net income are shown. In some cases the adjustments can be confusing. For instance, the sale of equipment resulting in an accrual-basis loss would require that the loss be added to net income to arrive at net cash from operating activities. (The loss was deducted in the computation of net income, but because the sale will be shown as an investing activity, the loss must be added back to net income.)

Although the indirect method is more commonly used in practice, the authors believe that the direct method is preferable. It portrays both the amounts of cash provided by and used in the reporting entity's operations, instead of presenting net income and reconciling items. The direct method reports only the items that affect cash flow (inflows/outflows of cash) and ignores items that do not affect cash flow (depreciation, gains, etc.). The general formats of both the direct method and the indirect method are shown below.

Direct method

Cash flows from operating activities:		
Cash received from sale of goods	$xxx	
Cash interest received	xxx	
Cash dividends received	xxx	
Cash provided by operating activities		$xxx
Cash paid to suppliers	(xxx)	
Cash paid for operating expenses	(xxx)	
Cash interest paid	(xxx)	
Cash paid for taxes	(xxx)	
Cash disbursed for operating activities		(xxx)
Net cash flows from operating activities		$xxx

Indirect method

Cash flows from operating activities:	
Net income	$ xx
Add/deduct items not affecting cash:	
Decrease (increase) in accounts receivable	(xx)
Depreciation expense	xx
Increase (decrease) in accounts payable	xx
Decrease (increase) in inventories	xx
Loss on sale of equipment	xx
Net cash flows from operating activities	$xxx

Other Requirements

Gross vs. net basis. The emphasis in the statement of cash flows is on gross cash receipts and payments. For instance, reporting the net change in bonds payable would obscure the financing activities of the entity by not disclosing separately cash inflows from issuing bonds and cash outflows from retiring bonds. In a few circumstances, netting of cash flows is allowed. Items having quick turnovers, large amounts, and short maturities may be presented as net cash flows if the cash receipts and payments pertain to (1) investments (other than cash equivalents), (2) loans receivable, and (3) debts (original maturity of three months or less).

Extraordinary items and discontinued operations. ASC 230 permits, but does not require, separate disclosure of cash flows related to extraordinary items and to discontinued operations. If an entity chooses to disclose this information, disclosure must be consistent for all periods affected.

Cash flow per share. This information may *not* be displayed in the financial statements of a reporting entity because the FASB does not want the cash flow statement to have equal status with the income statement. If a single cash flow per share amount were reported, it would conflate operating cash flows with those from investing and financing activities, and thus not represent a meaningful construct in any event.

Entities Exempt from Providing a Statement of Cash Flows

Per ASC 962-205-45-9, a statement of cash flows is not required for a defined benefit pension plan that presents the financial information under the guidelines of ASC 960. Other employee benefit plans are exempted, provided that the financial information presented is similar to the requirements of ASC 960. Investment enterprises or a common trust fund held for the collective investment and reinvestment of moneys are not required to provide a statement of cash flows if the following conditions are met:

1. Substantially all of the entity's investments are highly liquid.
2. The entity's investments are carried at market value.

3. The entity has little or no debt, based on average debt outstanding during the period, in relation to average total assets.
4. The entity provides a statement of changes in net assets.

Net Reporting by Financial Institutions

Per ASC 230-10-45, banks, savings institutions, and credit unions are allowed to report net cash receipts and payments for the following:

1. Deposits placed with other financial institutions
2. Withdrawals of those deposits
3. Time deposits accepted
4. Repayments of time deposits
5. Loans made to customers
6. Principal collections of loans made to customers

Not-for-Profit Organizations

ASC 958-230 requires not-for-profit organizations to include a statement of cash flows in a complete set of financial statements. The statement of cash flows is prepared as it is for business enterprises with the following differences:

1. The indirect method of reporting cash flows from operations (or reconciliation of net income to net cash flows from operations required when the direct method is used) is prepared beginning with the change in net assets.
2. Investing activities also include receiving contributions that are restricted by the donor to the purchase or improvement of long-lived assets or for long-term investment such as permanent or term endowment.
3. Noncash activities include gifts of long-lived assets and gifts of securities held for long-term investment.

Reporting Hedging Transactions

Per ASC 230-10-45, the cash flows resulting from derivative instruments that are accounted for as fair value hedges or cash flow hedges may be classified as the same type of cash flows as the hedged items provided that the accounting policy is disclosed. However, if the derivative instrument used to hedge includes at inception an other-than-insignificant financing element, all cash inflows and outflows of the derivative instrument are reported by the borrower as cash flows from financing activities. A derivative that at inception includes off-market terms, or requires up-front cash payment, or both, often contains a financing element. A derivative instrument is viewed as including a financing element if its contractual terms have been structured to ensure that net payments will be made by one party in the earlier periods of the derivative's term and subsequently returned by the counterparty in the later periods (other than elements that are inherent in at-the-money derivative instruments with no prepayments). If for any reason hedge accounting is discontinued, then any cash flows subsequent to the date of discontinuance are classified consistent with the nature of the instrument.

Reporting Foreign Currency Cash Flows

If an entity has foreign currency transactions or foreign operations, it should translate the foreign currency cash flows using exchange rates in effect at the time of the cash flows. A weighted-average exchange rate for the period can be used for the translation if the result is substantially the same. The effect of changes in exchange rates on any cash balances held in

foreign currencies should be shown as a separate part of the reconciliation of the change in cash and cash equivalents during the period. An example of reporting the effect of exchange rate changes is shown in the statement of cash flows in the "Classification" section of this chapter.

Noncash exchange gains and losses recognized in net income should be reported as a separate item when reconciling net income and operating activities.

For a more detailed discussion of the exchange rate effects on the statement of cash flows, see Chapter 23.

Preparation of the Statement

Under a cash and cash equivalents basis, the changes in the cash account and any cash equivalent account is the "bottom line" figure of the statement of cash flows. Using the 2008 and 2009 balance sheets shown below, an increase of $25,000 can be computed. This is the difference between the totals for cash and treasury bills between 2008 and 2009 ($41,000 – $16,000).

When preparing the statement of cash flows using the direct method, gross cash inflows from revenues and gross cash outflows to suppliers and for expenses are presented in the operating activities section.

In preparing the reconciliation of net income to net cash flow from operating activities (indirect method), changes in all accounts (other than cash and cash equivalents) that are related to operations are additions to or deductions from net income to arrive at net cash provided by operating activities.

A T-account analysis may be helpful when preparing the statement of cash flows. A T-account is set up for each account, and beginning (2008) and ending (2009) balances are taken from the appropriate balance sheet. Additionally, a T-account for cash and cash equivalents from operating activities and a master or summary T-account of cash and cash equivalents should be used.

Example of preparing a statement of cash flows

The financial statements below will be used to prepare the statement of cash flows.

Johnson Company
Balance Sheets
December 31, 2009 and 2008

	2009	2008
Assets		
Current assets:		
Cash	$ 37,000	$ 10,000
Treasury bills	4,000	6,000
Accounts receivable—net	9,000	11,000
Inventory	14,000	9,000
Prepaid expenses	10,000	13,000
Total current assets	$ 74,000	$ 49,000
Noncurrent assets:		
Investment in available-for-sale securities	7,500	15,000
Add (less) adjustment for changes in fair value	1,000	(3,000)
Investment in XYZ (35%)	16,000	14,000
Patent	5,000	6,000
Leased asset	5,000	--
Property, plant, and equipment	39,000	37,000
Less accumulated depreciation	(7,000)	(3,000)
Total assets	$140,500	$115,000

	2009	2008
Liabilities		
Current liabilities:		
Accounts payable	$ 2,000	$ 12,000
Notes payable—current	9,000	--
Interest payable	3,000	2,000
Dividends payable	5,000	2,000
Income taxes payable	2,180	1,000
Lease obligation	700	--
Total current liabilities	21,880	17,000
Noncurrent liabilities:		
Deferred tax liability	9,360*	4,920*
Bonds payable	10,000	25,000
Lease obligation	4,300	--
Total liabilities	$ 45,540	$ 46,920
Stockholders' equity		
Common stock, $10 par value	$ 33,000	$ 26,000
Additional paid-in capital	16,000	3,000
Retained earnings	45,320	41,000
Accumulated other comprehensive income		
Net unrealized loss on available-for-sale securities	640	(1,920)
Total stockholders' equity	$ 94,960	$ 68,080
Total liabilities and stockholders' equity	$140,500	$115,000

* *Net of deferred tax asset ($540) and ($1,080) respectively.*

Johnson Company
Statement of Earnings and Comprehensive Income
For the Year Ended December 31, 2009

Sales		$100,000
Other income		8,500
		$108,500
Cost of goods sold, excluding depreciation		60,000
Selling, general, and administrative expenses		12,000
Depreciation		8,000
Amortization of patents		1,000
Interest expense		2,000
		$ 83,000
Income before taxes		$ 25,500
Income taxes:		
Current	$6,180	
Deferred	3,000	9,180
Net income		$ 16,320
Other comprehensive income, net of tax		
Unrealized gains on securities:		
Unrealized holding gains (less applicable income taxes of $900)		1,600
Add reclassification adjustment (less applicable income taxes of $540)		960
Total other comprehensive income		$ 2,560
Comprehensive income		$ 18,880

Additional information (all relating to 2009)

1. Equipment costing $6,000 with a book value of $2,000 was sold for $5,000.
2. The company received a $3,000 dividend from its investment in XYZ, accounted for under the equity method and recorded income from the investment of $5,000 that is included in other income.
3. The company issued 200 shares of common stock for $5,000.
4. The company signed a note payable for $9,000.
5. Equipment was purchased for $8,000.
6. The company converted $15,000 bonds payable into 500 shares of common stock. The book value method was used to record the transaction.

7. A dividend of $12,000 was declared.
8. Equipment was leased on December 31, 2009. The principal portion of the first payment due December 31, 2010, is $700.
9. The company sold half of their available-for-sale investments during the year for $8,000. The fair value of the remaining available-for-sale investments was $8,500 on December 31, 2009.
10. The income tax rate is 36%.

Explanation of entries

a. Cash and Cash Equivalents—Operating activities is debited for $16,320 (net income) and the credit is to Retained Earnings.

b. Depreciation is not a cash flow; however, depreciation expense was deducted to arrive at net income. Therefore, Accumulated Depreciation is credited and Cash and Cash Equivalents—Operating activities is debited.

c. Amortization of patents is another expense not requiring cash; therefore, Cash and Cash Equivalents—Operating activities is debited and Patent is credited.

d. The sale of equipment (additional information, item 1.) resulted in a $3,000 gain. The gain is computed by comparing the book value of $2,000 with the sales price of $5,000. Cash proceeds of $5,000 are an inflow of cash. Since the gain was included in net income, it must be deducted from net income to determine cash provided by operating activities. This is necessary to avoid counting the $3,000 gain both in cash provided by operating activities and in investing activities. The following entry would have been made on the date of sale:

Cash	5,000	
Accumulated depreciation ($6,000 – $2,000)	4,000	
Property, plant, and equipment		6,000
Gain on sale of equipment ($5,000 – $2,000)		3,000

Adjust the T-accounts as follows: debit Summary of Cash and Cash Equivalents for $5,000, debit Accumulated Depreciation for $4,000, credit Property, Plant, and Equipment for $6,000, and credit Cash and Cash Equivalents—Operating activities for $3,000. Note that per FAS 95, the *gross* gain, not the net of tax gain, is removed from operating activities. The tax effect on this gain is left in operating activities.

e. The deferred income tax liability account shows an increase of $4,440. The $3,000 increase that pertains to amounts reported in the income statement must be added to income from operations. Although the $3,000 was deducted as part of income tax expense in determining net income, it did not require an outflow of cash. Therefore, debit Cash and Cash Equivalents—Operating activities and credit Deferred Taxes. The other two amounts in the deferred tax liability account are covered below, under paragraph "p."

f. Item 2. under the additional information indicates that the investment in XYZ is accounted for under the equity method. The investment in XYZ had a net increase of $2,000, which is the result of the equity in the earnings of XYZ of $5,000 and the receipt of a $3,000 dividend. Dividends received (an inflow of cash) would reduce the investment in XYZ, while the equity in the income of XYZ would increase the investment without affecting cash. The journal entries would have been

Cash (dividend received)	3,000	
Investment in XYZ		3,000
Investment in XYZ	5,000	
Equity in earnings of XYZ		5,000

The dividend received ($3,000) is an inflow of cash, and the equity earnings are not. Debit Investment in XYZ for $5,000, credit Cash and Cash Equivalents—Operating activities for

$5,000, debit Cash and Cash Equivalents—Operating activities for $3,000, and credit Investment in XYZ for $3,000.

g. The Property, Plant, and Equipment account increased because of the purchase of $8,000 (additional information, item 5.). The purchase of assets is an outflow of cash. Debit Property, Plant, and Equipment for $8,000 and credit Summary of Cash and Cash Equivalents.

h. The company sold 200 shares of common stock during the year (additional information, item 3.). The entry for the sale of stock was

Cash	5,000	
Common stock (200 shares × $10)		2,000
Additional paid-in capital		3,000

This transaction resulted in an inflow of cash. Debit Summary of Cash and Cash Equivalents $5,000, credit Common Stock $2,000, and credit Additional Paid-in Capital $3,000.

i. Dividends of $12,000 were declared (additional information, item 7.). Only $9,000 was actually paid in cash, resulting in an ending balance of $5,000 in the Dividends Payable account. Therefore, the following entries were made during the year:

Retained earnings	12,000	
Dividends payable		12,000
Dividends payable	9,000	
Cash		9,000

These transactions result in an outflow of cash. Debit Retained Earnings $12,000 and credit Dividends Payable $12,000. Additionally, debit Dividends Payable $9,000 and credit Summary of Cash and Cash Equivalents $9,000 to indicate the cash dividends paid during the year.

j. Accounts Receivable (net) decreased by $2,000. This is added as an adjustment to net income in the computation of cash provided by operating activities. The decrease of $2,000 means that an additional $2,000 cash was collected on account above and beyond the sales reported in the income statement. Debit Cash and Cash Equivalents—Operating activities and credit Accounts Receivable for $2,000.

k. Inventories increased by $5,000. This is subtracted as an adjustment to net income in the computation of cash provided by operating activities. Although $5,000 additional cash was spent to increase inventories, this expenditure is not reflected in accrual-basis cost of goods sold. Debit Inventory and credit Cash and Cash Equivalents—Operating activities for $5,000.

l. Prepaid Expenses decreased by $3,000. This is added back to net income in the computation of cash provided by operating activities. The decrease means that no cash was spent when incurring the related expense. The cash was spent when the prepaid assets were purchased, not when they were expensed on the income statement. Debit Cash and Cash Equivalents—Operating activities and credit Prepaid Expenses for $3,000.

m. Accounts Payable decreased by $10,000. This is subtracted as an adjustment to net income. The decrease of $10,000 means that an additional $10,000 of purchases were paid for in cash; therefore, income was not affected but cash was decreased. Debit Accounts Payable and credit Cash and Cash Equivalents—Operating activities for $10,000.

n. Notes Payable increased by $9,000 (as listed under additional information, item 4.). This is an inflow of cash and would be included in the financing activities. Debit Summary of Cash and Cash Equivalents and credit Notes Payable for $9,000.

o. Interest Payable increased by $1,000, but interest expense reported on the income statement was $2,000. Therefore, although $2,000 was expensed, only $1,000 cash was paid ($2,000 expense – $1,000 increase in interest payable). Debit Cash and Cash Equivalents—Operating activities for $1,000 for the noncash portion, debit Interest Payable for $1,000 for the cash portion, and credit Interest Payable for $2,000 for the expense.

p. The following entry was made to record the incurrence of the tax liability:

Income tax expense	9,180	
Income taxes payable		6,180
Deferred tax liability		3,000

Therefore, $9,180 was deducted in arriving at net income. The $3,000 credit to Deferred Income Taxes was accounted for in entry e. above. The $6,180 credit to Taxes Payable does not, however, indicate that $6,180 cash was paid for taxes. Since Taxes Payable increased $1,180, only $5,000 must have been paid and $1,180 remains unpaid. Debit Cash and Cash Equivalents—Operating activities for $1,180, debit Income Taxes Payable for $5,000, and credit Income Taxes Payable for $6,180.

q. Item 6. under the additional information indicates that $15,000 of bonds payable were converted to common stock. This is a *noncash* financing activity and should be reported in a separate schedule. The following entry was made to record the transaction:

Bonds payable	15,000	
Common stock (500 shares × $10 par)		5,000
Additional paid-in capital		10,000

Adjust the T-accounts with a debit to Bonds Payable, $15,000; a credit to Common Stock, $5,000; and a credit to Additional Paid-in Capital, $10,000.

r. Item 8. under the additional information indicates that leased equipment was acquired on the last day of 2009. This is also a noncash financing activity and should be reported in a separate schedule. The following entry was made to record the lease transaction:

Leased asset	5,000	
Lease obligation		5,000

s. The company sold half of its available-for-sale investments during the year for $8,000 (additional information, item 9.). The entry for the sale of the investments was

Cash	8,000	
Investment in available-for-sale securities		7,500
Gain on sale of investments		500

This transaction resulted in an inflow of cash. Debit Summary of Cash and Cash Equivalents $8,000, credit Investment in Available-for-Sale Securities $7,500, and credit Cash and Cash Equivalents—Operating activities $500. The following additional journal entries were made:

Adjustment for changes in FV	1,500	
Other comprehensive income ($1,500 × 64%)		960
Deferred tax liability ($1,500 × 36%)		540

To adjust the allowance account for the sale, one-half of the amounts provided at the end of 2008 must be taken off the books when the related securities are sold.

Adjustment for changes in FV	2,500	
Unrealized gain on available-for-sale securities ($2,500 × 64%)		1,600
Deferred tax liability ($2,500 × 36%)		900

The change in FV of the remaining securities at year-end (as listed under additional information, item 9.) must be adjusted. The book value of the securities before the adjustment above is $6,000 ($7,500 – $1,500). The fair value of the securities is $8,500. An adjustment of $2,500 is necessary.

t. The cash and cash equivalents from operations ($15,000) is transferred to the Summary of Cash and Cash Equivalents.

All of the changes in the noncash accounts have been accounted for and the balance in the Summary of Cash and Cash Equivalents account of $25,000 is the amount of the year-to-year increase in cash and cash equivalents. The formal statement may now be prepared using the T-account, Summary of Cash and Cash Equivalents. The alphabetic characters in the statement below refer to the entries in that T-account. The following statement of cash flows is prepared under the direct method. The calculations for gross receipts and gross payments needed for the direct method are shown below the statement.

Johnson Company
Statement of Cash Flows
For the Year Ended December 31, 2009

Cash flow from operating activities			
Cash received from customers	$102,000		
Dividends received	3,000		
Cash provided by operating activities			$105,000
Cash paid to suppliers	$ 75,000		
Cash paid for expenses	9,000		
Interest paid	1,000		
Income taxes paid	5,000		
Cash paid for operating activities			(90,000)
Net cash flow provided by operating activities		(t)	$ 15,000
Cash flow from investing activities			
Sale of equipment	5,000	(d)	
Sale of investments	8,000	(s)	
Purchase of property, plant, and equipment	(8,000)	(g)	
Net cash provided by investing activities			5,000
Cash flow from financing activities			
Sale of common stock	$ 5,000	(h)	
Increase in notes payable	9,000	(n)	
Dividends paid	(9,000)	(i)	
Net cash provided by financing activities			5,000
Net increase in cash and cash equivalents			$ 25,000
Cash and cash equivalents at beginning of year			16,000
Cash and cash equivalents at end of year			$ 41,000

Calculation of amounts for operating activities section

Cash received from customers = Net sales + Beginning A/R – Ending A/R
$100,000 + $11,000 – $9,000 = $102,000

Cash paid to suppliers = Cost of goods sold + Beginning A/P – Ending A/P + Ending inventory – Beginning inventory
$60,000 + $12,000 – $2,000 + $14,000 – $9,000 = $75,000

Cash paid for operating expenses = Operating expenses + Ending prepaid expenses – Beginning prepaid expenses – Depreciation expense (and other noncash operating expenses)
$12,000 + $8,000 + $1,000 + $10,000 – $13,000 – $8,000 – $1,000 = $9,000

Interest paid = Interest expense + Beginning interest payable – Ending interest payable
$2,000 + $2,000 – $3,000 = $1,000

Taxes paid = Income taxes + Beginning income taxes payable – Ending income taxes payable – Change in deferred income taxes—operating portion
$9,180 + $1,000 – $2,180 – $3,000 = $5,000

When a statement of cash flows is prepared using the direct method of reporting operating cash flows, the reconciliation of net income to operating cash flows must also be provided. The T-account, Cash and Cash Equivalents—Operating Activities is used to prepare the reconciliation. The alphabetic characters in the reconciliation below refer to the entries in the T-account.

Reconciliation of net income to net cash provided by operating activities

Net income		(a)	$16,320
Add (deduct) items not using (providing) cash:			
Depreciation	8,000	(b)	
Amortization	1,000	(c)	
Gain on sale of equipment	(3,000)	(d)	
Increase in deferred taxes	3,000	(e)	
Equity in XYZ	(2,000)	(f)	
Decrease in accounts receivable	2,000	(j)	
Increase in inventory	(5,000)	(k)	
Decrease in prepaid expenses	3,000	(l)	
Decrease in accounts payable	(10,000)	(m)	
Increase in interest payable	1,000	(o)	

Increase in income taxes payable	1,180	(p)	
Gain on sale of AFS securities	(500)	(s)	(1,320)
Net cash flow provided by operating activities		(t)	$15,000
Schedule of noncash transactions			
Conversion of bonds into common stock		(q)	$15,000
Acquisition of leased equipment		(r)	$ 5,000

Statement of Cash Flows for Consolidated Entities

A consolidated statement of cash flows must be presented when a complete set of consolidated financial statements is issued. The consolidated statement of cash flows would be the last statement to be prepared as the information to prepare it will come from the other consolidated statements (consolidated balance sheet, income statement, and statement of retained earnings). The preparation of these other consolidated statements is discussed in Chapter 13.

The preparation of a consolidated statement of cash flows involves the same analysis and procedures as the statement for an individual entity with a few additional items. When the indirect method is used, the additional noncash transactions relating to the business combination such as the differential amortization must also be reversed and all transfers to affiliates must be eliminated, as they do not represent cash inflows or outflows of the consolidated entity.

All unrealized intercompany profits should have been eliminated in preparation of the other statements. Any income or loss allocated to noncontrolling parties would need to be added back, as it would have been eliminated in computing consolidated net income but does not represent a true cash outflow or inflow. Finally, only dividend payments that are not intercompany should be recorded as cash outflows in the financing activities section.

In preparing the operating activities section of the statement by the indirect method following a purchase business combination, the changes in assets and liabilities related to operations since acquisition should be derived by comparing the consolidated balance sheet as of the date of acquisition with the year-end consolidated balance sheet. These changes will be combined with those for the acquiring company up to the date of acquisition as adjustments to net income. The effects due to the acquisition of these assets and liabilities are reported under investing activities.

Forthcoming Changes to Financial Statement Presentation Standards

As discussed in Chapters 2 and 3, the currently active FASB project (which is being pursued in conjunction with IASB), *Financial Statement Presentation*, will likely result in expanding the use of the categorizations long used to describe cash flows—operating, investing, and financing—to some or all of the other basic financial statements. The major change to the cash flow statement, if current thinking holds, would be to require the use of the direct method of reporting operating cash flows. As set forth earlier in this chapter, ASC 230 favors the use of the direct method, but the vast majority of all reporting entities have continued to employ the indirect method, which is generally defended as being less costly to prepare.

There is also a possibility that the required disclosure of noncash investing and financing activities might be relocated, although this remains an open matter for further debate.

Another likely change in the statement of cash flows will eliminate the concept of cash equivalents, thereby restricting reporting to actual changes in cash. Presumably cash equivalents would be merged with other short-term investments, and changes in such investments would be reported in the cash flow statement based on nature and intent of acquisition, as required under ASC 825, for those investments measured at fair value.

Current thinking on the format and content of the statement of cash flows is that, if changes are to be made, operating and investing cash flows will become subsections of a new major category to be denoted as "business." Cash flows associated with discontinued operations would be separately set forth in a newly established caption. Financing cash flows would be presented, as now, in a separate major category. Finally, cash flows relating to equity transactions and those pertaining to income taxes would also be uniquely categorized. A preliminary views or similar discussion-stage document is expected by year-end 2008.

The increased visibility of the cash flows from discontinued operations would be, if enacted, a response to complaints that have been voiced by the user community regarding interpretation of currently provided discontinued operations data; if adopted, the definition of discontinued operations would be narrowed and tax effects would no longer be associated with discontinued operations. (In the proposed cash flow presentation, all income taxes would be reported as such, in a separate major category, without intraperiod allocation.)

PERSPECTIVE AND ISSUES

Under US GAAP, management is granted the flexibility of choosing between or among certain alternative methods of accounting for the same economic transactions, although over time the range of choices has narrowed and will likely be further reduced. Examples of the availability of such choices are provided throughout this publication, in such diverse areas such as alternative cost-flow assumptions used to account for inventory and cost of sales, different methods of depreciating long-lived assets, and varying methods of identifying operating segments. The professional literature (in the areas of accounting principles, auditing standards, quality control standards, and professional ethics) is emphatic that, in choosing among the various alternatives, management is to select principles and apply them in a manner that results in financial statements that faithfully represent economic substance over form and that are fully transparent to the user.

Changes in accounting can be necessitated over time due to changes in the assumptions and estimates underlying the application of accounting principles and methods of applying them, changes in the principles defined as acceptable by a standards-setting authority, or other types of changes.

The accounting and disclosure of changes in accounting for given transactions are issues that have confronted the accounting profession for a great many years. The matter is particularly sensitive because of the impact on financial statement analysis, particularly of the trend

or longitudinal variety, of altering the methods of accounting for specific transactions, and of disclosing the effects of those changes.

From a managerial perspective as well, changes in the accounting for given transactions can have a profound influence on investing and operational decisions. Financial statement analysis and management decision making both generally presume the consistency and comparability of financial statements across periods and among entities within industry groupings. Any type of accounting change potentially can create inconsistency, and since some change is inevitable, the challenge is to present the effects of the change in a manner that is most readily comprehended by users of financial statements, who may impose various adjustments of their own in their efforts to make the information comparable for analysis purposes.

This concern is exacerbated by the fact that events of the late 1900s and early 2000s created a crisis of confidence about the accuracy of financial reports and the credibility of the parties associated with preparing and auditing them. The number and magnitude of restatements of previously issued financial statements raised disturbing questions about management manipulation, and about the possible complicity of, or at least negligence by, the external auditors. The enactment of the Sarbanes-Oxley Act of 2002 and the restructuring of oversight of, and standard setting for, the auditing profession were two consequences of this series of unfortunate developments. The move to "converge" US GAAP and international accounting standards—and the real possibility that IFRS may supersede US GAAP, at least for publicly held companies—are further indicators of the premium now being placed on accurate, transparent, and uniform financial reporting.

When contemplating a potential change in accounting principle, a primary focus of management should be to consider its effect on financial statement comparability. This should not, however, dissuade preparers from adopting preferable accounting standards, where otherwise warranted.

As one result of the joint FASB-IASB effort to converge US GAAP and International Financial Reporting Standards (IFRS), FASB updated ASC 250, *Accounting Changes and Error Corrections*, which essentially conformed US GAAP practice to that under international financial reporting standards. ASC 250 requires retrospective application of a newly adopted accounting policy for most changes in accounting principle, including changes in accounting principle required by newly issued pronouncements. FASB did, however, retain the right to require different transition provisions for changes in accounting principle mandated by the future issuance of new pronouncements, should it deem such differences to be appropriate.

In another significant alteration, ASC 250 also requires the reporting of a change in depreciation, amortization, or depletion *method* as a change in an accounting *estimate* rather than a change in *principle*. This type of change is not effected by retrospectively adjusting prior financial statements.

An accounting change is defined as a change in either

1. Accounting principle
2. Accounting estimate
3. Reporting entity

While the correction of an error in previously issued financial statements is not considered an accounting change, per se, this subject is also dealt with by ASC 250, which for the first time expressly restricts the use of the term "restatement" to describe corrections of prior period errors, in order to avoid any ambiguity regarding whether an error is involved in a particular change to previously issued financial statements.

ASC 250 contains the underlying presumption that, in preparing financial statements, an accounting principle, once adopted, should not be changed in accounting for events and transactions of a similar type. This consistent use of accounting principles is intended to enhance the utility of financial statements. The presumption that a reporting entity should not change an accounting principle may be overcome only if management justifies the use of an alternative acceptable accounting principle on the basis that it is actually preferable.

ASC 250 does not provide a definition of preferability or criteria by which to make such assessments, so this remains a matter of professional judgment. Because there is no universally agreed-upon set of objectives for external financial reporting, what is preferable for one industry or company is not necessarily considered preferable for another.

In 2003, the FASB staff began issuing FASB Staff Positions (abbreviated in this publication as FSP and discussed more fully in Chapter 1) to provide guidance on the application of its authoritative literature. Unless otherwise specified, FSP are effective for new transactions or arrangements entered into after the beginning of the first fiscal quarter following the date of final posting of the FSP to the FASB Web site (http://www.FASB.org). FSP are included in the ASC 250 definition of "accounting pronouncement" and, thus, in the rare instance that an FSP is silent regarding transition, the reporting entity will be required to retrospectively apply the new FSP to all prior periods.

820	Fair Value Measurements and Disclosures
825-10-25	Financial Instruments—Fair Value Option
830	Foreign Currency Matters

DEFINITIONS OF TERMS

Accounting change. Under ASC 250, an accounting change is one of three types of modifications that affect a reporting entity's accounting principles and practices, or their application. The three types of accounting changes are: (1) a change in accounting principle from one generally accepted accounting principle to another alternative that is considered preferable, (2) a change in an accounting estimate, and (3) a change in the reporting entity. Although, technically, corrections of errors in prior periods' financial statements (now referred to exclusively as "restatements") are not accounting changes, their treatment is also governed by ASC 250.

Accounting policies. The accounting principles of a reporting entity and the methods of applying them. Management is required to adopt the accounting policies that result in a fair, full, and complete presentation of financial position, results of operations, and cash flows in the financial statements of the reporting entity.

Accounting principle. A methodology used to measure and report the monetary effects of economic events in financial statements. Acceptable accounting principles are either prescribed by a recognized standard-setting body in an authoritative pronouncement or, in the absence of a relevant pronouncement, are predominantly followed by entities that engage in transactions of a similar nature or operate in a particular industry or profession. In the context of ASC 250, accounting principles encompass both accounting practices and the methods of applying them.

Change in accounting estimate. A revision of an accounting measurement based on the occurrence of new events, additional experience, subsequent developments, better insight, and improved judgment. Refining previously made estimates is an inherent part of the accounting process.

Change in accounting estimate effected by a change in accounting principle. A change in accounting estimate that is inseparable from the effect of a related change in accounting principle (for example, a change in depreciation method).

Change in accounting principle. A change from one generally accepted accounting principle to another generally accepted accounting principle, including the methods of applying the principles. This does not include selection and adoption of an accounting principle to account for the substance and/or form of events (1) occurring for the first time in the operations of a given reporting entity or (2) that had occurred in the past but that were previously considered immaterial. A change in accounting principle can also occur when an authoritative standards setter issues a new standard that renders an existing accounting principle no longer acceptable.

Change in reporting entity. A special type of change in accounting principle that results in financial statements that, in effect, are those of a different reporting entity. Financial statements are prepared for an entity that is different from the one reported on in previous financial statements. Specifically excluded from this type of accounting change are business combinations under ASC 805 and consolidation of variable interest entities under ASC 810.

Comparability. The quality of information that enables users to identify similarities in and differences between two sets of economic circumstances. Normally, comparability is a quantitative assessment of a common characteristic.

Consistency. Conformity from period to period with unchanging policies and procedures. Consistency enhances the utility of financial statements to users by facilitating analysis and understanding of comparative accounting data.

Cumulative catch-up. A method used to reflect a change in accounting estimate whereby the results of the change are recognized in the statement of income of the period of the change.

Cumulative effect. The difference between the retained earnings balance at the beginning of the year in which a change is reported and the beginning retained earnings balance that would have been reported if the new principle had been applied retrospectively in all prior periods that would have been affected.

Errors. Mathematical mistakes, mistakes in applying accounting principles, oversight or misuse of available facts, and use of unacceptable GAAP.

Restatement. The revision of previously issued financial statements in order to correct an error made in preparing them (see definition of "errors" above). Under ASC 250, this term is only to be used in the context of error corrections, and not to describe any other types of financial statement changes.

CONCEPTS, RULES, AND EXAMPLES

Accounting Policies

The reporting entity's management is responsible for adopting and adhering to the highest quality accounting policies possible. ASC 235 requires management, in discharging this responsibility, to adopt accounting principles and methods of applying them that are "the most appropriate in the circumstances to present fairly financial position, results of operations, and cash flows in accordance with generally accepted accounting principles." ASC 235 requires management to disclose, in the notes to the financial statements, a description of all significant accounting policies of the reporting entity. This requirement applies even in reporting situations where one or more of the basic financial statements has been omitted. In theory, if only one method of accounting for a type of transaction is acceptable under GAAP, it is not necessary to explicitly cite it in the accounting policies note, although many entities do routinely identify all accounting policies affecting the major financial statement captions.

A listing of accounting policies commonly disclosed by reporting entities follows (the listing is not intended to be all-inclusive):

- Advertising costs
- Advertising, direct response arrangements
- Cash equivalents
- Changes in accounting policies
- Combined financial statements, principles of combination
- Concentrations of credit risk, major customers and/or suppliers
- Consolidated financial statements, principles of consolidation
- Consolidated financial statements, variable interest entities
- Deferred income taxes
- Deferred income taxes, undistributed earnings of subsidiaries and/or joint ventures
- Derivatives and hedging activities
- Fair value elections, methods, assumptions, inputs used
- Financial instruments
- Fiscal year, 52-53 week year
- Fiscal year, difference between fiscal year used for financial reporting and income tax purposes
- Foreign currency translation
- Foreign sales corporations
- Goodwill
- Guarantees
- Impairment of long-lived assets, goodwill, other intangibles, investments, etc.
- Income taxes, deposit to retain fiscal year
- Income taxes, nonaccrual by flow-through entity
- Income taxes, liability for unrecognized income tax positions
- Intangibles, amortizable and/or nonamortizable
- Interest capitalization
- Internal-use software
- Inventories
- Investments, cost method
- Investments, debt and marketable equity securities including reclassifications between portfolios
- Investments, equity method

- Long-term contracts
- Nature of operations
- Not-for-profits; restrictions that are satisfied in the year they originate
- Operating cycle
- Out-of-pocket costs (typically for service businesses)
- Pension and other postretirement or postemployment plans
- Property and equipment, depreciation and amortization
- Property and equipment, changes from held-and-used to held-for-sale
- Rebates
- Receivables, past due, interest and late charges, determination of allowance for bad debts
- Reclassifications
- Revenue recognition, lessor leasing activities
- Revenue recognition, long-term contract accounting
- Revenue recognition, methods for each significant product or service
- Revenue recognition, multiple-element arrangements
- Revenue recognition, product returns
- Revenue recognition, real estate (time-sharing) sales (e.g., installment cost recovery, full accrual)
- Revenue recognition, software sold or otherwise marketed
- Share-based payment arrangements
- Shipping and handling costs
- Start-up costs
- Syndication costs
- Use of estimates
- Warranties

The "summary of significant accounting policies" is customarily, but not necessarily, the first note disclosure included in the financial statements. A more all-encompassing title such as "Nature of business and summary of significant accounting policies" is frequently used.

It is not necessary to repeat details provided elsewhere in the disclosures in the accounting policy disclosure. Many preparers simply cross-reference accounting policy disclosures to relevant details provided in other notes to the financial statements.

Alternatives and Elections under GAAP

Confusion abounds in the preparer and user communities regarding what alternatives are available to account for the same or similar transactions, and under which circumstances those alternatives are appropriate. Over the years, in order to facilitate consistent, comparable reporting between entities and between periods, FASB has been reducing the number of alternative accounting principles or methods of applying them. This trend should continue as FASB converges its authoritative literature with international standards (IFRS). The remainder of this section will discuss the alternatives most commonly encountered in practice. Each alternative includes parenthetical reference to the primary governing GAAP and to the chapter of this publication where the relevant issues are discussed in greater detail.

Advertising costs. ASC 720-35-05 categorizes the costs of media advertising (e.g., television, radio, newspapers, direct mail) into two broad categories: production costs and communication costs. Except for direct response advertising costs, the costs of advertising are accounted for as follows:

> **Production costs**—Management can elect an accounting policy of expensing production costs either when the costs are incurred or the first time that the advertising takes place. If management

chooses to defer these costs, they may only be deferred (recorded as an asset) if the advertising is expected to occur. If it is subsequently decided not to run the advertising, all deferred production costs are to be reversed and recorded as expense in the period that the decision is made.

Communication costs—These costs are generally expensed when the cost is incurred (i.e., when the television or radio advertising is broadcast or when the print advertising is published). An exception is provided for cooperative advertising arrangements. This is, in essence, an arrangement whereby a supplier reimburses its customer for all or a portion of the customer's costs of advertising the supplier's products. In most cases, the supplier's revenues from sale of its products to its customers have been earned prior to when it is obligated to reimburse the customer for the advertising. When this is the case, the supplier is required to accrue the cooperative advertising reimbursement and recognize it as an expense in the same period as the related revenues are recognized.

An example is provided, later in this chapter, to illustrate how to report a change in accounting principle with respect to accounting for advertising costs.

Fair value option (ASC 825-10-25; Chapter 6). ASC 825-10-25 is *The Fair Value Option*. This standard (discussed in detail in Chapter 6) permits reporting entities (including not-for-profit organizations) to elect to measure many financial assets and liabilities at fair value, with changes in fair value reflected in earnings (or another performance indicator, if applicable) as they occur. ASC 825-10-25 offers substantial flexibility to management in making the fair value election in that the election generally may be applied by individual instrument.

By offering reporting entities an option to apply fair value accounting to selected financial assets and liabilities, the risk of opportunistic application had to be dealt with. One dissenter to the enactment of this standard raised the objection that "…an instrument-by-instrument option that results in partial adoption of fair values…significantly reduces the relevance of the resulting reporting by failing to portray the earnings effects of financial (and other) instruments' exposures in the same reporting period and increases users' costs in processing the information by introducing treatment alternatives that reduce the comparability of reported results within and across reporting entities and line items."

To compensate for this admitted shortcoming, in adopting ASC 825-10-25, the electing entity is required to make substantial new disclosures and to simultaneously adopt ASC 820, *Fair Value Measurements and Disclosures*, which also includes additional disclosure requirements. See Chapter 6 for a comprehensive discussion of these standards and a description of the complex effective date and early adoption provisions.

Functional currency (ASC 830; Chapter 23). Management's determination of a reporting entity's functional currency is based on identification of the "primary economic environment in which the entity operates." This determination can, in many cases, be relatively straightforward. However, FASB acknowledged that this might not always be obvious. When this is the case, management must exercise judgment as to which functional currency will most faithfully portray the entity's economic performance. Once management makes the functional currency decision regarding a foreign entity, that decision is to be used consistently unless there are subsequent changes in the economic facts and circumstances that indicate clearly that there has been a change in that entity's functional currency. Should this occur, however, this is not considered to be a change in accounting principle.

The determination of a foreign entity's functional currency dictates which method of foreign currency translation is required to be used with respect to that entity. If the foreign entity's functional currency is its local currency, the current rate method is required to be used to translate its financial statements. If, instead, the foreign entity's functional currency is the US dollar, the remeasurement method is required.

Inventory cost flow assumptions (ASC 330; Chapter 9). Inventory may be costed by means of specific identification or by application of one of several acceptable alternative cost-flow assumptions, which are

1. First-in, first-out (FIFO),
2. Last-in, first-out (LIFO), and
3. Weighted-average

The adoption of a cost-flow assumption is not an all-or-nothing proposition. For example, management may choose to elect LIFO for certain types of inventory and FIFO or weighted-average for other types. Each of the assumptions has advantages and disadvantages and will yield different results.

In electing to use a particular cost-flow assumption, there are other policy matters that must be decided. Particularly in the use of LIFO, which originated as an income tax concept, the Internal Revenue Service (Form 970, *Application to Use the LIFO Method*) requires an electing taxpayer to provide details of the manner in which it is applying the method. For example, a taxpayer electing to use dollar-value LIFO must specify, among other things

1. How it defines "items" in the inventory,
2. The method it will use to determine LIFO pools and a description of the types of items that will be included in each pool,
3. The method that will be used to compute the LIFO value of each dollar-value pool (e.g., double-extension, link-chain, or index method),
4. The method that will be used to determine the current year cost of goods in closing inventories and to value any LIFO increments in the pool(s), and
5. If the taxpayer is using the Inventory Price Index Computation (IPIC) Method (either using link-chain IPIC or double-extension IPIC), the Bureau of Labor Statistics (BLS) price index table that will be used.

Changing one or more of the above conventions used to apply the LIFO method would constitute a change in accounting principle that, under ASC 250, would require *retroactive* application to all prior periods for which it is practical to do so. This is true even though both before and after the change, the reporting entity uses the LIFO method.

The future of LIFO inventory costing may be some doubt, given the FASB commitment to "converge" with IFRS, and given the possibility that IFRS may in fact supersede US GAAP in the not-too-distant future. Specifically, IFRS eliminated LIFO as an acceptable costing method several years ago, on the grounds that it does not realistically describe the flow of goods except in highly unusual circumstances. In the US, LIFO costing was embraced primarily because it was advantageous in inflationary periods for tax reporting purposes, and the LIFO conformity rule necessitated simultaneous use for GAAP financial reporting. The expectation is that there will be pressure for changes to tax law to de-couple tax reporting from GAAP financial reporting. At the same time, there is renewed agitation to eliminate LIFO from tax rules, to eliminate what has been a tax deferral strategy by corporate taxpayers. The outcome of these various debates is not yet clear.

Depreciation of long-lived assets (ASC 360-10-35; Chapter 11). Management is responsible for choosing a method of depreciating its long-lived assets that systematically allocates the cost of the asset (reduced by any residual or salvage value) to expense over the periods benefited by the use of those assets. In determining the appropriate method of depreciation, estimated useful life, and salvage value to assign to particular types of assets, management considers the nature of the assets, the manner or pattern in which they are expected to be used, nature, timing and extent of expected wear and tear, potential loss of productivity in later years of use, likelihood of technological obsolescence, etc.

Based on these considerations, a number of alternative methods of depreciation are available such as

1. Straight-line
2. Declining balance (e.g., double-declining balance)
3. Sum-of-the-years' digits
4. Group or composite methods
5. Present value methods
6. Units of production

Management also may elect to use certain conventions in applying the chosen depreciation methods. For example, many reporting entities adopt a convention of taking one-half of the annual depreciation computed for newly acquired assets in the year of acquisition and one-half in the final year or the year of subsequent disposition. Another convention adopted by some companies is to use an accelerated method of depreciation during the early years of use and then switch to straight-line depreciation over the remaining useful life at a defined point, in order to fully depreciate the asset over its useful life.

Subsequent change to the method of depreciation or the manner in which it is applied is considered a change in accounting estimate effected by a change in accounting principle. When management determines that such a change is required, the change is accounted for prospectively in the current and any future periods affected. Retrospective application to prior periods' financial statements is not permitted. However, unlike other changes in accounting estimate, management is required to justify the change on the basis of the revised depreciation method being considered preferable to the former method.

Long-term construction contracts (ASC 605-35; Chapter 10). The two primary methods of accounting for long-term construction contracts are completed-contract and percentage-of-completion. The appropriate method for a particular reporting entity depends on whether or not management is able to dependably estimate cost to complete and extent of progress towards completion of its construction contracts. Under ASC 605-35, there is a rebuttable presumption that management is capable of making these estimates and that, therefore, the percentage-of-completion method is the preferable method of accounting. When circumstances warrant, management may elect to use the percentage-of-completion method as its primary method of accounting for long-term construction contracts and still apply the competed-contract method of accounting to contracts that meet certain specified criteria. When this is the case, the facts and circumstances are to be fully disclosed in the notes to the financial statements.

Share-based payment arrangements (ASC 718; Chapter 19). In accounting for share-based payment arrangements, management has a number of policy decisions to make including

1. The method(s) and models used to value share-based payment arrangements such as whether to use a lattice model or a closed-form model such as the Black-Scholes-Merton model. Management may elect to use different valuation models for different types of instruments.
2. The share price to be used as the "current" share price in estimating fair value on the grant date (e.g., the closing share price or the share price at another specified time),
3. Subject to a specified minimum amount (floor), whether to recognize compensation cost for awards with service conditions and graded vesting schedules (a) on a straight-line basis over the requisite service period for each portion of the award as it separately vests as if the award were, in effect, separate awards, or (b) on a

straight-line basis over the requisite service period for the whole award. Once elected, this policy must be followed consistently for all similar awards.

4. The method to be used to compute the initial pool of excess tax benefits available on adoption of ASC 718.
5. For nonpublic companies
   a. Whether to measure all liability awards at fair value, calculated value, or intrinsic value
   b. Whether to measure equity awards at fair value or calculated value

Initial Adoption Decisions

Upon formation of a business or nonprofit organization, management makes decisions regarding the adoption of accounting policies, based on the types of activities in which the entity engages and the industry and environment in which it operates. Certain types of events and transactions are subject to GAAP that permits choices to be made from among alternative, acceptable accounting treatments. The principles selected from among the available alternatives and the methods of applying those principles constitute the reporting entity's accounting policies.

Management initially adopts accounting principles at two distinct times

1. Upon formation of the reporting entity
2. Upon the occurrence of a new type of event or transaction that had either not happened in the past or had previously been judged to be immaterial

Once the initial adoption decisions are made, the users of the financial statements expect a reporting entity's financial statements to be prepared consistently over time. This facilitates comparisons across periods and among different reporting entities.

Accounting Changes

There are legitimate reasons why a reporting entity would change its accounting, either voluntarily or because it is required to do so

1. Changing to an existing alternative accounting principle that management deems to be preferable to the one it is currently following
2. Adopting a newly issued accounting principle
3. Refining an estimate made in the past as a result of further experience and better information
4. Correcting an error made in previously issued financial statements. Although technically not an "accounting change" as defined in GAAP literature, this involves restating previously issued financial statements and is also governed by ASC 250.

To facilitate accurate analysis, it is important for management of the reporting entity to adequately inform the financial statement users when one or more of these changes is made, and to provide sufficient information to enable the reader to distinguish the effects of the change from other factors affecting results of operations.

ASC 250, *Accounting Changes and Error Corrections*, was issued to more closely conform the treatment of accounting changes under US GAAP to international financial reporting standards under IAS 8 (see Appendix B, *International vs. US Accounting Standards*). It applies to financial statements of commercial businesses and not-for-profit organizations as well as historical summaries and other presentations derived from them that include one or more periods reflecting an accounting change or error correction.

Each of the types of accounting changes and the proper treatment prescribed for them is discussed in detail in the following sections.

Change in Accounting Principle

Management is permitted to change from one generally accepted accounting principle to another only when (1) it voluntarily decides to do so and can justify the use of the alternative accounting principle as being preferable to the principle currently being followed, or (2) it is required to make the change as a result of a newly issued accounting pronouncement. If the change is being made voluntarily, the financial statements of the period of change are to include disclosure of the nature of and reason for the change and an explanation of why management believes the newly adopted accounting principle is preferable. This preferability assessment is required to be made from the perspective of financial reporting, and not solely from an income tax perspective. Thus, favorable income tax consequences alone do not justify making a change in financial reporting practices.

According to ASC 250, the term *accounting principle* includes not only the accounting principles and practices used by the reporting entity, but also its methods of applying them. A change in the components used to cost a firm's inventory is considered a change in accounting principle and, therefore, is only permitted when the new inventory costing method is preferable to the former method.

Preferability. As stated, management is only permitted to voluntarily change the reporting entity's accounting principles when the newly employed principle is preferable to the principle it is replacing. The independent auditors are then charged with concurring with management's assessment. If the auditors do not believe management has provided reasonable justification for the change, AU §508.51 requires the auditors to express either a qualified or adverse opinion, depending on the materiality of the effects of the unacceptable accounting principle on the financial statements.

When management of a public company voluntarily changes the registrant's accounting principles, a letter from the registrant's independent public accountants is required to be filed with the SEC. This "preferability letter" is to be included as an exhibit in 10-Q and 10-K filings (Regulation S-K Item 601, Exhibit 18) and must indicate whether the change in principle or practice (or method of applying that principle or practice) is to an acceptable alternative that, in the auditors' judgment, is preferable under the circumstances.

Retrospective application. ASC 250 provides that changes in accounting principle be reflected in financial statements by retrospective application to all prior periods presented unless it is impracticable to do so. ASC 250 points out that in the future when new accounting principles are issued, those pronouncements will include specific provisions regarding transitioning to the new principles that are to be followed by adopting entities. Thus, future standards may still provide for adoption using cumulative effect adjustments, if FASB believes this to be the most beneficial method of transition. The new default method, however, will be retrospective restatement, whereas previously the default procedure was to recognize a cumulative effect adjustment in current results of operations.

Retrospective application is accomplished by the following steps:

At the beginning of the first period presented in the financial statements,

Step 1 - Adjust the carrying amounts of assets and liabilities for the cumulative effect of changing to the new accounting principle on periods prior to those presented in the financial statements.

Step 2 - Offset the effect of the adjustment in Step 1 (if any) by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity).

For each individual prior period that is presented in the financial statements,

Step 3 - Adjust the financial statements for the effects of applying the new accounting principle to that specific period.

Example of retrospective application of a new accounting principle

In 1998, upon the incorporation of Newburger Company, its management elected to recognize advertising costs as incurred. Newburger has been consistently following that policy in its financial statements. In 2009, Newburger's management reviewed its accounting policies and concluded that application of its current policy was resulting in substantial costs associated with the production of television advertising being recognized in financial reporting periods that preceded the periods in which the related revenues were earned. Consequently, management decided to change Newburger's policy to elect to expense advertising costs the first time the advertising takes place as permitted by ASC 720-35, *Advertising Costs*. Additional assumptions follow:

- As has been its policy in the past, Newburger plans to issue comparative financial statements presenting two years, 2009 and 2008.
- Newburger does not engage in direct-response advertising activities.
- A combined federal and state income tax rate of 40% was in effect for all relevant periods.
- Prior to the change in accounting principle, there were no temporary differences or loss carryforwards and, thus, there were no deferred income tax assets or liabilities.
- Advertising costs are deductible for income tax purposes when incurred and, therefore, upon adoption of the new accounting policy, Newburger will have a temporary difference between the book and income tax bases of its asset, deferred advertising costs. These advertising costs that are being recognized in the financial statements in the year after they are deducted on Newburger's income tax return represent a future taxable temporary difference that will give rise to a deferred income tax liability.
- The financial statements originally issued as of and for the years ended December 31, 2008 and 2007, prior to the adoption of the new accounting principle are presented below with advertising-related captions shown separately for illustrative purposes.

Newburger Company
Statements of Income and Retained Earnings
Prior to Change in Accounting Principle
Years Ended December 31, 2008 and 2007

	2008	*2007*
Sales	$ 2,300,000	$ 2,000,000

Investing activities		
Property and equipment		
Acquisition	(133,000)	(120,000)
Proceeds from sale	--	--
Net cash used for investing activities	(133,000)	(120,000)
Financing activities		
Dividends paid to stockholders	(1,400,000)	(1,200,000)
Long-term debt		
Borrowed	--	--
Repaid	(5,000)	(5,000)
Net cash used for financing activities	(1,405,000)	(1,205,000)
Decrease in cash and cash equivalents	(200,000)	(150,600)
Cash and cash equivalents, beginning of year	2,400,000	2,550,600
Cash and cash equivalents, end of year	$2,200,000	$2,400,000

Step 1 - Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements (January 1, 2008, in this example).

for the cumulative effect of changing to the new accounting principle on periods prior to those presented in the financial statements.

In this example, the preparer refers to the previously issued 2007 financial statements presented above. Assume the following data regarding advertising costs at December 31, 2007/January 1, 2008:

Costs incurred during 2007 for advertising that will not take place for the first time until 2008	$25,000
Deferred income tax liability that would have been recognized at December 31, 2007, computed at 40% of the temporary difference	(10,000)
Net adjustment to beginning assets and liabilities	$15,000

Step 2 - Offset the effect of the adjustment in Step 1 by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity).

The $15,000 net effect of the adjustment in Step 1 is presented in the statement of income and retained earnings as an adjustment to the January 1, 2008 retained earnings as previously reported at December 31, 2007.

Step 3 - Adjust the financial statements of each individual prior period presented for the effects of applying the new accounting principle to that specific period.

In this case, the following adjustments are necessary to adjust the 2008 financial statements for the period-specific effects of the change in accounting principle:

Cost incurred in	*Year the advertising was first run*	
2007	2008	$ 25,000
2008	2009	(45,000)
Pretax, period-specific adjustment to advertising costs at 12/31/07		(20,000)
× 40% income tax effect		8,000
Effect on 2008 net income		$(12, 000)

Adjustments to the 2008 financial statements for the period-specific effects of retrospective application of the new accounting principle are

Adjustments to 2008 financial statements

	Deferred advertising costs	*Deferred income tax liability*	*Advertising expense*	*Income tax expense*
Balance at 12/31/08 prior to adjustment	$ --	$ --	$65,000	$404,000
Adjustment to opening balances from retrospective application to 2008	25,000	10,000	--	--
Advertising costs incurred in 2007, first run in 2008	(25,000)	--	25,000	--
Advertising costs incurred in 2008, first run in 2009	45,000	--	(45,000)	--
			(20,000)	
Income tax effect of net adjustment to 2008 advertising expense (40%)	--	8,000	--	8,000
Adjusted amounts for 2008 financial statements	$45,000	$18,000	$45,000	$412,000

The adjusted comparative financial statements, reflecting the retrospective application of the new accounting principle, follow.

Newburger Company
Statements of Income and Retained Earnings
Reflecting Retrospective Application of Change in Accounting Principle
Years Ended December 31, 2009 and 2008

	2009	*2008 as adjusted*
Sales	$ 2,700,000	$ 2,300,000
Cost of sales	995,000	850,000

	2009	*2008 as adjusted*
Gross profit	1,705,000	1,450,000
Advertising expense	66,000	45,000
Other selling, general, and administrative expenses	423,000	385,000
	489,000	430,000
Income from operations	1,216,000	1,020,000

Cash and cash equivalents, end of year	$2,382,000	$2,200,000

It is important to note that, in presenting the previously issued financial statements for 2008, the caption "as adjusted" is included in the column heading. Prior to ASC 250, many preparers used the caption "as restated." ASC 250 explicitly defines a restatement as a revision to previously issued financial statements to correct an error. Therefore, to avoid misleading the financial statement reader, use of the terms restatement or restated are to be limited to prior period adjustments to correct errors as discussed later in this chapter.

Indirect effects. The example above only reflects the direct effects of the change in accounting principle, net of the effect of income taxes. Changing accounting principles sometimes results in indirect effects from legal or contractual obligations of the reporting entity, such as profit sharing or royalty arrangements that contain monetary formulas based on amounts in the financial statements. In the preceding example, if Newburger Company had an incentive compensation plan that required it to contribute 15% of its pretax income to a pool to be distributed to its employees, the adoption of the new accounting policy would potentially require Newburger to provide additional contributions to the pool computed as

	Pretax effect of retroactive application	*Contractual rate*	*Indirect effect*
Prior to 2008	$25,000	15%	$3,750
2008	(20,000)	15%	(3,000)
			$ 750

Contracts and agreements are often silent regarding how such a change might affect amounts that were computed (and distributed) in prior years. Management of Newburger Company might have discretion over whether to make the additional contributions. Further, it would probably consider it undesirable to reduce the 2008 incentive compensation pool because of an accounting change of this nature, and it might thus decide for valid business reasons not to reduce the pool under these circumstances.

ASC 250 specifies that irrespective of whether the indirect effects arise from an explicit requirement in the agreement or are discretionary, if incurred they are to be recognized in the period in which the reporting entity makes the accounting change, which is 2009 in the example above.

Impracticability exception. All prior periods presented in the financial statements are required to be adjusted for the retroactive application of the newly adopted accounting principle, unless it is impracticable to do so. FASB recognized that there are certain circumstances when there is a change in accounting principle when it will not be feasible to compute (1) the retroactive adjustment to the prior periods affected or (2) the period-specific adjustments relative to periods presented in the financial statements presented.

In order for management to assert that it is impracticable to retrospectively apply the new accounting principle, one or more of the following conditions must be present:

1. Management has made a reasonable effort to determine the retrospective adjustment and is unable to do so.
2. If it were to apply the new accounting principle retrospectively, management would be required to make assumptions regarding its intent in a prior period that would not be able to be independently substantiated.
3. If it were to apply the new accounting principle retrospectively, management would be required to make significant estimates of amounts for which it is impossible to develop objective information that would have been available at the time the original financial statements for the prior period (or periods) were issued to provide evidence of circumstances that existed at that time regarding the amounts to be measured, recognized, and/or disclosed by retrospective application.

Inability to determine period-specific effects. If management is able to determine the adjustment to beginning retained earnings for the cumulative effect of applying the new accounting principle to periods prior to those presented in the financial statements, but is unable to determine the period-specific effects of the change on all of the prior periods presented in the financial statements, ASC 250 requires the following steps to adopt the new accounting principle:

1. Adjust the carrying amounts of the assets and liabilities for the cumulative effect of applying the new accounting principle at the beginning of the earliest period presented for which it is practicable to make the computation.
2. Any offsetting adjustment required by applying step 1. is made to beginning retained earnings (or other applicable components of equity or net assets) of that period.

Inability to determine effects on any prior periods. If it is impracticable to determine the cumulative effect of adoption of the new accounting principle on any prior periods, the new principle is applied prospectively as of the earliest date that it is practicable to do so. The most common example of this occurs when management of a reporting entity decides to change its inventory costing assumption from first-in, first-out (FIFO) to last-in, first-out (LIFO), as illustrated in the following example:

Example of change from FIFO to LIFO

During 2009 Warady Inc. decided to change the method used for pricing its inventories from FIFO to LIFO. The inventory values are as listed below using both FIFO and LIFO methods. Sales for the year were $15,000,000 and the company's total purchases were $11,000,000. Other expenses were $1,200,000 for the year. The company had 1,000,000 shares of common stock outstanding throughout the year.

Inventory values

	FIFO	*LIFO*	*Difference*
12/31/08 Base year	$ 2,000,000	$2,000,000	$ --
12/31/09	4,000,000	1,800,000	2,200,000
Variation	$ 2,000,000	$ (200,000)	$ 2,200,000

The computations for 2009 would be as follows:

	FIFO	*LIFO*	*Difference*
Sales	$15,000,000	$15,000,000	$ --
Cost of goods sold			
Beginning inventory	2,000,000	2,000,000	--
Purchases	11,000,000	11,000,000	--
Goods available for sale	13,000,000	13,000,000	--
Ending inventory	4,000,000	1,800,000	2,200,000
	9,000,000	11,200,000	(2,200,000)
Gross profit	6,000,000	3,800,000	2,200,000
Other expenses	1,200,000	1,200,000	--
Net income	$ 4,800,000	$ 2,600,000	$2,200,000

The following is an example of the required disclosure in this circumstance:

Note A: Change in Method of Accounting for Inventories

During 2009, management changed the company's method of accounting for all of its inventories from first-in, first-out (FIFO) to last-in, first-out (LIFO). The change was made because management believes that the LIFO method provides a better matching of costs and revenues. In addition, with the adoption of LIFO, the company's inventory pricing method is consistent with the method predominant in the industry. The change and its effect on net income ($000 omitted except for per share amounts) and earnings per share for 2009 are as follows:

	Net income	*Earnings per share*
Net income before the change	$4,800	$4.80
Reduction of net income due to the change	2,200	2.20
Net income as adjusted	$2,600	$2.60

Management has not retrospectively applied this change to prior years' financial statements because beginning inventory on January 1, 2009, using LIFO is the same as the amount reported on a FIFO basis at December 31, 2008. As a result of this change, the current period's financial statements are not comparable with those of any prior periods. The FIFO cost of inventories exceeds the carrying amount valued using LIFO by $2,200,000 at December 31, 2009.

Changing or eliminating differences in fiscal year-end. ASC 810-10-45 and ASC 810-10-50 state that the following scenarios constitute voluntary changes in accounting principle that are subject to the accounting and disclosure rules in ASC 250:

1. A consolidated entity changes its fiscal year-end to alter or eliminate a difference between its year-end and the fiscal year-end of the entity that consolidates it in its financial statements (the parent or ASC 810 primary beneficiary).
2. An investee that is accounted for by an investor using the equity method changes its fiscal year-end to alter or eliminate a difference between its year-end and the fiscal year-end of the equity method investor.

Retrospective application is not required if it is impracticable to do so.

Disclosure of Prospective Changes in GAAP

Disclosing the impact of newly established GAAP that has not yet become effective. The accounting principles used in the reporting entity's financial statements may comply with GAAP as of the reporting date but those principles may become unacceptable at a specified future date due to the issuance of a new accounting standard that is not yet effective. If the new GAAP, when adopted, is expected to materially affect the future financial statements, it is necessary to inform the users of the current financial statements about the future change. The objective of such a disclosure is to ensure that the financial statements are not

misleading and that the users are provided adequate information to assess the significance of adopting the new GAAP on the reporting entity's future financial statements.

Independent auditors are required to evaluate the adequacy of disclosure of the future change in accounting principle (AU §9410). In some cases, the effect of the future change will be so pervasive as to necessitate the presentation of pro forma financial data to supplement the historical financial statements. The pro forma data would present the effects of the future adoption as if it had occurred at the balance sheet date. The pro forma data may be presented in a column next to the historical data, in the notes to the financial statements, or separately accompanying the basic historical financial statements. Disclosure may also be needed of other future effects that may be triggered by the adoption of the new GAAP, such as adverse effects on the reporting entity's compliance with its debt covenants.

The best source of guidance in determining the form and content of these disclosures is ASC 250-10-S99. While this guidance is applicable to public companies, it also can be interpreted to apply to nonpublic companies as "practices that are widely recognized and prevalent." Under this requirement management is to disclose

1. A brief description of the new standard.
2. The date the reporting entity is required to adopt the new standard.
3. If the new standard permits early adoption and the reporting entity plans to do so, the date that the planned adoption will occur.
4. The method of adoption that management expects to use. If this determination has not yet been made, then a description of the alternative methods of adoption that are permitted by the new standard.
5. The impact that the new standard will have on reported financial position and results of operations. If management has quantified the impact, then it is to disclose the estimated amount. If management has not yet determined the impact or if the impact is not expected to be material, this is to be disclosed.

The SEC staff also encourages the following additional disclosures:

1. The potential impact of adoption on such matters as loan covenant compliance, planned or intended changes in business practices, changes in availability of or cost of capital, etc.
2. Newly issued standards that are not expected to materially affect the reporting entity should nevertheless be disclosed with an accompanying statement that adoption is not expected to have a material effect on the reporting entity.
3. When the newly issued standard only affects disclosure and the future disclosures are expected to be significantly different from the current disclosures, it is desirable to provide the reader with details.

Proposed GAAP. There is no requirement under GAAP or under SEC rules to disclose the potential effects of standards that have been proposed but not yet issued. If management wishes to voluntarily disclose information that it believes will provide the financial statement users with useful, meaningful information, the SEC provides guidance (§501.11 of the Codification of Financial Reporting Policies) on how to present this information, either in narrative form or as pro forma information, in a manner that "is reasonable, balanced and not misleading." In its guidance, the SEC notes that it may be reasonable to cover only those proposals where, based on the standard setter's published agenda, adoption appears imminent. When management chooses to make these disclosures, the disclosures should

1. Provide a brief description of the proposed standard.
2. Explain the purpose of the disclosures, the basis of presentation, and any significant assumptions made in preparing them.

3. Discuss, in a balanced manner,
   a. The positive and negative effects of applying the proposed standard,
   b. The effects the proposed standard would have had on prior results of operations,
   c. The potential effects of the proposed standard on future periods,
   d. The effects that can be quantified, and
   e. The effects, if any, that cannot be quantified.
4. Address the entire proposed standard, not just certain aspects of it.
5. Limit any disclosures that quantify the effects of the proposed standard to covering only the most recent fiscal year.
6. Warn the readers that the final standard, when and if issued, could differ from the proposal that was used as a basis for these disclosures and that, as a result, the actual application of any final standard could result in effects different than those disclosed.
7. If necessary for a fair and balanced presentation, provide information regarding more than one proposed standard. There is a risk to the reporting entity that the disclosure may appear to be incomplete or misleading if it discusses the effects of one significant proposed standard but not another.

Reclassifications

Occasionally, a company will choose to change the way it applies an accounting principle that results in a change in the way that a particular financial statement caption is displayed or in the individual general ledger accounts that comprise a caption. These reclassifications may occur for a variety of reasons that include

1. In management's judgment, the revised methodology more accurately reflects the economics of a type or class of transaction.
2. An amount that was immaterial in previous periods and combined with another number has become material and warrants presentation as a separately captioned line item.
3. Due to changes in the business or the manner in which the financial statements are used to make decisions, management deems a different form of presentation to be more useful or informative.

In order to maintain comparability of financial statements when such changes are made, the financial statements of all periods presented must be reclassified to conform to the new presentation.

Such reclassifications, which usually affect only the statement of income, do not affect reported net income or retained earnings for any period since they result in simply recasting amounts that were previously reported. Normally a reclassification will result in an increase in one or more reported numbers with a corresponding decrease in one or more other numbers. In addition, these changes reflect changes in the application of accounting principles either for which there are multiple alternative treatments, or for which GAAP is silent and thus management has discretion in presentation.

Reclassifications are not explicitly dealt with in GAAP but nevertheless do commonly occur in practice. The following examples are adapted from actual notes that appeared in the summary of significant accounting policies of publicly held companies:

Example 1

Effective January 1, 2009, the company removed the impact of intellectual property income, gains and losses on sales and other-than-temporary declines in market value of certain invest-

ments, realized gains and losses on certain real estate activity, and foreign currency transaction gains and losses from the caption, "Selling, General and Administrative Expenses" in the Consolidated Statement of Income. Custom development income was also removed from the "Research, Development, and Engineering" caption on the Consolidated Statement of Income. Intellectual property and custom development income are now presented in a separate caption in the Consolidated Statement of Income. The other items listed above are now included as part of "Other Income and Expense." Results of prior periods have been reclassified to conform to the current year presentation.

Example 2

Effective January 1, 2009, management has elected to reclassify certain expenses in its consolidated statements of income. Costs of the order entry function and certain accounting and information technology services have been reclassified from cost of sales to selling, general, and administrative expense. Costs related to order fulfillment have been reclassified from selling, general, and administrative expense to cost of sales. These reclassifications resulted in a decrease to cost of sales and an increase to selling, general, and administrative expense of $31.8 million, and $36.2 million for the years ended December 31, 2008 and 2007, respectively.

Change in Accounting Estimate

The preparation of financial statements requires frequent use of estimates for such items as asset service lives, salvage values, lease residuals, asset impairments, collectibility of accounts receivable, warranty costs, pension costs, etc. Future conditions and events that affect these estimates cannot be estimated with certainty. Therefore, changes in estimates will be inevitable as new information and more experience is obtained. ASC 250 requires that changes in estimates be recognized currently and prospectively. The effect of the change in accounting estimate is accounted for in "(a) the period of change if the change affects that period only or (b) the period of change and future periods if the change affects both." The reporting entity is precluded from retrospective application, restatement of prior periods, or presentation of pro forma amounts as a result of a change in accounting estimate.

For example, on January 1, 2009, a machine purchased for $10,000 was originally estimated to have a ten-year useful life and a salvage value of $1,000. On January 1, 2014 (five years later), the asset is expected to last another ten years and have a salvage value of $800. As a result, both the current period (the year ending December 31, 2009) and subsequent periods are affected by the change. Annual depreciation expense over the estimated remaining useful life is computed as follows:

Original cost	$10,000	
Less estimated salvage (residual) value	(1,000)	
Depreciable amount	9,000	
Accumulated depreciation, based original assumptions (10-year life)		
2009	900	
2010	900	
2011	900	
2012	900	
2013	900	
	4,500	
Carrying value at 1/1/2014	5,500	
Revised estimate of salvage value	(800)	
Depreciable amount	4,700	
Remaining useful life at 1/1/2014	10	years
	$ 470	depreciation per year
Effect on 2014 net income	$470 – $900 = $430 increase	

Note A: Change in Accounting Estimate.

During 2014, management assessed its estimates of the useful lives and residual values of the Company's machinery and equipment. Management revised its original estimates and currently estimates that its production equipment acquired in 2009 and originally estimated to have a 10-year useful life and a residual value of $1,000 will have a 15-year useful life and a residual value of $800. The effects of reflecting this change in accounting estimate on the 2014 financial statements are as follows:

Increase in	
Income from continuing operations and net income	$430.00
Earnings per share (for public companies)*	$ 0.02

* *Assuming 25,000 shares were outstanding for all of 2014*

As another example, the industry in which ABC Company operates suffers a significant downturn, resulting in a decline in the financial condition of its customers, and a noticeable worsening of the days required to collect its accounts receivable. ABC had formerly provided an amount equal to 2% of its credit sales as an increment to the bad debt allowance, resulting in a current balance in the allowance of $105,000. However, the new economic conditions mandate an immediate change to a 4% allowance. Accordingly, ABC provides an additional $105,000 in the current period to increase the previously recorded allowance to meet the new 4% estimate, and also begins providing 4% in the bad debt allowance on all new credit sales. Both of these adjustments are reflected in current period expense, even though the increased allowance on existing receivables pertains to sales made (in part) in a prior reporting period, because the change in estimate was made in the current period based on new circumstances that arose in that period—specifically, the declining credit standing of its customers.

Accounting for long-term construction contracts under the percentage-of-completion method necessarily involves ongoing revisions to estimates of total contract revenue, total contract cost, and extent of progress toward project completion. These revisions represent changes in accounting estimate and, in accordance with ASC 605-35, *Construction-Type and Production-Type Contracts*, the change in estimate is accounted for using the cumulative catch-up method. This is applied by

1. Computing the percentage of completion, earned revenues, cost of earned revenues, and gross profit on a contract-to-date basis at the balance sheet date using the reporting entity's consistently applied accounting policy for the contract and reflecting the revised estimates.
2. Reflecting in the current period's earned revenue and cost of earned revenue the difference between the newly computed contract-to-date results computed in 1. and those amounts recognized in previous periods.

This results in the effect of the change in accounting estimate being reflected in the current period statement of income, and prospectively accounting for the contract using the revised assumptions.

An impairment of a long-lived asset, as described by ASC 360-10-35, is not a change in accounting estimate. Rather, it is an event that is to be treated as an operating expense of the period in which it is recognized, in effect as additional depreciation. (See further discussion in Chapter 11.)

Change in Accounting Estimate Effected by a Change in Accounting Principle

In order to change certain accounting estimates, management must adopt a new accounting principle or change the method it uses to apply an accounting principle. In contemplating such a change, management would not be able to separately determine the effects of

changing the accounting principle from the effects of changing its estimate. The change in estimate is accomplished by changing the method.

Under ASC 250, a change in accounting estimate that is effected by a change in accounting principle is to be accounted for in the same manner as a change in accounting estimate, that is, prospectively in the current and future periods affected. However, because management is changing the company's accounting principle or method of applying it, the new accounting principle, as previously discussed, must be preferable to the accounting principle being superseded.

Management may decide, for example, to change its depreciation method for certain types of assets from straight-line to an accelerated method such as double-declining balance to recognize the fact that those assets are more productive in their earlier years of service because they require less downtime and do not require repairs as frequently. Such a change is permitted by ASC 250 only if management justifies it based on the fact that using the new method is preferable to the old one, in this case because it more accurately matches the costs of production to periods in which the units are produced.

A distinction is made in ASC 250, however, for entities that elect to apply a depreciation method that results in accelerated depreciation until the point during the useful life of the depreciable asset when it is useful to change to straight-line depreciation in order to fully depreciate the asset over the remaining term. At this point, the remaining carrying value (net book value) is depreciated using the straight-line method over its remaining useful life. ASC 250 provides that, if this method is consistently followed by the reporting entity, the changeover to straight-line depreciation is not considered to be an accounting change.

Change in Reporting Entity

An accounting change resulting in financial statements that are, in effect, of a different reporting entity than previously reported on, is retrospectively applied to the financial statements of all prior periods presented in order to show financial information for the new reporting entity for all periods. The change is also retrospectively applied to previously issued interim financial information.

The following qualify as changes in reporting entity:

1. Consolidated or combined financial statements in place of individual entities' statements
2. A change in the members of the group of subsidiaries that comprise the consolidated financial statements
3. A change in the companies included in combined financial statements

Specifically *excluded* from qualifying as a change in reporting entity are

1. A business combination accounted for by the purchase method and
2. Consolidation of a variable interest entity under ASC 810.

Error Corrections

Errors are sometimes discovered after financial statements have been issued. Errors result from mathematical mistakes, mistakes in the application of GAAP, or the oversight or misuse of facts known or available to the accountant at the time the financial statements were prepared. Errors can occur in recognition, measurement, presentation, or disclosure. A change from an unacceptable (or incorrect) accounting principle to a correct principle is also considered a correction of an error, and thus not as a change in accounting principle. Such a change should not be confused with the preferability determination discussed earlier that

involves two or more acceptable principles. An error correction pertains to the recognition that a previously used method was not an acceptable method at the time it was employed.

The essential distinction between a change in estimate and the correction of an error depends upon the availability of information. An estimate requires revision because by its nature it is based upon incomplete information. Later data will either confirm or contradict the estimate and any contradiction will require revision of the estimate. An error results from the misuse of existing information available at the time and is discovered at a later date. However, this discovery is not as a result of additional information or subsequent developments.

ASC 250 specifies that, when correcting an error in prior period financial statements, the term "restatement" is to be used. That term is exclusively reserved for this purpose so as to effectively communicate to users of the financial statements the reason for a particular change in previously issued financial statements.

Restatement consists of the following steps:

Step 1 - Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements for the cumulative effect of correcting the error on periods prior to those presented in the financial statements.

Step 2 - Offset the effect of the adjustment in Step 1 (if any) by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity) for that period.

Step 3 - Adjust the financial statements of each individual prior period presented for the effects of correcting the error on that specific period (referred to as the period-specific effects of the error).

Example of prior period adjustment

Assume that Truesdell Company had overstated its depreciation expense by $50,000 in 2007 and $40,000 in 2008, both due to mathematical mistakes. The errors affected both the financial statements and the income tax returns in 2007 and 2008 and are discovered in 2009.

Truesdell's balance sheets and statements of income and retained earnings as of and for the year ended December 31, 2008, prior to the restatement were as follows:

Truesdell Company
Statement of Income and Retained Earnings
Prior to Restatement
Year Ended December 31, 2008

	2008
Sales	$2,000,000
Cost of sales	
Depreciation	750,000
Other	390,000
	1,140,000
Gross profit	860,000
Selling, general, and administrative expenses	450,000
Income from operations	410,000
Other income (expense)	10,000
Income before income taxes	420,000
Income taxes	168,000
Net income	252,000
Retained earnings, beginning of year	6,463,000
Dividends	(1,200,000)
Retained earnings, end of year	$5,515,000

Truesdell Company
Balance Sheet
Prior to Restatement
December 31, 2008

	2008
Assets	
Current assets	$2,540,000
Property and equipment	
Cost	3,500,000
Accumulated depreciation and amortization	(430,000)
	3,070,000
Total assets	$5,610,000
Liabilities and stockholders' equity	
Income taxes payable	$ --
Other current liabilities	12,000
Total current liabilities	12,000
Noncurrent liabilities	70,000
Total liabilities	82,000
Stockholders' equity	
Common stock	13,000
Retained earnings	5,515,000
Total stockholders' equity	5,528,000
Total liabilities and stockholders' equity	$5,610,000

The following steps are followed to restate Truesdell's prior period financial statements:

Step 1 - Adjust the carrying amounts of assets and liabilities at the beginning of the first period presented in the financial statements for the cumulative effect of correcting the error on periods prior to those presented in the financial statements.

The first period presented in the financial statements is 2008. At the beginning of that year, $50,000 of the mistakes had been made and reflected on both the income tax return and financial statements. Assuming a flat 40% income tax rate and ignoring the effects of penalties and interest that would be assessed on the amended income tax returns, the following adjustment would be made to assets and liabilities at January 1, 2008:

Decrease in accumulated depreciation	$50,000
Increase in income taxes payable	(20,000)
	$30,000

Step 2 - Offset the effect of the adjustment in Step 1 by adjusting the opening balance of retained earnings (or other components of equity or net assets, as applicable to the reporting entity) for that period.

Retained earnings at the beginning of 2008 will increase by $30,000 as the offsetting entry resulting from Step 1.

Step 3 - Adjust the financial statements of each individual prior period presented for the effects of correcting the error on that specific period (referred to as the period-specific effects of the error).

The 2008 prior period financial statements will be corrected for the period-specific effects of the restatement as follows:

Decrease in depreciation expense and accumulated depreciation	$40,000
Increase in income tax expense and income taxes payable	(16,000)
Increase 2008 net income	$24,000

The restated financial statements are presented below.

Truesdell Company
Statements of Income and Retained Earnings
As Restated
Years Ended December 31, 2009 and 2008

	2009	2008 restated
Sales	$2,100,000	$2,000,000
Cost of sales		
Depreciation	740,000	710,000
Other	410,000	390,000
	1,150,000	1,100,000
Gross profit	950,000	900,000
Selling, general, and administrative expenses	460,000	450,000
Income from operations	490,000	450,000
Other income (expense)	(5,000)	10,000
Income before income taxes	485,000	460,000
Income taxes	200,000	184,000
Net income	285,000	276,000
Retained earnings, beginning of year, as originally reported	5,569,000	6,463,000
Restatement to reflect correction of depreciation (Note X)	--	30,000
Retained earnings, beginning of year, as restated	5,569,000	6,493,000
Dividends	(800,000)	(1,200,000)
Retained earnings, end of year	$5,054,000	$5,569,000

Truesdell Company
Balance Sheet
As Restated
December 31, 2009 and 2008

	2009	2008 restated
Assets		
Current assets	$2,840,000	$2,540,000
Property and equipment		
Cost	3,750,000	3,500,000
Accumulated depreciation and amortization	(1,050,000)	(340,000)
	2,700,000	3,160,000
Total assets	$5,540,000	$5,700,000
Liabilities and stockholders' equity		
Income taxes payable	$50,000	$ 36,000
Other current liabilities	110,000	12,000
Total current liabilities	160,000	48,000
Noncurrent liabilities	313,000	70,000
Total liabilities	473,000	118,000
Stockholders' equity		
Common stock	13,000	13,000
Retained earnings	5,054,000	5,569,000
Total stockholders' equity	5,067,000	5,582,000
Total liabilities and stockholders' equity	$5,540,000	$5,700,000

When restating previously issued financial statements, management is to disclose

1. The fact that the financial statements have been restated
2. The nature of the error
3. The effect of the restatement on each line item in the financial statements
4. The cumulative effect of the restatement on retained earnings (or other applicable components of equity or net assets)
   a. At the beginning of the earliest period presented in comparative financial statements or
   b. At the beginning of the period in single-period financial statements

5. The effect on net income, both gross and net of income taxes
   a. For each prior period presented in comparative financial statements or
   b. For the period immediately preceding the period presented in single-period financial statements
6. For public companies (or others electing to report earnings per share data), the effect of the restatement on affected per-share amounts for each prior period presented.

These disclosures need not be repeated in subsequent periods.

The correction of an error in the financial statements of a prior period discovered subsequent to their issuance is reported as a prior period adjustment in the financial statements of the subsequent period. In some cases, however, this situation necessitates the recall or withdrawal of the previously issued financial statements and their revision and reissuance.

Evaluating Uncorrected Misstatements

Misstatements, particularly if detected after the financial statements have been produced and distributed, may under certain circumstances be left uncorrected. This decision is directly impacted by judgments about materiality, an important concept discussed in Chapter 1. The financial statement preparer is expected to exercise professional judgment in determining the level of materiality to apply in order to cost-effectively prepare full, complete, and accurate financial statements in a timely manner. However, there have been instances where the materiality concept has been used to rationalize the noncorrection of errors that should have been dealt with, and indeed even to excuse errors known when first committed. The fact that the concept of materiality has sometimes been abused led to the promulgation of further guidance relative to error corrections.

Although independent auditors are charged with obtaining sufficient evidence to enable them to provide the financial statement user with reasonable assurance that management's financial statements are free of material misstatement, the financial statements are primarily the responsibility of the preparers. Certain auditing literature is therefore germane to the preparers' consideration of matters such as error corrections and application of materiality guidelines. These matters are further explored in the following paragraphs.

Types of misstatements. Preparers of financial statements obviously will need to have control procedures to reduce the risk of accounting errors being committed and not detected. From the auditors' perspective, it is required that the examination be conducted in a manner that will provide reasonable assurance of detecting material misstatements, including those resulting from errors. Auditors will evaluate both known misstatements and likely misstatements (i.e., those projected to exist based on sample data gathered during the audit), as defined in SAS 107 of the auditing literature. Known misstatements arise from

1. Incorrect selection or application of accounting principles
2. Errors in gathering, processing, summarizing, interpreting, or overlooking relevant data
3. An intent to mislead the financial statement user to influence their decisions
4. To conceal theft

Likely misstatements arise from

1. Differences in judgment between management and the auditor regarding accounting estimates where the amount presented in the financial statements is outside the range of what the auditor believes is reasonable

2. Amounts that the auditor has projected (the statistical term "extrapolated" is also used in this context) based on the results of performing statistical or nonstatistical sampling procedures on a population

Under auditing standards, auditors are responsible for accumulating all known and likely misstatements except those that, in the auditors' judgment, are trivial or inconsequential. In forming judgments regarding the triviality of misstatements, auditors consider whether the misstatement individually or when aggregated with other similar amounts would be considered immaterial to the financial statements. Despite many efforts to develop a firm definition of materiality that have been made by academicians and the profession over the decades, a universally agreed-upon definition of materiality remains elusive, and thus a matter for professional judgment (although the legal definition, of being likely to affect the conclusion reached by a decision maker, remains useful).

Auditors are expected to communicate known and likely misstatements to management in a timely manner, distinguishing between these categories. Timely communication is important in order to provide management the opportunity to evaluate whether they concur that the items are misstatements and to determine whether to adjust the financial statements or request that the auditor obtain additional evidence.

Auditors are obligated by professional standards to request that management record adjustments to correct all known misstatements, other than those deemed to be trivial. Because some of these may be based on audit sampling results, some management may either resist because there is inherent distrust of projections, or because it will not be clear how corrections can be recorded when the error items cannot be specifically identified.

Likely misstatements are treated as follows:

1. If the likely misstatement results from a projection to the population from examination of a sample, auditors will request management to examine the relevant population from which the sample was drawn. This might be a class of transactions, an account balance, or the information required to be presented in a disclosure. The purpose of the requested examination is for management to identify and correct misstatements in the remaining population, (i.e., the items [units] in the population that the auditors did not select for detailed testing). For example, the auditor may identify a misstatement caused by an error in inventory pricing relative to raw materials. Management would be requested, in this case, to reexamine the entire raw materials inventory to determine whether it includes other misstatements and to correct any other misstatements found as a result of the reexamination.
2. If the likely misstatement results from differences in estimates—such as the magnitude of the amount needed for the allowance for uncollectible accounts receivable—the auditors should request that management review the methods and assumptions used to develop their estimate.

Ultimately, management is responsible for deciding how to respond to auditors' requests and whether it wishes to correct some or all of the misstatements brought to its attention by the auditors. Both the auditors and management, in assessing the impact of uncorrected misstatements, are required to assess materiality both quantitatively and qualitatively, from the standpoint of whether a financial statement user would be misled if a misstatement were not corrected or if, in the case of informative disclosure errors, full disclosure was not made. Qualitative considerations include (but are not limited to) whether the misstatement

1. Arose from estimates or from items capable of precise measurement and, if the misstatement arose from an estimate, the degree of precision inherent in the estimation process

2. Masks a change in earnings or other trends
3. Hides a failure to meet analysts' consensus expectations for the reporting entity
4. Changes a loss to income or vice versa
5. Concerns a segment or other portion of the reporting entity's business that has been identified as playing a significant role in operations or profitability
6. Affects compliance with loan covenants or other contractual commitments
7. Increases management's compensation by affecting a performance measure used as a basis for computing it
8. Involves concealment of an unlawful transaction

Misstatements from prior years. Management, with the concurrence of the reporting entity's auditors, may have decided to not correct misstatements that occurred in one or more prior years because, in their judgment at the time, the financial statements were not materially misstated. Two methods of making that materiality assessment—sometimes referred to as the "rollover" and the "iron curtain" methods—have been widely used in practice. These are described and illustrated in the following paragraphs.

The *rollover method* quantifies a misstatement as its originating or reversing effect on the *current period's* statement of income, irrespective of the potential effect on the balance sheet of one or more prior periods' accumulated uncorrected misstatements.

The *iron curtain method,* on the other hand, quantifies a misstatement based on the *accumulated uncorrected amount* included in the current, end-of-period balance sheet, irrespective of the year (or years) in which the misstatement originated.

Each of these methods, when considered separately, has strengths and weaknesses, as follows:

Method	*Focuses on*	*Strength*	*Weakness*
Rollover	Current period income statement	Focuses on whether the income statement of the current period is materially misstated assuming that the balance sheet is not materially misstated	Material misstatement of the balance sheet can accumulate over multiple periods
Iron curtain	End of period balance sheet	Focuses on ensuring that the balance sheet is not materially misstated irrespective of the year or years in which a misstatement originated	Does not consider whether the effect of correcting a balance sheet misstatement that arose in one or more periods is material to the current period income statement

Guidance for SEC registrants. The SEC staff issued SAB 108, *Considering the Effects of Prior Year Misstatements in Current Year Financial Statements,* in order to address how registrants (i.e., publicly held corporation) are to evaluate misstatements. SAB 108 prescribes that if a misstatement is material to *either* the income statement or balance sheet, it is to be corrected in a manner set forth in the bulletin and illustrated in the example and diagram below.

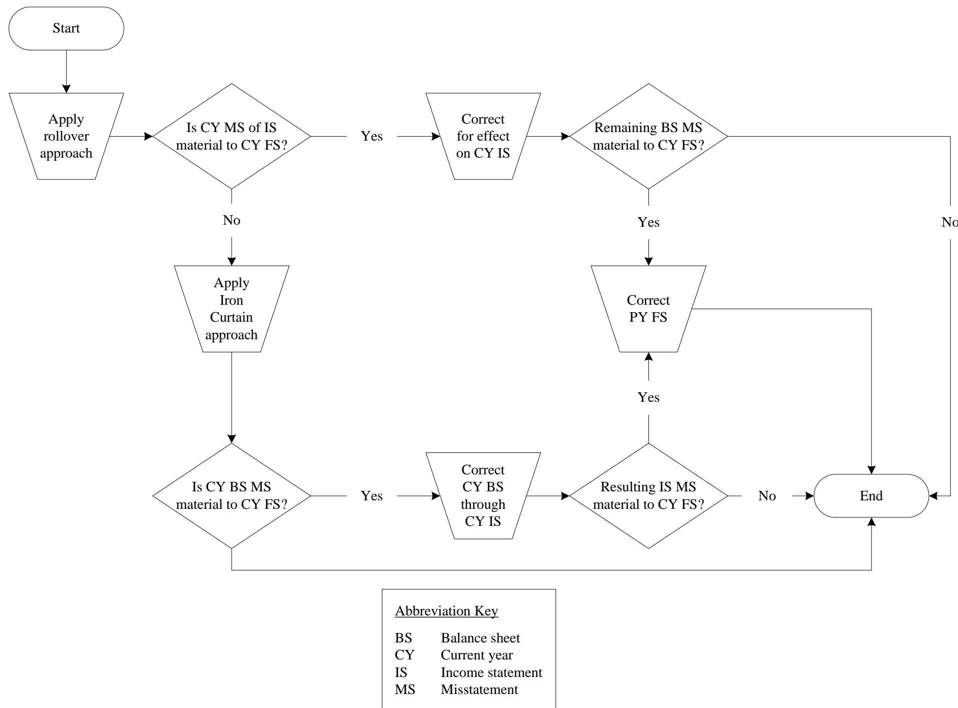
Example

Lenny Payne, the CFO of Flamingo Industries, is preparing the company's 2009 financial statements. The company has consistently overstated its accrued liabilities by following a policy of accruing the entire audit fee it will pay its independent auditors for auditing the financial statements for the reporting year, even though approximately 80% of the work is performed in, and is thus an expense of, the following year.

Due to regular increases in audit fees, the overstatement of liabilities at 12/31/2009 has accumulated as follows:

Year ended 12/31	*Amount of misstatement originating during year*	*End-of-year accumulated misstatement*
2005	$15	$15
2006	5	20
2007	5	25
2008	5	30
2009	10	40

Lenny has consistently used the rollover approach to assess materiality and, in all previous years, had judged the amount of the misstatement that originated during that year to be immaterial. The guidance in SAB 108 is illustrated in the following decision diagram:



Following the decision tree, Lenny analyzes the misstatement as follows:

1. Applying the *rollover* approach, as he had done consistently in the past, Lenny computes the misstatement as the $10 that originated in 2009. In his judgment, this amount is immaterial to the 2009 income statement.
2. Applying the *iron curtain* approach, Lenny evaluates whether the accumulated misstatement of $40 materially misstates the balance sheet at 12/31/2009. Lenny believes that, considering both quantitative and qualitative factors, the misstatement has grown to the point where it does result in a materially misstated balance sheet.

According to SAB 108 and as shown on the diagram, Lenny would record an adjustment to correct the balance sheet as follows:

	Debit	*Credit*
Accrued professional fees	40,000	
Professional fees (general and administrative expenses)		40,000

To correct balance sheet by reversing misstated accrual for audit fees not yet incurred.

Upon review of the effect of the correcting entry, Lenny believes that recording the entry will result in a material misstatement to the 2009 income statement. Consequently, to avoid this result, the prior years' financial statements of Flamingo Industries would, under normal circumstances,

be required to be restated as previously discussed in the section of this chapter covering error corrections. This would be the case even if the adjustment to the prior year financial statements was, and continues to be, immaterial to those financial statements. The SEC would not, however, require Flamingo Industries to amend previously filed reports; instead, registrants are permitted to make the correction in the next filing submitted to the SEC that includes the prior year financial statements.

In addition, the SEC provided transition relief for certain reporting entities initially adopting SAB 108. The SEC staff indicated in SAB 108 that in the following circumstances the ASC 250 requirement for prior period restatement would be waived:

1. The reporting entity's initial registration statement was effective on or before November 15, 2006, and
2. Management had, in the past, properly applied its pervious method of evaluating misstatements (either iron curtain or rollover), including consideration of all relevant qualitative factors (which the SEC set forth in SAB 99, *Materiality*)

Registrants that meet these criteria are permitted to reflect the results of initial application of SAB 108 as a cumulative effect adjustment to retained earnings as of the beginning of the fiscal year. Disclosures are required of

1. The nature and amount of each individual error correction included in the cumulative effect adjustment,
2. When and how each error arose, and
3. The fact that the errors had been previously considered to be immaterial.

The SEC encouraged early adoption of this guidance in any report for an interim period ending in the first fiscal year ending after November 15, 2006, that is filed after September 13, 2006, the publication date of SAB 108. If the cumulative effect adjustment occurs in an interim period other than the first interim period, the SEC waived the requirement that previously filed interim reports for that fiscal year be amended. Instead, comparative information presented for interim periods of the first year subsequent to initial application are to be adjusted to reflect the cumulative effect adjustment as of the beginning of the fiscal year of initial application. The adjusted results are also required to be included in the disclosures of selected quarterly information that are required by Regulation S-K, Item 302.

Entities that do not meet the criteria to use the cumulative effect adjustment are required to follow the provisions of ASC 250 that require restatement of all prior periods presented in the filing.

Guidance for private entities. FASB had proposed the issuance of a proposed FSP FAS 154-a, *Considering the Effects of Prior-Year Misstatements When Quantifying Misstatements in Current-Year Financial Statements,* in early 2007. If it had been issued as proposed, the FSP would have, in essence, adopted SAB 108 for all nongovernmental reporting entities that are not subject to SAB 108, including not-for-profit organizations. It would have, in common with SAB 108, permitted a onetime cumulative effect adjustment to retained earnings upon initial application, if management had previously evaluated misstatements for materiality using both quantitative and relevant qualitative factors using either the rollover method or the iron curtain method (but not both).

FASB subsequently decided to not issue this FSP, and removed the project from its agenda. Notwithstanding this development, readers are reminded that SABs offer useful guidance even for nonregistrants and their auditors. In the authors' opinion, these bulletins would be among the nonauthoritative literature to be considered when deliberating application of GAAP in the absence of authoritative guidance found in higher levels of the formal GAAP hierarchy (discussed in Chapter 1).

Interim Reporting Considerations

If a change in accounting principle is made in an interim period, the change is made using the same methodology for retrospective application discussed and illustrated earlier in this chapter. Management is precluded from using the impracticability exception to avoid retrospective application to prechange interim periods of the same fiscal year in which the change is made. Thus, if it is impracticable to apply the change to those prechange interim periods, the change can only be made as of the beginning of the following fiscal year. FASB believes this situation will rarely occur in practice.

ASC 270 requires that interim financial reports disclose any changes in accounting principles or the methods of applying them from those that were employed in

1. The prior fiscal year;
2. The comparable interim period of the prior fiscal year; and
3. The preceding interim periods of the current fiscal year.

The disclosures required by ASC 250 for changes in accounting principle are to be made, in full, in the financial statements of the interim period in which the change is made.

Public companies. When a public company adopts a new standard in an interim period, the ASC 270 disclosures cited above are to be supplemented, as applicable, with all disclosures required by the newly adopted standard to be included in annual financial statements. If the change is made in a period other than the first quarter, prior filings are not required to be amended; however, adjustment of each prior quarter's results is to be included in the filing for the quarter in which the new principle is being adopted. If the newly adopted standard requires retrospective application to all prior periods, the prior interim quarters are also to be presented on an adjusted basis.

In addition, a special disclosure rule applies to a public company that

1. Changes accounting principles in the fourth quarter of a fiscal year;
2. Regularly reports interim financial information; and
3. Does not separately disclose in its annual report (or in a separate report) the minimum summarized information required by ASC 270 for the fourth quarter of the fiscal year.

When all three of these conditions are present, management is required to disclose in a note to the annual financial statements the effects of the change on interim period results.

Summary of Accounting Changes and Error Corrections

Type and description of change or correction	*Treatment in financial statements, historical summaries, financial highlights, and other similar presentations of businesses and not-for-profit organizations*		
	Retrospective application to all periods presented [1]	*Affects period of change and, if applicable, future periods*	*Restatement of all prior period financial statements presented*
Accounting Changes Change in accounting principle *New principle required to be preferable*	✓		
Change in accounting estimate		✓	
Change in accounting estimate effected by a change in accounting principle *New principle required to be preferable*		✓	
Change in reporting entity[2]	✓		
Restatements[3] Correction of errors in previously issued financial statements			✓

---

[1] *ASC 250 provides an exception to the requirement for retroactive restatement when it is impracticable to make the restatement. This exception is only permitted to be used under specified conditions.*

[2] *This is generally limited to (a) presentation of consolidated or combined financial statements instead of financial statements of individual entities, (b) a change in the specific subsidiaries making up a group of entities for which consolidated financial statements are presented, and (c) changing the entities included in combined financial statements.* ***Neither a business combination under ASC 805 nor consolidation of a variable interest entity under ASC 810 is considered a change in reporting entity.***

[3] *The word "restatement" is only to be used to describe and/or present corrections of prior period errors.*

PERSPECTIVE AND ISSUES

The communities of financial statement preparers, users, auditors, standard setters, and regulators have engaged in a long-standing debate regarding the relevance, transparency, and decision-usefulness of financial statements prepared under the current US GAAP "mixed attribute" model for measuring assets and liabilities. The debate has become even more heated due to the recent economic turmoil in credit markets.

Financial statement users advance the argument that they are not being properly informed about the economic impact on the reporting entity of gains and losses associated with changes in the fair values of assets and liabilities that it owns or owes. They assert that, had they been provided this information, they might well have made different decisions regarding investing in, lending to, or entering into business transactions with the reporting entities.

Others argue that transparent reporting of fair values creates "procyclicality," whereby the reporting of fair values has the effect of directly influencing the economy and potentially causing great harm. These arguments are countered by fair value advocates, who state their belief that the extended economic malaise that afflicted Japan since the late 1980s was exacerbated by the lack of transparency in its commercial banking system, which allowed its banks to avoid recognizing losses on loans of questionable credit quality.

FASB has been on record for more than a decade regarding its long-term goal of having all financial assets and liabilities reported at fair value. That said, it has taken a very cautious, incremental approach towards attaining this goal. Its projects with respect to fair value have been conducted in multiple phases over long periods of time; they have involved a full complement of discussion memoranda, invitations to comment, preliminary views docu-

ments, public hearings, deliberations, and redeliberations. Certain modest disclosure standards were promulgated and later rescinded and replaced by other standards, but comprehensive requirements for full fair value reporting of financial instruments remained on the horizon.

There are, in the authors' opinion, many reasons for this deliberate, incremental approach to reaching the goal of full adoption of fair value measurement for financial instruments. These reasons include

1. *Project interdependencies*—Many of the projects on FASB's agenda have implications that affect fair value measurements and disclosures. Notable among them are
   a. The commitment to converge US GAAP with international standards (IFRS),
   b. The joint development of a new conceptual framework with the IASB,
   c. The development of new formats for the basic financial statements, to respond to user criticisms regarding the usefulness of the current model, and
   d. Pressure on FASB to reduce complexity of existing standards and to address calls from private company stakeholders to provide relief from the costs associated with the preparation of financial statements.
2. *Preoccupation with other important priorities*—In recent years, FASB has been dealing with a succession of complex, controversial, politically charged issues that required urgent attention due to the volatility of the business environment and financial markets, as well as a general deterioration in the legal and regulatory climate in reaction to a series of high-profile frauds and business failures. Among these issues were
   a. Share-based payments
   b. Special-purpose entities and off-balance-sheet financing
   c. Derivatives and hedging
   d. Recognition of guarantee obligations
   e. Business combinations of businesses, not-for-profit organizations, and mutual enterprises including determination of when voting ownership is not indicative of the party that controls an entity
   f. Recognition, measurement, and disclosures related to uncertain income tax positions
   g. Pensions and other postemployment benefits
   h. Leases
3. *Technical complexities encountered in resolving practice issues*—After completing the initial phase of a lengthy project to distinguish liabilities from equity, which is codified as ASC 480, *Distinguishing Liabilities from Equity*, it became necessary to indefinitely postpone the effective date of certain of its provisions as a result of unintended consequences that would have occurred if the standard had been implemented as written.[1]

---

[1] *ASC 480 contains a provision requiring reporting entities that issue mandatorily redeemable common stock to classify these instruments as liabilities in the balance sheet. Implementation of this provision adversely affected many privately held businesses whose common stock was subject to "buy-sell" agreements that obligated the reporting entity to redeem the owners' stock upon the event of their death. Application of ASC 480 would have required that 100% of these companies' equity be classified as liabilities, causing many of them to be in violation of restrictive debt covenants, or leaving them unable to obtain credit enhancements such as guarantees, letters of credit, or surety bonds.*

4. *The current political and economic environment*—Those who are seeking to assign blame for the current turmoil in credit markets have focused on several areas of GAAP that may have been contributing factors, such as
   a. Qualifying special-purpose entities (QSPEs) under ASC 860-40, and their exemption from the consolidation requirements of ASC 810, and
   b. Inconsistencies between specialized accounting rules that apply to different types of enterprises

Amidst all this controversy and all of these distractions, FASB and its international counterpart, the IASB, still firmly believe that, at a minimum, financial instruments are best measured and reported at fair value, and both standard setters are proceeding under that assumption.

ASC 820 contributes to FASB's goal by providing a unified definition of fair value, related guidance on measurement, and enhanced disclosure requirements to inform financial statement users about the fair value measurements included in the financial statements, the methods and assumptions used to estimate them, and the degree of observability of the inputs used in management's estimation process. ASC 820 does not impose any new fair value requirements (i.e., those not already identified under existing GAAP) but it does describe how to accomplish such measurements. The standard retains the exceptions that exist in current GAAP that apply when, in management's judgment, it is not practical to estimate fair value. In such instances, management is required to inform the reader in an explanatory note to the financial statements that it is unable to estimate fair value and the reasons that such an estimate cannot be made. ASC 820 amends numerous existing standards by, in many cases, simply deleting definitions of fair value contained in those standards that conflict with the ASC 820 definition.

While ASC 820 continued in the tradition of incrementally moving towards fair value accounting, ASC 825-10-25 provides a radical leap forward in encouraging voluntary adoption of fair value accounting for financial assets and liabilities within its scope. FASB took a controversial approach by allowing management of qualifying entities, subject to certain limitations, to elect to measure financial assets and liabilities at fair value in the balance sheet and recognize changes in fair value in earnings in the period in which they occur. Management is given an extraordinary amount of discretion in selecting the assets and/or liabilities for which it chooses to make this election. In general, the election is made on an individual contract basis. This conclusion resulted in strong dissents from two board members believing that, even with the additional disclosures mandated by ASC 825-10-25 (in tandem with the new disclosures required by ASC 820), this selective approach would reduce comparability between similar enterprises— and even between different years' financial statements of the electing enterprise. In addition, the flexibility permitted coupled with early adoption alternatives permitted under the standard provided loopholes that could enable management having questionable motives to financially engineer reported results to avoid recognizing losses on other-than-temporarily impaired investments in current earnings by, in effect, shifting the losses to the transition adjustment to beginning retained earnings associated with adoption of ASC 825-10-25.

In June 2007, FASB announced the formation of a Valuation Resource Group (VRG) to provide it with input with respect to issues relating to the application of ASC 820, including alternative views and practical solutions. The VRG, as presently constituted, consists of 25 members, including representatives of large audit firms, valuation experts, financial statement preparers, private equity investors, and the London-based International Valuation Standards Committee. In addition, meetings are attended by observers from the SEC, PCAOB, IASB, and AICPA. VRG meetings, the first of which was held in October 2007, are closed

to the public and minutes are not being distributed inasmuch as the group is not authorized to set standards or make authoritative decisions. The FASB staff facilitates VRG meetings and is charged with evaluating information gathered from the meetings to determine which, if any, issues raised by the VRG merit the consideration of FASB as additions to its technical agenda.

This chapter provides the reader/researcher with

1. A discussion of the current state of the mixed-attribute model
2. An explanation of the new fair value measurement model provided by ASC 820, *Fair Value Measurements*
3. An explanation of the provisions of ASC 825-10-25, *Financial Instruments: The Fair Value Option,* and the various elections it permits management to make
4. Illustrations of financial statement formats and comprehensive disclosures that integrate with the disclosures required by previously issued and still effective authoritative literature regarding financial instruments and fair value

It should be assumed that additional applications of fair value accounting will be forthcoming. Among the extensions of fair value being considered for the next phase of the project (and in connection with other FASB projects) are

1. Permitting election of the fair value option for certain *non*financial assets and *non*financial liabilities and the deposit liabilities of depository institutions which were excluded from the scope of ASC 825-10-25
2. Fundamentally changing hedge accounting from the current model to a model more consistent with ASC 825-10-25
3. Reconsideration of the model in ASC 480 for distinguishing between liabilities and equity

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
320	Investments—Debt and Equity Securities
Liabilities	
480	Distinguishing Liabilities from Equity
Broad Transactions	
805-20-30	Business Combinations—Identifiable Assets and Liabilities
815-10-50	Derivatives and Hedging—Disclosure
820	Fair Value Measurements and Disclosures
825-10-25	Financial Instruments: The Fair Value Option

DEFINITIONS OF TERMS

Active market. A market in which transactions occur with sufficient frequency and volume to provide pricing information on an ongoing basis.

Bond. A debt instrument evidencing a transaction whereby a borrower (referred to as the bond's issuer) agrees to pay a sum of money at a designated future date plus periodic interest payments at the stated rate. The contract between the issuer and the bondholder (also known as the holder or investor) is referred to as an indenture. Bonds are used by commercial enterprises; municipalities; federal, state and foreign governments; colleges and universities; hospitals; and other entities to finance a wide variety of activities or special projects.

Exit price. *For valuing asset*s, the price that a reporting entity that holds the asset would hypothetically receive by selling it on the measurement date. *For valuing liabilities*, the price that a hypothetical marketplace participant would pay to transfer the liability on the measurement date. Hypothetically, the amount that the holder of a reporting entity's debt

would receive to transfer its interest in the reporting entity's liability to another market participant on the measurement date.

Fair value. The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. Although GAAP literature has primarily focused on fair value in the context of assets and liabilities, the definition also applies to instruments classified in equity.

Financial asset. Cash, evidence of an ownership interest in an entity, or a contract that conveys to one entity a right (1) to receive cash or another financial instrument from a second entity or (2) to exchange other financial instruments on potentially favorable terms with the second entity.

Financial instrument with off-balance-sheet risk. A financial instrument has off-balance-sheet risk of accounting loss if the risk of accounting loss to the entity can exceed the amount recognized as an asset, if any, or if the ultimate obligation can exceed the amount that is recognized as a liability in the statement of financial position.

Financial liability. A contract that imposes on one entity an obligation (1) to deliver cash or another financial instrument to a second entity or (2) to exchange other financial instruments on potentially unfavorable terms with the second entity.

Firm commitment. A binding, legally enforceable agreement between unrelated parties that includes

1. All significant terms including the quantity of goods or services to be exchanged, a fixed price, and the transaction's timing. The fixed price may be denominated in the reporting entity's functional currency or in a foreign currency. It might also be stated as a specified interest rate or effective yield.
2. A disincentive for nonperformance sufficient to make performance probable.

Highest and best use. The use of an asset by market participants that would maximize its value or the value of the group of assets in which those market participants would use it. An asset is valued using one of the following approaches:

1. *In-use.* This approach is used if the maximum value would be provided to market participants by using the asset in combination with other assets *as a group*. The asset could be used as it is installed and configured at the measurement date or in a different configuration. An *in-use* fair value measurement is based on the price that would be received by the reporting entity on the measurement date in a current transaction to sell the asset along with the other assets in the group using consistent assumptions regarding the highest and best use of all of the assets in the group.
2. *In-exchange.* This approach is used if the maximum value would be provided to market participants from the asset on a standalone basis. An *in-exchange* fair value measurement is based on the price that would be received on the measurement date in a current transaction to sell the asset individually and not as part of a group of assets.

Market participants. Buyers and sellers in the principal or most advantageous market for an asset or liability who are

1. Independent of the reporting entity (i.e., other than related parties)
2. Knowledgeable to the extent that they have a reasonable understanding about the asset or liability and the transaction based on all available information, including information that is obtainable through the performance of usual and customary due diligence efforts
3. Able to buy or sell the asset or liability

4. Willing to enter into a transaction for the asset or liability (i.e., they are not under duress that would force or compel them to enter into the transaction)

Most advantageous market. From the standpoint of a reporting entity that does not have access to the principal market (see definition below) for an asset or liability, the market in which the reporting entity would sell the asset for the maximum amount or transfer the liability for the minimum amount, taking into consideration the costs of executing the transaction in the respective markets. Although transaction costs are considered in making a determination of the market that is most advantageous, such costs are not to be factored into the fair value valuation determined by reference to that market.

Net realizable value. The amount of cash anticipated to be produced in the normal course of business from an asset, net of any direct costs of the conversion into cash.

Orderly transaction. A sale or transfer by the reporting entity that holds an asset or owes a liability that

- Is not a forced liquidation or distress sale
- Assumes exposure of the asset or liability to the market for a period prior to the measurement date to facilitate marketing activities that are usual and customary for transactions involving such assets or liabilities

Principal market. From the standpoint of the reporting entity, the market that it would use to sell the asset or transfer the liability that has the highest volume of transactions and level or activity for the asset or liability. If there is a principal market for an asset or liability, fair value is required to be determined by reference to that market, even if the reporting entity could receive a more favorable price in a different market. This is the case even if the price is not directly observable and, instead, is determined using a valuation technique with assumptions (inputs) derived from market data.

CONCEPTS, RULES, AND EXAMPLES

The Mixed Attribute Model

Under longstanding US GAAP, assets, liabilities, and equity are measured and presented on a reporting entity's balance sheet by applying a disjointed, inconsistent assortment of accounting methods. This current state of affairs is sometimes referred to as the "mixed attribute model." The following table summarizes the current state of the mixed attribute model and the effects of ASC 820 and ASC 825-10-25 (if any) on specified assets and liabilities of reporting entities that are not financial institutions, investment companies, or insurance companies.

Assets			**Liabilities and Equity**		
*Key**	*Caption*	*Customary measurement attribute*	*Key**	*Caption*	*Customary measurement attribute*
A	Cash and cash equivalents	Cost, approximating fair value	E	Notes and bonds payable	Unpaid principal adjusted for accrued interest, unamortized premium or discount, unamortized debt issue costs
E	Accounts receivable (with terms not exceeding one year)	Estimated net realizable value	A,E	Accounts payable	Contractual price agreed upon by the parties; depending on the contractual terms, often will approximate fair value

Assets

*Key**	*Caption*	*Customary measurement attribute*
E	Notes, loans and accounts receivable with terms exceeding one year	Unamortized principal due less allowance for credit losses; also subject to evaluation for impairment when holder considers it probable that it will be unable to collect all amounts due in accordance with the contractual terms
N	Inventory	Lower of cost or market using FIFO, LIFO, average cost, or specific identification
N	Deposits	Cost less portion applied by the holder or for which no future benefits are expected
E	Investments in debt and marketable equity securities including those held by a not-for-profit organization	Trading and available-for-sale securities at fair value; held-to-maturity securities at amortized cost subject to evaluation for other-than-temporary impairment
E	Investments, cost method	Historical cost less dividends received by the investor in excess of the investee's net accumulated earnings since the date of acquisition by the investor, and subject to evaluation for other-than-temporary impairment
E	Investments, equity method	Historical cost adjusted to recognize the investor's share of investee income and losses, dividend distributions, and amortization of difference between investor cost and underlying net assets of the investee ("equity method goodwill"); subject to evaluation for other-than-temporary impairment

Liabilities and Equity

*Key**	*Caption*	*Customary measurement attribute*
A	Payroll taxes withheld and accrued; sales taxes payable	Amounts due to taxing authorities; due to short periods during which these amounts are outstanding, they usually approximate fair value without being discounted to their present value
N	Income tax liabilities currently payable	Amounts due to taxing authorities based on positions claimed on income tax returns filed or to be filed
N	Unrecognized income tax positions	Amounts due to taxing authorities for income tax positions claimed or to be claimed on tax returns that exceed the maximum amount that is more than 50% probable of being sustained upon audit
N	Deferred income taxes	Future taxable temporary differences multiplied by the effective tax rate expected to apply upon their future reversal
N	Accrued expenses	Expenses incurred or allocated to operations that have not yet been invoiced by the supplier or provider and are not yet currently payable
E	Warranty obligations	Estimated costs expected to be incurred over the warranty period

Assets			**Liabilities and Equity**		
*Key**	*Caption*	*Customary measurement attribute*	*Key**	*Caption*	*Customary measurement attribute*
A	Derivatives	Fair value (depending on the measurement, the derivative can be an asset in one period and a liability in another period)	N	Deferred compensation arrangements, pensions, other postemployment benefits	Subject to highly complex GAAP that, in general, accrues the cost of the benefits to be provided in the future in a manner that results in compensation cost being recognized in the periods benefiting from the services provided, including factors for the time value of money, various actuarial assumptions relevant to the measurement, and when the arrangement is funded and based on assumptions regarding future investment returns
N	Prepaid expenses	Cost less amounts consumed in operations or allocated to operations based on the passage of time	E	Guarantee liabilities	Initially recognized at fair value; reduced during the life of the guarantee as the guarantor is discharged from the obligation to stand ready to perform
N	Deferred income taxes	Future deductible temporary differences and carryforwards multiplied by the effective tax rate expected to apply upon their future reversal and less a valuation allowance for the portion, if any, that is not more than 50% probable of being realized.	N	Asset retirement obligations	Initially recognized as the expected present value of the future cost associated with a legal obligation to retire an asset or group of assets; generally increased in subsequent periods for accretion of interest on the obligation
N	Property and equipment held and used	Cost less accumulated depreciation subject to evaluation for impairment upon the occurrence of certain events and circumstances	N	Contingencies	If probable that a liability has been incurred and amount is reasonably estimable, the estimated settlement amount
N	Property and equipment held for sale	Fair value less cost to sell			
N	Cash surrender value of life insurance	Amount realizable under the contract at the balance sheet date net of outstanding policy loans			

Assets			**Liabilities and Equity**		
<u>*Key**</u>	<u>*Caption*</u>	*Customary* <u>*measurement attribute*</u>	<u>*Key**</u>	<u>*Caption*</u>	*Customary* <u>*measurement attribute*</u>
N	Goodwill	Arises in business combinations: ASC 805: The excess of the purchase price over the fair values of identifiable tangible and intangible net assets acquired; subject to annual impairment tests; ASC 805: The excess of the consideration transferred plus the fair value of any noncontrolling interest in the acquiree at the acquisition date over the fair values of the identifiable net assets acquired; In both cases, goodwill is subject to annual impairment testing			
N	Other intangible assets	Fair value at initial recognition; subject to considerations as to whether the intangible is amortizable and whether impaired; Under ASC 805 this category includes in-process research and development assets acquired in a business combination			

**ABBREVIATION KEY:*

E—Generally eligible for fair value election under ASC 825-10-25
A—Already stated at fair value or an amount that approximates fair value
N—Not eligible for fair value election or to be measured at fair value on a recurring basis

Further complicating this state of affairs is the current state of specialized industry accounting rules. A commercial bank holding a debt instrument is subject to ASC 320, *Investments—Debt and Equity Securities*, and thus would consider whether the debt instrument is held for trading purposes, is available for sale, or is expected to be held to maturity. Depending on how the instrument is classified, the bank would report the security at either fair value or at amortized cost. Furthermore, if the instrument is classified as available-for-sale or held-to-maturity, changes in fair value will not be recognized in the income statement while the bank holds the instrument, unless it becomes impaired and that impairment is considered "other-than-temporary."

An investment banking enterprise, however, that holds the same security would measure the security at fair value and recognize all changes in fair value, whether increases or decreases, in net income in the period they occur.

Objectives

Since the late 1980s, FASB has been pursuing a stated goal that would require all financial instruments and many other assets and liabilities to be stated at each balance sheet date at fair value with changes from period to period recognized as gains or losses in the statement of income. The pursuit of this goal has resulted in a succession of standards that have increased the number of fair value measurements required by GAAP and, to provide more transparency to users, increased the scope and complexity of the related disclosures required.

In the ASC Master Glossary, the term "fair value" was coined to replace the previously used term "market value" (for which the term "fair market value" was sometimes used interchangeably) in authoritative accounting literature. This change was made to emphasize the fact that, even in the absence of active primary markets for an asset or liability, the asset or liability can be valued by reference to prices and rates from secondary markets as well. Over time, this concept has been expanded further to include the application of various fair value estimation models, such as the discounted probability-weighted expected cash flow model first introduced in CON 7.

As these broader fair value concepts were evolving in the literature and in practice, the preexisting "market-based" literature had not been revised. Further, the concepts and definitions of fair value were not consistently understood or applied in similar situations by similar reporting entities.

ASC 820 was issued in order to

- Establish a single, consistent GAAP definition of fair value
- Provide uniform, consistent guidance on how to measure fair value including the establishment of a hierarchical fair value measurement framework that classifies measurement inputs based on their level of market observability
- Expand the information required to be provided to financial statement users about fair value measurements

In ASC 820, FASB asserts that it is not mandating new fair value measurements, but rather is only providing "clarification" regarding the application of these measurements in the existing literature.

Definition. Fair value is defined in ASC 820 as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. ASC 820 elaborates that an "orderly transaction" is a hypothetical transaction assumed to take place on the measurement date with the item being valued having been exposed to the market for the usual and customary period of time for transactions involving such assets or liabilities in order to provide sufficient time for marketing activities. Further, an orderly transaction is not a sale where the seller is under duress (e.g., a forced liquidation or distress sale).

Fair value measurements are to be considered from the perspective of a market participant that holds the asset or owes the liability. Thus, the objective of measuring fair value is to determine an exit price: the price that would be received to sell an asset or the price that would be paid to transfer the liability. This concept will be explained and illustrated later in this chapter.

Scope. In pursuing an incremental approach, ASC 820 contained scope exceptions for certain, highly-complex specialized applications.

1. Share-based payments (ASC 718 and ASC 505-50)
2. Measurement models that are based on vendor-specific objective evidence (VSOE) such as
    a. Multiple-deliverable arrangements
    b. Software revenue recognition
    c. Software stored on another entity's hardware

3. Market value[2] of inventory for the purposes of applying the lower of cost or market model to measure inventory realizability.

ASC 820-10-15 includes a scope exception excluding from its provisions the fair value measurements for purposes of lease classification or measurement. The scope exception does not apply to lease assets acquired and lease liabilities assumed in a business combination that are required to be measured at fair value under ASC 805-20-30.

In addition to the scope exceptions listed above, ASC 820 retains the exceptions included in GAAP that tacitly acknowledge that it is sometimes not practical to estimate fair value without "undue cost or effort." When this is the case, however, management is required to inform the users of the financial statements that it has invoked this exception, as well as the reasons that it believes making fair value measurements would be impractical. This exception applies to certain measurements made in connection with the following matters:

GAAP measurement category	*Primary GAAP (as amended and/or interpreted)*
Advertising barter transactions	ASC 605-20-25
Asset retirement obligations	ASC 410-20
Business combinations	ASC 805
Contributions made and received	ASC 958-605 and 720-25
Exit and disposal activities	ASC 420
Financial instrument disclosures	ASC 825-10-50
Guarantees	ASC 460
Nonmonetary transactions	ASC 845
Not-for-profit organizations	ASC 958
Pensions	ASC 715
Postemployment benefits other than pensions	ASC 715-60
Transfers of financial assets	ASC 860

Measurement Principles and Methodologies

It is helpful to break down the measurement process under ASC 820 into a series of steps. Although not necessarily performed in a linear manner, the following procedures and decisions need to be applied and made, in order to value an asset or liability at fair value under ASC 820. Each of the steps will be discussed in greater detail.

1. *Identify the item to be valued and the unit of account.* Specifically identify the asset or liability, including the unit of account to be used for the measurement.
2. *Determine the principal or most advantageous market and the relevant market participants.* From the reporting entity's perspective, determine the principal market in which it would sell the asset or transfer the liability. In the absence of a principal market, consider the most advantageous market for the asset or the liability. Once the principal or most advantageous market is identified, determine the characteristics of the market participants. It is not necessary that specifically named individuals or enterprises be identified for this purpose.
3. S*elect the valuation premise to be used for asset measurements.* If the item being measured is an asset, determine the valuation premise to be used by evaluating

---

[2] *The term "market" in the context of inventories has a very specialized definition quite different from its use in the fair value literature. When considering whether inventories have been stated at the lower of cost or market, market is generally considered to be replacement cost; however, for the purpose of this computation, market is not permitted to exceed a defined ceiling (net realizable value) or be less than a defined floor (net realizable value less a normal markup). Inventories are discussed in detail in Chapter 9.*

whether marketplace participants would judge the highest and best use of the asset utilizing an "in-use" valuation premise or an "in-exchange" valuation premise.

4. *Consider the risk assumptions applicable to liability measurements*. If the item being measured is a liability, identify the key assumptions that market participants would make regarding nonperformance risk including, but not limited to, the reporting entity's own credit risk (credit standing).[3]
5. *Identify available inputs.* Identify the key assumptions that market participants would use in pricing the asset or liability, including assumptions about risk. In identifying these assumptions, referred to as "inputs" by ASC 820, maximize the inputs that are observable (i.e., that are based on market data available from sources independent of the reporting entity). In so doing, assess the availability of relevant, reliable market data for each input that significantly affects the valuation, and identify the level of the new fair value input hierarchy in which it is to be categorized.
6. *Select the appropriate valuation technique(s)*. Based on the nature of the asset or liability being valued, and the types and reliability of inputs available, determine the appropriate valuation technique or combination of techniques to use in valuing the asset or liability. The three broad categories of techniques are the market approach, the income approach, and the cost approach.
7. *Make the measurement*. Measure the asset or liability.
8. *Determine amounts to be recognized and information to be disclosed*. Determine the amounts and information to be recorded, classified, and disclosed in interim and annual financial statements

Item identification and unit of account. In general, the same unit of account at which the asset or liability is aggregated or disaggregated by applying other applicable GAAP pronouncements is to be used for fair value measurement purposes. ASC 820 prohibits adjustment to the valuation for a "blockage factor." A blockage factor is an adjustment made to a valuation that takes into account the fact that the investor holds a large quantity (block) of shares relative to the market trading volume in those shares. The prohibition applies even if the quantity held by the reporting entity exceeds the market's normal trading volume—and that, if the reporting entity were, hypothetically, to place an order to sell its entire position in a single transaction, that transaction could affect the quoted price.

Principal or most advantageous market and market participants. ASC 820 requires the person performing the valuation to maximize the use of assumptions (inputs) that are observable from market data obtained from sources independent of the reporting entity. In making a fair value measurement, management is to assume that the asset or liability is exchanged in a hypothetical, orderly transaction between market participants at the measurement date. To characterize the exchange as orderly, it is assumed that the asset or liability will have been exposed to the market for a sufficient period of time prior to the measurement date to enable marketing activities to occur that are usual and customary with respect to transactions involving such assets or liabilities. It is also to be assumed that the transaction is not a forced transaction (e.g., a forced liquidation or distress sale).

FASB had tentatively concluded that fair value should be measured by reference to the most advantageous market for the asset or liability being measured. Two concerns were raised by FASB constituents regarding this tentative conclusion:

---

[3] *FSP FIN 157-3, **Determining the Fair Value of a Financial Asset When the Market for That Asset Is Not Active**, issued October 2008, offers certain guidance on applying ASC 820-10 in situations where the objective market values may not be readily obtainable.*

1. The US Securities and Exchange Commission (SEC), in ASR 118,[4] requires registered investment companies to obtain quoted market prices from "the exchange on which the security is principally traded" which might not always be the most advantageous market.
2. If ASC 820 required management to use the most advantageous market to measure fair value, it would mean that management would be required to continuously evaluate prices for multiple assets and liabilities across all possible markets with observable prices to determine which market yielded the best price. While technology can enable such a process, FASB acknowledged that it would not be cost effective to do so.

Given these concerns and FASB's belief that the principal market will generally also be the most advantageous market for the item being measured, ASC 820, as issued, specifies that if there is a principle market for an asset or liability (determined under ASR 118 or otherwise), the measure of fair value is to be the price in that market (whether directly observable or determined indirectly using a valuation technique), even if the price in a different market is potentially more advantageous at the measurement date.

Management is to identify the *principal market* for the asset or liability, if such a market exists. If the entity has access to more than one market, the principal market is the market in which the reporting entity would sell the asset or transfer the liability that has the greatest volume and activity level for the asset or liability. The greater volume of activity ensures that the measurement is based on multiple transactions potentially between multiple counterparties, and is thus more representative of fair value than if the measurement were based on less extensive data.

Note that the determination of the principal market is made from the perspective of the reporting entity. Thus, different reporting entities engaging in different specialized industries, or with access to different markets, might not have the same principal market for an identical asset or liability. Inputs from the principal market are to be used irrespective of whether the price is directly observable or determined through the use of a valuation technique.

If there is no principal market for an asset or liability from the perspective of the reporting entity, then management is to use the most advantageous market for the measurement. The most advantageous market is the market that the reporting entity has the ability to access at the measurement date, in which it would maximize the price it receives from the sale of an asset or would minimize the price it pays to transfer a liability. In determining the most advantageous market, management considers transaction costs. However, once the most advantageous market had been identified, transaction costs are not used to adjust the market price used for the purposes of the fair value measurement.

ASC 820 provides a typology of markets that potentially exist for assets or liabilities.

1. *Active exchange market*. A market in which closing prices are readily available and that generally represent fair value (e.g., NYSE Euronext, Toronto Stock Exchange, London Stock Exchange, Hong Kong Stock Exchange).
2. *Dealer market*. A market in which parties (dealers referred to as market makers) stand ready to buy or sell a particular investment for their own account at bid and ask prices that they quote. The bid price is the price the dealer is willing to pay to purchase the investment and the ask price is the price at which the dealer is willing to sell the investment. In these markets, these bid and ask prices are typically more readily available than closing prices characteristic of active exchange markets. By

[4] *Codified by topic in SEC Financial Reporting Releases (FRR) paragraph 404.03 et seq.*

using their own capital to finance and hold an inventory of the items for which they "make a market," these dealers provide the market with liquidity. Examples of dealer markets in the US are "over-the-counter" markets that publicly report prices through the National Association of Securities Dealers Automated Quotations Systems (NASDAQ) or Pink Sheets LLC, and the market for US Treasury securities. Dealer markets also exist for various financial and nonfinancial assets and liabilities, including commodities and used equipment.

3. *Brokered market.* These markets use "brokers" or intermediaries to match buyers with sellers. Brokers do not trade for their own account and do not hold an inventory in the security. The broker knows the bid and asked prices of the potential counterparties to the transaction but the counterparties are unaware of each other's price requirements. Prices of consummated transactions are sometimes available privately or as a matter of public record. Brokered markets include electronic communication networks that match buy and sell orders, as well as commercial and residential real estate markets. In some cases, each of the counterparties is aware of the other's identity, while in other cases, their identities are not disclosed by the broker.
4. *Principal-to-principal market.* A market in which the counterparties negotiate directly and independently without an intermediary. Because no intermediary or exchange is involved, little if any information about these transactions is released to the public.

Market participants in the principal or most advantageous market are buyers and sellers that

1. Are unrelated third parties
2. Have the ability to enter into a transaction for the asset or liability
3. Have the motivation to voluntarily enter into a transaction for the asset or liability without being forced to do so under duress
4. Are knowledgeable about the asset or liability since they would posses a reasonable understanding of the asset or liability and the terms of the transaction based on all available information including information obtainable through the performance of usual and customary due diligence procedures

The person determining the measurement is not required to identify specific individuals or enterprises that would potentially be market participants. Instead, it is important to identify the distinguishing characteristics of participants in the particular market by considering factors specific to the asset or liability being measured, the market identified, and the participants in that market with whom the reporting entity would enter into a transaction for the asset or liability.

Measurement considerations when markets become illiquid or less liquid. At the time many entities were in the process of adopting ASC 820, those same entities were experiencing the effects of a tumultuous credit market in the US and abroad. The previously active markets for certain types of securities became illiquid or less liquid. Questions arose regarding whether transactions occurring in less liquid markets with less frequent trades might cause those market transactions to be considered forced or distress sales, thus rendering valuations made using those prices not indicative of the actual fair value of the securities. In order to respond to these concerns, the Center for Audit Quality (CAQ), a nonprofit group based in Washington, D.C., closely affiliated with the AICPA, issued a white paper on October 3, 2007, entitled, "Measurements of Fair Value in Illiquid (or Less Liquid) Markets."[5]

---

[5] *http://www.aicpa.org/caq/download/WP Measurements of FV in Illiquid Markets.pdf*

The white paper indicates that an imbalance between supply and demand can occur when there are more sellers than buyers for a particular instrument and that imbalance can result in "forcing prices down." Transactions in markets affected by this situation where there is a lack of equilibrium between buyers and sellers are not considered to be forced or distressed transactions as contemplated by ASC 820. The white paper cites a 2004 SEC Accounting and Auditing Enforcement Release[6] in which the Commission imposed a cease-and-desist order on a registrant because the registrant departed from using established market-based valuation methods when it believed that supply and demand were not "in reasonable balance."

One of the practices covered by the cease-and-desist order involved the valuation of bonds, primarily in the telecommunications industry, that were contained in a high-yield bond portfolio near the end of 2000 when the telecommunications industry was experiencing significant turmoil (liquidations, reorganizations, and bankruptcy filings resulting from factors such as overexpansion of capacity in anticipation of business growth that never materialized). The registrant, a financial services firm, believed that market conditions rendered third-party price quotations unreliable and, rather than use such quotations in its fair value measurements, decided to take a "longer view of the market" and use management's own subjective opinion regarding the value of the bonds.

According to the SEC, the registrant in effect, "valued its positions at the price at which it *thought* a willing buyer and seller *should* enter into an exchange, rather than at the price at which a willing buyer and a willing seller *would* enter into a current exchange." (Emphasis added.) The situation cited in the release was exacerbated by the fact that the registrant had valued some of the same high-yield bonds held in the portfolios of its own mutual funds using a lower valuation.

Under ASC 820, orderly transactions are occurring in the marketplace for an asset or liability when knowledgeable buyers and sellers independent of the reporting entity are willing and able to transact, and are motivated to transact without being forced to do so. If orderly transactions are occurring in a manner that is usual and customary for the asset or liability, then the transactions are not to be characterized as forced or distress sales. Just because transaction volume in a market drops significantly from prior periods does not necessarily mean that the market is no longer active. The white paper asserts that persuasive evidence would be required to establish that an observable transaction is a forced or distressed transaction and, furthermore, it is inappropriate to assume that all transactions in a relatively illiquid market are forced or distressed transactions.

Selection of the valuation premise for asset measurements. The measurement of the fair value of an asset is to assume the highest and best use of that asset by market participants. Generally, the highest and best use is the way that market participants would be expected to deploy the asset (or a group of assets within which they would use the asset) that would maximize the value of the asset (or group). This highest and best use assumption might differ from the way that the reporting entity is currently using the asset or group of assets or its future plans for using it (them).

At the measurement date, the highest and best use must be physically possible, legally permissible, and financially feasible. Determination of the highest and best use of the asset will establish which of the two valuation premises to use in measuring the asset's fair value, the in-use valuation premise, or the in-exchange valuation premise.

---

Strategic buyers and financial buyers. ASC 820 differentiates between two broad categories of market participants that would potentially buy an asset or group of assets.

1. *Strategic buyers* are market participants whose acquisition objectives are to use the asset or group of assets (the "target") to enhance the performance of their existing business by achieving benefits such as additional capacity, improved technology, managerial, marketing, or technical expertise, access to new markets, improved market share, or enhanced market positioning. Thus, a strategic buyer views the purchase as a component of a broader business plan and, as a result, a strategic buyer may be willing to pay a premium to consummate the acquisition and may, in fact, be the only type of buyer available with an interest in acquiring the target. Ideally, from the standpoint of the seller, more than one strategic buyer would be interested in the acquisition which would create a bidding situation that further increases the selling price.
2. *Financial buyers* are market participants who seek to acquire the target based on its merits as a standalone investment. A financial buyer is interested in a return on its investment over a shorter time horizon, often three to five years, after which time their objective would typically be to sell the target. An attractive target is one that offers high growth potential in a short period of time resulting in a selling price substantially higher than the original acquisition price. Therefore, even at acquisition, a financial buyer is concerned with a viable exit strategy. A financial buyer, unlike a strategic buyer, typically does not possess a high level of industry or managerial expertise in the target's industry. Transactions involving financial buyers are often highly leveraged when the economic environment is such that the cost of debt is lower than the cost of equity.

The in-use valuation premise. This premise assumes that the maximum fair value to market participants is the price that would be received by the reporting entity (seller) assuming the asset would be used by the buyer with other assets as a group and further, that the other assets in the group would be available to potential buyers. The target might continue to be used as presently installed or may be configured in a different manner by the buyer. The assumptions regarding the level of aggregation (or disaggregation) of the asset and other associated assets may be different than the level used in applying other accounting pronouncements. Thus, in considering highest and best use and the resulting level of aggregation, the evaluator is not constrained by how the asset may be assigned by the reporting entity to a reportable or operating segment under ASC 280, a business, reporting unit, or asset or disposal group under The ASC Master Glossary. The assumptions regarding the highest and best use of the target should normally be consistent for all of the assets included in the group within which it would be used. Generally, the market participants whose highest and best use of an asset or group of assets would be "in-use" are characterized as strategic buyers, as previously described.

The in-exchange valuation premise. This premise assumes that the maximum fair value to market participants is the price that would be received by the reporting entity (seller) assuming the asset would be sold principally on a stand-alone basis. Generally, the market participants whose highest and best use of an asset or group of assets would be "in-use" are characterized as strategic buyers, as previously described.

Risk assumptions when valuing a liability. Many accountants, analysts, and others find the concept of computing fair value of liabilities and recognizing changes in fair value as they occur to be counterintuitive. Consider the case when a reporting entity's own credit standing declines (a "bad thing"). A fair value measurement that incorporates the effect of this decline in credit rating would result in a decline in the fair value of the liability and a

resultant increase in stockholders' equity (a "good thing"). The justification provided in ASC 820 (and by quoting from CON 7) is that

> *A change in credit standing represents a change in the relative positions of the two classes of claimants (shareholders and creditors) to an entity's assets. If the credit standing diminishes, the fair value of creditors' claims diminishes. The amount of shareholders' residual claims to the entity's assets may appear to increase but that increase is probably offset by losses that may have occasioned the decline in credit standing. Because shareholders usually cannot be called on to pay a corporation's liabilities, the amount of their residual claims approaches, and is limited by zero. Thus a change in the position of borrowers necessarily alters the position of shareholders, and vice versa.*

As ASC 820 was originally drafted and issued, fair value measurements of liabilities assume that a hypothetical transfer to a market participant occurs on the measurement date. In measuring the fair value of a liability, the evaluator is to assume that the reporting entity's obligation to its creditor (i.e., the counterparty to the obligation) will continue at and after the measurement date (i.e., the obligation will not be repaid or settled prior to its contractual maturity). This being the case, this hypothetical transfer price would most likely represent the price that the current creditor (holder of the debt instrument) could obtain from a marketplace participant willing to purchase the debt instrument in a transaction involving the original creditor assigning its rights to the purchaser. In effect, the hypothetical market participant that purchased the instrument would be in the same position as the current creditor with respect to expected future cash flows (or expected future performance, if the liability is not settleable in cash) from the reporting entity.

The evaluator is to further assume that the nonperformance risk related to the obligation would be the same before and after the hypothetical transfer occurs. Nonperformance risk is the risk that the obligation will not be fulfilled. It is an all-encompassing concept that includes the reporting entity's own credit standing but also includes other risks associated with the nonfulfillment of the obligation. For example, a liability to deliver goods and/or perform services may bear nonperformance risk associated with the ability of the debtor to fulfill the obligation in accordance with the timing and specifications of the contract. Further, nonperformance risk increases or decreases as a result of changes in the fair value of credit enhancements associated with the liability (e.g., collateral, credit insurance, and/or guarantees).

Reporting entities have reported to the FASB staff that they have experienced various operational difficulties in applying ASC 820 to fair value measurements of liabilities. Many businesses do not issue bonds in public debt markets and are not privy to the amounts that would be realized by their creditors for transferring or securitizing their debt to other market participants. FASB constituents also have asserted that the price that one investor pays another investor to purchase a debt instrument held as an asset would not be indicative of an exit price that the debtor would be required to pay to induce another party to assume the debt in a hypothetical exit transaction.

To respond to these concerns, the FASB staff issued Proposed FSP FAS 157-c, *Measuring Liabilities under FASB Statement No. 157,* on January 18, 2008. The one-month comment period ended on February 18, 2008, and FASB was still redeliberating the proposed FSP as this publication went to press. Based on the results of the redeliberations to date, the following tentative conclusions were reached:

1. The best measurement of fair value for an entity's liability is the price at which that liability is traded as an asset. Thus, a quoted, unadjusted price for the identical liability (and the identical unit of account) in an active market is the best evidence of fair value for that liability; this measurement would be equally valid for both the obligor of the liability and the asset holder.

2. In the absence of a quoted price for the identical liability in an active market, management of the reporting entity may measure the fair value of a liability at the price it would receive if it were to issue that liability at the measurement date.

NOTE: It is important for the reader to note that this valuation concept is not the same as the concept of the incremental borrowing rate used in accounting for leases. The incremental borrowing rate assumes that the borrower is incurring debt in addition to its existing debt. The valuation concept that would be used in the proposed FSP assumes that the borrower either did not owe the liability being measured as of the measurement date or refinanced it with the same repayment terms and remaining number of payments.

Example of measuring a liability absent a quoted market price (based on proposed FSP)

Gomberg Development Inc. (GDI) owed a commercial bank $2,679,824 at 12/31/2009 (the measurement date). When the loan was originated on 12/31/2006, it bore a fixed rate of 9.25% which, at the time, represented the lender's prime rate plus two percent. The original principal amount was $3,000,000 and the loan was to be repaid over a 15-year term with monthly payments of $30,876 of principal and interest.

In order to disclose the fair value of its financial instruments in accordance with ASC 825 (GDI does not qualify for the exemption from this disclosure because it is counterparty to derivative financial instruments), it needs to measure the fair value of this debt.

As is usually the case in private lending transactions, there is no available market information at 12/31/09, the measurement date, regarding the amount that GDI would be required to pay an unrelated counterparty with similar credit standing to assume its debt.

Alternatively, GDI's management contacts local lending institutions and inquires about the availability of terms to refinance its existing debt based on current interest rates and its current credit standing. GDI's management determines (and contemporaneously documents) that based on an improvement in its credit standing, it could obtain $2.7 million of replacement financing at 6% on the measurement date, which represents the lender's prime rate of 5% plus an additional 1%.

Management calculates the fair value of the loan at 12/31/2009 by solving for the present value of 144 remaining payments of $30,876, discounted at 6%, which yields $3,164,010. The logic behind this result from the standpoint of GDI is that due to a favorable change in interest rates and in its own credit standing, the fair value of its debt has increased. It would be more attractive for a counterparty to purchase the existing debt from the originating lender since the yield on the loan exceeds yields based on 12/31/2009 interest rates for investments with similar risk characteristics.

The FASB Staff proposed that the FSP be applied prospectively effective on the later of (1) the beginning of the first reporting period ending after the issuance date of the FSP or (2) the beginning of the period in which an entity initially applies ASC 820. Earlier application would not be permitted. The effect of initial application would be included as a change in fair value in the period of adoption. The authors recommend that readers/researchers monitor the status of this project on the FASB Web site (www.fasb.org) as it progresses to ensure that any effect a final FSP might have on the application of fair value measurement principles to liabilities is fully considered in applying the guidance we provide in this and other affected chapters.

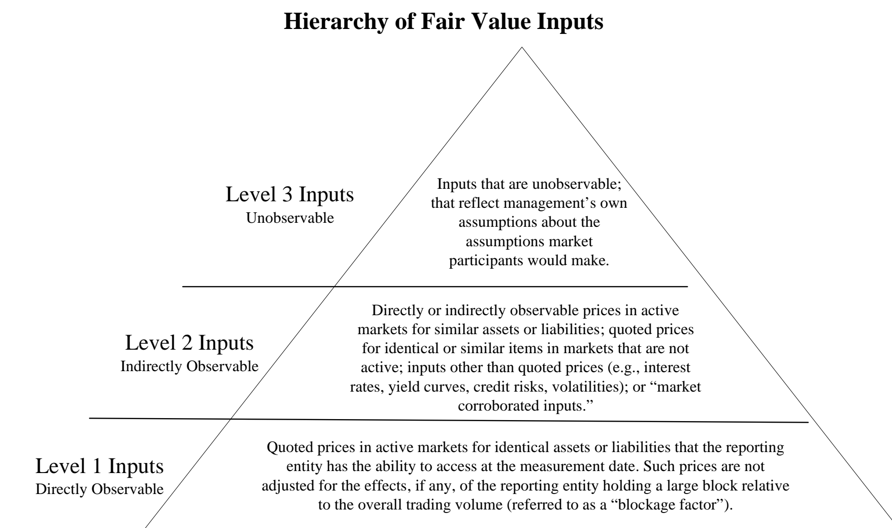
Inputs. For the purpose of fair value measurements, inputs are the assumptions that market participants would use in pricing an asset or liability, including assumptions regarding risk. An input is either observable or unobservable. Observable inputs are either directly observable or indirectly observable. ASC 820 requires the evaluator to maximize the use of observable inputs and minimize the use of unobservable inputs.

An observable input is based on market data obtainable from sources independent of the reporting entity. An unobservable input reflects assumptions made by management of the

reporting entity with respect to assumptions it believes market participants would use to price an asset or liability based on the best information available under the circumstances.

ASC 820 provides a fair value input hierarchy (see diagram below) to serve as a framework for classifying inputs based on the extent to which they are based on observable data.

Hierarchy of Fair Value Inputs



Level 1 inputs. Level 1 inputs are considered the most reliable evidence of fair value and are to be used whenever they are available. These inputs consist of quoted prices in active markets for identical assets or liabilities. The active market must be one in which the reporting entity has the ability to access the quoted price at the measurement date. To be considered an active market, transactions for the asset or liability being measured must occur frequently enough and in sufficient volume to provide pricing information on an ongoing basis.

If a market price at the exact measurement date is not readily available, or is available but not representative of fair value because the market is not active or because events occurring after the last available quoted price would have affected fair value at the measurement date[7], the quoted price is to be adjusted to more accurately reflect fair value. As discussed previously, in order for a market to be considered active, it must have a sufficient volume of transactions to provide quoted market prices that are the most reliable measure of fair value. Markets experiencing reduced transaction volumes are still considered active if transactions are occurring frequently enough on an ongoing basis to provide reliable pricing information. ASC 820 requires that quoted prices from active markets (Level 1 inputs) be used whenever they are available. The use of Level 2 or Level 3 inputs is generally prohibited when Level 1 inputs are available.

Even if management were to conclude that a reduction in transaction volume in a particular market rendered that market inactive (i.e., the market is unable to provide reliable pricing information) the observable transactions that were occurring in that market would

[7] *Examples of such events that could occur after the close of a market but prior to the measurement date would include principal-to-principal transactions or brokered trades about which the evaluator has access to reliable information, or announcements made in press conferences, shareholders meetings, or in regulatory filings.*

still be considered Level 2 inputs which need to be taken into account by management in its measurements of fair value. Management is required to establish and consistently apply a policy for identifying events that potentially affect its fair value measurements.

If the reporting entity holds a large number of similar assets and liabilities (such as a pool of debt securities), and quoted prices are not accessible with respect to each individual asset and/or liability in a cost-effective manner to enable timely financial reporting, management may choose to substitute, as a practical expedient, an alternative pricing model that does not rely exclusively on quoted prices such as using a matrix pricing model for debt securities. The use of a pricing model as an alternative to directly pricing each asset or liability in the group will require management to characterize the measurement in its entirety as a level lower than Level 1 in the hierarchy.

Under no circumstances, however, is management to adjust the quoted price for blockage factors. Blockage adjustments arise when an entity holds a position in a single financial instrument that is traded on an active market that is relatively large in relation to the market's daily trading volume. While there is no common agreement as to how large a position would constitute a "block" of a particular instrument, FASB unconditionally prohibits any adjustment as a result of blockage, even if the market's normal daily trading volume is insufficient to absorb the quantity held by the reporting entity and irrespective of whether the placing of an order to sell the position in a single transaction might affect the quoted price.

Level 2 inputs. Level 2 inputs are quoted prices for the asset or liability (other than those included in Level 1) that are either directly or indirectly observable. Level 2 inputs are to be considered when quoted prices for the identical asset or liability are not available. If the asset or liability being measured has a contractual term, a Level 2 input must be observable for substantially the entire term. These inputs include

1. Quoted prices for *similar* assets or liabilities in active markets
2. Quoted prices for identical or similar assets or liabilities in markets that are *not active*. As discussed in the previous section, these markets may not be considered active because
   a. They have an insufficient volume or frequency of transactions for the asset or liability
   b. Prices are not current
   c. Quotations vary substantially over time
   d. Quotations vary substantially among market makers (e.g., in some brokered markets)
   e. Insufficient information is released publicly (e.g., a principal-to-principal market)
3. Inputs other than quoted prices that are observable for the asset or liability (e.g., interest rates and yield curves observable at commonly quoted intervals; volatilities; prepayment speeds; loss severities; credit risks; and default rates)
4. Inputs that are derived principally from or corroborated by observable market data that, through correlation or other means, are determined to be relevant to the asset or liability being measured (market-corroborated inputs)

Adjustments made to Level 2 inputs necessary to reflect fair value, if any, will vary depending on an analysis of specific factors associated with the asset or liability being measured. These factors include

1. Condition
2. Location

3. Extent to which the inputs relate to items comparable to the asset or liability
4. Volume and level of activity in the markets in which the inputs are observed

Depending on the level of the fair value input hierarchy in which the inputs used to measure the adjustment are classified, an adjustment that is significant to the fair value measurement in its entirety could render the measurement a Level 3 measurement.

During the turmoil experienced in credit markets beginning in early 2008, a holder of collateralized mortgage obligations (CMOs) backed by a pool of subprime mortgages might determine that no active market exists for the CMOs. Management might use an appropriate ABX credit default swap index for subprime mortgage bonds[8] to provide a Level 2 fair value measurement input in measuring the fair value of the CMOs.

Level 3 inputs. Level 3 inputs are unobservable inputs. These are necessary when little, if any, market activity occurs for the asset or liability. Level 3 inputs are to reflect management's own assumptions about the assumptions regarding an exit price that a market participant holding the asset or owing the liability would make including assumptions about risk. The best information available in the circumstances is to be used to develop the Level 3 inputs. This information might include internal data of the reporting entity. Cost-benefit considerations apply in that management is not required to "undertake all possible efforts" to obtain information about the assumptions that would be made by market participants. Attention is to be paid, however, to information available to management without undue cost and effort and, consequently, management's internal assumptions used to develop unobservable inputs are to be adjusted if such information contradicts those assumptions.

Inputs based on bid and ask prices. Quoted bid prices represent the maximum price at which market participants are willing to buy an asset; quoted ask prices represent the minimum price at which market participants are willing to sell an asset. If available market prices are expressed in terms of bid and ask prices, management is to use the price within the bid-ask spread (the range of values between bid and ask prices) that is most representative of fair value irrespective of where in the fair value hierarchy the input would be classified. ASC 820 permits the use of pricing conventions such as midmarket pricing as a practical alternative for determining fair value measurements within a bid-ask spread.

Classifying inputs. Classification of inputs as to the level of the hierarchy in which they fall serves two purposes. First, it provides the evaluator with a means of prioritizing assumptions used as to their level of objectivity and verifiability in the marketplace. Second, as discussed later in this chapter, the hierarchy provides a framework to provide informative disclosures that enable readers to assess the reliability and market observability of the fair value estimates embedded in the financial statements.

In making a particular measurement of fair value, the inputs used may be classifiable in more than one of the levels of the hierarchy. When this is the case, the inputs used in the fair value measurement in its entirety are to be classified in the level of the hierarchy in which the lowest level input that is significant to the measurement is classified.

It is important to assess available inputs and their relative classification in the hierarchy prior to selecting the valuation technique or techniques to be applied to measure fair value for a particular asset or liability. The objective, in selecting from among alternative calculation techniques, would be to select the technique or combination of techniques that maximizes the use of observable inputs. FASB clarifies, however, that the intended use of the

---

[8] *ABX indices are disseminated by Markit Group Limited, a London-based consortium of 16 large banks and four hedge funds that provides credit derivative pricing data, valuations, and trade processing services.*

hierarchy is to prioritize the inputs themselves, not the valuation techniques in which they are used.

Valuation techniques. In measuring fair value, management is to employ one or more valuation techniques consistent with the market approach, the income approach, and/or the cost approach. As previously discussed, the selection of a particular technique (or techniques) to measure fair value is to be based on its appropriateness to the asset or liability being measured as well as the sufficiency and observability of inputs available.

In certain situations, such as when using Level 1 inputs, use of a single valuation technique will be sufficient. In other situations, such as when valuing a reporting unit, management may need to use multiple valuation techniques. When doing so, the results yielded by applying the various techniques are to be evaluated and appropriately weighted based on judgment as to the reasonableness of the range of results. The objective of the weighting is to determine the point within the range that is most representative of fair value.

Management is required to consistently apply the valuation techniques it elects to use to measure fair value. It would be appropriate to change valuation techniques or how they are applied if the change results in fair value measurements that are equally or more representative of fair value. Situations that might give rise to such a change would be when new markets develop, new information becomes available, previously available information ceases to be available, or improved techniques are developed. Revisions that result from either a change in valuation technique or a change in the application of a valuation technique are to be accounted for as changes in accounting estimate under ASC 250. Curiously, however, FASB exempted such changes from the disclosure requirements under ASC 250 that apply to other changes in accounting estimate.

Market approaches. Market approaches to valuation use information generated by actual market transactions for identical or comparable assets or liabilities (including a business in its entirety). Market approach techniques often will use market multiples derived from a set of comparable transactions for the asset or liability or similar items. The evaluator will need to consider both qualitative and quantitative factors in determining the point within the range that is most representative of fair value. An example of a market approach is matrix pricing. This is a mathematical technique used primarily for the purpose of valuing debt securities without relying solely on quoted prices for the specific securities. Matrix pricing uses factors such as the stated interest rate, maturity, credit rating, and quoted prices of similar issues to develop the issue's current market yield.

Income approaches. Techniques classified as income approaches measure fair value based on current market expectations about future amounts (such as cash flows or net income) and discount them to an amount in measurement date dollars. Valuation techniques that follow an income approach include the Black-Scholes-Merton model (a closed-form model) and binomial or lattice models (an open-form model), which use present value techniques, as well as the multiperiod excess earnings method that is used in fair value measurements of certain intangible assets such as in-process research and development.

Cost approaches. Cost approaches are based on quantifying the amount required to replace an asset's remaining service capacity (i.e., the asset's current replacement cost). A valuation technique classified as a cost approach would measure the cost to a market participant (buyer) to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence adjustments include factors for physical wear and tear, improvements to technology, and economic (external) obsolescence. Thus, obsolescence is a broader concept than financial statement depreciation which simply represents a cost allocation convention and is not intended to be used as a valuation technique.

Measurement considerations.

Initial recognition. When the reporting entity first acquires an asset or incurs (or assumes) a liability in an exchange transaction, the transaction price represents an entry price, the price paid to acquire the asset and the price received to assume the liability. Fair value measurements are based not on entry prices, but rather on exit prices; the price that would be received to sell the asset or paid to transfer the liability. While entry and exit prices differ conceptually, in many cases they may be identical and can be considered to represent fair value of the asset or liability at initial recognition. This is not always the case, however, and in assessing fair value at initial recognition, management is to consider transaction-specific factors and factors specific to the assets and/or liabilities that are being initially recognized. Examples of situations where transaction price is not representative of fair value at initial recognition include

1. Related-party transactions
2. Transactions occurring under duress such as a forced or liquidation transaction
3. The exchange transaction occurs in a market different from the principal or most advantageous market in which the reporting entity would sell the asset or transfer the liability. An example of this situation is when the reporting entity is a securities dealer that enters into transactions in different markets depending on whether the counterparty is a retail customer or another securities dealer.
4. Different units of account that apply to the transaction price and the assets/liabilities being measured. This can occur, for example, where the transaction price includes other elements besides the assets/liabilities that are being measured such as unstated rights and privileges that are subject to separate measurement or when the transaction price includes transaction costs (see discussion below).

Transaction costs. Transaction costs are the incremental direct costs that would be incurred to sell an asset or transfer a liability. While, as previously discussed, transaction costs are considered in determining the market that is most advantageous, they are not used to adjust the fair value measurement of the asset or liability being measured. FASB excluded them from the measurement because they do not represent an attribute of the asset or liability being measured.

Transportation costs. If an attribute of the asset or liability being measured is its location, the price determined in the principal or most advantageous market is to be adjusted for the costs that would be incurred by the reporting entity to transport it to or from that market.

Fair Value Disclosures

Substantial disclosures regarding fair value are required by many different pronouncements that comprise authoritative GAAP literature. In the preparation of the financial statements, these disclosures are often placed in different informative notes including descriptions of the entity's accounting policies, financial instruments, impairment, derivatives, pensions, revenue recognition, share-based compensation, risks and uncertainties, certain significant estimates, etc. ASC 820 requires additional quantitative and qualitative disclosures. ASC 820 encourages, but does not require management to combine its fair value disclosures with other required disclosures such as the financial instrument disclosures required by ASC 825. In addition, ASC 820 encourages disclosure of information about other similar measurements that are not intended to represent fair value such as inventories measured at the lower of cost or market. ASC 820 uses a hybrid principles-based approach and rules-based approach to detailing the fair value disclosures it requires. It provides the following high-level disclosure objectives:

1. For assets and liabilities measured at fair value on a recurring basis subsequent to their initial recognition, management is to provide information that will enable financial statement users to assess the inputs used to develop those measurements and, further, for measurements using significant unobservable (Level 3) inputs, the effect of those measurements on earnings for the period.
2. For assets and liabilities measured at fair value on a nonrecurring basis subsequent to their initial recognition, management is to provide information that will enable financial statement users to assess the inputs used to develop those measurements.

To operationalize these objectives, ASC 820 provides the following required disclosures. The quantitative disclosures are required to be presented in a tabular format. Unless otherwise specified, the disclosures are required to be made in each interim and annual period.

Disclosures required to be made with respect to assets and liabilities measured at fair value on a recurring basis in periods subsequent to initial recognition. Disclose separately for each major category of assets and liabilities

1. The amount of the fair value measurements at the reporting date
2. The level within the fair value hierarchy in which the fair value measurements fall in their entirety; separately disclosing the amounts of fair value measurements that use quoted prices in active markets for identical assets or liabilities (Level 1), significant other observable inputs (Level 2), and significant unobservable inputs (Level 3)
3. For those fair value measurements using significant unobservable (Level 3) inputs, a reconciliation of the beginning and ending balances, separately stating changes during the period attributable to
   a. Total realized and unrealized gains or losses for the period segregating those gains or losses included in income (or changes in net assets of a not-for-profit organization) and a description of where those gains or losses are reported in the statement of income (or statement of activities of a not-for-profit organization)
      (1) The unrealized gains or losses included in this disclosure that relate to assets and liabilities still held at the balance sheet date and
      (2) A description of where, in the statement of income, those unrealized gains or losses are reported
   b. Purchases, sales, issuances, and settlements (net)
   c. Transfers in and/or out of Level 3 (e.g., due to changes in the observability of significant inputs)

   Note that, for the purposes of this reconciliation, derivative assets and liabilities are permitted to be presented net.
4. In the first interim period of the fiscal year of adoption and subsequently in annual financial statements, the valuation techniques used to measure fair value and a discussion of changes in valuation techniques, if any, during the period

Disclosures required to be made with respect to assets and liabilities measured at fair value on a nonrecurring basis in periods subsequent to initial recognition (such as impaired assets). Disclose separately for each major category of assets and liabilities

1. Fair value measurements recorded during the period and the reasons for the measurements

2. The level within the fair value hierarchy in which the fair value measurements fall in their entirety; separately disclosing the amounts of fair value measurements that use quoted prices in active markets for identical assets or liabilities (Leve1), significant other observable inputs (Level 2), and significant unobservable inputs (Level 3)
3. For fair value measurements using significant unobservable (Level 3) inputs, a description of the inputs and the information used to develop them
4. In the first interim period of the fiscal year of adoption and subsequently in annual financial statements, the valuation techniques used to measure fair value and discussion of changes in valuation techniques used to measure similar assets and/or liabilities in prior periods

Enhanced disclosures regarding derivative instruments and hedging activities. To respond to concerns regarding lack of transparency regarding reporting entities' derivatives and hedging activities, FASB expanded upon ASC 815-10-50.

It establishes a disclosure framework intended to enhance the understanding of financial statement users about

1. How and why the reporting entity uses derivative instruments,
2. How derivative instruments and related hedged items are accounted for, and
3. How derivative instruments and related hedged items affect the reporting entity's financial position, financial performance, and cash flows.

Included in the extensive new disclosures is a requirement that every interim and annual financial statement include quantitative disclosures presented in a tabular format, detailing substantial information regarding the location in the financial statements and the fair value amounts of derivatives reported on the balance sheet. Those fair value amounts are to be presented gross, even if the derivatives are subject to master netting arrangements and are permitted to be presented net on the balance sheet. Derivatives and hedging transactions are discussed in detail in Chapter 8, and the newly required disclosures are included in the Disclosure Checklist in Appendix A.

Effective Date and Transition

As originally issued, ASC 820 was to be fully effective for financial statements issued for fiscal years beginning after November 15, 2007, and interim periods within those fiscal years. FASB encouraged early adoption but only for fiscal years during which the reporting entity had not yet issued interim or annual financial statements. In addition, if the management of the reporting entity elected to adopt ASC 825-10-25 prior to its scheduled effective date (described later in this chapter), the reporting entity was also required to simultaneously adopt the requirements of ASC 820.

On February 12, 2008, FASB issued a limited one-year delay of the effective date for certain limited provisions of ASC 820. The FASB's intent in adopting the delay is to allow it (and its constituents) additional time to resolve issues that may have arisen in the initial application of ASC 820. The delay is not available to any reporting entity that had already issued interim or annual financial statements reflecting the application of the measurement and disclosure provisions of ASC 820 prior to the issuance of the delay on February 12, 2008. Those entities are required to continue to apply the provisions of ASC 820 in their entirety.

The delay applies to nonfinancial assets and nonfinancial liabilities except for items recognized or disclosed at fair value in the reporting entity's financial statements on a recurring basis (at least annually).

With respect to eligible items, application of ASC 820 may be delayed until fiscal years beginning after November 15, 2008, and interim periods within those fiscal years.

Nonfinancial assets and nonfinancial liabilities are defined in the delay as all assets and liabilities that *do not* meet the definition of a financial asset or financial liability in the ASC Master Glossary (see "Definitions of Terms" at the beginning of this chapter).

Examples of items to which the deferral applies include the following (not all-inclusive):

1. Items measured at fair value on a recurring basis but not necessarily recognized or disclosed in the financial statements at fair value
   a. Reporting units measured at fair value in the first step of an annual goodwill impairment test
   b. Indefinite-lived intangible assets measured at fair value for impairment assessment purposes under ASC 350
2. Items measured at fair value on a nonrecurring basis
   a. Nonfinancial assets and nonfinancial liabilities initially measured at fair value in a business combination or other new basis event that are not measured at fair value in subsequent periods
   b. Nonfinancial long-lived assets (or asset groups) measured at fair value in performing an impairment assessment under ASC 360-10-35
   c. Asset retirement obligations that are initially measured at fair value under ASC 410-20 but are not required to be remeasured on a recurring basis
   d. Nonfinancial liabilities associated with exit or disposal activities initially measured at fair value under ASC 420
3. Items measured at fair value on a nonrecurring basis but not necessarily recognized or disclosed in the financial statements at fair value—nonfinancial assets and nonfinancial liabilities measured at fair value in the second step of a goodwill impairment test

Examples of items to which the deferral *does not* apply include the following (not all-inclusive):

1. Financial assets and financial liabilities initially measured at fair value in a business combination or other new basis event irrespective of whether they are to be measured at fair value in subsequent periods
2. Eligible items under ASC 825-10-15 that are recognized or disclosed at fair value on a recurring basis
3. Financial instruments within the scope of ASC 825 irrespective of whether they are recognized in the financial statements
4. Financial and nonfinancial derivatives within the scope of ASC 815
5. Servicing assets and servicing liabilities within the scope of ASC 860-50-35, including situations where management has elected the amortization method as the subsequent measurement attribute, because the fair value is required to be disclosed on a recurring basis
6. Loans measured for impairment using the practical expedient in ASC 310-10-35 (based on the fair value of the collateral if the loan is collateral dependent), even if the collateral is nonfinancial

Entities that elect the one-year deferral are required to include the following disclosures in all interim and annual financial statements it issues until ASC 820 is fully applied to all assets and liabilities covered by its scope:

1. The fact that the reporting entity has only partially applied ASC 820, and
2. Each major category of assets and liabilities that are recognized or disclosed at fair value for which the entity has not applied ASC 820

ASC 825-10-25, *Financial Instruments: The Fair Value Option*

Introduction. ASC 825-10-25, *The Fair Value Option*, encourages reporting entities to optionally elect to use fair value to measure eligible assets and liabilities in their financial statements. Electing entities would obtain relief from the onerous and complex documentation requirements that apply to certain hedging transactions under ASC 815 while reducing the financial statement effects of volatility caused by differing measurement methods for qualifying assets and related liabilities. ASC 825-10-25 applies to businesses and not-for-profit organizations and provides management of these entities substantial discretion in electing to measure eligible assets and liabilities at fair value.

Eligible financial assets and financial liabilities. The following items are eligible for the election (also see the summary table in the section of this chapter, entitled "The Mixed Attribute Model"):

1. All recognized financial assets and financial liabilities except
   a. Investments in subsidiaries required to be consolidated by the reporting entity
   b. Interests in variable interest entities required to be consolidated by the reporting entity[9]
   c. Financial assets recognized under leases
   d. Employers' and plans' obligations (unfunded or underfunded liabilities) or assets (representing net overfunded positions) for
      (1) Pension benefits
      (2) Other postretirement benefits (including health care and life insurance benefits)
      (3) Postemployment benefits
      (4) Other deferred compensation, termination, and share-based payment arrangements such as employee stock option plans; employee stock purchase plans; compensated absences; and exit and disposal activities
   e. Financial assets and financial liabilities under leases (this exception does not, however, apply to a guarantee of a third-party lease obligation or a contingent obligation associated with cancellation of a lease)
   f. Deposit liabilities, withdrawable on demand, of banks; saving and loan associations; credit unions; and other similar depository institutions
   g. Financial instruments that are, in whole or in part, classified by the issuer as a component of stockholders' equity (including "temporary equity," also sometimes referred to as "mezzanine") such as a convertible debt security with a noncontingent beneficial conversion feature.
2. Firm commitments that would otherwise not be recognized at inception and that involve only financial instruments. And example is a forward purchase contract for a loan that is not readily convertible to cash. The commitment involves only financial instruments (the loan and cash) and would not be recognized at inception since it does not qualify as a derivative.
3. A written loan commitment

---

[9] *Under ASC 805, consolidated variable interest entities are referred to as subsidiaries in the same manner as consolidated voting interest entities.*

4. Rights and obligations under insurance contracts or warranties that are not financial instruments[10] but whose terms permit the insurer (warrantor) to settle claims by paying a third party to provide goods and services to the counterparty (insured party or warranty claimant)
5. A host financial instrument resulting from bifurcating an embedded nonfinancial derivative instrument from a nonfinancial hybrid instrument under ASC 815-15-25. An example would be an instrument in which the value of the bifurcated embedded derivative is payable in cash, services, or merchandise but the host debt contract is only payable in cash.

Flexibility of application. ASC 825-10-25 provides management with substantial flexibility in electing the fair value option (FVO). Once elected, however, the election is irrevocable unless, as discussed later in this section, a new election date occurs. The election can be made for a single eligible item without electing it for other identical items subject to the following limitations:

1. If the FVO is elected with respect to an investment otherwise required to be accounted for under the equity method of accounting, the FVO election is to be applied to all of the investor's financial interests in the same entity (equity and debt, including guarantees) that are eligible items.
2. If a single contract with a borrower (such as a line of credit or construction loan) involves multiple advances to that borrower and those advances lose their individual identity and are aggregated with the overall loan balance, the FVO is only permitted to be elected to apply to the larger overall loan balance and not individually with respect to each individual advance.
3. If the FVO is applied to an eligible insurance or reinsurance contract, it is also required to be applied to all claims and obligations under the contract.
4. If the FVO is elected for an eligible insurance contract (base contract) for which integrated or nonintegrated contract features or coverages (some of which are referred to as "riders") are issued either concurrently or subsequently, the FVO is required to be applied to those features and coverages. The FVO is not permitted to be elected for only the nonintegrated contract features and coverages, even though they are accounted for separately under ASC 944-30.[11]

Other than as provided in 1. and 2. above, management is not required to apply the FVO to all instruments issued or acquired in a single transaction. The lowest level of election, however, is at the single legal contract level. A financial instrument that is, in legal form, a single contract is not permitted to be separated into component parts for the purpose of electing the FVO. For example, an individual bond is the minimum denomination of that type of debt security.

An investor in an equity security of a particular issuer may elect the FVO for its entire investment in that equity security including any fractional shares issued by the investee in connection, for example, with a dividend reinvestment plan.

---

[10] *Insurance contracts that require or permit the insurer to settle claims by providing goods or services instead of by paying cash are not, by definition, financial instruments. Similarly, warranties that require or permit the warrantor to settle claims by providing goods and services in lieu of cash do not constitute financial instruments.*

[11] *ASC 944-30-20 defines a nonintegrated contract feature in an insurance contract as a feature in which the benefits provided are not related to or dependent on the provisions of the base contract. For the purposes of applying the FVO election, neither an integrated nor a nonintegrated contract feature or coverage qualifies as a separate instrument.*

Management of an acquirer, parent company, or primary beneficiary[12] decides whether to elect the FVO with respect to the eligible items of an acquiree, subsidiary, or consolidated variable interest entity. That decision, however, only applies in the consolidated financial statements. FVO choices made by management of an acquiree, subsidiary, or variable interest entity continue to apply in their separate financial statements should they choose to issue them.

Timing of the election. Management may elect the FVO for an eligible item in one of two ways.

1. Based on an established policy for specified types of eligible items that it follows consistently, or
2. On the date of occurrence of one of the following events:
   a. The entity initially recognizes the item.
   b. The entity enters into an eligible firm commitment.
   c. Financial assets previously required to be reported at fair value with unrealized gains and losses included in income due to the application of specialized accounting principles cease to qualify for that accounting treatment (e.g., a subsidiary subject to ASC 946 transfers a security to another subsidiary of the same parent that is not subject to the ASC).
   d. The accounting treatment for an investment in another entity changes because
      (1) The investment becomes subject to the equity method of accounting (and, for example, had previously been accounted for under ASC 320, *Investments—Debt and Equity Securities*, or under the FVO)
      (2) The investor ceases to consolidate a subsidiary or variable interest entity but retains an interest in the entity
   e. An event requires an eligible item to be remeasured at fair value at the time that the event occurs but does not require fair value measurements to be made at each subsequent reporting date. Among the events that require initial fair value measurement or subsequent fair value remeasurement of this kind are
      (1) Business combinations,
      (2) Consolidation or deconsolidation of a subsidiary or variable interest entity, and
      (3) Significant modifications of debt, as defined in ASC 470-50, *Debt—Modifications and Extinguishments.*

      Specifically excluded from being considered an eligible event are

      (1) Recognition of impairment under lower-of-cost-or-market accounting, or
      (2) Other-than-temporary impairment

Financial statement presentation and disclosure.

Balance sheet. ASC 825-10-25 requires the reporting entity to report assets and liabilities for which the FVO was elected in a manner that separates those amounts from carrying amounts of similar assets and liabilities measured using another measurement method. Two alternatives are provided.

---

[12] *Under ASC 805 a primary beneficiary is referred to as a parent in the same manner as a company that consolidates a voting interest entity.*

1. Present the aggregate fair value and non–fair value amounts on the same balance sheet line and parenthetically provide the amount measured at fair value that is included in the aggregate amount.
2. Present two separate line items to display the fair value and non–fair value carrying amounts.

In the authors' opinion, the manner in which the first alternative is illustrated in ASC 825-10-25 could potentially confuse or mislead readers.

Private equity investments ($75 at fair value)	$125

This caption could easily be misunderstood by the reader to mean that the reporting entity holds private equity investments with an aggregate carrying value of $125 whose fair value has declined to $75 thus implying a $50 unrealized loss. In fact, this caption is intended to convey the fact that the reporting entity holds private equity investments with an aggregate carrying value of $125 and that the $125 is comprised of $75 valued at fair value in accordance with an election of the FVO and $50 using another measurement attribute such as the cost method or equity method.

If using parenthetical disclosure, it would be less misleading if the amount were presented as follows:

Private equity investments ($75 measured at fair value; $50 measured using the equity method)	$125

This can get cumbersome and is still confusing. It becomes even more unwieldy when considering the fact that reporting entities customarily present two or three years' comparative balance sheets and that not-for-profit organizations often use tabular formats for their statements of financial position that present separate columns for unrestricted net assets, temporarily restricted net assets, and permanently restricted net assets.

Another source of confusion is the fact that existing GAAP requires certain items (such as derivatives, trading securities, and available-for-sale securities) to be stated at fair value without consideration of the FVO. Therefore, it is conceivable that a single balance sheet will contain financial instruments that are stated at fair value due to a requirement in GAAP, financial instruments that are stated at fair value due to management's election of the FVO, and financial instruments that are stated using some other attribute such as cost method, equity method, or, as is permitted for investments in certain debt securities, using amortized cost. When this is the case, the reporting entity may wish to use a format such as the one shown below.

Many variations can be derived from this method of presentation. For example, subtotals are only necessary to be presented for the total column since the notes to the financial statements provide fair value totals by major class. The financial statement preparer may wish to augment this presentation by including a column that subtotals all amounts stated at fair value irrespective of whether they are subject to the FVO election.

Separate sections of assets and liabilities could contain separate line items enumerating the eligible items within each for which the FVO was elected by management.

Young Aviation Chopper and Helicopter Works, Inc.
Consolidated Balance Sheet (Unclassified for Illustrative Purposes)
December 31, 2009

	Amounts measured under the company's customary accounting policies at other than fair value	*Amounts required to be measured at fair value or whose carrying values approximate fair value*	*Eligible amounts measured at fair value at management's election*	*Total*
Assets				
Cash and cash equivalents		$ 38		$ 38
Accounts receivable	$ 97			97
Notes receivable	400		$150	550
Inventory	134			134

Trading securities		115		115
Securities available-for-sale		75		75
Securities held-to-maturity	32			32
Derivatives		60		60
Private equity	50		75	125
Property and equipment, net	10			10
Other assets	20			20
Total assets	$ 743	$288	$225	$1,256
Liabilities				
Borrowings under short-term line of credit	$ 128			$ 128
Long-term debt	140		$ 60	200
Accounts payable		$110		110
Accrued liabilities	130			130
Other liabilities	555			555
Total liabilities	953	110	60	1,123
Stockholders' equity				
Common stock	4			4
Additional paid-in capital	88			88
Retained earnings	42			42
Accumulated other comprehensive income	(1)			(1)
Total stockholders' equity	133	--	--	133
Total liabilities and stockholders' equity	$1,086	$110	$ 60	$1,256

Statement of cash flows. ASC 825-10-25 requires cash receipts and cash payments related to items measured at fair value to be classified in the statement of cash flows according to their nature and purpose. Inexplicably, however, ASC 825-10-25 leaves the provision of ASC 230 unchanged that requires returns on investments (interest and dividends) to be accounted for as operating activities.

Disclosure objectives. Consistent with the approach in ASC 820, ASC 825-10-25 provides financial statement preparers with the principal objectives associated with fair value option disclosures and then sets forth in detail the disclosures FASB deems necessary to meet the objective. The principal objectives are to facilitate comparisons (1) between entities that choose different measurement attributes for similar assets and liabilities, and (2) between assets and liabilities in the financial statements of an entity that elects to use different measurement attributes for similar assets and liabilities. FASB indicates that it expects the disclosures to result in

1. Information sufficient to enable financial statement users to understand
   a. The reasons why management elected or partially elected the FVO

   b. How changes in fair values affected net income for the period
   c. The differences between fair values and contractual cash flows for certain items

2. The information that would have been required to be disclosed about certain items (e.g., equity-method investments, nonperforming loans) absent the FVO election

Although not required by ASC 825-10-25, FASB encourages management to present the disclosures it requires in combination with related fair value disclosures required to be disclosed by parts of the codification (such as ASC 825-10-50 and ASC 820).

Unless otherwise indicated, all of the required disclosures are to be included in both interim and annual financial statements.

Items for which disclosures are required. The disclosures required by ASC 825-10-25 apply to items measured under the FVO, as well as under the option provided by ASC 815-15-25, that permits management, in applying ASC 815 to the initial recognition of a host contract with an embedded derivative, to irrevocably elect to initially and subsequently measure the hybrid financial instrument in its entirety at fair value with changes in fair value recognized in net income.

Items for which disclosures are not required. The disclosures required by ASC 825-10-25 do not apply to the following items. However, any existing disclosures required by the cited pronouncements continue to be required under GAAP.

1. Investments in securities classified as trading securities under ASC 320, *Investments—Debt and Equity Securities*
2. Life settlement contracts measured at fair value pursuant to ASC 325-30-30, *Investments in Insurance Contracts*
3. Servicing rights measured at fair value under ASC 860-50-35, *Servicing Assets and Liabilities*

Disclosures required as of each interim and annual balance sheet date.

1. The reasons that management elected the FVO for each eligible item or group of similar eligible items
2. If management elected the FVO for some but not all of the eligible items within a group of similar eligible items
   a. A description of the items in the group and the reasons for partial election
   b. Information sufficient to enable users to understand how the group of similar items relates to the individual line items presented on the balance sheet
3. For each balance sheet line item that includes one or more items for which the FVO was elected
   a. Information sufficient to enable users to understand how each balance sheet line item relates to major categories of assets and liabilities presented in accordance with the fair value disclosure requirements of ASC 820 discussed previously in this chapter. Those requirements include providing the reader information regarding the level or levels of the fair value hierarchy in which the assumptions used to measure fair value (referred to as "inputs") are derived.
   b. The aggregate carrying amount of items included in each balance sheet line item, if any, that are not eligible for the FVO
4. The difference between the aggregate fair value and the aggregate unpaid principal balance of
   a. Loans and long-term receivables (other than securities subject to ASC 320) with contractual principal amounts and for which the FVO has been elected

   b. Long-term debt instruments that have contractual principal amounts and for which the FVO has been elected

5. For loans held as assets for which the FVO has been elected
   a. The aggregate fair value of loans on nonaccrual status if the entity's policy is to recognize interest income separately from other changes in fair value
   b. The aggregate fair value of loans that are 90 or more days past due
   c. The difference between the aggregate fair value and the aggregate unpaid principal balance for loans that are 90 or more days past due, in nonaccrual status, or both

6. For investments that, absent election of the FVO, would have been accounted for under the equity method, the following disclosures from ASC 323, *Investments—Equity Method and Joint Ventures*[13]
   a. Financial statements of the investor are to disclose parenthetically, in the notes to the financial statements, or in separate statements or schedules
      (1) The name of each investee and percentage of ownership of its common stock, and
      (2) The accounting policies of the investor with respect to investments in common stock.
   b. When investments in common stock of corporate joint ventures or other investments accounted for under the equity method are, in the aggregate, material in relation to the investor's financial position and results of operations, it may be necessary to present in the notes or in separate statements, either individually or in groups, summarized information as to assets, liabilities, and results of operations of the investees.

Disclosures required about items for which the fair value option has been elected for each interim and annual period for which an income statement is presented.

1. For each line item in the statement of financial position, the amounts of gains and losses from changes in fair value included in net income during the period and the specific line in the income statement on which those gains and losses are reported. ASC 825-10-25 permits management to meet this requirement by aggregating these disclosures with respect to items for which the FVO was elected with the amounts of gains and losses from changes in fair value with respect to other items measured at fair value as required by other authoritative literature.
2. A description of how interest and dividends are measured and where they are reported in the statement of income.[14]
3. With respect to gains and losses included in net income during the period attributable to changes in instrument-specific credit risk associated with loans and other receivables held as assets.

---

[13] *ASC 323 indicates that management of the investor is to evaluate the significance of an investment to its financial position and results of operations in determining the extent of disclosures necessary to inform the reader of the financial position and results of operations of an investee. If the investor holds more than one investment in common stock, it may be appropriate to provide disclosures wholly or partially on an aggregate basis.*

[14] *ASC 825-10-25 is silent with respect to the methods to be used for measuring and reporting dividend income, interest income, and interest expense associated with items for which the FVO has been elected.*

   a. The estimated amount or such gains or losses
   b. How the gains or losses were determined

4. For liabilities with fair values that have been significantly affected during the reporting period by changes in instrument-specific credit risk
   a. The estimated amount of gains and losses from changes in fair value included in net income attributable to changes in the instrument-specific credit risk
   b. How the gains and losses were determined
   c. Qualitative information regarding the reasons for those changes

Other required disclosures.

1. In annual financial statements only, the methods and significant assumptions used to estimate the fair value of items for which the FVO was elected.[15]
2. If management elects the FVO upon the occurrence of an event where (a) an investment newly becomes subject to the equity method, (b) a subsidiary or variable interest entity that the investor previously consolidated ceases to qualify for consolidation but the investor continues to hold common stock in the entity, or (c) an eligible item is required to be measured or remeasured at fair value at the time of the event but is not required to be subsequently measured at each succeeding reporting date, the following disclosures are required in the financial statements covering the period of the election:
   a. Qualitative information about the nature of the event
   b. Quantitative information by balance sheet line item indicating which line items in the income statement include the effect on net income of initially electing the FVO for the item.

Special provisions applicable to not-for-profit organizations. Not-for-profit organizations (NFPs) are to apply ASC 825-10-25 in the same manner as commercial enterprises with the following exceptions:

1. Where provisions of ASC 825-10-25 refer to an income statement, those references should be replaced by references to a statement of activities, statement of changes in net assets, or statement of operations.
2. References to earnings or net income should be replaced with references to changes in net assets unless the NFP is a health-care organization subject to the AICPA Audit and Accounting Guide, *Health-Care Organizations*. Because NFP health-care organizations present performance indicators that are analogous to income from continuing operations of business enterprises, they are to report unrealized gains and losses on items for which the FVO has been elected within the performance indicator or as a part of discontinued operations, as applicable under the circumstances. In accordance with ASC 958, *Not-for-Profit Entities*, NFPs may present such gains and losses either within or outside other intermediate measures of operations unless the gains or losses are part of discontinued operations. NFP health-care organizations are permitted to present such unrealized gains or losses that are not part of discontinued operations as a part of any intermediate measures of operations that are presented as a component of the performance indicator.

---

[15] *While ASC 825-10-50,* ***Financial Instruments Disclosure,*** *already required reporting entities to annually disclose the methods and significant assumptions used to estimate the fair value of financial instruments, this disclosure requirement expands that disclosure to include instruments that are outside the scope of ASC 825-10-50 such as certain insurance contracts for which the FVO was elected.*

3. The disclosure requirements presented above under the caption, "Disclosures required about items for which the fair value option has been elected for each interim and annual period for which an income statement is presented" are to apply not only to the effect on performance indicators or other intermediate measures of operations that may be presented, but also with respect to the effect on the change in each of the classes of net assets, as applicable (unrestricted, temporarily restricted, and permanently restricted).

Example of disclosure under ASC 820 and ASC 825-10-25 combined with ASC 825-10-50 disclosures

The following example does not purport to illustrate all of the disclosure requirements specified within the standards. Instead, it is presented to illustrate how the financial statement preparer might organize the required tabular disclosures by integrating the ASC 825-10-50 disclosures regarding the fair value of financial instruments with the ASC 820 and ASC 825-10-25 disclosures discussed in this chapter.

Effective date. ASC 825-10-25 was effective as of the beginning of each reporting entity's first fiscal year beginning after November 15, 2007. Special early adoption provisions applied, however, except as those provisions permitted, the statement was not to be applied retrospectively to fiscal years beginning prior to the effective date.

Early adoption. Management was permitted to adopt ASC 825-10-25 and elect the FVO for existing eligible items as of the beginning of a fiscal year beginning on or before November 15, 2007, if it met the following conditions:

1. Management also adopted all of the requirements of ASC 820 at the early adoption date of ASC 825-10-25 (the first day of the fiscal year of early adoption) or earlier.
2. At the time management chose to early adopt ASC 825-10-25, it had not yet issued financial statements of the reporting entity including required notes to those financial statements, for any interim period of the fiscal year that included the early adoption date.
3. The choices to apply or not to apply the FVO to eligible items existing at the early adoption date were retroactive to that early adoption date.
4. For eligible items with an election date occurring after the early adoption date but before management's choice to apply early, the election for those items was retroactive to their election date.
5. All other requirements that would normally have applied as of the required effective date also applied as of the early adoption date.
6. Management's choice to adopt early was to be made after FASB issued ASC 825-10-25 in February 2007, but within 120 days of the beginning of the fiscal year of adoption. Thus, the deadlines for the early election by management were as follows:

Fiscal year		*ASC 825-10-25*
Beginning	*Ending*	*early election deadline*
3/1/2007	2/29/2008	6/29/2007
4/1/2007	3/31/2008	7/30/2007
5/1/2007	4/30/2008	8/29/2007
6/1/2007	5/31/2008	9/29/2007
7/1/2007	6/30/2008	10/29/2007
8/1/2007	7/31/2008	11/29/2007
9/1/2007	8/31/2008	12/30/2007
10/1/2007	9/30/2008	1/29/2008
11/1/2007	10/31/2008	2/29/2008

Private equity investments for which the fair value option was elected represent investments that would otherwise be accounted for using the equity method of accounting. See Note 1, Summary of Significant Accounting Policies for disclosures regarding the methods and assumptions used to value each major class of financial assets and liabilities.

PERSPECTIVE AND ISSUES

Assets displayed on the balance sheet are the resources available to the reporting entity to support its current and future operations. To provide information about liquidity, the assets are often divided into current and noncurrent assets. Current assets consist of cash and other assets that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. When the normal operating cycle is less than one year, a one-year period is used to distinguish current assets from noncurrent assets. If the operating cycle exceeds one year, the operating cycle is the proper period to use for current asset identification. When information about current assets is accompanied by information about current liabilities, readers of the financial statements can assess the amount of net working capital (current assets less current liabilities) possessed by the reporting entity and its *current ratio* (current assets divided by current liabilities). Each of those measures provides useful, and different, information about the liquidity of the reporting entity—that is, its ability to satisfy current obligations as they become due in the normal course of business.

Current assets usually include cash, short-term investments, receivables, inventory, and prepaid expenses. This chapter discusses cash, receivables, and prepaid expenses. Chapter 8 discusses short-term investments, and Chapter 9 discusses inventory. This chapter also discusses the standards in ASC 860, *Transfers and Servicing*. Because of certain recent developments associated with the off-balance-sheet accounting for certain securitizations (e.g.,

various subprime mortgage and collateralized debt obligations) FASB appears committed to making revisions to certain aspects of this standard by the end of 2008, which readers should keep abreast of. Discussion of ASC 860 is included in this chapter because that standard describes the proper accounting for sales of receivables to third parties and the use of receivables as collateral in secured borrowings. This chapter also includes ASC 860's standards for repurchase agreements and securities lending. Although those two types of transfers usually involve investments, they are discussed in this chapter because the same underlying theory—the financial components approach—is used for those transactions as is used for transfers involving receivables. ASC 860's standards for extinguishment of debt are set forth in Chapter 15.

Recognition and measurement of cash is generally straightforward. However, it is necessary to inform readers of the financial statements about any limitations on the ability to use cash in current operations.

Trade receivables and other customary trade term receivables that are due in no longer than one year are measured at outstanding face value (principal) adjusted for any write-offs and the allowance for doubtful accounts, provided that management has the intent and ability to hold those receivables for the foreseeable future or until maturity or payoff. Loans receivable that management will hold until maturity or payoff are valued at outstanding principal adjusted for any write-offs, the allowance for loan losses, any deferred fees or costs on originated loans, and any unamortized premiums of discounts on purchased loans.

If a receivable is due on terms exceeding one year, the proper valuation is the present value of future payments to be received, computed by using an interest (discount) rate commensurate with the risks involved, as of the date of the receivable's creation. In many situations where an explicit interest rate is provided, the rate commensurate with the risks involved is the rate stated in the agreement between the payee and the obligor. However, if the receivable is noninterest-bearing or if the rate stated in the agreement is not indicative of the market rate for a debtor of similar creditworthiness under similar terms, interest must be imputed at the market rate. The resulting discount is amortized as additional interest income over the life of the agreement, per ASC 835.

Receivables that are pledged or assigned to a lender as collateral for a lending agreement remain under the control of the reporting entity and therefore remain on its balance sheet, as does the debt incurred under the borrowing arrangement. It is necessary, however, to inform readers of the financial statements about the pledge or assignment.

As an alternative to borrowing against the value of the receivables, customer obligations are sometimes sold in order to generate cash before their due dates. If the transferor has no continuing involvement with the transferred assets or with the transferee, it is clear that a sale has taken place, and a gain or loss on sale is measured and recognized. However, in many cases, the transferor of the receivables has continuing involvement with the transferred assets because it sells the receivables with recourse for uncollectible amounts, retains an interest in the receivables, or agrees to service the receivables after the sale. The greater the control that the transferor retains over the receivables, the more likely that the transfer will be accounted for as a secured borrowing rather than a sale.

Under the financial components approach used in ASC 860, a sale is recognized only if control over the transferred assets is relinquished in fact. A determination that control has been surrendered is made if three criteria are all met. If control has been surrendered, the reporting entity recognizes the financial and servicing assets (if any) it controls and liabilities (if any) it assumes, and removes from its accounting records the carrying value of any assets surrendered and liabilities extinguished. The same accounting and the same three criteria are applied to all transfers of financial assets, regardless of type. Thus, the standards apply to sales of receivables with recourse, sales of receivables with retained interests or servicing,

securitizations (the transformation of the receivables into securities that are sold to other investors), repurchase agreements (a "sale" of a security accompanied by an agreement to "repurchase" it at a future date), and securities lending agreements.

If control has not been surrendered, the transfer of financial assets is accounted for as a secured borrowing. The accounting for the collateral by the debtor and the secured party depends on whether the debtor has defaulted and the nature of the rights and obligations that result from the collateral agreement. If the secured party (the lender) has the right to sell or repledge the collateral, then the debtor reports that asset in its balance sheet separately from other assets not so encumbered. If the secured party does in fact sell the collateral, it recognizes the proceeds from the sale and its obligation to return the collateral. Accounting for the sale of the collateral is also subject to the standards set forth by ASC 860. If the original debtor defaults on the secured borrowing agreement, thereby forfeiting the right to redeem the collateral, the lender will recognize the collateral as its asset, measured at fair value, or, if it has already sold the collateral, derecognize its obligation to return the collateral; concurrently, the debtor will derecognize the collateral, as it no longer has an equitable claim to it.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
310-20	Receivables—Nonrefundable Fees and Other Costs
310-30	Receivables—Loan and Debt Securities Acquired with Deteriorated Credit Quality
320	Investments—Debt and Equity Securities
Liabilities	
450	Contingencies
460	Guarantees
Broad Transactions	
810	Consolidation
815	Derivatives and Hedging
835	Interest
860	Transfers and Servicing
860-10-40	Transfers and Servicing—Derecognition
860-50	Transfers and Servicing—Servicing Assets and Liabilities
Industries	
942	Financial Services—Depository and Lending

DEFINITIONS OF TERMS

Accounts receivable. Amounts due from customers for goods or services provided in the normal course of business operations.

Aging the accounts. Computation of the adjustment for uncollectibility of accounts receivable outstanding at the end of the period based upon the length of time the accounts have been unpaid.

Assignment. The formal procedure for collateralization of borrowings through the use of accounts receivable. It normally does not involve debtor notification.

Beneficial interests. Rights to receive all or portions of specified cash inflows to a trust or other entity.

Cash. Coins and currency on hand and balances in checking accounts available for immediate withdrawal.

Cash equivalents. Short-term, highly liquid investments that are readily convertible to known amounts of cash and are so near their maturity that they present negligible risk of changes in value due to changes in interest rates. Examples include treasury bills, commercial paper, and money market funds.

Collateral. Personal or real property used to secure the performance of a loan or other obligation. Upon default of the obligation the collateral may be sold by the lender in order to satisfy the obligation.

Current assets. Those assets that are reasonably expected to be realized in cash or sold or consumed within a year or within the normal operating cycle of the reporting entity, if longer than a year.

Factoring. The outright sale of accounts receivable to a third-party financing entity. The sale may be with or without recourse.

Financial asset. Cash, evidence of an ownership interest in an entity, or a contract that conveys to another entity a right to (1) receive cash or a financial instrument from a first entity, or (2) exchange other financial instruments on potentially favorable terms with the first entity.

Financial liability. A contract that imposes on one entity a contractual obligation to (1) deliver cash or a financial instrument to another entity, or (2) exchange other financial instruments on potentially unfavorable terms with another entity.

Interest-only strip. The contractual right to receive some or all of the interest due on a financial instrument without the rights to receive the principal.

Net realizable value. The amount of cash anticipated to be produced in the normal course of business from an asset, net of any direct costs of the conversion into cash.

Operating cycle. The average time between the acquisition of materials or services and the cash realization from the sale of products or services produced using the acquired materials or services.

Percentage-of-sales method. Computing the adjustment for uncollectible accounts receivable based on the historical relationship between bad debts and gross credit sales.

Pledging. Using an asset as collateral for borrowings. It generally refers to borrowings secured by accounts receivable.

Recourse. The right of a transferee (factor) to receive payment from the transferor of receivables for uncollectible accounts, prepayments by the debtors, merchandise returns, or other defects in the eligibility of the receivables.

Securitization. The transformation of receivables into securities that are sold to other investors.

Servicing asset. A contract to service financial assets that provides the servicer with estimated future revenues (e.g., fees, late charges) that more than adequately compensate the servicer for performing the service.

Servicing liability. A contract to service financial assets that provides the servicer with estimated future revenues (e.g., fees, late charges) that are not expected to adequately compensate the servicer for performing the service.

Transfer. Conveyance of a noncash financial asset by or to someone other than issuer of financial asset.

CONCEPTS, RULES, AND EXAMPLES

Cash

To be included as cash in the balance sheet, funds must be represented by coins, currency, undeposited checks, money orders, drafts, and demand deposits that are immediately available without restriction. Cash that is restricted as to use would not be included with cash unless the restrictions on it expire within the year (or the operating cycle, if longer). Thus, cash contractually required to be held in a sinking fund is classified as a current asset if it will be used to retire the current portion of long-term debt. However, if material, it would

be reported on a separate line rather than included with cash. Cash in a demand deposit account that is being held for the retirement of long-term debts that do not mature currently is excluded from current assets and shown as a noncurrent investment. Cash in transit to the reporting entity (e.g., checks already mailed by the customer) cannot be included in cash because it is not under the control of the reporting entity.

It has long been common to see the caption "Cash and Cash Equivalents" in the balance sheet. That caption includes other forms of near-cash as well as demand deposits and liquid, short-term securities. Cash equivalents must be available upon demand in order to justify inclusion. However, a current joint FASB-IASB project, addressing financial statement presentation, might restore the prominence of "cash," excluding equivalents, by dispensing with the concept of cash and equivalents. Such a change would affect both the balance sheet and the statement of cash flows, as these two financial statements must articulate.

Compensating balances. An entity will often be required to maintain a minimum amount of cash on deposit, generally in connection with having a borrowing arrangement with a financial institution (compensating balance). The purpose of this balance may be to substitute for service fees foregone by the bank (or fees at a rate less than market) or simply to increase the yield on a loan to the lender. Since most organizations must maintain a certain working balance in their cash accounts simply to handle routine transactions and to cushion against unforeseen variations in the demand for cash, borrowers often will not find compensating balance arrangements objectionable. Nevertheless, the compensating balance is not available for unrestricted use and penalties will result if it is used. If material, the portion of the reporting entity's cash account that is a compensating balance must be segregated and shown as a separate caption on the balance sheet, and this should be included in noncurrent assets if related borrowings are noncurrent liabilities. If the borrowings are current liabilities or if the compensating balance reduces fees that would have been incurred in the next year, it is acceptable to show the compensating balance as a separately captioned current asset.

Example of compensating balance disclosure

The Arkansas Billboard Company (ABC) has obtained a short-term, $10 million line of credit with Premier Bank. The loan agreement with Premier includes a requirement that ABC maintain a compensating balance of 5% of the maximum amount of the line of credit (5% × $10 million = $500,000). ABC also has a loan with First National Bank involving a single balloon payment of $200,000 due in two years, and requiring a compensating balance of 10%. (10% × $200,000 = $20,000) At year-end, ABC has cash balances of $782,000 at Premier and $28,000 at First National. ABC's reporting of cash on its balance sheet is as follows:

Current assets:	
Cash	290,000
Restricted cash compensating balances	500,000
Noncurrent assets:	
Restricted cash compensating balances	20,000

Cash not immediately available. Cash in savings accounts subject to a statutory notification requirement and cash in certificates of deposit maturing during the current operating cycle or within one year may be included as current assets but, if material, is to be separately captioned in the balance sheet to avoid the misleading implication that these funds are available immediately upon demand. Typically, such items will be included in the short-term investments caption, but these could be labeled as time deposits or restricted cash deposits.

Overdrafts. A reporting entity may issue checks with a dollar value exceeding the balance in its checking account. If the excess amount of these checks over the checking account balance has not yet cleared the bank, the overage is called a book overdraft, since the over-

draft only exists in the reporting entity's accounting records. For reporting purposes, although the bank is yet unaware of this situation, the overdraft is reported as a liability, since the checks have already been released and are thus no longer under the control of the reporting entity. If the checks have cleared the bank, and the bank has advanced the reporting entity the funds (sometimes marketed as "automatic overdraft protection"), then this borrowing is also reported as a liability.

Petty cash. Petty cash and other imprest cash accounts are usually combined in financial statements with other cash accounts.

Receivables

Types of receivables. Accounts receivable, open accounts, or trade accounts are agreements by customers to pay for services received or merchandise obtained. Notes receivable are formalized obligations evidenced by written promissory notes. Other categories of receivables include trade acceptances, third-party instruments, and amounts due from officers, shareholders, employees, or affiliated companies. The latter categories of receivables generally arise from cash advances but could result from sales of merchandise or the provision of services. The nature of amounts due from trade customers is often different from that of balances receivable from related parties, such as employees or shareholders. Thus, generally accepted accounting principles require that the different classes of receivables be separately identified either on the face of the balance sheet itself, or in the notes thereto.

Receivables due within one year (or one operating cycle, if longer) generally should be presented at outstanding face value (principal amount), adjusted for any write-offs already taken and valuation allowances. Valuation allowances adjust the carrying amount of receivables downward because not all of those receivables will ultimately be realized as cash. For example, valuation allowances are reported for amounts estimated to be uncollectible and also for the estimated returns, allowances, and other discounts to be taken by customers prior to or at the time of payment. In practice, the deductions that should be made for estimated returns, allowances, and trade discounts are usually deemed to be immaterial and such adjustments are rarely made. However, if it is known that sales are recorded for merchandise that is shipped "on approval" and available data suggests that a sizable proportion of such sales are returned by the customers, then the estimated future returns must be accrued. Similarly, material amounts of anticipated discounts and allowances are to be recorded in the period of sale.

Example of different classes of receivables

Snowy Winters & Sons is a purveyor of fine books about the Alaskan heartland. Its total ending receivable balance is $420,000. The receivable balance is affected by the following items:

- The allowance for uncollectible accounts receivable is $17,000, reflecting a historical rate of bad debts equal to 4% of receivables.
- It ships books on a subscription basis, resulting in a 15% return rate. Winters has recorded an allowance for returns of $63,000.
- It offers an early payment discount of 1%, which is generally taken. Winters maintains a 1% early payments allowance of $4,200 to reflect this arrangement.
- One large customer, Anchorage Book Company (ABC), is delinquent in its payments, so the collections department has converted ABC's outstanding balance of $58,000 into a short-term note receivable, payable over ten months at a 12% interest rate.
- The Winters legal staff has won a lawsuit from which the company can expect to receive a total of $12,000, payable over two years.
- Early Winters, the family patriarch, borrowed $15,000 from the company to purchase an antique dogsled.

Snowy Winters' controller reports this information on the Winters balance sheet in the following manner:

Accounts receivable, trade	335,000	
Less: Allowances for doubtful accounts	(17,000)	
Returns allowance	(63,000)	
Early payment for discount allowance	(4,200)	250,800
Receivables due from officers		15,000
Notes receivable due in current year		58,000
Noncurrent receivables		
Claims receivable (litigation settlement to be collected over two years)		12,000

Valuation allowance for uncollectible amounts. The recording of a valuation allowance for anticipated uncollectible amounts is almost always necessary. The direct write-off method, in which a receivable is charged off only when it is clear that it cannot be collected, is unsatisfactory since it overstates assets and also results in a mismatching of revenues and expenses. (Note that the direct charge-off method may be required for tax purposes, but if so, this results in temporary differences for which interperiod tax allocation will generally be required.) Proper matching, which remains a valid financial reporting objective, can only be achieved if bad debts are recorded in the same fiscal period as the revenues to which they are related. Since the amount of uncollectible accounts is not known with certainty, however, an estimate must generally be made.

There are two popular estimation techniques. One, the percentage-of-sales method, is principally oriented towards achieving the best possible matching of revenues and expenses. The other method, aging the accounts, is more inclined toward the presentation of the correct net realizable value of the trade receivables in the balance sheet. Both methods are acceptable under GAAP, and are widely employed.

For the percentage-of-sales method, historical data are analyzed to ascertain the relationship between bad debts and credit sales. The derived percentage is then applied to the current period's sales revenues in order to arrive at the appropriate debit to bad debts expense for the year. The offsetting credit is made to allowance for uncollectible accounts (often still referred to as the reserve for bad debts). When specific customer accounts are subsequently identified as uncollectible, they are written off against this allowance.

Example of percentage-of-sales method

Total credit sales for year:	$7,500,000
Bad debt ratio from prior years or other data source:	1.75% of credit sales
Computed year-end adjustment for bad debts expense:	$131,250 ($7,500,000 × .0175)

The entry required is

Bad debts expense	131,250	
Allowance for uncollectible receivables		131,250

Care must be taken to ensure that the bad debt ratio computed will be representative of uncollectibility of the current period's credit sales. A ratio based on historical experience may require an adjustment to reflect the current economic climate. For example, if a large percentage of customers are concentrated in a geographic area that is experiencing an economic downturn, the rate of default may increase over that previously suffered. Changes in credit terms and in customer mix may also affect the relationship between sales and bad debts, and should be given consideration in determining the bad debt percentage to be applied to current period credit sales. In practice, these relationships evolve slowly over time and may not always be observed over the short term.

When aging the accounts, an analysis is prepared of the customer receivables at the balance sheet date. Each customer's balance is categorized by the number of days or months the underlying invoices have remained outstanding. Based on the reporting entity's past experience or on other available statistics, such as industry trends, historical bad debts percentages are applied to each of these aggregate amounts, with larger percentages being applied to the older accounts. The end result of this process is a computed total dollar amount that implies the proper ending balance in the allowance for uncollectible receivables at the balance sheet date. The computed amount is compared to the balance in the valuation account, and an adjustment is made for the differences. Thus, the adjustment needed will be an amount other than the amount computed by the aging.

Example of the aging method

		Age of accounts		
	Under 30 days	*30-90 days*	*Over 90 days*	*Total*
Gross receivables	$1,100,000	$425,000	$360,000	
Bad debt percentage	0.5%	2.5%	15%	
Provision required	$ 5,500	$ 10,625	$ 54,000	$70,125

The credit balance required in the allowance account is $70,125. Assuming that a debit balance of $58,250 already exists in the allowance account (from charge-offs during the year that exceeded the credit balance in the allowance account at the previous year-end), the necessary entry is

Bad debts expense	128,375	
Allowance for uncollectible receivables		128,375

Both of the estimation techniques should produce approximately the same result over the course of a number of years. Nonetheless, these adjustments are based upon estimates and will never precisely predict ultimate results. When facts subsequently become available to indicate that the amount provided as an allowance for uncollectible accounts was incorrect, an adjustment classified as a change in estimate is made, unless this was the consequence of a failure to consider facts available at the time the estimate was made, in which case a correction of an accounting error will have to be recognized (see Chapter 5). For discussion of impairments of loans receivable and troubled debt restructurings, see Chapter 15.

Imputed interest. If a receivable is due on terms exceeding one year, the proper valuation is the present value of future payments to be received, determined by using an interest rate commensurate with the risks involved at the date of the receivable's creation. In many situations the interest rate commensurate with the risks involved is the rate stated in the agreement between the payee and the debtor. However, if the receivable is noninterest-bearing or if the rate stated in the agreement is not indicative of the market rate for a debtor of similar creditworthiness under similar terms, interest is imputed at the market rate. A valuation allowance is used to adjust the face amount of the receivable to the present value at the market rate. The balance in the valuation allowance is amortized as additional interest income so that interest income is recognized using a constant rate of interest over the life of the agreement. Initial recording of such a valuation allowance also results in the recognition of an expense, typically (for customer receivables) reported as selling expense or as a contra-revenue item (sales discounts).

ASC 835-30 specifies when and how interest is to be imputed when the receivable is noninterest-bearing or the stated rate on the receivable is not reasonable. It applies to transactions conducted at arm's length between unrelated parties, as well as to transactions in which captive finance companies offer favorable financing to increase sales of related companies. ASC 835-30 divides receivables into three categories for discussion: notes issued solely for cash, notes issued for cash and a right or privilege, and notes issued in exchange for property, goods, or services.

When a note is issued solely for cash, its present value is necessarily assumed to be equal to the cash proceeds. The interest rate is that rate which equates the cash proceeds received by the borrower to the amounts to be paid in the future. For example, if a borrower agrees to pay $1,060 in one year in exchange for cash today of $1,000, the interest rate implicit in that agreement is 6%. A valuation allowance of $60 is applied to the face amount ($1,060) so that the receivable in included in the balance sheet at its present value ($1,000).

When a note receivable that bears an unrealistic rate of interest is issued in exchange for cash, an additional right or privilege is usually granted, unless the transaction was not conducted at arm's length. If there was an added right or privilege involved, the difference between the present value of the receivable and the cash advanced is the value assigned to the right or privilege. It will be accounted for as an addition to the cost of the products purchased for the purchaser/lender, and as additional revenue to the debtor.

Example of accounting for a note issued for both cash and a contractual right

1. Schwartz borrows $10,000 from Weiss via an unsecured five-year note. Simple interest at 2% is due at maturity.
2. Schwartz agrees to sell Weiss a car for $15,000, which is less than its market price.
3. The market rate of interest on a note with similar terms and a borrower of similar creditworthiness is 10%.

The present value factor for an amount due in five years at 10% is .62092. Therefore, the present value of the note is $6,830 [= ($10,000 principal + $1,000 interest at the stated rate) × .62092]. According to ASC 835, the $3,170 (= $10,000 – $6,830) difference between the present value of the note and the face value of the note is regarded as part of the cost/purchase price of the car. The following entry would be made by Weiss to record the transaction:

Note receivable	10,000	
Car	18,170	
Cash		25,000
Discount on note receivable		3,170

The discount on note receivable is amortized using the effective interest method, as follows:

	Effective interest (10%)	*Stated interest (2%)*	*Amortization*	*Note and interest receivable*
01/01/09				6,830
01/01/10	683	200	(483)	7,513
01/01/11	751	200	(551)	8,264
01/01/12	826	200	(626)	9,091
01/01/13	909	200	(709)	10,000
01/01/14	1,000	200	(800)	11,000

The entry for the first year would be

Discount on note receivable	483	
Interest receivable	200	
Interest revenue		683

When a note is issued in exchange for property, goods, or services and the transaction is entered into at arm's length, the stated interest rate is presumed to be fair unless (1) no interest rate is stated, (2) the stated rate is unreasonable, (3) the face value of the note receivable is materially different from fair value of the property, goods, or services received, or (4) the face value of the note receivable is materially different from the current market value of the note at the date of the transaction. According to ASC 835, when the rate on the note is not fair, the note is to be recorded at the fair market value of the property, goods, or services sold or the market value of the note, whichever is the more clearly determinable. The difference is recorded as a discount or premium and amortized to interest income.

Example of accounting for a note exchanged for goods

1. Green sells Brown inventory that has a fair market value of $8,573.
2. Green receives a two-year noninterest-bearing note having a face value of $10,000.

In this situation, the fair market value of the consideration is readily determinable and, thus, represents the amount at which the note is to be recorded. The following entry would be made by Green:

Notes receivable	10,000	
Discount on notes receivable		1,427
Sales revenue		8,573

The discount will be amortized to interest expense over the two-year period using the interest rate implied in the transaction, which is 8%. The present value factor is .8573 ($8,573/$10,000). Using a present value table for amount due in two years, .8573 is located under the 8% rate.

If neither the fair value of the property, goods, or services sold nor the fair value of the note receivable is determinable, then the present value of the note must be determined using an imputed market interest rate. This rate will then be used to establish the present value of the note by discounting all future payments on the note at that rate. General guidelines for determining the appropriate interest rate, which are provided by ASC 835, include the prevailing rates of similar instruments with debtors having similar credit ratings and the rate the debtor could obtain for similar financing from other sources. Other factors to be considered include any collateral or restrictive covenants involved, the current and expected prime rate, and other terms pertaining to the instrument. The objective is to approximate the rate of interest that would have resulted if an independent borrower and lender had negotiated a similar transaction under comparable terms and conditions. This determination is as of the issuance date, and any subsequent changes in market interest rates are irrelevant.

Additional discussion about present value techniques, including additional examples, is found in Chapter 15.

Lending and financing activities, including trade receivables. Receivables generally arise from extending credit to others. Banks, savings institutions, finance companies, credit unions, and mortgage companies are generally thought of as the types of entities that extend credit. However, all entities that sell on credit to customers (that is, trade receivables) also extend credit, however briefly. ASC 942, *Financial Services—Depository and Lending,* sets standards for the recognition, measurement, presentation, and disclosure of financing and lending transactions of all types.

The scope of ASC 942 is very broad. The only financing and lending transactions exempt from the standard are those (1) of entities that report receivables at fair value with gains and losses included in earnings or (2) that are subject to a category (a) standard that conflicts with the guidance in the standard. The provisions of the standard are discussed below, at the end of this chapter, and further in Chapter 25.

If the reporting entity has the intent and ability to hold trade receivables or loans for the foreseeable future or until maturity or payoff, those receivables are reported in the balance sheet at outstanding principal (face) amount less any write-offs and allowance for uncollectible receivables. Loans originated by the reporting entity are reported net of deferred fees or costs of originating them, and purchased loans are reported net of any unamortized premium or discount. Once a decision has been made to sell loans, those loans are transferred to a held-for-sale category on the balance sheet and reported at the lower of cost or fair value. Any amount by which cost exceeds fair value is accounted for as a valuation allowance.

When a trade receivable or loan is deemed uncollectible, the balance is written off against the allowance for uncollectible receivables. Recoveries of loans and trade receivables that were previously written off are recorded when received—either by a credit directly

to earnings or by a credit to the allowance for uncollectible receivables. A credit loss on a financial instrument with off-balance-sheet risk is recorded as a liability rather than being included in a valuation allowance netted against a recognized financial instrument. When settled, the credit loss is deducted from the liability.

ASC 942 also includes standards for recognizing fees related to receivables. Delinquency fees are to be recognized when chargeable, provided that collectibility is reasonably assured. Prepayment fees are not to be recognized until prepayments have occurred. Rebates of finance charges due because payments are made earlier than required are to be recognized when the receivables are prepaid and are accounted for as adjustments to interest income.

Example of delinquency fees, prepayment fees, and rebates

The DitchWay Company sells a ditch digging machine called the DitchMade that contractors use to lay utility lines and pipes. DitchWay invoices customers a standard monthly fee for two years, using a book of 24 preprinted invoices, after which they receive title to their DitchMade machines. The DitchMade machine is patent-protected and unique, so contractors must purchase from DitchWay. If a contractor makes a late payment, DitchWay bills them a $150 late fee. Since DitchWay can withhold title to the equipment if all fees are not received, the collection of these fees is reasonably assured. Its entry to record a late fee follows:

Accounts receivable	150	
Income—delinquency fees		150

One contractor enters bankruptcy proceedings. It has accumulated $450 of unpaid delinquency fees by the time it enters bankruptcy. DitchWay uses the following entry to eliminate the fees from its accounts receivable:

Bad debt reserve	450	
Accounts receivable		450

DitchWay's sale agreement recognizes that its billing schedule is essentially a series of loan payments with an implied interest rate of 12%. About 20% of all contractors obtain better financing elsewhere and prepay their invoices in order to reduce the interest payment. DitchWay charges a flat $500 prepayment fee when a prepayment occurs. Though the proportion of early payments is predictable, DitchWay cannot recognize prepayment fees until each prepayment actually occurs. One contractor makes a prepayment, so DitchWay records the following entry:

Accounts receivable	500	
Income—prepayment fees		500

The DitchWay sales agreement also states that, when a contractor prepays an invoice, it should pay the full amount of the invoice, even if paid early, and DitchWay will rebate the unearned portion of the interest expense associated with the early payment. In one case, a contractor prepays a single $2,500 invoice for which the original sales entry was as follows:

Accounts receivable	2,500	
Interest income		450
Revenue		2,050

The amount of interest to be rebated back to the contractor is $225, which DitchWay records with the following entry:

Interest income—rebated	225	
Cash		225

The use of the contra account, interest income—rebated, provides the reporting entity with greater control and information for management purposes. However, the debit could be made directly to interest income if these enhancements are not useful.

Pledging, assigning, and factoring receivables. An organization can alter the timing of cash flows resulting from sales to its customers by using its accounts receivable as collat-

eral for borrowings or by selling the receivables outright. A wide variety of arrangements can be structured by the borrower and lender, but the most common are pledging, assignment, and factoring.

Pledging is an agreement in which accounts receivable are used as collateral for loans. The customers whose accounts have been pledged are not aware of this event, and their payments are still remitted to the original entity to which the debt was owed. The pledged accounts merely serve as security to the lender, giving comfort that sufficient assets exist to generate cash flows adequate in amount and timing to repay the debt. However, the debt is paid by the borrower whether or not the pledged receivables are collected and whether or not the pattern of their collection matches the payments due on the debt.

The only accounting issue relating to pledging is that of adequate disclosure. The accounts receivable, which remain assets of the borrowing entity, continue to be shown as current assets in its financial statements but must be identified as having been pledged. This identification can be accomplished either parenthetically or by note disclosures. Similarly, the related debt should be identified as having been collateralized by the receivables.

Example of disclosure for pledged receivables

Current assets:	
Accounts receivable ($3,500,000 of which has been pledged as collateral for bank loans), net of allowance for doubtful accounts of $600,000	8,450,000
Current liabilities:	
Bank loans payable (collateralized by pledged accounts receivable)	2,700,000

A more common practice is to include the disclosure in the notes to the financial statements. Since the borrower has not surrendered control of the pledged receivables, it continues to carry the pledged receivables as its assets (ASC 860). (More complex collateral arrangements are described in the section "Accounting for collateral" later in this chapter.)

The assignment of accounts receivable is a more formalized transfer of the receivables to the lending institution. The lender investigates the specific receivables that are being proposed for assignment and will approve those that it deems worthy as collateral. Usually customers are not aware that their accounts have been assigned and they continue to forward their payments to the original obligee (the borrowing entity). In some cases, the assignment agreement requires that collection proceeds be immediately delivered to the lender. The borrower is, however, the primary obligor of the debt and is required to make timely payment on the debt whether or not the receivables are collected as anticipated. The borrowing is with recourse, and the general credit of the borrower is pledged to the payment of the debt.

Since the lender knows that not all the receivables will be collected on a timely basis by the borrower, only a fraction of the face value of the receivables will be advanced as a loan to the borrower. Typically, this amount ranges from 70 to 90%, depending upon the credit history and collection experience of the borrower.

Assigned accounts receivable remain the assets of the borrower and continue to be presented in its financial statements, with appropriate disclosure of the assignment similar to that illustrated for pledging. Prepaid finance charges would be recorded as a prepaid expense and amortized to expense over the period to which the charges apply.

In the typical case involving the assignment of receivables, the borrower retains control of the receivables, and it is clear that the transaction is a secured borrowing rather than a sale. If it is unclear whether the borrower has retained control of the receivables, a determination must be made as to whether to account for the transfer as a sale or as a secured borrowing. Making that determination is discussed later in this chapter in the section titled "Transfers of Financial Assets under ASC 860."

Factoring traditionally involves the outright sale of receivables to a finance company known as a factor. These arrangements involve (1) notification to the customer to remit fu-

ture payments to the factor and (2) the transfer of receivables to the factor without recourse to the transferor. The factor assumes the risk of an inability to collect. Thus, once a factoring arrangement is completed, the transferor has no further involvement with the accounts, except for a return of merchandise.

In its simplest form, the receivables are sold and the difference between the cash received and the carrying value is recognized as a gain or loss.

Example of accounting for the factoring of receivables without recourse

Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables without recourse for $180,055. A total face value of $200,000 accounts receivable (against which a 5% allowance had been recorded) are involved. The entries required are as follows:

Cash	180,055	
Allowance for bad debts (200,000 × .05)	10,000	
Loss on sale of receivables	19,945	
Bad debts expense		10,000
Accounts receivable		200,000

The classic variety of factoring provides two financial services to the business: it permits the reporting entity to obtain cash earlier than waiting for customers to pay, and it transfers the risk of bad debts to the factor. The factor is compensated for each of these services. Interest is charged based on the anticipated length of time between the date the factoring arrangement is consummated and the expected collection date of the receivables sold. A fee is charged based upon the factor's anticipated bad debt losses.

Example of accounting for the factoring of receivables without recourse

Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables without recourse. The receivables have a total face value of $200,000 (against which a 5% allowance had been recorded). The factor will charge 20% interest computed on the weighted-average time to maturity of the receivables of thirty-six days plus a 3% fee.

The entries required are as follows:

Cash	180,055	
Allowance for bad debts (200,000 × .05)	10,000	
Interest expense (or prepaid) (200,000 × .20 × 36/365)	3,945	
Factoring fee (200,000 × .03)	6,000	
Loss on sale of receivables	10,000	
Bad debts expense		10,000
Accounts receivable		200,000

The interest expense, factor's fee and loss can be combined into a $19,945 loss on the sale of receivables.

Some companies factor receivables as a means of transferring bad debt risk, but leave the cash on deposit with the factor until the weighted-average due date of the receivables, thereby avoiding interest charges. This arrangement is still referred to as factoring, since the customer receivables have been sold. However, the borrowing entity does not receive cash but instead records a new receivable, usually captioned "Due from Factor." This receivable, in contrast to the original customer receivables, is essentially without risk and is presented in the balance sheet without a deduction for estimated uncollectible receivables.

Merchandise returns are normally the responsibility of the transferor, who must then make the appropriate settlement with the factor. To protect against the possibility that merchandise returns will diminish the total of receivables to be collected, a factor will frequently advance only a portion of the face amount of the factored receivables (less any interest and factoring fee deductions). The factor will retain a certain fraction of the total proceeds relating to the portion of sales that are anticipated to be returned by customers. This sum is known as the factor's holdback. When merchandise is returned to the transferor, an entry is

made offsetting the receivable from the factor. At the end of the return privilege period, any remaining holdback will become due and payable to the transferor.

Example of accounting for the factoring of receivables without recourse

1. Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables without recourse. The receivables have a total face value of $200,000 (against which a 5% allowance had been recorded). The factor will charge 20% interest computed on the weighted-average time to maturity of the receivables of thirty-six days plus a 3% fee. A 5% holdback will also be retained.
2. Thirsty's customers return for credit $4,800 of merchandise.
3. The customer return privilege period expires and the remaining holdback is paid to the transferor.

The entries required are as follows:

		Debit	Credit
1.	Cash	180,055	
	Allowance for bad debts (200,000 × .05)	10,000	
	Interest expense (or prepaid) (200,000 × .20 × 36/365)	3,945	
	Factoring fee (200,000 × .03)	6,000	
	Factor's holdback receivable		
	[$10,000/($10,000 + $190,000) × $190,000]	9,500	
	Loss on sale of receivables	500	
	Bad debts expense		10,000
	Accounts receivable		200,000

The interest expense, factor's fee and loss can be combined into a $10,445 charge to loss on the sale of receivables.

		Debit	Credit
2.	Sales returns and allowances	4,800	
	Factor's holdback receivable		4,800
3.	Cash	5,200	
	Factor's holdback receivable		4,700
	Loss on sale of receivables		500

The factor's holdback receivable recorded by the seller is required by ASC 860 to be an allocation of the carrying value of the receivables ($190,000) between the assets sold (the receivables) and the assets retained (the holdback) based on their relative fair values at the date of the factoring agreement. The factor holds back 5% of the face value ($200,000) for a total of $10,000. Upon settlement the loss or gain recorded at the origination of the factoring arrangement needs to be adjusted because the factor pays the remaining holdback of $5,200 ($10,000 holdback – $4,800 returns) in settlement of an asset with a carrying value of $4,700 ($9,500 – $4,800).

Factoring results in a transfer of title to the factored receivables. Where there is a no recourse provision or other continuing involvement with the receivables, the removal of the receivables from the borrower's balance sheet is clearly warranted.

Another variation is known as factoring with recourse. Accounting for factoring with recourse requires a determination of whether the transfer is a sale or a secured borrowing. That determination is made by applying ASC 860.

Transfers of Financial Assets under ASC 860

If receivables or other financial assets are transferred to another entity and the transferor has no continuing involvement with the transferred assets or with the transferee, it is clear that a sale has taken place, the asset should be derecognized, and a gain or loss on the sale is to be measured and recognized. However, in many cases, the transferor of the receivables has some form of continuing involvement with the transferred assets, either because it sells the receivables with recourse for uncollectible amounts, it retains an interest in the receiv-

ables, or it agrees to service the receivables after the sale. The more control that the transferor retains over the receivables, the more the transfer appears to be in substance a secured borrowing rather than a sale.

ASC 860 established the procedures used to determine whether a transfer of financial assets is a sale or a secured borrowing. The standard uses a financial components approach in which a single financial asset is viewed as a mix of component assets (controlled economic benefits) and component liabilities (obligations for probable future sacrifices of economic benefits). The focus is on who controls the components and whether that control has changed as a result of a given transfer. If the transferor has surrendered control of the transferred assets, the transfer is a sale. If the transferor retains control of the transferred assets, the transfer is a secured borrowing.

In order to be accounted for as an actual transfer (i.e., disposition) of financial assets, the transferred assets must be isolated from the transferor (put presumptively out of reach of the transferor's creditors); each transferee or holder of beneficial interest must be granted the right to pledge or exchange the transferred assets; and the transferor cannot maintain effective control over the assets. All conditions must be satisfied for derecognition accounting by the transferor to be appropriate.

Derecognition of financial liabilities by a debtor can be properly reflected only if the obligation is extinguished, which requires that either the debt is retired (paid off) or the debtor is legally released from being the primary obligor by either the counterparty or by judicial action (e.g., in bankruptcy proceedings). These conditions are discussed in the following paragraphs (financial assets) and in Chapter 14 (financial liabilities).

Scope. ASC 860 applies to transfers of noncash financial assets by and to an entity other than the issuer of the financial asset. Thus, a transfer includes selling a receivable, transferring a receivable to a trust, or using a receivable as security for a loan. A transfer includes neither the origination of a receivable, the settlement of a receivable, nor the restructuring of a receivable in a troubled debt restructuring because those transactions are transfers involving the issuer of the receivable.

Among the types of transfers of financial assets for which ASC 860 establishes standards are

- Transfers of receivables with recourse (factoring with recourse)
- Transfers of undivided partial interests in receivables (retained interests)
- Transfers of receivables with servicing retained
- Transfers of minimum lease payments under sales-type and direct financing leases and any related guaranteed residual
- Securitizations
- Repurchase agreements
- Securities lending
- Transfers of receivables as collateral

The foregoing types of transactions are discussed in this chapter. In addition, ASC 860 sets standards for extinguishments of liabilities, which are discussed in Chapter 15.

Examples of items included in the scope of ASC 860 are the accounting for

1. Beneficial interests in a securitization trust that holds nonfinancial assets such as securitized stranded costs or similar imposed rights (unless a third party must consolidate the trust).
2. A litigation judgment that is enforceable and contractually reduced to a fixed payment schedule.

3. Transfer of an equity method investment unless subject to ASC 845 (similar productive assets) or ASC 360-20-15 (sale of real estate).
4. A forward contract on a financial instrument that may be net settled or physically settled by exchange for cash or some other financial asset.
5. Recognized financial instruments that may be either financial assets or financial liabilities at some point (e.g., forward or swap contracts), must meet the criteria applicable to derecognition of financial assets *and* financial liabilities to be derecognized.
6. Dollar rolls in connection with the transfer of existing securities.
7. Transfers of investments in subsidiaries that have not been consolidated because the parent carries the investment at fair value (e.g., an investment company).

The following items are *excluded* from the scope of ASC 860:

1. The right to receive the minimum lease payments under an operating lease since it is an unrecognized financial asset.
2. Transfers of servicing rights that are contractually separated from the serviced assets because they are nonfinancial assets.
3. Payment of cash or conveyances of noncash financial assets in partial or full settlement of a debt. An origination, settlement, or restructuring of a receivable is not a transfer since it does not involve a conveyance of a noncash financial asset by or to someone other than the issuer.
4. Acquisition of treasury shares by exchanging noncash financial assets, because it is an investment by or a distribution to owners.
5. Desecuritization of securities into loans or other financial assets.
6. Securitized stranded costs of electric utilities (although enforceable rights) are not considered financial assets since they arise from an imposition of tax rather than a contractual agreement.
7. Contingent receivables from litigation before terms are reduced to a contract.
8. Transfer of ownership interest in a consolidated subsidiary if the subsidiary's assets are not all financial assets.
9. Recognized derivatives that are nonfinancial assets (an option to purchase commodities) at the date of transfer.
10. Dollar rolls when the underlying securities do not yet exist or are to be announced (TBA GNMA rolls).
11. Transfers of unguaranteed residual values on transfers of sales-type or direct financing lease receivables.

Surrender of control. A transfer of financial assets (or a portion of a financial asset) is a sale if the transferor surrenders control over those assets in exchange for consideration. However, control is not surrendered to the extent that the consideration received is a beneficial interest in the transferred assets. For example, a transferor's exchange of one form of beneficial interests in a trust for an equivalent, but different, form in the same transferred financial assets cannot be accounted for as a sale. If the trust initially issued the beneficial interests, the exchange is not even considered to be a transfer under ASC 860. A proposed amendment to ASC 860, *Accounting for Transfers of Financial Assets*, was first exposed in 2003, further exposed in revised form in 2005, and remains under deliberation as of early 2009. Given recent subprime and other lending concerns, which in part arise from securitization practices involving complex structures employing off-balance-sheet accounting, this project is expected to receive renewed attention until resolution, now projected for mid-2009.

Elimination of *qualified* SPE status is deemed a likely outcome, although this is by no means a certainty.

The existing standard specifies that control is deemed to have been surrendered by the transferor only if all of the following conditions are met.

NOTE: Proposed amendments to these criteria, currently under consideration by FASB, are set forth in italics in the following:

1. The assets transferred are beyond the reach of the transferor and its affiliates (to be amended to specify consolidated affiliates that are not an SPE or other bankruptcy-remote entity), its creditors, potential bankruptcy trustees or other receivers, except for an affiliate that is a qualifying special-purpose entity (QSPE).

   NOTE: ASC 810 introduced the concept of variable interest entities, or VIE, which largely superseded the concept of SPE, but entities that met the criteria for qualifying special-purpose entities, or QSPE, under ASC 860 continue to be so classified. That is, by definition QSPEs are not VIEs and are not subject to consolidation.

   NOTE: Largely as a consequence of the subprime mortgage lending and collateralized debt obligation (CDO) developments of late 2007 and early 2008, FASB has signaled its intent to reexamine the use of QSPEs, and there is a reasonable expectation that QSPEs may be eliminated as a vehicle for off-balance-sheet financing, perhaps by mid-2009.

2. The transferee (or if the transferee is a QSPE, each holder of its beneficial interests) has the right to pledge or exchange the assets (or beneficial interests) it received, and no condition both (1) constrains the transferee (or holder) from taking advantage of its right to pledge or exchange and (2) provides more than a trivial benefit to the transferor.

   NOTE: This will be expanded to state that if the transaction involves a series of steps intended to isolate the transferred assets, each entity that receives the transferred financial assets is a transferee, and thus each transfer must meet the foregoing conditions.

3. The transferor (or its consolidated affiliates, per the proposed amendment) does not maintain effective control over the transferred assets. A transferor maintains effective control if (1) an agreement both entitles and obligates the transferor to repurchase or redeem the assets before their maturity or (2) the transferor has the ability to unilaterally cause the holder to return specific assets. If the transferor can cause the holder to return assets only through a cleanup call, that ability does not indicate effective control. (A cleanup call is an option to purchase the remaining transferred financial assets, or the remaining beneficial interests in a QSPE if the amount of outstanding assets or beneficial interests falls to a prespecified level at which the cost of servicing those assets or beneficial interests becomes burdensome in relation to the benefits of servicing.)
4. The proposed amendment to ASC 860 will further stipulate that the isolation analysis must take into account any arrangement or agreement that is undertaken in connection with the transfer, even if not consummated at the time of the transfer.
5. The proposed amendment to ASC 860 will also specify that, if the transferee is a QSPE, no arrangement or agreement is to be made between any holder of beneficial interests issued by the QSPE and the transferor or its consolidated affiliates that would have resulted in not isolating the assets transferred if such arrangement or agreement had been between the QSPE itself, rather than its beneficial interest holders.

All available evidence is to be assessed to determine if transferred assets would be beyond the reach of the powers of a bankruptcy trustee (or equivalent). It is irrelevant to this

determination that the possibility of bankruptcy is remote at the date of the transfer. Instead, the transferor must endeavor to isolate the assets in the event of bankruptcy, however unlikely that eventuality may be. In many cases, transferors use two transfers to isolate the transferred assets. First, it transfers the assets to a wholly owned corporation that is designed in a way that prevents the transferor or its creditors from reclaiming the assets (or makes the possibility that they can reclaim them remote). Next, the wholly owned corporation transfers the assets to a trust. The trust is prevented from undertaking any business other than management of the assets and from incurring any liabilities. (Thus, there are no creditors to force bankruptcy of the trust.)

A determination that the transferred assets are beyond the reach of a bankruptcy trustee may require a legal opinion regarding the application of the laws of the relevant jurisdiction. Such legal opinions commonly address whether a "true sale" has occurred, and in practice different attorneys may reach different conclusions regarding a given transaction. If a transfer is to an affiliated entity, the legal opinion would also have to address whether the transferee did not need to be consolidated (i.e., that it was a QSPE). There is nothing under GAAP that makes obtaining a "true sale" opinion an absolute necessity, however.

The existence of setoff rights does not impede the finding of a "true sale." In practice, while setoff rights may exist for the transferor and transferee, if either the obligor under the transferred financial asset (e.g., debtor under transferred receivable) or the transferor entity enters bankruptcy, the transferee might have only an unsecured claim, notwithstanding the nominal right of setoff.

Assets transferred by a bank or other financial institution that is subject to possible receivership by the FDIC can be considered isolated from the transferor even if the FDIC or another creditor can require their return, provided that the return can only occur in receivership, after a default, and in exchange for a payment of, at a minimum, principal and interest earned at the contractual yield to the date the investors are paid. (That rule does not apply to situations in which the transferor can require return of the assets in exchange for payment of principal and interest earned at the contractual yield to the date the investors are paid. In those cases the assets are not isolated from the transferor.)

A transferee has control of transferred assets if there is the unconstrained right to both pledge and exchange the assets. In actual practice it may be more difficult to discern whether the transferee has control if it can pledge the transferred assets but cannot sell them. The key to a determination of control by a transferee with the right to pledge *or* exchange the assets rests on whether the transferee obtains all or most of the cash inflows that are the primary economic benefits of the pledged or exchanged assets. Generally, the right of first refusal, prohibition of a sale to competitors, and the requirement to obtain transferor permission that won't be unreasonably withheld (judgment is necessary in this case) to sell or pledge won't preclude accounting as a sale. Agreements that constrain the transferee from pledge or exchange are to be accounted for as secured borrowings.

Maintaining effective control. The criteria set forth by ASC 860 must be met in order for a transfer to be accounted for as a sale, and the formal criteria identified in the body of the standard are affected by the expanded implementation guidance included in Appendix A to the standard. If the transferor maintains effective control, the transfer is accounted for as a secured borrowing and not as a sale.

The transferor must not be able to unilaterally take back the transferred assets. Therefore, a call option, a forward purchase contract, or a removal of accounts provision will in most cases defeat the determination that a sale has taken place. The transferor cannot take back the transferred assets even through the liquidation of the VIE or QSPE. For example, a transferor that holds a residual interest in a QSPE must be precluded from participating in

any auction that QSPE may hold at the termination of its existence because presumably it would be willing to pay a price above any other bidder because it would receive any excess over fair value back via its residual interest.

A transferor maintains effective control over the transferred assets, and thus cannot account for the transfer as a sale, if a repurchase or redemption agreement meets all of the following conditions:

1. The assets covered by the agreement must be the same or substantially the same as the transferred assets. In order to meet this condition, the assets transferred and those to be repurchased or redeemed must meet all of the following conditions:
   a. The same primary obligor or, in the case of government-guaranteed instruments, the same guarantor and terms of the guarantee. (If the asset is debt guaranteed by a sovereign government, central bank, government-sponsored enterprise or agency thereof, the guarantor and the terms of the guarantee must be the same.)
   b. Identical form and type providing the same risks and rights
   c. The same maturity, or, in the case of mortgage-backed pass-through or pay-through securities, have similar remaining weighted-average maturities that provide approximately the same market yield
   d. Identical contractual interest rates
   e. Similar collateral
   f. The same aggregate unpaid principal amount or principal amounts that are within accepted "good delivery" standards for the type of security being transferred
2. The transferor is able to repurchase or redeem the assets on substantially the agreed terms even if the transferee were to default. In order to meet this condition, the transferor must, during the entire term of the contract, have obtained cash or other collateral sufficient to fund substantially the entire cost of purchasing replacement assets from others. For example, a contractual provision that terminates a repurchase agreement immediately if the value of the collateral becomes insufficient to fund substantially all of the cost of purchasing replacement assets would satisfy the requirement, as would a margining provision.
3. The redemption or repurchase agreement is executed concurrently with the transfer of the assets and requires repurchase or redemption prior to maturity at a fixed or determinable price.

ASC 860-20-55 addresses situations where the original transferee subsequently transfers the financial assets back to the original transferor as collateral for a borrowing arrangement under a repurchase arrangement. The issue is whether this violates the surrender of control criterion of ASC 860, obviating the ability of the original transferor to record the transfer as a sale. It establishes criteria under which the secured borrowing could be evaluated separately from the initial transfer for purposes of determining proper accounting.

Under the provisions of this standard, the transferor and transferee are to separately account for a transfer of a financial asset and a related repurchase financing arrangement only if the two transactions have a valid and distinct business or economic purpose for being entered into separately, *and* the repurchase financing does not result in the transferor regaining control over the financial asset. The valid business purpose criterion excludes obtaining favorable accounting treatment. To qualify for separate accounting treatment, the initial transfer of a financial asset and the repurchase financing entered into either contemporaneously

with, or in contemplation of, each other must meet *all* of the following conditions at inception of the transaction:

1. The initial transfer and the repurchase financing are not contractually contingent on each other, so that the pricing and performance of either the transfer or the repurchase financing will not be dependent on the terms and execution of the other.
2. The repurchase financing provides the initial transferor with recourse to the transferee upon default, which must leave the transferor exposed to the credit risk of the transferee or its affiliates, and not only exposed to the market risk of the transferred financial asset.
3. The transferee's agreement to repurchase the previously transferred financial asset is at a fixed price (generally related to the agreed interest rate on the amount financed) and not at fair value.
4. The financial asset is readily obtainable in the marketplace, and the transfer and repurchase financing are executed at market rates, and not circumvented by embedding off-market terms in a separate transaction contemplated at the time of the initial transfer or the repurchase financing.
5. The maturity date of the repurchase financing is earlier than that of the financial asset.

If the transaction satisfies each of the above-noted conditions, the initial transfer should be evaluated to determine if, without consideration of the repurchase financing, it meets the requirements for sale accounting under ASC 860. Also, the transferor and transferee should analyze the repurchase financing as a repurchase agreement, with both parties using the same criteria.

On the other hand, if the transactions do not meet all of these conditions, the initial transfer and repurchase financing should be evaluated as a linked transaction to determine whether it meets the requirements in ASC 860 for sale accounting. If the linked transaction does not qualify for sale accounting, the linked transactions should be accounted for based on the economic substance of the combined transactions. Typically, these will represent a forward contract, to be accounted for in accordance with ASC 815.

Readers should also be alert to the possibility that the status of qualified special-purpose entities (QSPE) may be changed significantly, largely due to the reaction to the subprime lending problems that surfaced in 2007 and 2008. One possible outcome is that QSPE may be eliminated entirely. FASB now promises to promulgate revised guidance by mid-2009.

Accounting for transfers. Upon any transfer (whether accounted for as a sale or as a secured borrowing), the transferor will allocate, based on relative fair values at the date of transfer, the previous carrying amount between the retained interests, if any, and the assets transferred. Retained interests are interests in the transferred assets over which control has not been given up by the transferor. They include servicing assets and liabilities, undivided interests in the transferred assets, and beneficial interests in assets transferred to a qualifying special-purpose entity in a securitization.

If a sale, the transferor (seller) is to

1. Derecognize all assets sold
2. Recognize all assets obtained (including cash, options, swaps, etc.) and liabilities incurred (including forward commitments and servicing liabilities) in consideration as proceeds
3. Measure assets controlled and liabilities incurred at fair value initially if they are part of the proceeds of the sale (new assets and liabilities, which could include cash, put or call options held or written—such as guarantee or recourse obligations, for-

ward commitments, swaps, beneficial interests, and servicing liabilities). If it is not practical to estimate the fair value of the assets, the transferor will record those assets at zero. If it is not practical to estimate the fair value of the liabilities, the transferor will not recognize any gain on the transaction and will record liabilities at the greater of

a. Excess fair value of the assets obtained minus the fair value of the liabilities incurred, over the carrying value of the assets transferred or
b. The amount to be recorded in conjunction with ASC 450-20-55 that represents the minimum amount in an estimated range of a probable liability.

4. Recognize gains or losses in earnings.

All financial asset transfers not meeting the sale criteria are required to be accounted for as secured borrowings with collateral (or another security interest) pledged.

Other qualifying SPE issues. ASC 860 sets forth certain conditions that must be met for a trust or other legal entity to be considered a qualifying special-purpose entity (QSPE). One condition is that a QSPE may hold only passive derivative financial instruments that pertain to beneficial interests issued or sold to parties other than the transferor, its affiliates, or its agents. (Note that, in the context of the recent subprime mortgage crisis, the strict requirement that the QSPE act only in a passive capacity has been blamed for the inability of banks and other financial institutions to respond in a proactive way, e.g., by restructuring the terms of troubled debt.)

Another set of requirements established by ASC 860 defines when a derivative financial instrument pertains to beneficial interests issued (other than another derivative financial instrument). It states this will be satisfied only if the derivative instrument

1. Is entered into (a) when the beneficial interests are issued by the QSPE to parties other than the transferor, its affiliates, or its agents or sold to such other parties after being issued by the QSPE to the transferor, its affiliates, or its agents or (b) when a passive derivative financial instrument needs to be replaced upon occurrence of an event or circumstance (specified in the legal documents that established the SPE or created the beneficial interests in the transferred assets that it holds) outside the control of the transferor, its affiliates, or its agents, for example, when the counterparty to the derivative defaults or is downgraded below a specified threshold;
2. Has a notional amount that does not initially exceed the amount of those beneficial interests and is not expected to exceed them subsequently; and
3. Has characteristics that relate to, and partly or fully but not excessively counteract, some risk associated with those beneficial interests or the related transferred assets.

The FASB limited the notional amount of the derivatives in a QSPE to the amount of beneficial interests held by parties other than the transferor, its affiliates, or its agents (outside parties) in order to prevent a transferor from avoiding the requirements of ASC 815 by transferring derivatives to a QSPE that relate to its own beneficial interests in the QSPE. According to ASC 860, "The Board noted that if the transferor wanted to enter into derivative instruments pertaining to the beneficial interests it holds, it could accomplish that by entering into such derivative instruments on its own behalf, which would be accounted for under ASC 815." The basis for requiring that the derivatives not excessively counteract the risks associated with the beneficial interests held by parties other than the transferor or its affiliates was to preclude a QSPE from holding a derivative that does not pertain to the beneficial interests held by outside parties.

However, questions have since arisen in practice which caused FASB to expand upon the standard in ASC 860-40-55, to clarify application of the original provisions of ASC 860. The standard holds that

> *The requirements of paragraphs (b) and (c), above, must be met when beneficial interests are initially issued by the QSPE, or when a passive derivative financial instrument needs to be replaced upon the occurrence of a specified event outside the control of the transferor, its affiliates, or its agents. Assessing whether the requirements of paragraphs (b) and (c), above, are met is to be based on an analysis of the expected assets of the QSPE and the expected amount of beneficial interests held by outside parties over the expected life of the qualifying SPE. However, unexpected subsequent events outside the control of the transferor, its affiliates, or its agents (e.g., prepayments of assets of the QSPE), that were not contemplated by an analysis of the expected assets of the QSPE and the expected amount of beneficial interests held by outside parties when the beneficial interests of the QSPE were issued would not impair the qualified status of the QSPE.*
>
> *Purchases of previously issued beneficial interests by a transferor, its affiliates, or its agents from outside parties that are held temporarily and are classified as trading securities are not to be considered when determining whether the requirements of paragraphs (b) and (c), above, are met.*
>
> *Furthermore, any remedial action taken by the QSPE to "rebalance" the derivative amount with the amount of beneficial interests held by parties other than the transferor, its affiliates, or its agents must be taken in accordance with the terms and activities specified in the governing documents of the QSPE at the time it was originally established. That is, all activities must continue to meet the permitted activities limitations of ASC 860. In this regard, activities include, but are not limited to, the selection of a derivative counterparty, the determination of the notional amount, and the timing of the amortization of the notional amount and must be considered with the activities specified in the legal document that established the SPE.*

Measuring assets and liabilities after completion of a transfer. ASC 860 addresses initial recognition and measurement but, except for servicing, does not address subsequent measurement. Existing GAAP must be used for that purpose. For example

1. Interest-only strips, retained interests in securitizations, loans, other receivables, or other financial assets that can contractually be prepaid or otherwise settled in such a way that the holder would not recover substantially all of its recorded investment (except for derivative instruments that are within the scope of ASC 815) are to be subsequently measured like investments in debt securities classified as available-for-sale or trading under ASC 320, and thus at fair value.
2. Equity securities that have readily determinable fair values are subsequently measured in accordance with ASC 320, at fair value (either available-for-sale or trading).
3. Debt securities are subsequently measured in accordance with ASC 320, ASC 948 (mortgage-backed securities) or ASC 325-40 (purchased and retained beneficial interests in securitized financial assets).
4. Derivative financial instruments are subsequently measured in accordance with ASC 815.

If it was initially impracticable to measure the fair value of an asset or liability but it later becomes practicable, the transferor does not remeasure the asset or liability (or the gain or loss) under ASC 860 unless it is a servicing asset or liability. (ASC 860-50-35, *Transfers and Servicing—Servicing Assets and Liabilities*, has revised accounting for servicing assets and liabilities; this is discussed in detail later in this chapter.) However, adjustment of the carrying value may be required by other standards, such as ASC 320.

The provisions of ASC 860 apply to a wide range of transfers of financial instruments. Some of those are discussed in the following paragraphs.

Transfers of receivables with recourse. Classic factoring involves the outright sale of receivables and, notwithstanding the existence of a "holdback" intended to deal with returns and allowances, are accounted for as sales. However, some entities have such a poor history of uncollectible accounts that factors are only willing to purchase their accounts if a substantial fee is collected to compensate for the risk. If the company believes that the receivables are of a better quality than the factor has assessed them, a way to avoid excessive factoring fees is to sell these receivables with recourse. This variation of factoring is, in substance, an assignment of receivables with notification to the affected customers (whereas traditional assignment does not include notification of debtors).

Structure of transfer. In a transfer of receivables with recourse, the transferor is obligated to make payments to the transferee or to repurchase receivables sold upon the occurrence of an uncertain future event. Typically, recourse provisions compensate the transferee for uncollectible accounts (sometimes amounts over a defined threshold), but they can also be written to compensate the transferee for such uncertain future events as prepayments of receivables subject to discounts or that are interest bearing, merchandise returns, or other events that change the anticipated cash flows from the receivables.

The effect of a recourse provision on the application of ASC 860's surrender of control provisions may vary by jurisdiction and by the level of recourse provided. For example, in some jurisdictions, full recourse will not place the receivables beyond the reach of the transferor and its creditors, while a limited recourse provision may have this result. Thus, some transfers of receivables with recourse will meet the criteria of ASC 860 and be accounted for as sales; other transfers will fail the criteria and be accounted for as secured borrowings. The remaining discussion in this section relates to scenarios where the arrangement qualifies for sales treatment.

Applicability of ASC 815 or ASC 460. In order for the recourse provision to be exempt from derivatives accounting, it must meet *all three* of the following criteria:

1. The contract provides for payments to be made solely to reimburse the guaranteed party (the factor) for failure of the debtor to satisfy its obligations to make required payments, when due at prespecified payment dates or at dates that are earlier due to acceleration caused by a default. For the purposes of meeting this criterion, the debtor's obligation cannot be due under a contract that is accounted for as a derivative.
2. Payment under the recourse provision is made only if the debtor's obligation under 1. above is past due.
3. At the date of inception of the factoring arrangement and subsequently throughout the term of the arrangement, the factor will be exposed to the risk of nonpayment through direct or indirect ownership of the guaranteed receivable.

If the recourse provision fails any of the three above criteria, it is considered a derivative and is accounted for by the transferor under the provisions of ASC 815, discussed in detail in Chapter 8.

Another accounting issue to consider is whether the recourse provision is considered a guarantee under ASC 460. ASC 460, which is discussed in detail in Chapter 14, provides that a contract that contingently requires the guarantor to make payments to the guaranteed party (in this case the factor) based on the nonoccurrence of a scheduled payment under a contract is considered a guarantee. The determination that the recourse obligation is a guarantee does not affect the measurement of that obligation because the measurement rules of ASC 460 are identical with the measurement rules for a recourse obligation that is not

considered a guarantee. However, it is important to determine the applicability of that interpretation because ASC 460 requires additional disclosures not demanded by ASC 860.

Computing gain or loss. In computing the gain or loss to be recognized at the date of a transfer of receivables that meets the criteria of ASC 860, the borrower (transferor) must take into account the anticipated chargebacks from the transferee. This action requires an estimate by the transferor, based on its past experience. Adjustments are to be made at the time of sale to record the recourse obligation for the estimated effects of any bad debts, prepayments by customers (where the receivables are interest-bearing or where cash discounts are available), and any defects in the eligibility of the transferred receivables. In computing this recourse obligation, the transferor is to consider all probable credit losses over the life of the transferred receivables. The recourse obligation is to be measured at its fair value on the date of sale.

A present value method is acceptable for estimating fair value if the timing of the future cash flows are reasonably estimable. In applying a present value method, the estimated future cash flows are to be discounted using a discount rate at which the liability could be settled in an arm's-length transaction (i.e., a risk-adjusted rate versus a risk-free rate). Subsequent accruals to adjust the discounted amount are to be discounted at the interest rate inherent in determining the initial recourse obligation. ASC 860 expresses a preference for the use of the CON 7 probability-weighted expected cash flow model over the more traditional discounting of the single point estimate of the most probable or most likely cash flows. This model is discussed and illustrated in Chapter 1.

Example of accounting for the transfer of receivables with recourse

1. Thirsty Corp. enters into an agreement with Rich Company to sell a group of its receivables with a face value of $200,000 on which a 5% allowance for uncollectible accounts had been recorded. Rich Company (the factor) will charge 20% interest computed on the weighted-average time to maturity of the receivables of thirty-six days and a 3% fee. A 5% holdback will also be retained.
2. Generally, 40% of Thirsty's customers take advantage of a 2% cash discount.
3. The factor accepts the receivables subject to recourse for nonpayment.
4. In this jurisdiction, the transfer qualifies as a sale.

Under ASC 860, Thirsty must record the recourse liability. It has accepted the obligation for all credit losses and has, in effect, guaranteed the receivables. The recourse obligation is measured as the estimate of uncollectibles (5% of face value).

The entry required to record the sale is

Cash	180,055	
Allowance for bad debts	10,000	
Interest expense (200,000 × .20 × 36/365)	3,945	
Factoring fee (200,000 × .03)	6,000	
Factor's holdback receivable		
[$10,000/($10,000 + $190,000) × $190,000]	9,500	
Loss on sale of receivables	2,100	
Due to factor for discounts (200,000 × .40 × .02)		1,600
Accounts receivable		200,000
Recourse obligation		10,000

Simplified, the entry is

Cash	180,055	
Allowance for bad debts	10,000	
Factor's holdback receivable (9,500 – 1,600)	7,900	
Loss on sale of receivables (3,945 + 6,000 + 2,100)	12,045	
Accounts receivable		200,000
Recourse obligation		10,000

The accounts receivable net of the allowance for uncollectible accounts (a valuation allowance) is removed from the transferor's accounting records as it has been sold. Previously accrued bad debts expense is not reversed, however, as the transferor still expects to incur that expense through the recourse provision of the factoring agreement. (Alternatively, the bad debts expense could have been reversed and the new charge to loss on sale will have to be increased by $10,000.) The loss on sale of receivables is the sum of the interest charged by the factor ($3,945), the factor's fee ($6,000), the expected chargeback for cash discounts to be taken ($1,600), and the difference between the holdback receivable at face value and at carrying value ($500). The factor's holdback receivable is a retained interest in the receivables transferred, and it is measured by allocating the original carrying amount ($190,000) between the assets sold ($190,000) and the assets retained ($10,000).

If, subsequent to the sale of the receivables, the actual experience relative to the recourse terms differs from the provision made at the time of the sale, a change in an accounting estimate results. It is accounted for prospectively, as are all changes in accounting estimates, and therefore will be reflected as an additional gain or loss in the subsequent period. These changes are not to be deemed corrections of errors or other retroactive adjustments.

If the above facts apply, but the transfer does not qualify as a sale, the borrower's entry will be

Cash	180,055	
Interest expense (or prepaid)	3,945	
Factoring fee	6,000	
Factor borrowing payable		190,000

In a secured borrowing, the accounts receivable continue to be recognized by the borrower. Both the accounts receivable and the factor borrowings payable must be cross-referenced on the face of the balance sheet or in the notes to the financial statements. The accounting for the collateral under ASC 860 depends upon the terms of the collateral agreement. Accounting for collateral is discussed later in this chapter.

Retained interests. Interests in transferred assets that are not a part of the proceeds of a sale are considered retained interests that are still under the control of the transferor. Retained interests include undivided interests for which control has not been given up by the transferor, servicing assets and liabilities, and beneficial interests in assets transferred to a qualifying special-purpose entity in a securitization. In general, the more extensive an interest that the transferor of assets retains, the less likely the transaction will be classified as a sale and the more likely the transaction will be classified as a secured borrowing. The primary reason for this result is that in a true sale, the transferor no longer bears the risks or reaps the rewards associated with the transferred assets. If a determination cannot be made between classification as proceeds of a sale or as retained interests, the asset is classified as proceeds and measured at fair value.

Retained interests are measured by allocating the carrying value of the transferred assets before the transfer between the assets sold (if any) and the assets retained based on their relative fair values on the date of transfer. ASC 860-50-35 specifies that the carrying value allocated is to be exclusive of any amounts included in an allowance for loan losses. Any gain recognized upon a partial sale of a loan is not to exceed the gain that would be recognized if the entire loan were sold. If the transferor retains a servicing contract, a portion of the carrying value is allocable to either a servicing asset retained or a servicing liability undertaken since ASC 860 requires all entities servicing financial assets for others to recognize either a servicing asset or servicing liability for each servicing contract.

Relative fair value determinations are to incorporate assumptions regarding interest rates, defaults, and prepayments that marketplace participants would make, as well as the expected timing of cash flows. This allocation must be applied to all transfers that have re-

tained interests, regardless of whether or not they qualify as sales. It should be noted that this fair value allocation may result in a relative change in financial reporting basis unless the fair values are proportionate to their carrying values. Thus, the gain or loss from any sale component could also be affected.

The retained interests continue to be the transferor's assets since control of these assets has not been transferred. Thus, the retained interest is considered continuing control over a previously owned asset (although the form may have changed). It is not to be remeasured at fair value, nor is a gain or loss recognized on it.

Example: Sale of partial interest in receivables

Facts Given

Receivables' fair value	$16,500
Receivables' book value	15,000

Seller sells 80% of receivables and agrees to service them. The benefits of servicing are just adequate to compensate for the servicing, thus there is no servicing asset or liability to be recognized.

	FV	*80% FV*	*20% FV*	*Allocated 80% BV**	*Allocated 20% BV**
Receivables sold	$16,500	$13,200		$12,000	
Retained amount (20%)			$3,300		$3,000

* *Allocated based on the relative fair values.*

Seller's Journal Entry

Cash	13,200	
Receivables		12,000
Gain		1,200

Seller reports retained amount at $3,000, which is defined by book value, not fair value.

Examples: Sale of loans with various types of retained interests

Facts Given Applicable to All Examples Below (Each Example Is Independent)

Loans' fair value and amount of cash proceeds	$16,500
Loans' book value	15,000
Fair value of recourse obligation	(900)
Fair value of call option* on portfolio of $16,500	800
Fair value of interest rate swap on portfolio of $16,500	700

* *An option that permits the seller/transferor to repurchase the same or similar loans.*

Seller's Journal Entries

1. Sale only

Cash	16,500	
Loans		15,000
Gain		1,500

2. Sale with recourse obligation

Cash	16,500	
Loans		15,000
Recourse obligation		900
Gain		600

3. Sale with recourse obligation and call option to purchase the loans sold or similar loans

Cash	16,500	
Call option	800	
Loans		15,000
Recourse obligation		900
Gain		1,400

4. Sale with recourse obligation, call and swap (seller provides floating interest rate return although the underlying loans are at fixed interest rate terms)

Cash	16,500	
Call option	800	
Interest rate swap	700	
Loans		15,000
Recourse obligation		900
Gain		2,100

5. Partial sale with recourse obligation, call and swap. Seller sells 80% of loans.

	FV	*80% FV*	*20% FV*	*Allocated 80% BV**	*Allocated 20% BV**
Loans	$16,500	$13,200		$11,579	
Call	800	640		561	
Swap	700	560		491	
Recourse obligation	(900)	(720)		(631)	
Retained amount (20%)			$ 3,420		$3,000
	$17,100	$13,680	$ 3,420	$12,000	$3,000

Cash	13,200	
Call	640	
Swap	560	
Loans		12,000
Recourse obligation		720
Gain		1,680

Seller reports retained amount of receivables at $3,000, at book value.

* *Allocated based on the relative fair values.*

In some transfers of receivables, the transferor provides credit enhancement (similar to a recourse provision) by retaining a beneficial interest that absorbs the credit risk. If there is no liability beyond the transferor's retained subordinated interests, the retained interest is initially measured at allocated carrying value based on relative fair value, and no recourse liability is necessary. The retained interest would be subsequently measured like other retained interests held in the same form.

Cash reserve accounts and subordinated beneficial interests created as credit enhancements are retained interests and are accounted for as such even if the seller collects the proceeds and deposits a portion in the cash reserve account. (New asset credit enhancements such as financial guarantees and credit derivatives are measured at the fair value of the amount to benefit the transferor.) Paragraphs 68-70 provide guidance on estimating fair values and are to be used in the case of credit enhancements.

One possible method of estimating fair value of a credit enhancement is the cash-out method. Using that method, cash flows are discounted from the date the credit enhancement asset becomes available to the transferor (i.e., when the cash in the credit enhancement account is expected to be paid out to the transferor). The present value can be computed using an expected present value technique with a risk-free rate or a "best estimate" technique with an appropriate discount rate. Among other transferor assumptions, time period of restrictions, reinvestment income, and potential losses due to uncertainties must be included. ASC 860 does not provide guidance concerning subsequent measurement of credit enhancements.

ASC 860-20-55 holds that if the right to collect accrued interest and fees receivable (AIR) is transferred with receivables to a qualifying special-purpose entity (QSPE), those rights are one of the components of the sale transaction and are accounted for as a retained beneficial interest (presumably to the extent that cash flows from the AIR will return to the

transferor). Because the AIR cannot be contractually prepaid or settled in such a way that the transferor would not recover substantially all of its recorded investment, the beneficial interest is not required to be subsequently measured like an investment in debt securities classified as available for sale or trading under ASC 320.

Servicing. ASC 860-50-35 offers reporting entities a onetime option to reclassify certain financial assets categorized as available-for-sale to trading, in order to achieve more accurate matching of gains and losses on servicing obligations and those assets used, effectively, to hedge certain risks associated with holding servicing rights.

Servicing of financial assets can include such activities as

1. Collecting payments (principal, interest, and escrows)
2. Paying taxes and insurance from escrows
3. Monitoring delinquencies
4. Foreclosing
5. Investing funds temporarily prior to their distribution
6. Remitting fees to guarantors, trustees, and service providers
7. Accounting for and remitting distributions to holders of beneficial interests

Although inherent in holding most financial assets, servicing is a distinct asset or liability only when separated contractually from the underlying financial asset. The servicing asset usually results either from separate purchase or assumption of rights or from securitization with retained servicing. Servicers normally receive a defined percentage for performing these services (e.g., one-fourth of 1% on outstanding loan balances). Servicers' obligations are contractually specified. Servicing is subject to significant risks due to the effects of change in interest rates and debtors' propensity for prepayment of the related obligations.

When a transferor undertakes a duty to service the transferred financial assets, it recognizes either a servicing asset or a servicing liability unless the benefits of servicing neither exceed nor are less than the compensation to be received, in which case there is neither an asset nor liability to record (which would occur only in rare circumstances). Where the contractually agreed compensation is greater than the objective value of servicing, an asset is recognized, while if lower than the value, a liability is recorded.

Adequate compensation for servicing is determined by the marketplace. The concept of adequate compensation is judged by requirements that would be imposed by a new or outside servicer. It includes profit demanded by the marketplace and does not vary with the specific servicing costs of the servicer. Thus, it would not be acceptable to use a given servicer's cost plus a profit margin to estimate the fair value of a servicing asset or liability to be recognized by that particular servicer.

In general, servicing is associated with loans—most commonly, with mortgage loans—and as interest rates change the value of servicing contracts will also change, sometimes dramatically so. For example, if interest rates decline, debtors will have a greater propensity to prepay, reducing the amount of future servicing fees to be earned, and thus causing the value of the servicing contract to shrink. Conversely, if interest rates rise, the likelihood of prepayments declines, increasing the value of servicing contracts.

Other changes in economic conditions may also impact the value of servicing arrangements. Some entities having servicing contracts will attempt to hedge these risks by holding financial assets, the value of which will move in the opposite direction of the servicing contracts. Under ASC 860, financial reporting generally did not allow these offsetting effects to be accurately matched in periodic earnings; ASC 860-50-35 is intended, in part, to improve this accounting outcome.

Typically, the benefits are more than adequate compensation for the servicing and the servicing contract results in an asset. The benefits to be reaped by the servicer include

1. Fees
2. Late charges
3. Float
4. Other income

If the above benefits are not expected to provide adequate compensation, the contract results in a liability. With regard to the sale of assets, a servicing liability would reduce the net proceeds and would affect the gain or loss calculation.

If servicing is retained when the related assets are transferred, under ASC 860, any resulting servicing assets were to be measured at book value allocated based on relative fair values of loans and servicing at the date of sale, if practical. Servicing liabilities undertaken, servicing assets purchased, and servicing liabilities assumed were measured at fair value. Under ASC 860-50-35, however, separately recognized servicing assets and liabilities are both to be initially recognized at fair values, and—optionally—may also be remeasured at each subsequent reporting date at fair values. This standard thus altered the gain or loss recognition arising in connection with the sale of financial assets with retained servicing, when contrasted to past practice under ASC 860.

The remainder of this discussion is based on ASC 860-50-35.

ASC 860-50-35 requires that servicing assets or liabilities must be given recognition whenever the entity undertakes a commitment to provide servicing of financial assets, such as loans. This may arise when the entity transfers assets in a "true sale" situation (i.e., when gain or loss on the transfer is recognized, in contrast to transfers that are only secured borrowings). It will also arise when the reporting entity transfers financial assets into a QSPE in a guaranteed mortgage securitization transaction where the transferor retains all the resulting securities and categorizes them as available-for-sale or trading securities under ASC 320. Additionally, it can arise from independent acquisitions or assumptions of servicing rights or obligations unrelated to financial assets of the reporting entity or its consolidated affiliates.

In sharp contrast to practice under ASC 860, the new standard requires that all servicing assets and liabilities be initially recorded at fair values. The only exception permitted occurs when it is not practicable to do this (i.e., when fair values cannot be assessed). In subsequent reporting periods, the servicer may either use the amortization method or the fair value remeasurement method of accounting for the servicing assets and liabilities. Under the amortization method, servicing assets or liabilities are amortized in proportion to and over the period of estimated net servicing income or net servicing loss; servicing assets are to be assessed for any impairment, and servicing liabilities are assessed for increased obligation based on fair value at each reporting date. Under the fair value measurement method, servicing assets or servicing liabilities are adjusted up or down to fair value at each reporting date, and changes in fair value are included in earnings in the period in which the changes occur.

A reporting entity that elects to subsequently measure a class of separately recognized servicing assets and servicing liabilities at fair value should apply that election prospectively to all new and existing separately recognized servicing assets and servicing liabilities within those classes that a servicer elects to subsequently measure at fair value. This election cannot be applied on a contract-by-contract basis.

ASC 860-50-35 provides reporting entities with recognized servicing rights with an *optional* onetime reclassification of available-for-sale securities to trading securities, without calling into question the treatment of other available-for-sale securities under ASC 320, provided that the available-for-sale securities are identified as offsetting the entity's exposure to changes in fair value of servicing assets or servicing liabilities that a servicer elects to subsequently measure at fair value. Note that this election is not available relative to servicing

assets or liabilities that will be accounted for by the amortization method. Any gains and losses associated with the reclassified securities that are included in accumulated other comprehensive income at the time of the reclassification should be reported as a cumulative-effect adjustment to retained earnings as of the beginning of the fiscal year that an entity adopts ASC 860-50-35. The carrying amount of reclassified securities and the effect of that reclassification on the cumulative-effect adjustment should be separately disclosed.

The purpose of reclassifying financial assets to trading is to have the changes in fair values reported in current earnings, rather than in other comprehensive income. Including fair value changes in current income will tend to offset, albeit not perfectly, the income effects of changes in the servicing assets and liabilities being accounted for at fair value. There is no need to test for hedging effectiveness, in contrast to hedge accounting under ASC 815, although ASC 860-50-35 does require that these assets be identified as being useful in this regard.

Finally, ASC 860-50-35 requires that servicing assets and liabilities that are being accounted for at fair value must be segregated from those being accounted for by the amortization method. This can be accomplished by using separate financial statement captions, or by footnote disclosures.

Example: Sale of receivables with servicing asset retained by transferor

Facts

Receivables' fair value, without servicing	$16,500
Receivables' book value	15,000
Servicing liability of $16,500 portfolio	800

Partial sale of receivables with servicing liability (i.e., excess cost to provide servicing over fees anticipated) retained. Seller sells 80% of receivables.

	FV	*80% FV*	*20% FV*	*Receivables allocated 80% BV**	*Receivables allocated 20% BV**
Receivables sold	$16,500	$13,200		$12,000	
Servicing asset**	800	640			
Retained amount (20%)			$3,460		$3,000
	$17,300	$13,840	$3,460	$12,000	$3,000

* *Allocated based on the relative fair values.*
** *Initially measured at fair value, if practicable per ASC 860-50-35.*

Journal Entry

Cash	13,200	
Servicing asset	640	
Receivables		12,000
Gain		1,840

Seller reports retained receivables at $3,000 (book value) and the servicing liability at its fair value of $640.

Example: Sale of receivables with servicing liability retained by transferor

Facts Given

Receivables' fair value, without servicing	$16,500
Receivables' book value	15,000
Servicing (liability) for $16,500 portfolio	(500)

Partial sale of receivables with servicing liability (i.e., excess cost to provide servicing over fees anticipated) retained. Seller sells 80% of receivables.

Journal Entry

Cash	13,200	
Servicing liability		400
Receivables		12,000
Gain		800

Seller reports retained receivables at $3,000 (book value) and the servicing obligation at its fair value of $400.

ASC 860 imposes standards for both initial measurement and subsequent measurement of servicing assets and liabilities. Specifically, servicing assets or servicing liabilities from each contract are to be accounted for separately as follows:

1. Assets are to be reported separately from liabilities. They are not to be netted, since there is no right of offset.
2. Initially measure retained servicing assets and liabilities at fair values at date of sale or securitization.
3. Initially measure at fair value all purchased servicing assets, assumed servicing liabilities, and servicing liabilities undertaken in a sale or securitization.
4. Account separately for interest-only strips (future interest income from serviced assets that exceeds servicing fees).
5. Either amortize servicing assets and liabilities in proportion to and over the period of estimated net servicing income (the excess of servicing revenues over servicing costs), or adjust to fair value at each reporting date. However, if amortization is employed, impairment of servicing assets and increased obligation of servicing obligations must be accounted for, as described in the following point.
6. Evaluate and measure impairment of servicing assets as follows:
   a. Stratify recognized servicing assets based on predominant risk (asset size, type, interest rate, term, location, date of organization, etc.)
   b. Recognize impairment through a valuation allowance for individual stratum in the amount of the excess of carrying value over fair value.
   c. Adjust the valuation allowances to reflect subsequently needed changes. Excess fair value for a stratum is not recognized.
7. If amortization of servicing liabilities is employed, it is done in proportion to and over the period of net servicing loss (excess of servicing costs over servicing revenues). In cases where subsequent changes have increased the fair value of the servicing liability above the carrying value, an increased liability and a loss are recognized.
8. If servicing assets and liabilities are reported at fair value, changes in value are to be included in periodic earnings as they occur.

In remeasuring servicing assets for impairment, this is to be based on the fair value of the contracts and not on the gain or loss from carrying out the terms of the contracts. ASC 860-50-35 requires that entities separately evaluate and measure impairment of designated

strata of servicing assets. Stratification requires that judgment be used when selecting the most important characteristic. ASC 860 does not require that either the most predominant risk characteristic or more than one predominant risk characteristic be used to stratify the servicing assets for purposes of evaluating and measuring impairment. Different stratification criteria may be used for ASC 860 impairment testing and for ASC 815 grouping of similar assets to be designated as a hedged portfolio in a fair value hedge. The stratum selected is to be used consistently; a change is to be accounted for as a change in estimate under ASC 250. The change and reasons for the change are to be included in the disclosures made in accordance with ASC 860-50-50.

A servicing liability accounted for by the amortization method, on the other hand, is to be remeasured for increases in fair value, which would be recognized as a loss. Similar to the accounting for changes in a valuation allowance for an impaired asset, increases in the servicing obligation may be recovered, but the obligation cannot be adjusted to less than the amortized measurement of its initially recognized amounts.

The fair value of a servicing asset or liability at date of transfer is best measured by quoted market prices for similar servicing responsibilities. There is the potential for significantly different estimates of fair value when a quoted market price is not available. The transferor is to analyze all available information to obtain the best estimate of the fair value of the servicing contract. These include

1. The amount that would result in a current transaction between willing parties other than in a forced or liquidation sale
2. The legitimacy of the offer
3. The third party's specific knowledge about relevant factors
4. The experience of the broker with similar contracts
5. The price of other parties that have demonstrated an interest
6. The right to benefit from cash flows of potential future transactions (late charges, ancillary revenue, etc.)
7. The nature of the assets being serviced

In cases where there are few servicing contracts purchased or sold, present value methods may be used for estimating the fair value of servicing. Disclosure is required of the methods and significant assumptions followed to determine the estimate of fair value (unless not practicable) of recognized servicing assets and liabilities.

Examples: Sale of receivables with servicing asset retained

Facts Given Applicable to Both Examples Below (Each Example Is Independent)

Receivables' fair value	$16,500
Receivables' book value	15,000
Servicing asset fair value on portfolio of $16,500	700
Recourse obligation on portfolio of $16,500	(900)

1. Receivables sold, with servicing asset retained, no recourse obligation on receivables.

Journal Entry

Cash	16,500	
Servicing asset	700	
Receivables		15,000
Gain on transfer		2,200

2. Partial sale of receivables with servicing asset retained and recourse obligation. Seller sells 80% of receivables.

	FV	*80% FV*	*20% FV*	*Allocated 80% BV**	*Allocated 20% BV**
Receivables sold	$16,500	$13,200		$12,000	
Servicing asset	700	560			
Recourse obligation	(900)	(720)			
Retained amount (20%)			$3,300		$3,000
	$16,300	$13,040	$3,300	$12,000	$3,000

* *Allocated based on the relative fair values of the receivables sold and retained.*

Journal Entry

Cash	13,200	
Servicing asset	560	
Receivables		12,000
Recourse obligation		720
Gain on transfer		1,040

Seller reports retained receivables at $3,000 (book value) and servicing asset at $560, the fair value of servicing the 80% of the portfolio that has been transferred.

In the unlikely circumstance that it is not practicable to measure the fair value of servicing at the date of transfer, the transferor must evaluate whether a liability has been incurred and does not automatically assume that an asset exists. If it is determined that a liability does not exist, then a value of zero is assigned to the servicing asset that cannot be measured. If it is determined that a liability does exist, a valuation technique using discounted cash flows is used to estimate its fair value.

Example: Estimate of fair values is not practical

Entity A sells loans with a recourse obligation to repurchase any delinquent loans and retains the servicing, which is expected to provide more than adequate compensation for performance.

	Case I *Asset fair value cannot be determined*	***Case II*** *Liability fair value cannot be determined*
Loans' fair value	$16,500	$16,500
Loans' book value	15,000	15,000
Fair value of servicing asset	?	700
Fair value of recourse obligation	(900)	?

Proceeds

Cash	$16,500	$16,500
Less: Recourse obligation	(900)	?
Net proceeds	$15,600	$16,500

Allocation of book value based on fair value of assets

	FV	*%*	*BV allocated*	*FV*	*%*	*BV allocated*
Loans sold	$15,600	100	$15,000	$16,500	96	$14,400
Servicing assets	0	0	0	700	4	600
	$15,600	100	$15,000	$17,200	100	$15,000

Journal Entries

Cash	16,500		16,500	
Servicing asset	0		600	
Loans		15,000		15,000
Recourse obligation		900		2,100
Gain		600		0

In Case I, it is not practicable to measure the fair value of servicing, but it is known that the servicing is expected to provide at least adequate compensation. Thus, servicing is an asset and not a liability. If it is not practicable to measure the fair value of an asset, that asset is measured at zero. In Case II, it is not practicable to measure the fair value of the recourse obligation. If it is

not practicable to measure the fair value of a liability, no gain is to be recorded on the sale. The liability is recorded at the greater of (1) the excess fair value of the assets obtained minus the fair value of the liabilities incurred over the carrying value of the assets transferred or (2) the amount to be recorded in conjunction with ASC 450. In Case II, the liability is recognized at the excess fair value.

Subcontracting the servicing to another entity is not accounted for under ASC 860 because it does not involve a transfer. It is to be accounted for under other existing guidance (noting that executory contracts generally do not receive financial statement recognition under GAAP).

In the unusual case that servicing assets are assumed without a cash payment, the facts and circumstances will determine how the transaction is recorded. For example, the servicing asset may represent consideration for goods or services provided by the transferee to the transferor of the servicing. The servicing assets also might be received in full or partial satisfaction of a receivable from the transferor of the servicing. Another possibility is that the transferor (the party providing servicing) is in substance making a capital contribution to the transferee (the party receiving the servicing) in exchange for an increased ownership interest. Additionally, the possibility that there is an overstatement of the value of the servicing by the transferee must be carefully considered.

The amount to be paid to a replacement servicer under the terms of the servicing contract is not relevant to the determination of adequate compensation. This amount could, however, be relevant for determining the contractually specified servicing fees.

Rights to future income from serviced assets that exceed contractually specified servicing fees are accounted for as a servicing asset, an interest-only strip, or both, depending on whether the servicer would continue to receive the value of the right to future income if a replacement servicer started servicing the assets. Generally, the value of the right to receive future cash flows from ancillary sources such as late fees is included with the servicing asset if retention of the right depends on servicing being performed satisfactorily.

An interest-only strip does not depend on satisfactory performance of servicing, and any portion that would continue to be received if servicing were shifted to a replacement servicer would be accounted for separately as a financial asset. ASC 860-50-35 specifies that interest-only strips or other interests that continue to be held by the transferor in securitizations, loans, other receivables, or other financial assets that can be prepaid or otherwise settled in such a way that the entity might not recover its investment are to be subsequently remeasured as an investment in debt securities classified as available-for-sale or trading under ASC 320.

Example of rights to future income from serviced assets

The NorthStar Bank sells a portion of its loan portfolio, but retains the obligation to service the loans and the rights to a portion of any future interest income. Accounting for the servicing asset will be on the amortization method permitted by ASC 860-50-35. NorthStar records a servicing asset of $148,000 and an interest-only strip receivable of $68,000 (based on the fair value of its retention of a portion of interest proceeds) as part of the sale transaction. The total book value of loans sold is $3,000,000, for which it receives total payment of $2,900,000. The entry to record these assets as part of the sale is

Servicing asset	148,000	
Interest-only strip receivable	68,000	
Cash	2,900,000	
Loans		3,000,000
Gain on transfer of receivables		116,000

The $3,000,000 of loans to be serviced will be contractually terminated at different times, so the estimated net servicing income and related amortization of the servicing asset will decline in accordance with the following schedule:

	Year 1	Year 2	Year 3	Year 4	Year 5
Estimated net servicing income	$120,000	$109,000	$82,000	$53,000	$19,000
Percent of total estimated servicing income	31%	28%	21%	14%	6%
Annual amortization of servicing asset	$45,880	$41,440	$31,080	$20,720	$8,880

Thus, the entry to record amortization of the servicing asset in Year 1 follows:

Amortization—servicing asset	45,880	
Servicing asset		45,880

NorthStar retains a portion of the interest income to which it is due under the original loan sale agreement. The initial interest income retention is for $23,000, and is recorded as follows:

Cash	23,000	
Interest-only strip receivable		23,000

At the beginning of Year 4, NorthStar sells its servicing business to a third party, but retains the interest-only strip receivable, whose balance has now declined to $17,500. The entry to eliminate the remaining unamortized balance of the servicing asset, covering Years 4 and 5, follows:

Amortization—servicing asset	29,600	
Servicing asset		29,600

Since the interest-only strip receivable is no longer dependent on NorthStar's satisfactory servicing activities, it shifts the remaining balance of this receivable into an available-for-sale investment account, as shown in the following entry:

Investment in debt securities—available-for-sale	17,500	
Interest-only strip receivable		17,500

Some organizations transfer servicing rights on loans to third parties. ASC 942 provides criteria to be considered when evaluating whether the transfer qualifies as a sale, the first three of which are cited by reference to ASC 860-50-40, which is discussed in Chapter 8.

1. Has title passed?
2. Have substantially all risks and rewards of ownership been irrevocably passed to the buyer?
3. Are any protection provisions retained by the seller considered minor and are they reasonably estimable?
4. Has the seller received written approval from the investor (if required)?
5. Is the buyer a currently approved seller/servicer and not at risk of losing approved status?
6. If the sale is seller-financed
    a. Has the buyer made a nonrefundable deposit large enough to demonstrate a commitment to pay the remaining sales price?
    b. Does the note receivable from the buyer provide full recourse to the buyer?
7. Is the seller adequately compensated in accordance with a subservicing agreement for any short-duration, temporary servicing provided?

If the servicing rights sold are on loans that are retained, the carrying amount is allocated between servicing rights and loans retained using the relative fair value method prescribed by ASC 860.

Changes resulting in transferor regaining control of financial assets sold. If a transferor is required to re-recognize financial assets in which it holds a beneficial interest because the transferor's contingent right (for example, a removal of accounts provision, known as ROAP, or other contingent call option on the transferred financial assets) becomes

exercisable, no gain or loss is recognized. The transferor continues to account for its beneficial interest in those assets apart from the re-recognized assets. That is, the beneficial interest is not combined with and accounted for with the re-recognized assets. A gain or loss may be recognized upon the exercise of a ROAP or similar contingent right with respect to the "repurchased" portion of the transferred assets that were sold if the ROAP or similar contingent right held by the transferor is not accounted for as a derivative under ASC 815 and is not at-the-money. The exercise would result in a recombination of the beneficial interest with the repurchased assets.

If a transferor is required to rerecognize financial assets because the SPE becomes nonqualifying, no gain or loss is recognized with respect to the "repurchase" by the transferor of the financial assets originally sold that remain outstanding in the SPE (or the portion thereof if the transferor retained a partial interest in those assets). The fair value of the re-recognized assets will equal the fair value of the liability assumed by the transferor because the transferor is contractually required to pass on all of the cash flows from the re-recognized assets to the SPE for distribution in accordance with the contractual documents governing the SPE. The transferor continues to account for its beneficial interest in those assets, if any, apart from the re-recognized assets.

Under no circumstances is a valuation allowance initially recorded for assets (loans) that are re-recognized at their fair value.

The accounting for the servicing asset related to the previously sold financial assets does not change because the transferor, as servicer, is still contractually required to collect the asset's cash flows for the benefit of the SPE and otherwise service the assets. The transferor continues to recognize the servicing asset and assess the asset for impairment as required by ASC 860-20-55.

Sales-type and direct financing lease receivables. Lessors' lease receivables are composed of two components: minimum lease payments and residual values. Minimum lease payments are requirements for lessees to pay cash, and thus are financial assets subject to ASC 860 if transferred. Residual values are the rights to the leased equipment at the end of the lease. If the residual value is guaranteed at the inception of the lease, the right is a financial asset subject to ASC 860 if transferred. If the residual value is not guaranteed (or if it is guaranteed after the inception of the lease), transfers of that residual value are not subject to ASC 860. When entities sell lease receivables, the gross investment of the lease is allocated between minimum lease payments, residual values guaranteed at inception, and residual values not guaranteed at inception. If the reporting entity retains servicing rights, it also records a servicing asset or liability if appropriate. ASC 860 does not apply to sales of operating lease payments.

Example of sale of interest in lease payments

Lucky Leasing sells a senior interest in the guaranteed cash flows of a financing lease for $12,200. It retains a subordinated interest in the guaranteed cash flows and the residual value that is not guaranteed. The lease has the following components:

	Face value	*Present value*
Minimum lease payments	$ 8,350	$ 7,000
Guaranteed residual value	7,000	5,875
Residual value not guaranteed	1,400	1,175
Total investment in lease	$16,750	$14,050

The present values are computed using the implicit lease rate. The fair value of the subordinated interest retained is $1,200. Lucky Leasing receives no explicit compensation for servicing the lease, but it estimates that the benefits of servicing are just adequate to compensate it for its servicing responsibilities (that is, there is no servicing asset or liability). The allocation of the carrying amount for the interest sold is as follows:

	Fair value	Allocated cost
Senior interest sold	$12,200	$11,722
Subordinated interest retained	1,200	1,153
Totals	$13,400	$12,875

The entry to record the sale would be as follows:

Cash	12,200	
Subordinated interest	1,153	
Residual value	1,175	
Net investment in lease		14,050
Gain on sale		478

Securitizations. Entities that generate a large number of similar receivables, such as mortgages, credit card receivables, or car loans, sometimes securitize those receivables. Securitization is the transformation of the receivables into securities that are sold to other investors. For example, mortgages can be converted into mortgage-backed securities, which entitle the investors to receive specific cash flows generated by the mortgages. With an established market, issuance of the securities can cost less than using the receivables as collateral for a borrowing. Because QSPE assets are isolated from a possible transferor's bankruptcy, the QSPE's credit quality is enhanced and the financing costs on the debt are reduced. For even lower financing costs, the QSPE can obtain credit enhancements in the form of recourse debt, subordinate assignments, or guarantees. Additionally, the resulting securities are more liquid than the underlying receivables. Securitizations are accounted for as sales only if (1) a qualified special-purpose entity is used to buy the assets, (2) each holder of its beneficial interests has the right to pledge or exchange the beneficial interest and there is no condition that both constrains the holder from taking advantage of that right and provides more than a trivial benefit to the transferor, and (3) the transferor does not maintain effective control over the assets.

The transferor (also called issuer or sponsor) forms a securitization mechanism (separate corporation or a trust, referred to as a qualifying special-purpose entity [QSPE]) to buy the assets and to issue the securities. The securitization mechanism then generates beneficial interests in the assets or resulting cash flows that are sold to investors with the sales proceeds used to pay the transferor/sponsor for the transferred assets. The form of the securities chosen depends on such things as the nature of the assets, income tax considerations, and returns to be received. The securities issued by the SPE may consist of a single class of interests with the characteristics of equity or multiple classes of interests, some having debt characteristics and others equity characteristics. A properly structured QSPE is not to be consolidated in the financial statements of the transferor or its affiliates. (Note that, although ASC 810 creates the concept of *variable interest entities*, or VIE, which largely replaces the earlier concept of special-purpose entities, the concept of *qualifying special-purpose entities*, or QSPE, as established by ASC 860, continues unchanged as of early 2009, although FASB is likely to alter or eliminate QSPE accounting, perhaps as early as mid-2009.)

For example, a transferor originates long-term loans and accumulates them on its balance sheet (referred to as warehousing). When the group of loans reaches a sufficient size, the loans are sold to a QSPE. During the accumulation phase, the transferor finances the cost of holding the loans with prearranged lines of credit, known as warehouse lines. Often the transferor hedges the price risk of the loans as they await sale. This is referred to as an on-balance-sheet warehousing.

Alternatively, a transferor may use a properly structured off-balance-sheet warehousing to securitize assets. In an off-balance-sheet warehouse, the transferor creates a temporary securitization vehicle. A bank typically extends credit to the securitization vehicle in the form of a variable-funding note. Using the proceeds of the note, the vehicle acquires loans

from the transferor as they are originated. The principal of the note increases, up to a ceiling, as the transferor transfers additional loans to the securitization vehicle. When the loans have reached the ceiling amount of the note, the bank puts the note back to the securitization vehicle, forcing the vehicle to sell the loans to a permanent QSPE to raise the cash to pay the note.

Payments by the securitization mechanism are usually classified as pay-through, pass-through or revolving-period. In a pay-through, cash flows from the assets pay off the debt securities. The assets are essentially collateral. In a pass-through, undivided interests are issued and the investors share in the net cash flows. In a revolving-period**,** undivided interests are issued, but until liquidation, the net cash flows are split between buying additional assets and paying off investors. During the reinvestment period, principal repayments are reinvested in additional receivables generated by the debtors whose receivables were securitized. Under ASC 860-10-05, any gain recognized by the transferor/sponsor on the sale of credit card or other receivables to a QSPE is limited to amounts relating to receivables existing at the date of sale. This prevents the transferor/sponsor from recognizing additional gains on transfers that are anticipated to occur during the specified reinvestment period. In computing gain or loss on the initial transfer, the transferor/sponsor recognizes costs estimated to be incurred for all future servicing activities including the costs of servicing the receivables expected to be sold during the reinvestment period. If the initial sale results in a gain, the costs associated with the receivables to be sold during the reinvestment period may be recorded as an asset and allocated to expense using a systematic and rational method over the initial and reinvestment periods.

A QSPE is considered qualified if it meets the criteria set forth by ASC 860. In general, those criteria require that the SPE remain on "autopilot" after its creation. The QSPE is required to be a passive custodian for the benefit of the holders of its beneficial interests. All of the QSPE's responses to changes in business conditions must be predetermined and spelled out in the agreements that create the QSPE. The QSPE cannot make business decisions, nor can it direct an agent to make business decisions on its behalf. The four criteria are

1. The QSPE is demonstrably distinct from the transferor. To be demonstrably distinct, the transferor, its affiliates, or its agents cannot unilaterally dissolve the SPE and either
   a. At least 10% of the fair value of its beneficial interests is held by parties other than the transferor, its affiliates, or its agents or
   b. The transfer is a guaranteed mortgage securitization. A guaranteed mortgage securitization is a securitization of mortgage loans that is within the scope of ASC 948 and includes a substantive guarantee by a third party.
2. The permitted activities of the QSPE
   a. Must be significantly limited
   b. Must have been entirely specified in the legal documents that established the QSPE or created the beneficial interests in the transferred assets it holds
   c. May be significantly changed only with the approval of a majority of the holders of the beneficial interests not including the transferor, its affiliates, or its agents
3. The QSPE may hold only
   a. Financial assets that are passive in nature. A financial asset is passive only if holding the asset requires no decisions of the holder other than decisions inher-

ent in servicing. For example, an equity instrument is not passive if the SPE is permitted to choose how to vote the shares, and an investment accounted for by the equity method is not passive since that method is used when the investor has the ability to exercise significant influence over that investment.

b. Passive derivative instruments related to beneficial interests issued or sold to parties other than the transferor, its affiliates, or its agents. Options to call or put are not passive investments, since they require a decision as to whether to exercise the rights. Interest rate swaps, caps, and floors are passive derivative instruments.
c. Financial assets that would reimburse the QSPE if the servicer failed to adequately perform or if others failed to pay timely. The financial assets must have been entered into when the QSPE was created, when assets were transferred to it, or when it issued beneficial interests.
d. Servicing rights related to the financial assets it holds
e. Nonfinancial assets obtained in connection with the collection of financial assets it holds (but the QSPE may hold them only temporarily)
f. Cash collected from financial assets it holds
g. Investments purchased pending distribution to holders of beneficial interests, provided that those investments are appropriate for that purpose. For example, the investments must be relatively risk-free and have a maturity date no later than the expected distribution date.

4. The QSPE can sell or dispose of noncash financial assets only in automatic response to one of the following conditions:

   a. Occurrence of an event that causes the fair value of those financial assets to decline by a specified degree below the fair value of those assets when the QSPE obtained them. The occurrence of the event must be outside the control of the transferor, its affiliates, or its agents. The nature of the event must be specified in the legal documents that established the QSPE or created the beneficial interests in the transferred assets it holds.
   b. Exercise of a right to put a beneficial interest back to the QSPE by a beneficial interest holder other than the transferor, its affiliates, or its agents
   c. Exercise by the transferor of a call or a removal-of-accounts provision ("ROAP"), provided that the exercise is specified in the legal documents that established the QSPE, transferred assets to the QSPE, or created the beneficial interests in the transferred assets it holds. Care must be exercised in designing a call or a ROAP because it can be construed as giving the transferor the ability to unilaterally cause the holder to return specific assets (and thus the transfer will not be a sale). In general, any call or ROAP that allows the transferor to specify the assets to be removed or that are conditioned upon an event within the transferor's control (such as a transferor's decision to exit a product line) will cause the transfer to fail the ASC 860 criteria. Calls or ROAPs that allow the transferor to remove defaulted receivables are permitted, as are those that allow limited access for random removal of excess assets.
   d. Termination of the QSPE or maturity of the beneficial interests in those financial assets on a fixed or determinable date that was specified at the inception

5. The QSPE can make decisions inherent in servicing the transferred assets. For example

a. A QSPE that performs servicing can restructure or "work out" a loan, as long as its discretion is significantly limited and the parameters of that discretion are fully described in the legal documents that established the QSPE or that created the beneficial interests in the transferred assets. However, the QSPE cannot initiate a new lending to the borrower as a result of the workout. Nor can the QSPE have the ability to determine whether to restructure (or work out) the loan versus disposing of the loan, since that decision is generally not automatic because it requires use of judgment and estimates.
b. A QSPE can pay certain expenses (e.g. property taxes or insurance) that are the responsibility of the debtor if the debtor fails to pay them.
c. A QSPE can advance funds to make timely payments to the holders of the beneficial interests and later reimburse itself for those advances.
d. A QSPE can decide whether to initiate foreclosure proceedings, as long as its discretion is significantly limited and the parameters of that discretion are fully described in the legal documents that established the QSPE or that created the beneficial interests in the transferred assets.
e. A QSPE can decide how to dispose of foreclosed assets that it temporarily holds, as long as its discretion is significantly limited and the parameters of that discretion are fully described in the legal documents that established the QSPE or that created the beneficial interests in the transferred assets.
f. A QSPE can decide how to dispose of defaulted loans only if a servicing agreement that was in effect when the QSPE was established describes specific conditions in which the servicer is required to dispose of a loan. In other words, the QSPE must have no choice but to dispose of the defaulted loan when the described conditions occur.

ASC 810, which curbs the use of unconsolidated nonqualified SPE structures, excludes QSPE from the definition of a variable interest entity (VIE). Under ASC 810, a QSPE is not permitted to be consolidated by the asset transferor or its affiliates. If, however, the SPE does not qualify as a QSPE or as a formerly qualifying SPE ("FQSPE") under ASC 860, it would not be exempt from the consolidation and disclosure requirements of ASC 810. In addition, a beneficial interest holder (BIH) in a QSPE or FQSPE could potentially be required to consolidate the trust if the BIH has the unilateral ability to either cause the trust to liquidate or to change the trust so that it no longer qualifies as a QSPE or FQSPE.

The issuance of ASC 810 created an incentive to convert former SPE to QSPE, thereby avoiding the need for consolidation. FASB addressed this concern in several projects it pursued, one of which, ASC 860-50-35 (discussed above), was finalized in early 2006.

Various financial components arise from securitizations. Examples include servicing contracts, interest-only strips, retained interests, recourse obligations, options, swaps, and forward contracts. All controlled assets and liabilities must be recognized under ASC 860.

Example of a securitization deal involving four classes of securities

Principal of loans held by the securitizer/transferor	$10,000,000
Accrued interest on loans held by the securitizer/transferor	230,000
Deferred origination costs of loans held by the securitizer/transferor	100,000
Deferred origination fees of loans held by the securitizer/transferor	(200,000)
Loss allowance on loans held by the securitizer/transferor	(250,000)
Net carrying amount of loans	$ 9,880,000

Classes of securities issued and prices:

	Principal	*Price*	*Fair value*
Class A	$9,000,000	100	$ 9,000,000
Class B	1,000,000	90	900,000
Interest-only strip (retained)			150,000
Residual class (retained)			100,000
Total fair value			$10,150,000

Servicing is retained by the transferor and has a fair value of $75,000
Transaction costs are $100,000
Proceeds are $9,800,000 ($9,000,000 Class A + $900,000 Class B – $100,000 costs)

Allocation of carrying value:

	Fair value	*Percent*	*Allocation*	*Sold*	*Retained*
Class A	$ 9,000,000	88.0	$8,696,332	$8,696,332	
Class B	900,000	8.8	869,633	869,633	
Interest-only strip	150,000	1.5	144,939		$144,939
Residual class	100,000	1.0	96,626		96,626
Servicing	75,000	.7	72,470		72,470
Total	$10,225,000	100.0	$9,880,000	$9,565,965	$314,035

The entry to record the sale would be as follows:

Cash	9,800,000	
Interest-only strip	144,939	
Residual class	96,626	
Servicing asset	72,470	
Loan loss allowance	250,000	
Deferred origination fees	200,000	
Loans receivable		$10,000,000
Interest receivable		230,000
Deferred origination costs		100,000
Gain on sale of loans		234,035

The entry to mark the securities retained to fair value under ASC 320 would be

Interest-only strip	5,061	
Residual class	3,374	
Comprehensive income (unless trading)		8,435

Just as it is necessary to distinguish new assets, which are recorded at fair value, from retained interests, which are recorded at allocated carrying value, when accounting for a transfer to another enterprise, it is necessary to do so when accounting for a transfer to a QSPE. In certain securitization transactions, more than one transferor contributes assets to a single QSPE. A transferor treats the beneficial interests it receives in a securitization that commingles assets from more than one transferor as

1. New assets to the extent that the sources of the cash flows to be received by the transferor are assets transferred by another entity
2. Retained interests to the extent that the sources of the cash flows are assets transferred by the transferor
3. New assets to the extent that any derivatives, guarantees, or other contracts were entered into by the QSPE to "transform" the transferred assets. (They are new because they were entered into by the QSPE rather than transferred into the QSPE by another entity.)

After a securitization, the beneficial interests held by the transferor either are in the form of securities that are accounted for under ASC 320 or are required to be accounted for as available-for-sale securities or trading securities in accordance with ASC 860. Thus, the transferor must classify the beneficial interests into one of the ASC 320 categories. If beneficial interests held by the transferor after the transfer convey rights to the same cash flows as

the transferor was entitled to receive from securities that it transferred to the QSPE, the ASC 320 classification of the beneficial interests is the same as the securities held before the transfer. For example, if prior to the transfer the debt securities were accounted for as available-for-sale securities in accordance with ASC 320, the beneficial interests are to be classified as available-for-sale securities if the transferor receives the cash flows from those securities via its beneficial interest. In contrast, if the transferred assets were not ASC 320 securities prior to the transfer but the beneficial interests were issued in the form of debt securities or in the form of equity securities that have readily determinable fair values, then the transferor has the opportunity to decide the appropriate ASC 320 classification at the date of the transfer.

Revolving-period securitizations present some unique issues because they contain an implicit forward contract to sell new receivables during the revolving period. The forward contract may become valuable to the transferor or burdensome depending upon how interest rates and market conditions change. The value of the implicit forward contract arises from the difference between the rate promised to the holders of the beneficial interests and the market rate of return on similar investments. For example, if the agreed-upon rate to holders is 5% and the market rate is 7%, the forward contract's value to the transferor is 2% of the amount of the investment for each year remaining in the revolving period after the initially transferred receivables are collected. When receivables are sold to a revolving-period securitization trust, gain or loss recognition is limited to receivables that exist and have been sold. Similarly, servicing assets or liabilities are limited to servicing receivables that exist and have already been transferred. As proceeds from collection of the receivables are used to purchase new receivables for the trusts, each additional transfer is treated as a separate sale, with its own gain or loss calculation. Those additional transfers also can result in recognition of additional servicing assets and liabilities.

ASC 860 does not address the accounting for desecuritization of securities into loans or other financial assets. ASC 320-10-25 addresses that issue. It states that the guidance in ASC 860 is to be extended by analogy to desecuritizations. Thus, the transfer of securities or beneficial interests in a securitized pool of financial assets in which the transferor receives in exchange only the financial assets underlying those securities or beneficial interests would not be accounted for as a sale.

Example of revolving period securitizations

The Mason-Dixon Auto Sales Company enters into a revolving-period securitization agreement to sell $100,000 of its car loan receivables each month to the Meridian QSPE for a four-year period. Meridian guarantees a 5% rate of return to its investors for the entire four-year period. Mason-Dixon will continue to service all receivables sold to Meridian. If Mason-Dixon can create new car loans at interest rates greater than 5%, then it can recognize the difference between the actual interest rate and the rate issued to Meridian's investors as an interest-only strip.

At the end of the first month, Mason-Dixon sells $100,000 of principal on car loan receivables to Meridian, as well as $600 of accrued interest on the loans. Thus, the net carrying amount of the loans sold is $100,600. Mason-Dixon retains receivables servicing, which has a fair value of $6,000, as well as an interest-only strip receivable that recognizes the difference between the 5% guaranteed interest rate paid to Meridian's investors and the average 7% actual interest rate on the loan receivables, which has a fair value of $8,000 at the sale date.

The initial sale includes transaction costs of $5,000, which are deducted from the cash paid by Meridian to Mason-Dixon. The following entry by Mason-Dixon records the sale transaction:

Cash	95,600	
Interest-only strip receivable	8,000	
Servicing asset	6,000	
Loans receivable		100,000
Interest receivable		600
Gain on sale of loans		9,000

At the end of the next month, Mason-Dixon sells another $100,000 of receivables to Meridian, as well as $350 of accrued interest on the loans. Thus, the net carrying amount of the second group of loans is $100,350. The lower accrued interest is due to a drop in the actual interest rate on this second block of loans, which averages 4% and is below the 5% guaranteed Meridian's investors. The fair value of the servicing asset associated with these loans is $6,000. The following calculation allocates the fair value of the various elements of the transaction to the net carrying amount of the loans:

	Fair value	*Percent*	*Allocation*
Loans	$100,000	98.0	$98,343
Interest-only strip	(4,000)	(3.9)	(3,914)
Servicing asset	6,000	5.9	5,921
Totals	$102,000	100.0	$100,350

This second sale also includes transaction costs of $5,000, which are deducted from the cash paid to Mason-Dixon. The following entry records the sale transaction:

Cash	95,350	
Servicing asset	6,000	
Loss on sale of loans	3,000	
Interest-only strip receivable		4,000
Loans receivable		100,000
Interest receivable		350

Proposed changes to accounting for transfers of financial assets. FASB exposed a draft standard, *Qualifying Special-Purpose Entities and Isolation of Transferred Assets*, in 2003, which was intended to amend ASC 860 to revise or clarify the derecognition requirements for financial assets and the initial measurement of interests related to transferred financial assets that are retained or acquired by a transferor. A revised Exposure Draft, *Accounting for Transfers of Financial Assets*, was issued in 2005 and remains outstanding and an active project as of early 2009.

This draft standard, if adopted, would amend ASC 860 in several important ways.

1. It would require that the isolation analysis defined under ASC 860 consider any arrangement or agreement made in connection with a transfer even if it was not entered into at the time of the transfer.
2. It would require that if the transferee is a qualifying SPE, no arrangement or agreement is made between any holder of beneficial interests issued by the QSPE and the transferor, or its consolidated affiliates or agents that would have caused the assets not to be isolated as required by ASC 860-10-40 if the same arrangement or agreement had involved the QSPE instead of its beneficial interest holders.
3. It would define a *participating interest* as a portion of a financial asset that (a) conveys proportionate ownership rights with priority under the law that is equal to the priority of each other participating interest, (b) involves no recourse to or subordination by any participating interest holder, and (c) does not entitle any participating interest holder to receive cash before any other participating interest holder.
4. It would establish the following conditions for reporting a transfer of a portion (or portions) of a financial sale:

   (a) The transferred portion (or portions) and any portion retained by the transferor must be participating interests.

(b) The transferred portion (or portions) must meet the conditions for surrender of control in ASC 860-10-40.

If the transfer does not meet those conditions, sale accounting can be achieved only by transferring an entire financial asset or group of financial assets to a QSPE or other entity that is not consolidated with the transferor and the entire transferred financial asset(s) must meet the conditions of ASC 860-10-40.

5. It would replace the term *retained interest* with other, more specific terms. The two most prevalent types of interests that are described in the proposed standard are *transferor's beneficial interests* and *participating interests retained by the transferor.* A transferor's beneficial interest is a beneficial interest received by a transferor as part of the proceeds from a sale of financial assets to a qualifying SPE. A participating interest retained by the transferor represents the transferor's ownership interest (or share of ownership) in a financial asset that has been divided according to the requirements for participating interest specified in paragraph 3(a) of the proposed standard. Some of the other types of interest referred to as retained interests in ASC 860 include *servicing rights, rights to a portion of the interest from a transferred financial asset* or *transferred participating interest,* and *cash collateral accounts*. In the proposed standard, each of those types of interest is referred to either specifically or as other interests received (or held) by the transferor. Except for a transferor's participating interest, a servicing right, and cash or other collateral posted by the transferor, all of the interests called retained interests in ASC 860 are considered new assets to the transferor by the proposed standard.
6. It would require that a transferor's beneficial interest be initially measured at fair value.
7. It would require that for an SPE with the ability to roll over (i.e., to retire and reissue) beneficial interests to meet the conditions to be a QSPE, no party, (including that party's consolidated affiliates or agents) may have two or more involvements with the QSPE that provide that party with the opportunity to obtain a more-than-trivial incremental benefit relative to the benefit that would be obtained if separate parties had those same involvements.
8. It would prohibit a QSPE from holding equity instruments unless those instruments result from efforts to collect the transferred financial assets, in which case they may be held only temporarily.
9. It would prohibit financial assets transferred to any entity (including a QSPE) from being derecognized by the transferor unless the financial assets are isolated from the transferor and its consolidated affiliates, except for certain bankruptcy-remote affiliates. Any arrangement made in connection with a transfer must be considered even if the arrangement is not entered into at the time of the transfer.

This project remains active, and readers should be alert to further developments regarding this matter, as there is a reasonable likelihood that changes will be made to it during FASB's redeliberation process. Thus, the final standard, if and when issued, may differ from the elements discussed above. As of early-2009, FASB appears inclined to remove the concept of QSPE from ASC 860 as well as from ASC 810, and is also intending to amend the derecognition criteria of ASC 860 to clarify and improve the isolation and effective control criteria of that standard.

Repurchase agreements. Repurchase agreements are used to obtain short-term use of funds. Under the terms of a repurchase agreement the transferor transfers a security to a transferee in exchange for cash. Concurrently, the transferor agrees to reacquire the security

at a future date for an amount equal to the cash exchanged and an interest factor. Many repurchase agreements are for short terms, often overnight.

It is necessary to determine if the repurchase agreement meets the requirements described in the section, "Surrender of control." Usually the critical determination is whether the repurchase agreements gives the transferor effective control over the transferred assets. That determination is made by applying the criteria described in the section, "Maintaining effective control." In most cases, if the repurchase is required prior to the maturity of the security transferred and the cash transferred is sufficient to repurchase the assets if the transferee defaults, the transferor retains effective control and the agreement is accounted for as a secured borrowing. For example, fixed-coupon and dollar-roll repurchase agreements, and other contracts under which the securities to be repurchased need not be the same as the securities sold, qualify as borrowings if the return of substantially the same securities as those transferred is assured. However, if a transferor does not maintain control over the transferred assets and other criteria in ASC 860 are met, the transfer is accounted for as a sale and a forward commitment. ASC 860-20-55, discussed earlier in this chapter, addresses situations where a transferee transfers the assets back to the transferor in a repurchase financing arrangement, which (depending on meeting criteria specified in that staff position) may or may not interfere with derecognition of the assets by the original transferor.

Example of a repurchase agreement

Mighty Manufacturing has $1,995,000 excess cash that it desires to invest for a 7-day period. It transfers the cash to Lion Bank in exchange for $2,000,000 of commercial paper. At the end of the 7-day period, Lion Bank agrees to repurchase the commercial paper for $1,996,500. Mighty Manufacturing does not have the right to sell or pledge the commercial paper during the 7-day period.

The entries to record the origination of the agreement are as follows:

Mighty Manufacturing			*Lion Bank*		
Investment	1,995,000		Cash	1,995,000	
Cash		1,995,000	Short-term payable		1,995,000

The entries to record the termination of the agreement seven days later are as follows:

Mighty Manufacturing			*Lion Bank*		
Cash	1,996,500		Short-term payable	1,995,000	
Investment		1,995,000	Interest expense	1,500	
Interest income		1,500	Cash		1,996,500

Securities lending transactions. Broker-dealers and other financial services companies initiate securities lending transactions when they need to obtain specific securities to cover a short sale or a customer's failure to deliver securities sold. The transferor/lender provides the securities to the transferee/borrower in exchange for "collateral," usually in an amount greater than the fair value of the borrowed securities. This collateral is commonly cash but could alternatively be other securities or standby letters of credit.

When the collateral is cash, the transferor/lender invests the cash during the period that the security is loaned. The investment return on the cash collateral is larger than the fees paid by the lender under the agreement (the rebate). Because the cash collateral is usually valued daily and adjusted frequently for changes in the market value of the underlying securities, the transaction has very low credit risk.

In determining whether to account for a securities lending transaction as a sale or a secured borrowing, the same criteria used for other asset transfers are applied. Many securities lending transactions are accompanied by an agreement that entitles and obligates the transferor/lender to repurchase or redeem the transferred assets before their maturity. Thus, the transferor maintains effective control over the securities lent. If that is the case, the

transaction is accounted for as a secured borrowing. The following is an example of a securities lending transaction accounted for as a secured borrowing:

Example: Securities lending transaction (30 days)

Fair value of loaned security	$16,500
Book value of loaned security	16,500
Collateral (cash)	16,995
Transferor/lender's return from investing cash	5%
Transferor/lender's rebate to transferee/borrower	4%

Transferor/lender's journal entries

At date of loan:

Securities pledged	16,500	
Securities		16,500
To record transfer of securities as a loan		
Cash	16,995	
Loan agreement payable		16,995
To record receipt of cash collateral		
Money market instrument	16,995	
Cash		16,995
To invest cash collateral		

At end of 30 days:

Cash	17,065	
Interest income		70
Money market instrument		16,995
To transfer cash from money market and record interest earned		
Securities	16,500	
Securities pledged		16,500
To record securities returned by transferee/borrower		
Loan agreement payable	16,995	
Interest rebate	56	
Cash		17,051
To return cash collateral and pay rebate		

Accounting for collateral. Accounting for collateral depends both on whether the secured party has the right to sell or repledge the collateral and on whether the debtor has defaulted. Ordinarily, the transferor should carry the collateral as an asset and the transferee does not record the pledged asset.

The collateral provisions of ASC 860 apply to all transfers (repurchase agreements, dollar-roll, securities lending, etc.) of financial assets pledged as collateral and accounted for as a secured borrowing. The provisions do not apply to the accounting for cash in secured borrowing transactions.

If the secured party (transferee) has the right to sell or repledge the collateral, then the debtor (transferor) reclassifies the asset used as collateral and reports it in the balance sheet separately from other assets not similarly encumbered. That is, the debtor (transferor) continues to hold the collateral assets as its own, and the secured party (transferee) does not recognize the collateral asset. If the secured party (transferee) sells the collateral, it recognizes the proceeds from the sale and the obligation to return the collateral to the debtor (transferor).

Although collateral is required to be reclassified and reported separately by the transferor if the transferee has the right to sell or repledge the collateral, that requirement does not change the transferor's measurement of the collateral. The same measurement principles are to be used as before the transfer and the collateral is not derecognized. The subsequent measurement of the transferee's obligation to return the collateral in securities borrowing and resale agreement transactions is not addressed by ASC 860.

If the transferor defaults and is not entitled to the return of the collateral, it is to be derecognized by the transferor. If not already recognized, the transferee records its asset at fair value.

Example of accounting for collateral

Deep Water Marine enters into a loan arrangement with Key West Bank for $4,700,000, using one of its submersibles as collateral. The loan terms are monthly interest payments at an annual rate of 9%, followed by a balloon payment in five years for the entire amount of the principal. The submersible has a book value of $4,250,000, net of accumulated depreciation of $500,000, and a fair value of $4,650,000. Deep Water misses its first loan payment, so the parties renegotiate the loan agreement, allowing Key West the right to resell the submersible. Deep Water records this change by separately listing the submersible in the property, plant, and equipment section of its balance sheet in the following manner:

Equipment used as collateral with right of sale (net of accumulated depreciation of $500,000)	$4,250,000

Two months after the loan initiation date, Deep Water defaults on the note and enters bankruptcy proceedings, so Key West takes possession of the submersible. Deep Water records the default with the following entry:

Loan payable	4,700,000	
Accrued interest payable	70,500	
Accumulated depreciation	500,000	
Fixed assets—equipment		4,750,000
Gain on loan defaults		520,500

Foreclosure of the Deep Water loan is certain. The estimated cost to sell the submersible is a 2% commission, or $93,000, which Key West includes in the following entry to record its ownership of the submersible ($4,650,000 fair value net of $93,000 commission):

Repossessed assets	4,557,000	
Bad debt expense	213,500	
Interest receivable		70,500
Loans receivable		4,700,000

Key West sells the submersible for $4,500,000, net of all sales costs. It records the transaction with the following entry:

Cash	4,500,000	
Loss on asset sale	57,000	
Repossessed assets		4,557,000

Financial assets subject to prepayment. ASC 860 requires interest-only strips, loans, other receivables, or retained interests in securitizations to be measured like investments in debt securities. If they can be contractually prepaid or settled in a way that precludes recovery of substantially all of the recorded investment, they are classified as available-for-sale or trading under ASC 320 (i.e., they generally cannot be treated as held-to-maturity debt instruments). Only assets meeting all of the ASC 320 requirements and acquired late enough in life that, even if prepaid, the holder would recover substantially all of its recorded investment may be initially classified as held-to-maturity. The probability of prepayment or settlement is not relevant to the classification under ASC 320.

Although financial assets that do not meet the securities definition of ASC 320 must be measured in the same manner as investments under ASC 320, other provisions of that Statement (disclosures, etc.) are not required to be applied.

Accounting for acquired loans and related standby commitment fees.

Decline in credit quality. ASC 310-30 addresses the accounting for the differences between contractual and expected future cash flows of acquired (i.e., nonoriginated) loans

when these differences are attributable, at least in part, to a decline in the debtor's credit quality subsequent to loan inception.

Under ASC 310-30, which is applicable to all nongovernmental entities including not-for-profit organizations, purchased loans are displayed at the initial investment amount on the balance sheet. The amount of any discount is not displayed on the balance sheet nor does the acquirer carry over an allowance for loan losses established by the seller. This prohibition applies equally to stand-alone purchases of loans and to those that occur as part of purchase business combinations.

When loans are acquired with evidence of deterioration in credit quality since origination, the acquirer is required to estimate the cash flows expected to be collected on the loan. This estimation is to be performed both at the purchase date and again periodically over the lives of the loans. Cash flows in excess of the initial investment (purchase price) expected to be collected are recognized as yield; this is referred to as "accretable yield." On the other hand, contractual cash flows in excess of expected cash flows (the nonaccretable difference) are not recognized as yield.

The accounting for changing expectations regarding future cash flows depends on whether these are decreases or increases. If, subsequent to acquisition, there are decreases in the probable cash flows, impairments are to be recognized in the current period's income statement. In other words, such a development cannot be handled prospectively, as a yield adjustment, over the remaining lives of the loans.

By contrast, probable increases in subsequent flows expected to be collected are recognized prospectively as a yield adjustment. In cases where a new, higher yield on a loan is established (due to a probable increase in cash flows to be collected), that yield is to be used as the effective interest rate in any later impairment test.

If loans are refinanced or restructured after acquisition, these cannot be accounted for as new loans, unless these are troubled debt restructurings, addressed by ASC 310 and ASC 320.

Acquired loans are not to be aggregated for purposes of determining evidence of post-origination credit deterioration. Rather, each loan, even if purchased in a pool, must be individually evaluated. However, subsequent pooling or aggregation of smaller-balance homogeneous loans is allowed for purposes of recognition, measurement, and disclosure. To be accounted for in the aggregate, loans must have a common credit risk (such as past due status or credit score) and have a common predominant risk characteristic (such as type of loan or date of origination). Furthermore, aggregation is limited to loans purchased in the same fiscal quarter.

ASC 310-30 does not provide general guidance as to the recognition of income, because that guidance does not exist for originated loans. However, income recognition will still be prohibited on loans for which an investor expects to substantially improve the collateral for resale or expects to use the collateral in operations.

Variable loans with index rate decreases, contractual cash flow decreases, and expected cash flow decreases are to be evaluated based on the change in expected cash flows attributable to the decrease in index rates. Those changes are recognized prospectively, rather than as impairments. The decrease in expected cash flows due to index rate decreases must be ascertained, and those changes are to be evaluated against the loan's contractual payments receivable, which must be calculated based on the index rate as it changes over the life of the loan.

Standby commitment fees. Some entities agree to purchase loans at a stated price in return for a standby commitment fee. If the settlement date of a standby commitment to purchase loans is reasonable (i.e., within a normal loan commitment period), then the commit-

ment fee is recognized in accordance with ASC 310-20. In general, ASC 310-20 requires the fee to be recognized as a yield adjustment over the life of the loan (or group of loans) purchased. If the commitment expires unexercised, the fee is recognized as income upon its expiration. ASC 310-20 provides two exceptions to the general rule.

1. If, based on the reporting entity's experience with similar arrangements, there is a remote likelihood that the commitment will be exercised, the fee is amortized as service fee income using the straight-line method over the commitment period. Should the commitment be exercised, the remaining unamortized portion of the fee is recognized as a yield adjustment over the life of the loan.
2. If the commitment fee is determined on a retrospective basis as a percentage of the unused portion of an available line of credit, the commitment fee is to be recognized as service fee income on the determination date if
   a. The commitment fee percentage is nominal compared to the stated interest rate on any related borrowing under the line of credit, and
   b. Borrowings under the line of credit will bear the market rate of interest on the date of the loan.

If the settlement date is not within a reasonable period, or if the reporting entity does not have the intent and ability to accept delivery without selling assets, the standby commitment is accounted for as a written put option. That is, the standby commitment fee is recorded as a liability. Thereafter, the liability is reported at the greater of the initial standby commitment fee or the fair value of the written put option, with the offsetting entry reported in current operations.

Disclosures

ASC 942. ASC 942 includes disclosure requirements for all entities involved in financing activities (including trade receivables).

1. The following amounts must be reported separately on the face of the balance sheet:
   a. The amount of receivables held for sale
   b. The amount of foreclosed or repossessed assets, which can be included in the other assets category if the notes to the financial statements disclose the amount
2. The balance sheet or notes are to report
   a. Separately, each major category of loans and trade receivables
   b. The allowance for doubtful accounts or loan losses
   c. Any unearned income, unamortized premiums or discounts, and any net unamortized deferred fees and costs related to loans or trade receivables
   d. The recorded investment in loans (and trade receivables, if applicable) on nonaccrual status, as of each balance sheet presented
   e. The recorded investment in loans (and trade receivables, if applicable) on accrual status that are past due ninety days or more, as of each balance sheet presented
   f. The carrying amount of financial instruments that serve as collateral for borrowings
3. The "summary of significant accounting principles" note is to include the following:
   a. The basis for accounting for trade receivables, loans receivable, and lease financings, including those held for sale

  b. Whether aggregate or individual asset basis is used in determining the lower of cost or fair value of nonmortgage loans held for sale
  c. The classification and method of accounting for receivables that can be contractually prepaid or otherwise settled in a way that the reporting entity would not recover substantially all of its recorded investment
  d. The method for recognizing interest income on loan and trade receivables, including related fees and costs, and the method of amortizing net deferred fees or costs
  e. The accounting policies and methodology used to estimate the allowance for doubtful accounts and/or loan losses, including the factors that influenced management's judgment (such as existing economic conditions and historical losses)
  f. The accounting policies and methodology used to estimate any liability for off-balance-sheet credit losses, including the factors that influenced management's judgment
  g. The policy for placing loans (and trade receivables, if applicable) on nonaccrual status
  h. The policy for recording payments received on loans (and trade receivables, if applicable) that are in nonaccrual status
  i. The policy for resuming interest accruals on loans that are in nonaccrual status
  j. The policy for charging off uncollectible trade receivables and loans
  k. Whether past due or delinquency status is based on how recently payments have been made or on contractual terms

4. The aggregate amount of gains or losses on sales of loans or trade receivables (including the amounts of adjustments to record receivables held for sale at the lower of cost or fair value) are to be presented separately in the financial statements or disclosed in the notes.

ASC 860. ASC 860 disclosures include

1. For collateral
  a. If the reporting entity has entered into repurchase agreements or securities lending transactions, its policy for requiring collateral or other security
  b. If the reporting entity has pledged any of its assets as collateral that are not reclassified and separately reported on the balance sheet, the carrying amount and classification of those assets on the date on the most recent balance sheet
  c. If the reporting entity has accepted collateral that it is permitted by contract or custom to sell or repledge, the fair value of that collateral as of the date of each balance sheet, the portion of that collateral that it has sold or repledged, and the sources and uses of that collateral
2. Description of items for which it is not practicable to estimate fair value and reasons why it is not practicable
3. For servicing assets and liabilities
  a. Amounts recognized and amortized during the period
  b. Fair value recognized, method and assumptions used to estimate fair value
  c. Risk characteristics used to stratify recognized servicing assets in order to measure impairments
  d. Valuation allowance and all related activity for each period for which results of operations are reported

4. If the reporting entity has securitized any financial assets during any period presented and accounted for that securitization as a sale, it must disclose the following information for each major asset type (e.g., mortgage loans, auto loans, credit card receivables):
   a. Accounting policies for initially measuring the retained interests
   b. The method used in measuring the fair value of the retained interests and the key assumptions used in that measurement (at a minimum, assumptions about discount rates, expected prepayments, expected weighted-average life of prepayable assets, anticipated credit losses)
   c. A description of the reporting entity's continuing involvement with the assets securitized
   d. The amount of the gain or loss from sale of the assets in the securitization
   e. Cash flows between the QSPE and the reporting entity
5. If the reporting entity has retained interests in securitized financial assets at the most recent balance sheet presented, it must disclose the following information for each major asset type (e.g., mortgage loans, auto loans, credit card receivables)
   a. Accounting policy for subsequently measuring the retained interests
   b. The method used in measuring the fair value of the retained interests and the key assumptions used in that measurement (at a minimum, assumptions about discount rates, expected prepayments, expected weighted-average life of prepayable assets, anticipated credit losses, expected static pool losses, if applicable)
   c. A sensitivity analysis or stress test showing the hypothetical effect on the fair value of the retained interests of two or more unfavorable variations from the expected level for each key assumption (computed independently of any other change in the key assumptions) and a description of the objectives, methodology, and limitations of the sensitivity analysis or stress test
   d. For the securitized assets and any other financial assets managed with them, the total principal amount, the portion derecognized, the portion remaining, and delinquencies as of the end of the period, and the credit losses, net of recoveries, during the period. This disclosure is to exclude securitized assets that the reporting entity manages but with which it does not have any other continuing involvement.
   e. Average balances during the period for the securitized assets and any other financial assets managed with them. (This disclosure is not required but merely encouraged.)

ASC 310-30. Additional disclosures required for acquirers of loans

1. How prepayments on loans are accounted for
2. For loans acquired through purchase, including in a business combination, separately for loans accounted for as debt securities, and for those not accounted for as debt securities
   a. The outstanding balance (undiscounted cash flows owed)
   b. The carrying amount at the beginning of the period
   c. The carrying amount at the end of the period
   d. A reconciliation of the amount of accretable yield at the beginning of the period to the amount of accretable yield at the end of the period
   e. For loans acquired in the current period

(1) The contractually required payments receivable
(2) The cash flows expected to be collected
(3) The fair value at acquisition
(4) The carrying amount of any acquired loans that are in nonaccrual status

f. The carrying amount of all loans in nonaccrual status
g. For loans not accounted for as debt securities

(1) The amount of any expense recognized for impairment
(2) The amount of any reduction in a valuation allowance for losses that results from an increase in cash flows previously expected to be collected
(3) The amount of the allowance for uncollectible loans at the beginning of the period
(4) The amount of the allowance for uncollectible loans at the end of the period

Prepaid Expenses

Types of prepaid expenses. Prepaid expenses are amounts paid to secure the use of assets or the receipt of services at a future date or continuously over one or more future periods. Prepaid expenses will not be converted to cash, but they are classified as current assets because, if not prepaid, they would have required the use of current assets during the coming year (or operating cycle, if longer). Examples of items that are often prepaid include dues, subscriptions, maintenance agreements, memberships, licenses, rents, and insurance.

The examples of prepaid expenses cited in the previous paragraph are unambiguous. This is, however, not always the case. In negotiating union labor contracts, the parties may agree that the union employees will be entitled to receive a lump-sum cash payment or series of payments in exchange for agreeing to little or no increase in the employees' base wage rate. These lump-sum arrangements ordinarily do not require the employee to refund any portion of the lump sum to the employer in the event that the employee terminates employment during the term of the labor agreement. Further, it is assumed by the parties that, upon termination of a union member, the employer will replace that individual with another union member at the same base wage rate to whom no lump sum would be due. Management believes that the lump-sum payment arrangement will reduce or eliminate raises during the contract term and that these lump-sum payments will benefit future periods. In order to record these lump sums as prepaid expenses, ASC 710-10-25 specifies that, based on a careful review of the facts and circumstances around the contract and negotiations, the payments must clearly benefit a future period in the form of a lower base wage rate than would otherwise have been in effect. Further, the amortization period is not permitted to extend beyond the term of the union contract. The presumption of replacing terminating union members with other union members at the same wage rate is essential to this conclusion and, thus, this accounting treatment is only applicable to union contracts and is not permitted to be applied by analogy to account for individual employment contracts or other compensation arrangements. The SEC observer noted that accounting for this transaction as a prepaid expense is only appropriate when there is no evidence of any kind that the lump-sum payment or payments are related to services rendered in the past.

Amortization. Prepaid expenses are amortized to expense on a ratable basis over the period during which the benefits or services are received. For example, if rent is prepaid for the quarter at the beginning of the quarter, two months of the rent will be included in the prepaid rent account. At the beginning of the second month, the equivalent of one month's rent (half the account balance) would be charged to rent expense. At the beginning of the third month, the remaining prepayment would be charged to rent expense.

Example of prepaid expenses

The PipeTrak Company starts using geographical information systems (GIS) software to track the locations of the country's pipeline infrastructure under a contract for the Department of Homeland Security. It pays maintenance fees on three types of GIS software, for which the following maintenance periods are covered:

Software name	*Maintenance start date*	*Maintenance duration*	*Maintenance fee*
Culture Data (CD)	February	Annual	$4,800
Map Layering (ML)	April	Semiannual	18,000
Land Grid (LG)	June	Quarterly	6,000

It initially records these fee payments as prepaid expenses. PipeTrak's controller then uses the following amortization table to determine the amount of prepaid expenses to charge to expense each month:

Software	*Feb*	*Mar*	*Apr*	*May*	*Jun*	*Jul*	*Aug*	*Sep*	*Oct*	*Nov*	*Dec*
CD	400	400	400	400	400	400	400	400	400	400	400
ML			3,000	3,000	3,000	3,000	3,000	3,000			
LG					2,000	2,000	2,000				
Totals	400	400	3,400	3,400	5,400	5,400	5,400	3,400	400	400	400

In June, PipeTrak records the following entry to charge a portion of its prepaid software maintenance to expense:

Software maintenance expense	5,400	
Prepaid expenses		5,400

PERSPECTIVE AND ISSUES

Reporting entities have an unprecedented variety of financial products available to them to meet their short-term (and long-term) investing and risk management goals. These products have differing characteristics and present the investor with a wide range of returns and, of course, a wider range of risks. Many of these are useful as hedging tools, as well.

GAAP has evolved slowly, deliberately, and sometimes reactively to the emergence of new financial vehicles and their increasing complexity. Initial efforts in this regard focused primarily on informing financial statement readers about the risks and uncertainties inherent in these investments. This was achieved by providing disclosures that accompanied financial

statements, but that did not formally recognize the investments as assets or liabilities, and also did not recognize their inherent volatility in the income statement. This approach thus did not fully provide the needed transparency and proved an inadequate substitute for full financial statement recognition.

ASC 815, *Derivatives and Hedging,* governs the accounting for derivatives. Scores of interpretations have since been issued by a special implementation guidance task force (the Derivatives Implementation Group or DIG) established by FASB. Derivatives literature is exceedingly complex, which is largely a consequence of the rules establishing "special accounting" for hedging. Limited accounting relief (i.e., simplified accounting) for certain types of hedging activities may be provided by applying ASC 825-10-25, *Financial Instruments: Fair Value Option*. In addition, FASB and IASB are conducting other projects designed to simplify and converge accounting for financial instruments, derivatives, and hedging. Accountants therefore must be particularly alert to changes in these requirements.

ASC 815 applies to all entities and requires that all derivative instruments (DI) be recognized as either assets or liabilities on the balance sheet at their respective fair values. Gains and losses on DI which are *not* designated as hedges are always to be recognized currently in earnings (in the case of a not-for-profit entity, in the change in net assets). Special accounting (effectively, the deferral of gains or losses) for derivatives is permissible only when the instrument has been designated as a hedge, and then only to the extent that the hedge is effective. Depending upon which of the conditions specified in the standard are met, a derivative will be specifically designated as either a hedge of fair value changes, of cash flows, or of certain foreign currency exposures.

Hedges of the changes in fair value can be associated with a recognized asset or liability or of an unrecognized firm commitment. In a fair value hedge, gains and losses of both the DI and the hedged item are recognized currently in earnings. In the case of a perfectly effective hedge, these gains and losses will fully offset each period, but more typically this result will not be achieved. There will thus be a residual charge or credit to earnings each period that the hedge position is in place.

Cash flows hedges, on the other hand, pertain to forecasted transactions. The effective portions of these hedges are initially reported in other comprehensive income and are reclassified into earnings only later, when the forecasted transactions affect earnings. Any ineffective portions of the hedges are reported currently in earnings. (Fair value and cash flow hedges are addressed in detail in this chapter.)

Hedges of the foreign currency exposure of a net investment in a foreign operation also qualify for special accounting treatment. In a foreign currency net investment hedge, the gain or loss is reported in other comprehensive income as part of the cumulative translation adjustment. In the case of foreign currency hedges of unrecognized firm commitments, the gain or loss is reported the same way as a fair value hedge. A gain or loss on a foreign currency hedge that is associated with an available-for-sale security will also be reported the same way as a fair value hedge. Finally, a gain or loss arising from a hedge relating to a foreign currency denominated forecasted transaction is reported in the same way as a cash flow hedge. (These hedges are discussed in this chapter and in Chapter 23.)

Not-for-profit entities (NFP) are not permitted to use hedge accounting for forecasted transactions. This is because NFP do not report *other comprehensive income*—all such items are included in the statement of activity, which provides an all-inclusive measure of changes in net assets for the period. In other regards, however, ASC 815 requirements are fully applicable to NFP.

A nonderivative financial instrument generally cannot be designated as a hedge. An exception, however, occurs when that instrument is denominated in a foreign currency and is

designated as a hedge of a net investment in a foreign operation or an unrecognized firm commitment.

Hedge effectiveness must be demonstrated if the accounting set forth in ASC 815 is to be employed. This does not require perfect effectiveness (which is almost never attainable in practice), but the standard is not explicit regarding the degree of effectiveness that must be attained to justify the use of special hedge accounting. The method to be used for assessing the effective and ineffective portions of a hedge must be established at the inception of the hedge and must be consistent with the approach actually used by the reporting entity for managing risk. Should a hedge fail to meet a minimum threshold of effectiveness, it is to be dedesignated, and hedge accounting ceases.

Rules pertaining to the recognition of transfers of financial assets and to the extinguishments of financial liabilities have gone through several changes over the years. Under the provisions of ASC 860, *Transfers and Servicing*, subsequent to a transfer of financial assets an entity recognizes the financial and servicing assets it controls and the liabilities it has incurred, derecognizes those financial assets over which control has been surrendered, and derecognizes liabilities which have been extinguished. Multiple criteria pertaining to surrender of control must all be met for sale treatment to apply. Derivatives and liabilities resulting from a transfer of financial assets are measured at fair value. ASC 860 established requirements for "qualified special-purpose entities (QSPE)," which remain an exception to the more general, and also highly complex, requirements applicable to what are now called "variable interest entities."

ASC 320 remains GAAP regarding passive investments in all debt securities and in those equity securities that have a readily determinable fair value. It classifies these securities into one of three categories: held-to-maturity, trading, or available-for-sale. The first of these can only be applied to debt securities, which are then to be reported at amortized cost. The trading category can include both debt and equity securities, which are to be reported at fair value, via charges or credits included in current earnings. The available-for-sale category is used for those investments that do not fit in either of the other two classifications; these are also reported at fair value in the balance sheet, although changes in fair value are not reflected in current earnings.

ASC 320 did not change the accounting for financial liabilities and it does not apply to DI. In the case of an investment subject to this standard with an embedded derivative, the host instrument is accounted for under ASC 320 and the embedded derivative is accounted for under ASC 815.

ASC 825 and ASC 815 require entities to disclose the fair value of *all* (i.e., both recognized and unrecognized) financial instruments for which it is practicable to estimate values, including liabilities. Pertinent descriptive information regarding the instrument is to be disclosed if an estimate of fair value cannot be made without incurring excessive costs. Certain types of financial instruments—including pensions, postretirement benefits, deferred compensation, insurance contracts, lease contracts, and warranty obligations—are excluded from the requirements of this standard. ASC 825 also requires disclosure of concentrations of credit risk for all financial instruments.

ASC 825-10-50 makes disclosures optional for entities that

1. Have total assets less than $100 million on the balance sheet date; and
2. Have not held or issued any derivative financial instruments during the reporting period; and
3. Are nonpublic

As a general principle, the offsetting of assets and liabilities is not permitted under GAAP. However, when a right of setoff exists—defined as a debtor's legal right to dis-

charge debt owed to another party by applying against the debt an amount the other party owes to the debtor—offsetting is allowed. ASC 210-20-45 makes another exception in the case of multiple forward swap, and similar contracts executed with the same party under master netting arrangements. The conditions to be met are

1. Each of the two parties owes the other determinable amounts.
2. The reporting party has the right to set off.
3. The reporting party intends to set off.
4. The right of setoff is enforceable at law.

Confusing and often conflicting definitions of fair value, which appeared throughout GAAP, have been eliminated and replaced by a single definition provided by The Master Glossary. ASC 820 also provides measurement guidance and new disclosure requirements. Full coverage of ASC 820 and ASC 825-10-25 is provided in Chapter 6.

Chronic complaints about the quality of disclosures as prescribed by ASC 815 have resulted in the 2008 imposition of ASC 815-10-50, which provides for enhanced disclosures about (1) how and why an entity uses derivative instruments, (2) how derivative instruments and related hedged items are accounted for under ASC 815 and its related interpretations, and (3) how derivative instruments and related hedged items affect the reporting entity's financial position, financial performance, and cash flows.

DEFINITIONS OF TERMS

Bifurcation. Separation of an embedded derivative instrument from the host contract so that separate accounting can be applied to the embedded derivative instrument.

Carrying amount (value). The amount at which securities are measured and reported on the reporting entity's balance sheet by applying the appropriate GAAP.

Contractual obligations. All contractual obligations that are financial instruments meet the definition of a liability set forth in CON 6, *Elements of Financial Statements*. Some may not be recognized as liabilities in financial statements (i.e., they may be "off-balance-sheet") because they fail to meet some other criterion for recognition. For some financial instruments, the obligation is owed to or by a group of entities rather than a single entity.

Contractual rights. All contractual rights that are financial instruments meet the definition of asset set forth in CON 6. Some may not be recognized as assets in financial statements (may be "off-balance-sheet") because they fail to meet some other criterion for recognition. For some financial instruments, the obligation is held by or due from a group of entities rather than a single entity.

Cost (of a security). The original purchase price plus all costs incidental to the acquisition (e.g., brokerage fees and taxes) unless a new cost basis is assigned as a result of a decline in fair value which is other than temporary.

Derivative instruments. In ASC 815, derivative instruments are defined by their three distinguishing characteristics. Specifically, derivative instruments are financial instruments or other contracts that have

1. One or more underlyings and one or more notional amounts (or payment provisions or both);
2. No initial net investment or a smaller net investment than required for contracts expected to have a similar response to market changes; and
3. Terms that require or permit
   a. Net settlement
   b. Net settlement by means outside the contract
   c. Delivery of an asset that results in a position substantially the same as net settlement

In contrast to prior GAAP, ASC 815 defines derivative instruments by reference to specific characteristics, rather than in terms of classes or categories of financial instruments. These distinctive features are believed to distinguish the fundamental nature of derivative instruments such as options and futures.

Equity security. Any security (defined below) that evidences an ownership interest in an entity or the right to acquire or dispose of such an ownership interest in an entity for a fixed or determinable price. Equity securities include common or preferred stock, warrants, stock rights, call options, or put options. Equity securities do not include convertible debt or preferred stock that, by their terms, either must be redeemed by the issuer or is redeemable at the option of the investor.

Equity securities with readily determinable fair values. Equity securities (see definition above) that meet one of the following criteria:

1. Sales prices or bid-and-asked quotations are available currently on an SEC-registered securities exchange or in an over-the-counter market whose prices or quotations are publicly reported by the National Association of Securities Dealers' Automated Quotations Systems (NASDAQ) or by Pink Sheets LLC.
2. For equity securities traded exclusively in a foreign market, the foreign market is of comparable breadth and scope to one of the US markets mentioned in 1. above.
3. For equity securities representing investments in mutual funds, the fair value per share or per unit is determined and published, and is used as the basis for current transactions.

Equity securities that otherwise meet one of the above criteria that are restricted as to transfer from their current holder to another party are included in the scope of this definition if the restriction terminates within one year. In accordance with ASC 820, *Fair Value Measurements*, the fair values of these securities are to be measured based on the quoted price of an otherwise unrestricted security of the same issuer, adjusted for the effect of the restriction.

Fair value. The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

Financial asset. A financial asset is defined as

1. Cash,
2. Evidence of an ownership interest in an entity, or
3. A contractual right that conveys to one entity a right
   a. To receive cash or another financial asset from another entity, or
   b. To exchange other financial instruments on potentially favorable terms with the other entity.

Financial instrument. As defined by the Master Glossary, a financial instrument is

1. Cash,
2. Evidence of an ownership interest in an entity, or
3. A contract that meets both of the following criteria:
   a. Imposes on one entity a contractual obligation
      (1) To deliver cash or another financial instrument to a second entity or
      (2) To exchange other financial instruments on potentially unfavorable terms with the second entity, and
   b. Conveys to that second entity a contractual right
      (1) To receive cash or another financial instrument from the first entity, or
      (2) To exchange other financial instruments on potentially favorable terms with the first entity.

The definition was intended to encompass both financial assets and liabilities. Attempting to meet these twin objectives rendered the definition difficult to comprehend, however. ASC 820 provides separate definitions of financial assets and financial liabilities, as summarized herein, which aid the accountant charged with applying GAAP in practice.

Financial liability. A contractual obligation of an entity

1. To deliver cash or another financial asset to another entity or
2. To exchange other financial instruments on potentially unfavorable terms with the other entity.

Firm commitment. An agreement with an unrelated party, binding on both parties and usually legally enforceable, having the following attributes:

1. The agreement specifies all significant terms including the timing of the transaction, the quantity to be exchanged, and a fixed price. The fixed price can be expressed in the entity's functional currency or in a foreign currency. The fixed price can also be expressed as a specified interest rate or specified effective yield.
2. The agreement includes a disincentive for nonperformance sufficient to make contractual performance probable.

Forecasted transaction. A transaction that is expected to occur for which there is no firm commitment. Because no transaction or event has yet occurred, when the transaction or event does occur, it will be at the prevailing market price.

Initial net investment. A derivative instrument is one where the initial net investment is zero or is less than the notional amount (possibly plus a premium or minus a discount). This characteristic refers to the relative amount of investment. Derivative instruments allow the holder an opportunity to take part in the rate or price change without owning the underlying asset or owing the actual liability. If an amount approximating the notional amount must be invested or received, it is not a derivative instrument. The two basic forms of derivative instruments are futures and options. The futures contract involves little or no initial

net investment. Settlement is usually near the delivery date. Call options, when purchased, require a premium payment that is less than the cost of purchasing the equivalent number of shares. Even though this distinguishing characteristic is the result of the action by only one of the parties, it determines the application for both.

ASC 815-10-15 specifies that if the initial net investment in the contract, after adjusting for the time value of money, is less by more than a nominal amount, then an initial net investment that would be commensurate with the amount that would be exchanged either to acquire the asset related to the underlying or to incur the obligation related to the underlying, the threshold condition for classification as a derivative is met. The amount of the asset acquired or liability incurred, for purpose of this determination, should be comparable to the *effective* notional amount of the contract. The effective notional amount is the stated notional amount adjusted for any leverage factor.

Net settlements. To qualify as a derivative instrument, one of the following settlement criteria must be met:

1. No delivery of an asset equal to the notional amount is required. For example, an interest rate swap does not involve delivery of the instrument in which the notional amount is expressed.
2. Delivery of an asset equal to the notional amount is required of one of the parties, but an exchange (or other market mechanism, institutional arrangement or side agreement) facilitates net settlement. For example, a call option has this attribute.
3. Delivery by one of the parties of an asset equal to the notional amount is required but the asset is either readily convertible to cash (as with a contract for the delivery of a marketable equity security), or is required but that asset is itself a derivative instrument (as is the case for a swaption [an option on a swap]).

This characteristic means that the derivative instrument can be settled by a net delivery of assets (the medium of exchange does not have to be cash). Contract terms based on changes in the price or rate of the notional that implicitly or explicitly require or permit net settlement qualify. Situations where one of the parties can liquidate their net investment or be relieved of the contract rights or obligations without significant transaction costs because of a market arrangement (broadly interpreted) or where the delivered asset can be readily converted to cash also meet the requirements for net settlement. It is assumed that an exchange-traded security is readily converted to cash. Thus, commodity-based contracts for gold, oil, wheat, etc. are now included under this standard. The convertible to cash condition requires an active market and consideration of interchangeability and transaction volume. Determining if delivery of a financial asset or liability equal to the notional amount is a derivative instrument may depend upon whether it is readily convertible into cash. Different accounting will result if the notional is not readily converted to cash. Using the notional as collateral does not necessarily mean it is readily convertible to cash.

Normal purchases and sales. Contracts without a settlement provision and without a market mechanism to facilitate net settlement; or which require delivery of nonfinancial assets that constitute normal purchases or normal sales of the reporting entity.

Notional amount. The notional amount (or payment provision) is the referenced units of measure associated with the underlying asset or liability, such as shares of stock, principal amount, face value, stated value, basis points, barrels of oil, etc. It may be that amount plus a premium or minus a discount. The interaction of the price or rate (underlying) with the referenced associated asset or liability (notional amount) determines whether settlement is required and, if so, the amount.

Other-than-temporary decline. A downward movement in the value of a marketable equity security for which there are known causes. The decline indicates a remote likelihood of a price recovery.

Security. A security is defined as one of the following:

1. A share, participation, or other interest in an enterprise or in property of the issuer, or
2. An obligation of the issuer that
   a. Is represented by an instrument issued in bearer or registered form or is registered in books maintained to record transfers by or on behalf of the issuer,
   b. Is of a type commonly dealt in on securities exchanges or markets or, when represented by an instrument, is commonly recognized in any area in which it is issued or dealt in as an investment medium, and
   c. Is either one of a class or series or, by its terms, is divisible into a class or series of shares, participations, interests, or obligations

Short-term investments. Securities or other assets acquired with excess cash, having ready marketability and intended by management to be liquidated, if necessary, within the current operating cycle.

Temporary decline. A downward fluctuation in the fair value of a security that has no known causes that suggest the decline will not reverse in the future.

Underlying. An underlying is commonly a specified price or rate such as a stock price, interest rate, currency rate, commodity price, or a related index. However, any variable (financial or physical) with (1) observable changes or (2) objectively verifiable changes such as a credit rating, insurance index, climatic or geological condition (temperature, rainfall) qualifies. Unless it is specifically excluded, a contract based on any qualifying variable is accounted for under ASC 815 if it has distinguishing characteristics 2. and 3. above.

Unrealized gain (loss). The unrealized difference between the fair value of a short-term investment and its carrying value.

Valuation allowance. An account used to adjust the carrying value of equity securities to fair value. The offset is either a gain or loss account (for trading securities) or a contra equity account (for available-for-sale securities).

CONCEPTS, RULES, AND EXAMPLES

Short-Term Investments

Short-term (or temporary) investments usually consist of debt securities and equity securities with readily determinable fair values. Accordingly, investments that are held for purposes of control of another entity or pursuant to an ongoing business relationship, for example, stock held in a supplier, would be excluded from current assets and would instead be listed as other assets or long-term investments (discussed in detail in Chapter 12).

Debt securities and equity securities with readily determinable fair values. ASC 320, *Investments—Debt and Equity Securities*, governs the accounting for all debt securities and for equity securities with readily determinable fair values.

Included in the scope of ASC 320	*Excluded from the scope of ASC 320*
All debt including loans that meet the ASC 320 definition of a "security," even if the loan involved a modification of terms in connection with a troubled debt restructuring (ASC 320-10-55)	Unsecuritized loans
Mortgage-backed securities	Equity securities that, absent election of the fair value option permitted by ASC 825-10-25, would be required to be accounted for using the equity method
Equity securities with readily determinable fair values	Investments in consolidated entities
Rights to purchase equity securities (e.g., warrants and call options) or to sell equity securities (e.g., put options)	Not-for-profit organizations (subject, instead to ASC 958-320)
An instrument otherwise subject to ASC 320 that contains an embedded derivative subject to ASC 815. The host instrument remains within the scope of ASC 320	Derivatives subject to ASC 815
Cooperatives and mutual enterprises including credit unions, and mutual insurance companies	Reporting entities subject to specialized industry requirements that substantially all their investments be stated at fair value with changes in fair value recognized currently in income (e.g. brokers and dealers in securities; employee benefit plans; investment companies)
	Transaction gains or losses on held-to-maturity foreign-currency-denominated debt securities (accounted for under ASC 830)

ASC 320 requires all debt securities and equity securities with readily determinable fair values to be placed into one of three categories.

Classification of Debt Securities and Equity Securities with Readily Determinable Fair Values

Category	*Type*	*Characteristics*	*Reported on balance sheet*	*Reported in income*
1. Held-to-maturity	Debt	Positive intent and ability to hold until maturity	Amortized cost	Interest Realized gains and losses
2. Trading	Debt or equity	Bought and held principally to sell short-term	Fair value	Interest and dividends Realized gains and losses Unrealized gains and losses
3. Available-for-sale	Debt or equity	Neither held-to-maturity nor trading securities	Fair value Unrealized gains and losses to accumulated other comprehensive income (component of equity)	Interest and dividends Realized gains and losses

If a classified balance sheet is presented, the debt and equity securities owned by an entity are to be grouped into current and noncurrent portfolios. By definition, all trading securities are classified as current assets. The determination of current or noncurrent status for

individual held-to-maturity and individual available-for-sale securities is made on the basis of whether or not the securities are considered working capital available for current operations (ASC 210-10-45).

Fair value readily determinable. The fair value of an equity security is considered readily determinable if

1. Sales prices or bid-and-ask quotations are currently available on SEC-registered exchanges or in an over-the-counter market publicly reported by the National Association of Securities Dealers Automated Quotation System (NASDAQ) or by Pink Sheets LLC. Unless qualified for sale within one year, restricted stock does not meet this definition.
2. It is traded on a foreign market of comparable breadth and scope to one of the US markets identified above.
3. It represents an interest in a mutual fund and fair value per unit (share) is determined and published and is the basis for current transactions.

Classification. Classification is to be made at the time of the initial acquisition of the investment. The appropriateness of classification is to be reassessed at each reporting date.

Held-to-maturity debt securities. If an entity has both the *positive intent* and the *ability* to hold debt securities to maturity, they are measured and presented at amortized cost. In general, transfers to or from this category are not permitted. In those rare circumstances when there are transfers or sales of securities in this category, disclosure must be made of the following in the notes to the financial statements for each period for which the results of operations are presented:

1. Amortized cost
2. Realized or unrealized gain or loss
3. Circumstances leading to the decision to sell or transfer

Isolated, nonrecurring, and unusual events that could not have been reasonably anticipated may cause a sale or transfer without calling the originally determined intent or ability to hold into question. Other changes in circumstances that are not considered inconsistent include

1. Material deterioration in creditworthiness of the issuer
2. Elimination or reduction of tax-exempt status of interest through a change in tax law
3. Major business disposition or combination
4. Statutory or regulatory changes that materially modify what a permissible investment is or the maximum level of the security to be held
5. Downsizing in response to a regulatory increase in the industry's capital requirements
6. A material increase in risk weights for regulatory risk-based capital purposes

The held-to-maturity category does not include securities available for sale in response to a need for liquidity or changes in

1. Market interest rates
2. Foreign currency risk
3. Funding sources and terms
4. Yield and availability of alternative investments
5. Prepayment risk

For asset-liability management purposes, similar or identical securities may be classified differently depending upon intent and ability to hold.

Under ASC 860-20-35, securities such as interest-only strips, which can be settled in a manner that could cause the recorded amounts to not be substantially recovered, cannot be

classified as held-to-maturity. Dependent upon the circumstances these are to be categorized as either trading or available-for-sale.

For a discussion of the treatment of foreign-currency-denominated held-to-maturity securities and permissible hedging strategies under ASC 815, see Chapter 23.

Maturity date. The sale of a security within three months of its maturity meets the requirement to hold to maturity since the interest rate risk is substantially diminished. Likewise, if a call is considered probable, a sale within three months of that date meets the requirement. The sale of a security after collection of at least 85% of the principal outstanding at acquisition (due to prepayments or to scheduled payments of principal and interest in equal installments) also qualifies since the "tail" portion no longer represents an efficient investment due to the economic costs of accounting for the remnants. Scheduled payments are not required to be equal for variable-rate debt.

Example of held-to-maturity debt securities

The 12/31/08 debt security portfolio categorized as held-to-maturity is as follows:

Security	*Maturity value*	*Amortized cost*	*Assumed fair value*
DEF 12% bond, due 12/31/09	$ 10,000	$10,320	$10,200
PQR mortgage-backed debt, due 12/31/11	$100,000	$92,000	$90,000
JKL 8% bond, due 12/31/15	$ 10,000	$ 8,929	$ 9,100

The balance sheet would report all the securities in this category at amortized cost and would classify them as follows:

Security	*Maturity date*	*Balance sheet*	*Classification*
DEF	12/31/09	$10,320	Current
PQR	12/31/11	92,000	Noncurrent
JKL	12/31/15	8,929	Noncurrent

Interest income, including premium and discount amortization, is included in income. Any realized gains or losses are also included in income.

Trading securities. If an entity has debt and/or equity securities (with readily determinable fair value) that it intends to actively and frequently buy and sell for short-term profits, those securities are classified as trading securities. Unless classified as held-to-maturity securities, under ASC 948 mortgage-backed securities held for sale require classification as trading securities. The securities in this category are required to be carried at fair value on the balance sheet as current assets. All applicable interest and dividends, realized gains and losses, and unrealized gains and losses on changes in fair value are included in income from continuing operations.

Example of accounting for trading securities

The year one current trading securities portfolio is as follows:

Security	*Cost*	*Fair value*	*Difference (fair value minus cost)*
ABC	$1,000	$ 900	$(100)
MNO calls	1,500	1,700	200
STU	2,000	1,400	(600)
XYZ 7% bond	2,500	2,600	100
	$7,000	$6,600	$(400)

A $400 adjustment is required in order to recognize the decline in fair value. The entry required is

Unrealized loss on trading securities	400	
Trading securities—MNO calls	200	
Trading securities—XYZ 7% bond	100	
Trading securities—ABC		100
Trading securities—STU		600

The unrealized loss would appear on the income statement as part of other expenses and losses. Dividend income and interest income (including premium and discount amortization) is included in income. Any realized gains or losses from the sale of securities are also included in income.

An alternative to direct write-up and write-down of securities is the use of an asset valuation allowance account to adjust the portfolio totals. In the above example, the entry would be

Unrealized loss on trading securities	400	
Valuation allowance (contra asset)		400

The valuation allowance of $400 would be deducted from historical cost to obtain a fair value of $6,600 for the trading securities on the balance sheet.

All trading securities are classified as current assets and the balance sheet would appear as follows:

Current assets:

Trading securities at fair value (cost = $7,000)	$6,600

The year two current trading portfolio is as follows:

Security	*New securities cost*	*Old securities X1 fair value*	*X2 fair value*	*Difference**
ABC		$ 900	$1,000	$100
DEF Puts	$1,500		1,500	0
STU		1,400	1,800	400
VWX	2,700		2,800	100
	$4,200	$2,300	$7,100	$600

* *Difference = X2 fair value – (Cost or X1 fair value)*

A $600 adjustment is required in order to recognize the increase in fair value. The entry required is

Trading securities—ABC	100	
Trading securities—STU	400	
Trading securities—VWX	100	
Unrealized gain on trading securities		600

The unrealized gain would appear on the income statement as part of other income.

Example of accounting for a realized gain

1. The same information as given in the above example for year one
2. In year two, the MNO calls are sold for $1,600 and the XYZ 7% bonds are sold for $2,700.

The entry required to record the sale is

Cash	4,300	
Realized loss on sale of trading securities	100	
Realized gain on sale of trading securities		100
Trading securities—MNO calls (X1 fair value)		1,700
Trading securities—XYZ 7% bonds (X1 fair value)		2,600

Under the valuation allowance method, the current trading portfolio would appear as follows:

Security	*Cost*	*X2 fair value*
ABC	$1,000	$1,000
DEF Puts	1,500	1,500
STU	2,000	1,800
VWX	2,700	2,800
	$7,200	$7,100

The required entries to recognize the increase in fair value and the realized gain are

Valuation allowance	300	
Unrealized gain on trading securities		300

To adjust the valuation allowance to reflect the unrealized loss of $100 at the end of year two on the remaining trading portfolio

Cash	4,300	
Trading securities—MNO calls (Cost)		1,500
Trading securities—XYZ 7% bonds (Cost)		2,500
Realized gain on sale of trading securities		300

The balance sheet under both methods would appear as follows:

Current assets:

Trading securities at fair value (cost = $7,200)	$7,100

Available-for-sale securities. Investments in debt securities and in equity securities with a readily determinable fair value that are *not* classified as either trading securities or held-to-maturity are classified as available-for-sale. The securities in this category are required to be carried at fair value on the balance sheet. The determination of current or noncurrent status for individual securities depends on whether the securities are considered working capital (ASC 210-10-45).

Other than the possibility of having some noncurrent securities on the balance sheet, the major difference between trading securities and available-for-sale securities is the handling of unrealized gains and losses. Unlike trading securities, the *unrealized* gains and losses are excluded from net income. Instead, they are reported in other comprehensive income per ASC 220. All applicable interest (including premium and discount amortization) and any realized gains or losses from the sale of securities are included in income from continuing operations.

Example of available-for-sale equity securities

Bonito Corporation purchases 2,500 shares of equity securities at $6 each, which it classifies as available-for-sale. At the end of one year, the quoted market price of the securities is $4, which rises to $9 at the end of the second year, when Bonito sells the securities. The company has an incremental tax rate of 25%. The calculation of annual gains and losses follows:

	Gain/(loss) before tax	*Tax on gain/(loss)*	*Gain/(loss) net of tax*
End of Year 1	(5,000)	(1,250)	(3,750)
End of Year 2	12,500	3,125	9,375
Net gain	7,500	1,875	5,625

Bonito reports these gains and losses in net income and other comprehensive income in the indicated years as follows:

	Year 1	*Year 2*
Net income:		
Gain on sale of securities		$7,500
Income tax expense		(1,875)
Net gain realized in net income		5,625
Other comprehensive income:		
Gain/(loss) on available-for-sale securities arising during period, net of tax	$(3,750)	9,375
Reclassification adjustment, net of tax		(5,625)
Other comprehensive income net gain/(loss)	(3,750)	3,750

Example of available-for-sale debt securities

Bonito Corporation purchases 10,000 bonds of Easter Corporation maturing in 6 years, at a price of $95.38, and classifies them as available-for-sale. The bonds have a par value of $100 and pay interest of 7% annually. At the price Bonito paid, the effective interest rate is 8%. The calculation of the bond discount follows:

Maturity value of bonds receivable		$1,000,000
Present value of $1,000,000 due in 6 years at 8% (multiplier = 0.63017)	630,170	
Present value of $70,000 interest payable annually for 6 years at 8% annually (multiplier = 4.6229)	323,600	
Purchase price of bonds		953,770
Discount on bonds payable		46,230

The complete table of interest income and discount amortization calculations for the remaining life of the bonds follows:

Year	*Beginning value*	*Interest received*	*Recognized interest income**	*Discount amortization*	*Ending value*
1	$953,800	$70,000	$76,304	6,304	960,104
2	960,104	70,000	76,808	6,808	966,912
3	966,912	70,000	77,353	7,353	974,265
4	974,265	70,000	77,941	7,941	982,206
5	982,206	70,000	78,576	8,576	990,782
6	990,782	70,000	79,218	9,218	1,000,000

* *(Beginning value) × (Effective interest rate of 8%)*

At the end of Year 1, the quoted market price of the bonds is $98, and it is $94 at the end of Year 2. The company has an incremental tax rate of 25%. The following table calculates the before-tax and after-tax holding gains and losses on the investment.

Year	*Ending carrying value*	*Ending fair value*	*Holding gain/(loss)*	*Income tax*	*Net of tax*
1	$960,104	$980,000	$19,896	4,974	14,922
2	966,912	940,000	(26,912)	(6,728)	(20,184)
Net			(7,016)	(1,754)	(5,262)

Bonito sells the bonds at the end of Year 2, and reports these gains and losses in net income and other comprehensive income in the indicated years as follows:

	Year 1	*Year 2*
Net income:		
Interest income	76,304	76,808
Loss on sale of bonds		(7,016)
Income tax expense	(19,076)	(17,448)
Net gain/(loss) realized in net income	57,228	52,344
Other comprehensive income:		
Gain/(loss) on available-for-sale securities arising during period, net of tax	14,922	(20,184)
Reclassification adjustment, net of tax		5,262
Other comprehensive income net gain/(loss)	14,922	(14,922)

Deferred income tax effects. The recognition of unrealized gains and losses for financial statement purposes is likely to have deferred income tax effects. See the discussion in Chapter 12.

Transfers between categories. Fair value is used for transfers between categories. When the security is transferred, any unrealized holding gains and losses are accounted for in the following manner:

1. **From trading**—Already recognized and not to be reversed
2. **Into trading**—Recognize immediately in income
3. **Available-for-sale debt security into held-to-maturity**—Continue to report the unrealized holding gain or loss at the transfer date as other comprehensive income and amortize the gain or loss over the investment's remaining life as an adjustment of yield in the same manner as a premium or discount. The transferred-in security will probably record a premium or discount since fair value is used. Thus, the two amortizations will tend to cancel each other on the income statement.

4. **Held-to-maturity debt security into available-for-sale**—Recognize in other comprehensive income per ASC 220. Few transfers are expected from the held-to-maturity category.

See examples of accounting for transfers between portfolios in Chapter 12. Note that transfers are expected to be rare in occurrence and indeed may have significant, negative consequences, such as the "tainting" of other held-to-maturity investments when an asset in that category is transferred or sold before maturity.

Other-than-temporary impairment. ASC 320-10-35 addresses the meaning of "other-than-temporary" impairment.

Investments within the scope of ASC 320-10-35 are

1. Cost-method investments in equity securities,
2. Debt and equity securities subject to ASC 320 including host instruments from which embedded derivatives have been bifurcated (separated) under ASC 815,
3. Debt and equity securities subject to ASC 958-320 when the holder of the investment reports a "performance indicator" as defined in the Master Glossary.

The amended pronouncement sets forth a multistep process for evaluating whether a security is impaired and, if so, whether the impairment is deemed to be other than temporary.

Unit of accounting. The unit of accounting to be used for the purpose of performing these steps is the individual security level. This is defined as the level and method of aggregation used by the reporting entity to measure realized and unrealized gains and losses on its debt and equity securities. An example of an acceptable method of aggregation would be for the reporting entity to consider equity securities of an issuer that carry the same CUSIP number[1] that were purchased in separate trade lots to be considered together on an average cost basis.

In considering whether the issuer (i.e., borrower or debtor) of a debt security can prepay or settle the security in a manner that would result in the investor not recovering substantially all of its cost, the investor is not permitted to combine separate contracts such as a debt security and a guarantee or other credit enhancement.

Cost-method equity investments. Special rules apply to cost-method investments because, by definition, they do not have readily determinable fair values. These rules are discussed in detail in Chapter 12.

Step 1: Determining whether the investment is impaired. The first step is to determine whether the investment is impaired. Impairment is determined by comparing the fair value of the investment to its adjusted cost. For this purpose, cost is adjusted for any applicable accretion, amortization, hedging adjustments, and previous write-downs caused by other-than-temporary impairment. If adjusted cost exceeds fair value, the investment is impaired.

Step 2: Evaluating whether the impairment is other than temporary. If an investment is determined to be impaired by applying Step 1, management is to evaluate whether it considers the impairment to be other than temporary by considering all available evidence. In lieu of providing guidance on how to make this determination, refer to pertinent guidance contained in ASC 320-10-35, ASC 325-20-35, ASC 325-40-35, SEC Staff Accounting Bulletin Topic 5M, and SAS 92.

---

[1] *CUSIP is an acronym for the* ***Committee on Uniform Security Identification Procedures*** *of the American Bankers Association (ABA). The committee developed a nine-digit numbering system for uniquely identifying US government, municipal, and corporate securities. The first six digits identify the issuer of the securities and the remaining three digits uniquely identify the particular issue.*

The reader is referred to the SEC's SAB 59 which, in essence, provides that it is the refutable presumption that impairments of investments are indeed "other than temporary" and thus (in the case of available-for-sale and held-to-maturity investments) such declines in value would have to be reported currently in results of operations, unless there were positive evidence to support the alternative contention (i.e., that the impairment instead was merely temporary in nature), and thus—in the case of held-to-maturity investments—not to be recognized at all. A similar approach is applicable to the evaluation of impairments of equity-method investments.

For equity securities, this criterion will automatically be met, unless the investor has both the intent and ability to hold the investment for a period of time sufficient for a forecasted recovery in fair value to the cost of the investment, and evidence indicating the likelihood of a recovery outweighs evidence to the contrary. Ability and intent must be evaluated in light of the entity's working capital and other needs, any regulatory limitations it faces, the issuer's ability to settle the security, and other factors. A history of selling investments before recovery of fair value would suggest that, for that reporting entity, the decline in fair value should be seen as other than temporary.

Step 3: Accounting for impairment that is other than temporary. If, as a result of the evaluation performed in Step 2, management determines that the impairment of an investment is other than temporary, an impairment loss is recognized as a charge to earnings for the difference between the carrying value of the investment and its fair value at the balance sheet date of the reporting period in which the determination is made. The full amount of the impairment write-down is recognized even if, subsequent tot the balance sheet date and prior to the issuance of the financial statements, a portion of the impairment loss is recovered due to an increase in the fair value of the investment. The impaired value becomes the new cost basis, from which recoveries in value may not be given recognition—in distinct contrast to the accounting prescribed for temporary declines in value.

When debt securities are deemed to have been other-than-temporarily impaired, and the carrying value is accordingly reduced, the amount and timing of income recognition in subsequent periods would then be governed by the provisions of ASC 310-30. This topic is discussed in detail in the *Banking and Thrift* section of Chapter 25; briefly, it holds that purchased loans, and loans or debt instruments that have been written down to impaired values, are to be displayed at the initial investment (impaired value) amount on the balance sheet. The amount of the downward adjustment is not to be displayed. Given the evidence of deterioration in credit quality since origination, the reporting entity will be required to estimate the cash flows expected to be collected on the debt instrument; this is to be done both at the purchase date and again periodically over the terms of the debt instruments. Cash flows in excess of the adjusted carrying (impaired) value expected to be collected are to be recognized as yield, and are referred to as "accretable yield." If, subsequently, there are decreases in the probable cash flows, further impairments are to be recognized. Probable increases in subsequent cash flows expected to be collected are recognized *prospectively* as a yield adjustment.

Example of impairment of available-for-sale securities

Bonito Corporation purchases 5,000 shares of Southern Star Corporation's common stock at $8 per share, for a total investment of $40,000, and classifies the investment as available-for-sale. The following events occur:

- Towards the end of Year 1, Southern experiences a significant decline in its earnings performance and related credit rating due to the loss of a key customer, resulting in a drop in the common stock price to $4. Bonito's management feels that the price decline is temporary, and so records the loss in other comprehensive income.

- The stock price drops to $3 at the end of Year 2, due to Southern's inability to generate replacement sales. Bonito's management now feels that the price decline is other than temporary, and records the loss in net income.
- The stock price increases in Year 3 to $5, which is reflected in other comprehensive income.

Bonito's incremental income tax rate is 30%. Its calculation of annual gains and losses follows:

	Stock price	*Gain/(loss) before tax*	*Tax effect of gain/(loss)*	*Gain/(loss) net of tax*
End of Year 1	$4	$(20,000)	$6,000	$(14,000)
End of Year 2	$3	(5,000)	1,500	(3,500)
End of Year 3	$5	10,000	(3,000)	7,000
Net (loss)		$(15,000)	$4,500	$(10,500)

The effects of Bonito's reporting of these events are reflected in the following table:

	Year 1	*Year 2*	*Year 3*
Net income:			
Loss on other-than-temporary impairment of available-for-sale investment		$(25,000)	
Income tax expense		7,500	
Net gain/(loss) realized in net income		$(17,500)	
Other comprehensive income:			
Gain/(loss) on available-for-sale securities arising during period, net of tax	$(14,000)	$(3,500)	$7,000
Reclassification adjustment, net of tax		17,500	
Other comprehensive income net gain/(loss)	$(14,000)	$14,000	$7,000

Cash flow statement. Cash flows resulting from sales, purchases or maturity of securities are to be accounted for as follows:

1.	Held-to-maturity	Investing activity
2.	Available-for-sale	Investing activity
3.	Trading	Classify based on the nature and purpose for which the securities were acquired This was mandated by ASC 825-10-25, discussed in detail in Chapter 6, which was effective as of the beginning of the reporting entity's first fiscal year that begins after 11/15/2007

Cash flows from 1. and 2. above are required to be reported gross (cash inflows from gross proceeds separately from outflows for purchase of investments) for each security classification.

Irrespective of the classification of the above cash flows from (or for) purchases, sales, and maturities of investments, ASC 230 requires that cash inflows representing "…returns on loans, other debt instruments of other entities, and equity securities-interest and dividends" be classified as operating activities.

Option contracts. Call and put options can serve as valuable hedging instruments or as highly leveraged speculative investments. Options give one party, the *holder,* the right but not the obligation to either buy (call) or sell (put) a fixed quantity of an instrument at a defined price. The counterparty, known as the *writer* of the option, has no choice to make and must perform if called upon to do so by the holder.

One call contract gives the holder the right to buy 100 shares of the underlying security at a specific exercise price, regardless of the market price. The seller (writer) of the call, on the other hand, must sell the security to the buyer at that specified exercise price, regardless of the market price. For example, assume a Dreamy July 35 call has a quoted market price of

$6 (per share or $600 per contract). These facts indicate that a buyer that pays $600 to a seller for a call has the right to purchase 100 shares of Dreamy at any time until July (typically, the end of trading on the third Friday of the month quoted) for $35 per share. The buyer can exercise this right at any time until it expires. The writer of the call must stand ready to deliver 100 shares to the buyer for $35 per share until expiration. Typically, the holder expects the market price to rise and the writer expects the market price to stay the same or to fall.

A put is the opposite of a call. A put gives the holder of the put the right to sell the underlying security at the exercise price regardless of the market price. It gives the writer of the put the obligation to buy at the exercise price, if so demanded by the holder. Typically, the holder of a put option expects the market price to fall, and the writer expects the market price to stay the same or to rise.

There are many compound options used by traders and investors, all of which consist of combinations of one or more calls and puts, in some cases having differing expiration dates. Strips, straps, straddles, and spreads are combinations and/or variations of the basic call and the basic put. These and other compound instruments should be analyzed in terms of their constituent elements, and accounted for accordingly.

Example

Writer D owns 100 shares of Dreamy at a cost of $75 per share and sells 1 Dreamy July 35 call to Holder E at $6. The following positions result if the market price:

		Position	
		Writer (D)	*Holder (E)*
1.	Stays at 35 and there is no exercise	+$600	–$600

D receives the $600 premium and E pays for the right to call the stock. If the market price doesn't move, the option expires; E is out $600 and D collects it.

2.	Rises to 55 and there is an exercise and immediate sale	+$600 (0 + $600)	+$1,400 ($2,000 – $600)

If the price rises to $55 per share and the security is called, D sells the security to E at $35 ($0 profit on the shares) and is effectively $600 (the amount of the premium) better off. E, however, buys the security at $35 per share and immediately sells it for $55 per share. E gains $2,000 from the security sale less the $600 premium, and so is $1,400 better off.

3.	Falls to 15 and there is no exercise	–$1,400 (– $2,000 + $600)	–$600 (0 – $600)

If the market price falls to $15 per share, D incurs an effective $2,000 decrease in value of the shares held, less the $600 premium received. E does not exercise the option and loses the premium paid.

The issue in accounting for options is whether cost or fair value—or some combination—is to be used in accounting for the option itself and for the associated underlying security. For instance, assume M buys 100 shares of XYZ at $15 per share and the security price immediately moves to $25 per share. At this point, M buys a November 25 put contract at $100 for the contract. M has effectively hedged and guaranteed a minimum profit of $900 [(100 shares x $10) – ($1 x 100 shares)] regardless of market price movement, since XYZ can be sold for $25 per share until the third Friday in November. If the price continues upward, the put will expire unexercised and M will continue to benefit point for point. If the price stays the same, M locks in a profit of $900. If the price falls, M has locked in a profit of $900. The question is whether, under this fact pattern, both the option and the security can be accounted for at historical cost or at fair value or at some combination of the two.

Before the promulgation of ASC 815, ASC 320 had been the only relevant guidance, and it was not really definitive. ASC 320 established the requirements for accounting for

investments. Theoretically, therefore, ASC 320 only applied to *purchased* puts and calls, since *written* options are liabilities, not investments. Likewise, cash settled options and equity indexed options do not represent ownership interests and debt securities options are not covered by ASC 320.

Other guidance on accounting for investments. A number of specialized issues arising in connection with short-term (or other) investments are addressed in the following paragraphs.

ASC 320-10-50 holds that investments in open-end mutual funds that invest in US government securities are to be reported at fair value per ASC 320. Investments in mutual funds that invest solely in US government debt securities are deemed to be equity investments (since it is the shares of the fund, and not the ultimate debt securities, that are owned), and therefore cannot be classified as held-to-maturity investments.

ASC 815-10-35 addresses the accounting for certain forward contracts and purchased options to acquire securities covered by ASC 320. It applies only when the terms require physical settlement. It stipulates that forward contracts and purchased options, which are not classified as derivatives, having no intrinsic value at acquisition, are to be designated and accounted for as prescribed by ASC 320. These forwards and options would not be eligible for designation as hedging instruments.

ASC 320-10-35 deals with the complex area of "structured notes," in particular with the matters of recognition of interest income and of balance sheet classification of such instruments. According to this consensus, when recognizing interest income on structured note securities in an available-for-sale or held-to-maturity portfolio, the retrospective interest method is to be used if three conditions are satisfied. These conditions are

1. Either the original investment amount or the maturity amount of the contractual principal is at risk
2. Return of investment on note is subject to volatility arising from either
   a. No stated rate or stated rate that is not a constant percentage or in same direction as changes in market-based interest rates or interest rate index, or
   b. Fixed or variable coupon rate is lower than that for interest for traditional notes with similar maturity and a portion of potential yield is based on occurrence of future circumstances or events
3. Contractual maturity of bond is based on a specific index or on occurrence of specific events or situations outside the control of contractual parties

This does not apply to structured note securities that, by their nature, subject the holder to reasonably possible loss of all or substantially all of the original invested amount (other than due to debtor failure to pay amount owed). In those instances, the investment is to be carried at fair value with changes in value recognized in current earnings.

The retrospective interest method requires that periodic income be measured by reference to the change in amortized cost from period beginning to period end, plus any cash received during the period. Amortized cost is determined with reference to the conditions applicable as of the respective balance sheet date. Other than temporary declines in fair value would also have to be recognized in earnings, consistent with ASC 320 requirements for held-to-maturity investments.

ASC 815 prohibits the use of a foreign-currency-denominated liability as a hedge of an AFS debt security. Thus, in a fair hedge of an AFS debt instrument, any gain or loss on the currency derivative will have to be reported in current earnings, not in other comprehensive income, as will any foreign currency portion of the gain or loss on the debt security.

A relatively recent development has been the creation of "weather derivatives," which were addressed by ASC 815-45. At issue was whether such contracts should be reported under accrual accounting, under settlement accounting, under insurance accounting, marked to fair value through earnings at each reporting date, or under some other method. Also at issue was whether the accounting for these derivatives should vary based on the type of contract. Past practice has been diverse.

ASC 815 provides that contracts that are not exchange-traded are not subject to the requirements of that statement if settlement is based on a climatic or geological variable or on some other physical variable. Any derivative based on a physical variable that eventually becomes exchange-traded automatically becomes subject to the requirements of ASC 815.

ASC 815-45 states that an entity that enters into a non-exchange-traded forward-based weather derivative in connection with nontrading activities is to account for the contract by applying an "intrinsic value method." The intrinsic value method computes an amount based on the difference between the expected results from an upfront allocation of the cumulative strike and the actual results during a period, multiplied by the contract price (for example, dollars per heating degree day). The use of external statistical sources, such as the National Weather Service, is necessary in applying this technique.

Furthermore, an entity that purchases a nonexchange-traded option-based weather derivative in connection with nontrading activities is to amortize to expense the premium paid (or due) and apply the intrinsic value method to measure the contract at each interim balance sheet date. The premium asset is to be amortized in a rational and systematic manner.

Also, all entities that sell or write a non-exchange-traded option-based weather derivative are to initially recognize the premium as a liability and recognize any subsequent changes in fair value currently in earnings (the premium would not be amortized).

In addition, a purchased or written weather derivative may contain an "embedded" premium or discount when the contract terms are not consistent with current market terms. In those circumstances, the premium or discount is to be quantified, removed from the calculated benchmark strike, and accounted for as noted above.

Finally, all weather derivative contracts entered into under trading or speculative activities are to be accounted for at their fair value, with subsequent changes in fair value reported currently in earnings.

Financial Instruments

Terminology and scope. The Master Glossary provides a definition of financial instruments that is intended to cover both financial assets and liabilities. Attempting to make the definition all-encompassing made it difficult to understand and apply in practice. ASC 825-10-25, *Financial Instruments: The Fair Value Option*, assists in that endeavor by providing separate definitions of financial assets and financial liabilities. These definitions are provided earlier in this chapter in the section entitled Definitions of Terms. Financial assets are discussed in this chapter; financial liabilities are discussed in Chapter 14.

Types of financial assets. The term "financial assets" encompasses a wide range of instruments including, but not limited to

Accounts receivable	General partnership interests
Beneficial interests in trusts	Limited partnership interests
Cash	LLC member interests
Certificates of deposit	Municipal bonds
Commercial paper	Mutual fund shares or units
Common and preferred stock	Notes and loans receivable
Corporate bonds	US Government securities

An unconditional contractual obligation whose economic benefit or sacrifice is to be the receipt or delivery of a financial instrument other than cash is to be considered a financial instrument. For example, a note that is payable in US Treasury bonds gives an issuer the contractual obligation to deliver and gives a holder the contractual right to receive bonds, not cash. But because the bonds represent obligations of the US Treasury to pay cash, they are considered financial instruments. Therefore, the note is also a financial instrument to both the holder of the note and the issuer of the note.

Another type of financial instrument is one that gives an entity the *contractual right* or obligation to exchange other financial instruments on *potentially* favorable or unfavorable terms. An example of this type of financial instrument would be a call option to purchase a specific US Treasury note for $100,000 in six months. The option *holder* has a contractual right, but not obligation, to exchange the financial instrument on potentially favorable terms. Six months later, if the fair value of the note exceeds $100,000, the holder will exercise the option because the terms are favorable (the option is now "in the money"). The *writer* of the call option has a contractual obligation to exchange financial instruments on potentially unfavorable terms if the holder exercises the option. The writer is normally compensated for accepting this obligation by being paid a premium, which it keeps whether or not the option is exercised.

A put option to sell a Treasury note has similar effects, although the change in fair values making it worthwhile to exercise the option will be a decline, rather than an increase. The holder of the put option, as with the call option, effectively has an unlimited profit potential and no risk of loss (the only sunk cost is the premium paid), whereas the writer of the option has unlimited risk of loss and only a fixed amount of income.

Options, such as those discussed here, are derivative financial instruments because their fair value depends upon the value of the underlying. A bank's commitment to lend $100,000 to a customer at a fixed rate of 10% any time during the next six months at the customer's option is also a derivative financial instrument, since its value would vary as market interest rates change. It is an option, with the potential borrower being the holder and the bank being the writer (the parties are collectively referred to as the "counterparties").

An interest rate swap is a series of forward contracts to exchange, for example, fixed cash payments for variable cash receipts. The cash receipts are computed by multiplying a specified floating-rate market index by a notional amount of principal. An interest rate swap is both a contractual right and a contractual obligation of both counterparties.

Exclusions. Excluded from financial instrument classification are options and contracts that contain the right or obligation to exchange a financial instrument for a physical asset, such as bushels of wheat. For example, two entities enter a sale-purchase contract in which the purchaser agrees to take delivery of wheat or gold six months later and pay the seller $100,000 at the time of delivery. The contract is not a financial instrument because it requires the delivery of wheat or gold, which are not financial instruments.

Also excluded from financial instrument classification are contingent items that may ultimately require the payment of cash but that are not contractual. An example would be a contingent liability for tort judgments payable. However, when such an obligation becomes enforceable and is reduced to a fixed payment schedule, it then would be considered to be a financial instrument.

Derivative financial instruments. Derivative financial instruments (DFI) are financial instruments whose fair value correlates to a specified benchmark such as stock prices, interest rates, mortgage rates, currency rates, commodity prices, or some other agreed-upon reference (these are called "underlyings"). Option contracts and forward contracts are the two basic forms of derivatives, and they can be either publicly or privately traded. Forward con-

tracts have symmetrical gain and loss characteristics—that is, they provide exposure to both losses and gains from market movements, although generally there is no initial premium to be paid. Forward contracts are usually settled on or near the delivery date by paying or receiving cash, rather than by physical delivery. On the other hand, option contracts have asymmetrical loss functions: they provide little or no exposure to losses (beyond the premium paid) from unfavorable market movements, but can provide large benefits from favorable market movements. Both forwards and options have legitimate roles to play in hedging programs, if properly understood and carefully managed.

Typical derivative financial instruments *include*

1. Option contracts
2. Interest rate caps
3. Interest rate floors
4. Fixed-rate loan commitments
5. Note issuance facilities
6. Letters of credit
7. Forward contracts
8. Forward interest rate agreements
9. Interest rate collars
10. Futures
11. Swaps
12. Instruments with similar characteristics

DFI *exclude* all on-balance-sheet receivables and payables including

1. Mortgage-backed securities
2. Interest-only obligations
3. Principal-only obligations
4. Indexed debt
5. Other optional characteristics incorporated within those receivables and payables (such as convertible bond conversion or call terms)

In addition, DFI *exclude* contracts that either

1. Require exchange for a nonfinancial commodity or
2. Permit settlement by delivering a nonfinancial commodity

Thus, most product (petroleum, grain, etc.) futures contracts would be excluded from the definition of DFI, while swaps (if settled in cash) would be included.

As with other financial instruments, derivatives can be acquired either for investment purposes or for speculation. For enterprises which are not in the business of speculation, however, the typical purpose of DFI is to manage risk, such as that associated with stock price movements, interest rate variations, currency fluctuations, and commodity price volatility. The parties involved tend to be brokerage firms, financial institutions, insurance companies, and large corporations, although any two or more entities of any size can hold or issue derivatives. Even small companies often engage in hedging, most commonly for risk arising from importing and exporting denominated in foreign currencies.

The DFI are contracts which are intended to protect or hedge one or more of the parties from adverse movement in the underlying base, which can be a financial instrument position held by the entity or a commitment to acquire same at some future date, among others. Unfortunately, these protections or hedges are rarely perfect and sometimes the hedge, once established, is later modified, even indirectly—such as by disposing of the underlying position while retaining the former hedge—so that the DFI becomes in effect a speculative position. The DFI themselves can become risky and, if leveraged, small adverse price or interest rate variations can produce significant losses. Thus, instead of providing protection, many DFI have actually generated losses and the failure to manage these instruments properly has contributed to a popular perception that hedging itself is a suspect activity.

The financial engineering efforts common in recent decades resulted in the creation of a wide range of derivative instruments, from easily understood interest rate swaps (exchanging

variable- or floating-rate debt for fixed-rate debt) and interest rate caps (limiting exposure to rising interest rates) to such complicated "exotics" as structured notes, inverse floaters, and interest-only strips. Prior to ASC 815, most of these were not given formal balance sheet recognition, resulting in great accounting risk (i.e., risk of loss in excess of amounts reported in the financial statements). Over time, various disclosure requirements were imposed, but these did not deal with the fundamental issues of recognition and measurement. In hindsight it is clear that the failure to explicitly account for many of these derivative instruments contributed to the failure to effectively manage investments in derivatives. ASC 815 superseded the various prior requirements while incorporating most of the earlier disclosure rules.

Accounting for Derivatives and Hedging Transactions Per ASC 815: An Overview

ASC 815, while far more comprehensive than any predecessor standards, is still not an all-inclusive standard on the accounting for all financial instruments. ASC 815 addresses the accounting for derivatives (which formerly presented the most intractable financial reporting problems) and continues, in much modified form, the practice of "special accounting" for hedges, which would not be necessary if a universal fair value financial reporting rule were imposed.

Fair values are defined in ASC 815. The standard resolves a number of previous inconsistencies and other inadequacies found in previous standards, including

- The effects of derivative instruments were not easily understood, were often not properly displayed in the financial statements, and, sometimes, were not even recognized in the financial statements.
- The available accounting guidance was incomplete. Many derivative instruments were carried off balance sheet.
- The accounting guidance was inconsistent. There was different measurement of various derivative instruments, and different qualifications for alternative types of hedging.
- The guidance that did exist was difficult to apply. There was a variety of sources and no single comprehensive approach had been defined.

ASC 815 requires standardized accounting and reporting for all derivative instruments (including derivatives which are embedded in other instruments) and for hedging activities.

Underlying principles. There are four key principles underlying the new standard.

1. Derivative instruments are assets and liabilities.
2. The fair value of derivative instruments is the only relevant measure to be reported.
3. Only true assets and liabilities are reported as such. Gains and losses from derivative instruments are not separate liabilities or assets and are not to be reported as such.
4. Only designated qualifying items that are effectively offset by changes in fair value or cash flows during the term of the hedge are eligible to use the special accounting for hedging.

Derivative instruments represent rights and obligations, and these must be reported as assets and liabilities at fair value (which reflects the current cash equivalent). Gains and losses on derivative instruments not designated as hedges are recognized in earnings (or as a change in net assets, in the case of not-for-profit enterprises). The ability to apply hedge accounting requires that specified criteria be met, because of its elective nature and because of its reliance on management intent. Strategic risk hedges do not meet the qualifying criteria. Thus, hedge accounting is limited to relationships involving derivative instruments and

certain foreign currency denominated instruments that are designated as hedges and meet the qualifying criteria.

Contracts not subject to ASC 815. The following contracts are considered exceptions and are not subject to the requirements of ASC 815:

1. **Regular-way security trades**—Delivery of a security readily convertible to cash within the time period generally established by marketplace regulations or conventions where the trade takes place rather than by the usual procedure of an individual enterprise. Contracts for the delivery of securities that are not readily convertible to cash are not subject to ASC 815's provisions because net settlement would not be possible.

   For example, most trades of equity securities in the US require settlement in three business days. If an individual contract requires settlement in more than three business days (even if this is normal for a particular entity), this exception would not apply, unless (per ASC 815-10-15) the reporting entity is required to account for such transactions on a trade-date basis. This exception also applies to when-issued and to-be-announced securities, if there is no other way to purchase or sell them and if the trade will settle within the shortest period permitted.

   Based on the foregoing, the following may be excluded: forward purchases or sales of to-be-announced securities, and when-issued, as-issued, or if-issued securities.
2. **Normal purchases and normal sales**—Contracts for future delivery of assets (other than derivative instruments or financial instruments) that are readily convertible to cash and for which there is no net settlement provision and no market mechanism to ease net settlement. Terms must be consistent with normal transactions and quantities must be reasonable in relation to needs. All relevant factors are to be considered. An example would include contracts similar to binding purchase orders. However, take or pay contracts that require little or no initial net investment, and that have products readily convertible to cash that do not qualify as normal purchases, would be a derivative instrument, and not an exception.

   The purpose of the "normal purchases and normal sales" definition was to exclude certain routine types of transactions from the required accounting as derivative instruments. This exemption includes certain contracts which do contain net settlement or market mechanisms if it is judged probable, at the inception and throughout the duration of such contracts, that they will not in fact settle net and will instead result in physical delivery. Notwithstanding, this more broadly based exemption from the accounting requirements of ASC 815, certain contracts will not qualify for exemption in any case; these include contracts the price of which are based on an underlying that is not clearly and closely related to the assets being sold or purchased, and those requiring cash settlement for any gains or losses or otherwise settled net on a periodic basis. Documentary evidence is required to support the use of the expanded exemption from the ASC 815 provisions.

   ASC 815-10-15 has further addressed the "normal purchases and sales" provisions of ASC 815. Under the amendment, power purchase or sales agreements (whether forwards, options, or some combination thereof) pertaining to delivery of electricity qualify for this exception only if a series of conditions are all met. The contracts cannot permit net settlement, but must require physical delivery, and must be capacity contracts, as differentiated from ordinary option contracts. For the seller, the quantities deliverable under the contracts must be quantities normally to be sold; for the buyer, quantities must be those normally to be used or sold, and the

buyer must be an entity which is contractually obligated to maintain sufficient capacity to meet the needs of its customers. Certain additional requirements, and further exceptions, are set forth by ASC 815-10-15.

Counterparties may reach different conclusions as to whether the contracts are a derivative instrument. Asymmetrical results are acceptable (i.e., the exception may apply to one party but not the other).

3. **Certain insurance contracts**—Contracts where the holder is only compensated when an insurable event (other than price or rate change) takes place and

   a. The value of the holder's asset or liability is adversely changed or
   b. The holder incurs a liability.

   For example, contracts generally not considered to be derivative instruments include those within the scope of ASC 944, traditional life insurance, and traditional property and casualty insurance policies.

   Most traditional insurance contracts will not be derivative instruments. Some, however, can include embedded derivatives that must be accounted for separately. For example, embedded derivatives may be found in indexed annuity contracts, variable life and annuity contracts, and property and casualty contracts involving changes in currency rates.
4. **Certain financial guarantee contracts**—Contracts that call for payments only to reimburse for a loss from debtor failure to pay when due. However, a credit-indexed contract requiring payment for changes in credit ratings (an underlying) would not be an exception.
5. **Certain contracts that are not exchange traded**—Contracts with underlyings based on one of the following:

   a. Climatic, geological or other physical variable: for example, inches of rain or heating-degree days;
   b. Value or price involving a nonfinancial asset not readily converted to cash or a nonfinancial liability that does not require delivery of an asset that is readily converted to cash; or
   c. Specified volumes of revenue of one of the parties: examples are royalty agreements or contingent rentals based on related sales.

   In the case of a mixture of underlyings, some of which are exceptions, the predominant characteristic of the combined variable of the contract is the determinant. If there is a high correlation with the behavior of the excepted variables above, it is an exception and if there is a high correlation with the nonexcepted variables, it is a derivative instrument.
6. **Derivatives that serve as impediments to sales accounting**—A derivative instrument that affects the accounting for the transfer of an asset. For example, a call option on transferred assets under ASC 860 would prevent accounting for the transfer as a sale. This is necessary, since recognizing the call as a derivative instrument would result in double counting. For instance, a lessor guarantee of the residual value may prevent the accounting for a sales-type lease.

In addition to the foregoing, the following are not considered derivative instruments:

1. Contracts issued or held that are both

   a. Indexed to the enterprise's own stock, and
   b. Classified in shareholders' equity.

Derivative instruments are assets or liabilities. Items properly accounted for in shareholders' equity are thus excluded from the definition of derivatives. Contracts that can or must be settled through issuance of an equity instrument but that are indexed in part or in full to something other than the enterprise's own stock are considered derivative instruments if they qualify and they are to be classified as assets or liabilities. Some of these kinds of items will be revisited later by the FASB.

2. Contracts issued in connection with stock-based compensation arrangements as addressed in ASC 718.

   Many instruments under ASC 718 are classified in shareholder equity. The FASB felt that those properly classified as liabilities have been adequately addressed.

3. Contracts issued as contingent consideration in a business combination under ASC 805.

   Contracts in a business combination that are similar to, but are not accounted for as contingent consideration under ASC 805, are subject to this standard as derivative instruments or embedded derivative instruments.

The exceptions for the above three issued contracts are not applicable to the counterparties.

Embedded derivative instruments. A reporting entity is not allowed to circumvent the requirements of ASC 815 recognition and measurement by embedding a derivative instrument in another contract. If these embedded derivative instruments would otherwise be subject to ASC 815, they are included in its scope. However, some common compound instruments that generally have been widely employed for some time, and where the derivative component bears a close economic relationship to the host contract, are excluded from ASC 815 for practical reasons.

Embedded derivative instruments are defined as explicit or implicit terms affecting (1) the cash flows or (2) the value of other exchanges required by contract in a way similar to a derivative instrument (one or more underlying can modify the cash flows or exchanges). An embedded derivative instrument is to be separated from the host contract and accounted for separately as a derivative instrument by both parties if and only if *all* the three following criteria are met:

1. Risks and economic characteristics are not clearly and closely related to those of the *host contract*;
2. The hybrid instrument is not required to be measured at fair value under GAAP with changes reported in earnings; and
3. A separate instrument with the same terms as the embedded derivative instrument would be accounted for as a derivative instrument. For this condition, the initial net investment of the hybrid instrument is not the same as that for the embedded derivative instrument.

The foregoing three conditions for the separate accounting for embedded derivatives are explained in the following paragraphs.

Risks and economic characteristics are not clearly and closely related to those of the host contract. If the underlying is an interest rate or interest rate index that changes the net interest payments of an interest-bearing contract, it is considered clearly and closely related unless one of the following conditions exist:

1. The hybrid instrument can be settled contractually in a manner that permits any possibility whatsoever that the investor would not recover substantially all of the initial recorded investment.

2. The embedded derivative instrument could under any possibility whatsoever
    a. At least double the investor's initial rate of return (ROR) on the host contract and
    b. Could also result in a ROR at least twice the market return for a similar contract (same host contract terms and same debtor credit quality).

The date acquired (or incurred) is the assessment date for the existence of the above conditions. Thus, the issuer and an acquirer in a secondary market could account for the instrument differently because of different points in time.

Example of embedded instruments which are separately accounted for

Assuming that the host contract is a debt instrument, the following are considered not to be clearly and closely related and would normally have to be separated out as embedded derivatives:

1. Interest rate indexes, floors, caps and collars not meeting the criteria for exclusion (see below);
2. Leveraged inflation-indexed interest payments or rentals;
3. Calls and puts that do not accelerate repayment of the principal but require a cash settlement equal to the option price at date of exercise. Subsequently added options that cause one party to be exposed to performance or default risk by different parties for the embedded option than for the host contract;
4. Term extending options where there is no reset of interest rates;
5. Equity-indexed interest payments;
6. Commodity-indexed interest or principal payments;
7. A convertible debt conversion option for the investor if it qualifies as a derivative instrument (readily convertible to cash, etc.); and
8. A convertible preferred stock conversion option if the terms of the preferred stock (not the conversion option) are more similar to debt (a cumulative fixed rate with a mandatory redemption feature) than to equity (cumulative, participating, perpetual).

Example of embedded instruments which are not separately accounted for

Assuming that the host contract is a debt instrument, the following are considered to be clearly and closely related and would not normally have to be separated out as embedded derivative instruments:

1. Interest rate indexes (see below);
2. Interest rate floors, caps and collars, if at issuance
    a. The cap is at or above the current market price (or rate) and/or
    b. The floor is at or below the current market price (or rate)
3. Nonleveraged inflation-indexed interest payments or rentals
4. Credit-sensitive payments (interest rate resets for debtor creditworthiness)
5. "Plain-vanilla" servicing rights not containing a separate embedded derivative instrument
6. Calls and puts that can accelerate repayment of principal unless
    a. The debt involves substantial premium or discount (zero coupon) and
    b. The call or put is only contingently exercisable (not exercisable unless default occurs) and is indexed only to credit risk or interest rates.
7. Term-extending options if the interest rate is concurrently reset to approximately the current market rate for the extended term and the host contract had no initial significant discount
8. Contingent rentals based on a variable interest rate

Based on the foregoing, calls and puts embedded in equity instruments are normally accounted for as follows:

1. Investor—Both the call and the put are embedded derivative instruments.
2. Issuer—Only the put could be an embedded derivative instrument. The put and the call would not be embedded derivative instruments if they are both
   a. Indexed to the issuing entity's own stock and
   b. Classified in shareholders' equity.

The hybrid instrument is not required to be measured at fair value under GAAP with changes reported in earnings. For example, most unsettled foreign currency transactions are subject to ASC 830. Gains or losses are recognized in earnings and thus instruments of this nature are not considered embedded derivative instruments. Trading and available-for-sale securities that have cash flows denominated in a foreign currency also are not considered embedded derivative instruments.

A separate instrument with the same terms as the embedded derivative instrument would be accounted for as a derivative instrument. For this condition, the initial net investment of the hybrid instrument is not the same as that for the embedded derivative instrument.

To illustrate, a convertible debt conversion option for the issuer would not be an embedded derivative instrument since a separate option with the same terms would not be a derivative instrument because it is indexed to the issuer's own stock and would be classified in shareholders' equity.

Another example would involve convertible preferred stock. A convertible preferred stock conversion option would not be an embedded derivative instrument if the terms of the preferred stock (not the conversion option) bear greater similarity to equity (e.g., cumulative, participating, perpetual) than to debt (i.e., a cumulative fixed rate with a mandatory redemption feature).

Interest-only strips and principal-only strips are specifically not subject to this standard assuming (1) the original financial instrument did not contain an embedded derivative instrument and (2) they don't incorporate any new terms from the original. In addition, foreign currency derivative instruments are specifically not separated from the host contract if (1) the currency of the primary economic environment is the functional currency of one of the parties or (2) the good or service price is routinely denominated in that currency in international commerce.

If an embedded derivative instrument is separated from the host, the accounting is as follows:

1. The embedded derivative instrument is accounted for based on ASC 815; and
2. The host contract is accounted for based on GAAP for that instrument, without the embedded derivative instrument.

If the embedded derivative instrument cannot be reliably identified and measured separately, the entire contract must be measured at fair value with the gain or loss recognized in income. In this case, the contract cannot be designated as a hedging instrument.

Gains and losses of derivative instruments not designated as hedges are recognized in earnings or, for a not-for-profit organization, in the change in net assets.

The SEC's position, as articulated in ASC 815-10-S99, is that in performing an evaluation of an embedded derivative feature, the consideration of the economic characteristics and risks of the host contract should be based on all of the stated or implied substantive terms and features of the hybrid financial instrument. In evaluating the stated and implied substantive terms and features, the existence or omission of any single term or feature is not necessarily determinative of the economic characteristics and risks of the host contract (i.e., whether the nature of the host contract is more akin to a debt instrument or more akin to an equity instrument). Although the consideration of an individual term or feature may be weighted

more heavily in the evaluation, judgment is required based upon an evaluation of all the relevant terms and features.

Hybrid financial instruments. By definition, financial instruments that contain embedded derivatives are known as hybrid financial instruments. As issued, ASC 815 contained an exception to exclude interest-only and principal-only strips from the definition of an embedded derivative. ASC 815-15-25 simplifies the accounting for such hybrid financial instruments by permitting fair value remeasurement for any hybrid financial instrument that contains an embedded derivative that otherwise would require bifurcation under ASC 815. ASC 815-15-25 narrows the scope exception for interest-only and principal-only strips on debt instruments to include only such strips representing rights to receive a specified portion of the contractual interest or principal cash flows.

Per ASC 815, if an embedded instrument requiring separation (because the close correlation criterion noted above is not met) from its host, but it cannot be reliably identified and measured, the entire contract must be measured at fair value. Upon recognition of a hybrid instrument that would otherwise require separation into a derivative and a host, the reporting entity may elect irrevocably to measure, on an instrument-by-instrument basis, the entire hybrid instrument at fair value. The changes in fair value will be reported currently in earnings. Such an election must be supported either by concurrent documentation or by a preexisting documented policy supporting automatic election.

This fair value election is also available for remeasurement with respect to previously recognized financial instruments upon the occurrence of a business combination, a significant modification of debt, or other qualifying remeasurement event, where a new basis of accounting may be created.

Fair value measurements will often differ because they exclude transaction costs, which are included in many historical cost-based accounting entries. (For example, the fair value of stock just purchased on an exchange is lower than cost.) ASC 815 holds that any difference at inception of a recognized hybrid financial instrument for which the fair value election is applied and the transaction price is *not* to be included in current earnings (and thus is retained in the asset carrying amount) unless estimated fair value has been determined (1) from a quoted price in an active market, (2) from comparison to other observable current market transactions, or (3) using a valuation technique that incorporates observable market data.

According to ASC 815, the holder of an interest in securitized financial assets (other than holders of strips or related claims to cash flows) is to determine whether the interest is a freestanding derivative or contains an embedded derivative that would be required to be separated from the host contract and accounted for separately. That determination is to be based on an analysis of the contractual terms of the interest in securitized financial assets. This, in turn, requires understanding the nature and amount of assets, liabilities, and other financial instruments that constitute the complete securitization transaction. It is expected that the holder of an interest in securitized financial assets will obtain sufficient information about the payoff structure and the payment priority of the interest to make a determination about whether an embedded derivative exists.

Changes in cash flows that are attributable to changes in the creditworthiness of an interest resulting from securitized financial assets and liabilities (including derivative contracts) that represent the assets or liabilities that are held by the issuer are not to be considered an embedded derivative. The concentration of credit risk in the form of subordination of one financial instrument to another is also not to be considered an embedded derivative under the new standard.

ASC 815 requires balance sheet segregation of those hybrid financial instruments that are being measured at fair value. This can be accomplished either by (1) the display of sepa-

rate line items for fair value and non–fair value carrying amounts, or (2) parenthetical disclosure of fair value carrying amounts included in the aggregate of all carrying amounts. Also, disclosure must be made of the effect on earnings of changes in the fair value of recognized hybrid financial instruments.

Hedging Activities—General Requirements

Overview. Matters relating to hedging activities constitute the core of the new standard and represent the most difficult accounting issues. While the standard requires that all derivatives be reported at fair value in the balance sheet, the changes in fair value will be reported in different ways depending on the nature and effectiveness of the hedging activities to which they are related, if held for hedging purposes. ASC 815 identifies changes in the fair values of derivatives as being the result of (1) effective hedging, (2) ineffective hedging, or (3) unrelated to hedging. Furthermore, the hedging itself can be related to the fair value of an existing asset or liability or of a firm commitment, the cash flow associated with forecasted transactions, or foreign currency exposures.

After meeting specified conditions, a qualified derivative may be specifically designated as a total or partial (expressed as a percentage where the risk exposure profile is the same as that in the whole derivative) hedge of

1. Changes in the fair value of
   a. A recognized asset or liability, or
   b. An unrecognized firm commitment.

   In a fair value hedge, all gains and losses (of both the derivative instrument and the hedged item) are recognized in earnings in the period of change.
2. Variable cash flows of a forecasted transaction.

   In a cash flow hedge, the effective portion of the hedge is reported in other comprehensive income and is reclassified into earnings when the forecasted transaction affects earnings.
3. Foreign currency exposure of
   a. A net investment in a foreign operation

      In a foreign currency net investment hedge, the gain or loss is reported in other comprehensive income as part of the cumulative translation adjustment to the extent that it is effective.
   b. An unrecognized firm commitment

      In a foreign currency unrecognized firm commitment hedge, the gain or loss is reported the same way as a fair value hedge (see category 1., above).
   c. An available-for-sale security

      In a foreign currency available-for-sale security hedge, the gain or loss is reported the same way as a fair value hedge (see category 1., above).
   d. A foreign currency denominated forecasted transaction.

      In a foreign currency denominated forecasted transaction hedge, the gain or loss is reported in the same way as a cash flow hedge (see category 2., above).

Hedge portions that are not effective are reported in earnings immediately.

A nonderivative financial instrument cannot generally be designated as a hedge. One exception, however, occurs when that instrument is denominated in a foreign currency and is designated as a hedge under 3a. or 3b. above. Not-for-profit enterprises cannot use hedge accounting for forecasted transactions.

Effectiveness—General observations. The method used for assessing the effective and ineffective portions of a hedge must be defined at the time of designation, must be used throughout the hedge period and must be consistent with the approach used for managing risk. Similar hedges should usually be assessed for effectiveness in a similar manner unless a different method can be justified. If an improved method is identified and is to be applied prospectively to an existing hedge, that hedge must be discontinued. The new method can then be designated and a new hedge relationship can be established.

Factors to be included in the effectiveness assessment must be specified at inception. The effect of all excluded factors and ineffective amounts are to be included in earnings. For example, if an option contract hedge is assessed for effectiveness based on changes in the option's intrinsic value, the change due to the time value of the contract would be excluded from the effectiveness assessment and that amount would be included in earnings. As another example, differences in key terms between the hedged item and the hedging instrument such as notional amounts, maturities, quantities, location or delivery dates would cause ineffectiveness and that amount would be included in earnings.

Fair Value Hedges

The change in the fair value of an entire financial asset or liability for a period is computed as the fair value at the end of the period, adjusted to exclude changes in fair value (1) from payments received or made (partial recoveries or settlements) and (2) from the passage of time, minus the fair value at the beginning of the period.

Qualifications. To qualify as a fair value hedge, both the hedged items and the designated hedging instruments must meet all of the following criteria:

1. At the hedge's origin, formal documentation exists of the
   a. Hedging relationship;
   b. Risk management objectives;
   c. Strategy for undertaking the hedge;
   d. Identification of the hedged item, the hedging instrument, the nature of the risk being hedged, the method of assessing effectiveness and the components (if any) that are excluded (such as time value) from the effectiveness assessment; and the
   e. Reasonable method to be used in recognizing in earnings the asset or liability representing the gain or loss in the case of a hedged firm commitment.
2. The hedging relationship is expected to be highly effective in producing offsetting fair value changes throughout the hedge period. This relationship must be assessed at least every three months and each time financial statements or earnings are reported.
3. If hedging with a written option, the combination must provide as much potential for gains from positive fair value changes as potential for losses from negative fair value changes. If a net premium is received, a combination of options is considered a written option. The combination of a written option and some other nonoption derivative is also considered a written option.

Unless foreign currency is involved, a nonderivative instrument cannot be designated as a hedging instrument.

According to ASC 815, an asset or liability will be eligible for designation as a hedged item in a fair value hedge (to which a hedging position will be related, for purposes of reporting gain or loss) if the hedged item is specifically identified as all or a specific portion of a recognized asset or liability, or an unrecognized firm commitment; is exposed to fair value changes that are attributable to the hedged risk such that earnings would be affected; and is

not either remeasured at fair value for financial reporting purposes, or an equity-method investment, or an equity method or minority interest in a consolidated subsidiary, a firm commitment related to the foregoing, or an equity instrument issued by the entity. Other limitations also apply, affecting held-to-maturity debt securities and nonfinancial assets.

More specifically, to be eligible for designation as a hedged item, an asset or liability must meet all of the following criteria:

1. The single item (or portfolio of similar items) must be specifically identified as hedging all or a specific portion.
   a. If similar items are aggregated and hedged, each item has to share the risk exposure that is being hedged (i.e. each individual item must respond in a generally proportionate manner to the change in fair value).
   b. A specific portion must be one of the following:
      (1) A percentage of the total asset, liability, or portfolio;
      (2) One or more selected contractual cash flows: for instance, the present value of the interest payments due in the first two years of a four-year debt instrument;
      (3) An embedded put, call, cap, or floor that does not qualify as an embedded derivative in an existing asset or liability; or
      (4) Residual value in a lessor's net investment in a sales-type or direct financing lease.
2. The item has an exposure to fair value changes that could affect earnings (this does not apply to not-for-profit enterprises).
3. The item is not
   a. Remeasured with changes reported currently in earnings; for example, a foreign currency denominated item;
   b. An ASC 323 equity-method investment or an equity investment in a consolidated subsidiary;
   c. A minority interest;
   d. A firm commitment to enter into a business combination or to acquire or dispose of
      (1) A subsidiary;
      (2) A minority interest; or
      (3) An equity method investee; or
   e. An entity-issued equity interest classified in stockholders' equity.
4. The item is not a held-to-maturity debt security (or similar portfolio) unless the hedged risk is for something other than for fair value changes in market interest rates or foreign exchange rates; examples include hedges of fair value due to changes in the obligor's creditworthiness, and hedges of fair value due to changes in a prepayment option component.
5. If the item is a nonfinancial asset or liability (other than a recognized loan servicing right or a nonfinancial firm commitment with financial components), the designated hedged risk is the fair value change of the total hedged item (at its actual location, if applicable); ASC 815 stipulates that the price of a major ingredient cannot be used, and the price of a similar item at a different location cannot be used without adjustment.
6. If the item is a financial asset or liability, a recognized loan servicing right or a nonfinancial firm commitment with financial components, the designated hedge risk is the risk of changes in fair value from fair value changes in

a. The total hedged item;
b. Market interest rates;
c. Related foreign currency rates;
d. The obligor's creditworthiness; or
e. Two or more of the above, other than a.

Prepayment risk for a financial asset cannot be hedged, but an option component of a prepayable instrument can be designated as the hedged item in a fair value hedge. Embedded derivatives have to be considered also in designating hedges. For instance, in a hedge of interest rates, the effect of an embedded prepayment option must be considered in the designation of the hedge.

Reporting gains and losses from fair value hedges. The accounting for qualifying fair value hedges' gains and losses is as follows:

- On the hedging instrument, gains and losses are recognized in earnings.
- On the hedged item, gains and losses are recognized in earnings, even if they would normally be included in other comprehensive income if not hedged. For example, gains and losses on an available-for-sale security would be taken into income, if this is being hedged. The carrying amount of the hedged item is adjusted by the gains and losses resulting from the hedged risk.

Differences between the gains and losses on the hedged item and the hedging instrument are either due to amounts excluded from the assessment of hedging effectiveness, or are due to ineffectiveness. These gains and losses are to be recognized currently in earnings.

Example

An available-for-sale security carrying amount is adjusted by the amount resulting from the hedged risk, a fair value hedge.

Hedged item:	Available-for-sale security
Hedging instrument:	Put option
Underlying:	Price of the security
Notional amount:	100 shares of the security

On July 1, 2009, Company XYZ purchased 100 shares of Widgetworks at a cost of $15 per share and classified it as an available-for-sale security. On October 1, 2009, Company XYZ purchased for $350 an at-the-money put on Widgetworks with an exercise price of $25 and an expiration date of April 2010. This put purchase locks in a profit of $650 ($1,000 spread in market price less $350 cost of the put), if the price stays at $25 or goes lower, but allows continued profitability if the price of the Widgetworks stock continues to go up. Company XYZ specifies that only the intrinsic value of the option is to be used to measure effectiveness. Thus, the time value decreases in the fair value of the put will be charged against the income of the period. Company XYZ then documents the hedge's strategy, objectives, hedging relationships, and method of measuring effectiveness. The following table shows the fair value of the hedged item and the hedging instrument.

Case 1

Hedged Item	*10/1/09*	*12/31/09*	*3/31/10*	*4/17/10*
Widgetworks share price	$ 25	$ 22	$ 20	$ 20
Number of shares	100	100	100	100
Total	$2,500	$2,200	$2,000	$2,000
Hedging Instrument				
Put option (100 shares)

The put expired unexercised and Company XYZ must decide whether to sell the security. If it continues to hold, normal ASC 320 accounting would apply. If it continues to hold and a new put is purchased, the above example would be applicable again with the present position as a starting point. If the security is sold, the entry would be

Cash (fair value)	3,100	
Other comprehensive income	1,000	
Available-for-sale security		1,500
Valuation allowance		1,600
Gain on sale		1,000

Measuring the effectiveness of fair value hedges. Although there are specific conditions applicable to the hedge type (fair value or cash flow), in general, the assumption of no ineffectiveness in a hedging relationship between an interest-bearing financial instrument and an interest rate swap (or a compound hedging instrument composed of an interest rate swap and a mirror-image call or put option) can be made if all of the following conditions are met:

1. The principal amount of the interest-bearing asset or liability being hedged and the notional amount of the swap match;
2. The fair value of the swap is zero at inception, if the hedging instrument is solely an interest rate swap. If the hedging instrument is a compound derivative containing the swap and a mirror-image call or put, the premium for the option must be paid or received in the same manner as the premium on the option embedded in the hedged item, and further conditions must be met depending on whether the premium on the option element of the hedged item was paid upon inception or over the life of the instrument.
3. The net settlements under the swap are computed the same way on each settlement date;
4. The financial instrument is not prepayable, but this criterion does not apply to an interest-bearing asset or liability that is prepayable only due to an embedded call option when the hedging instrument is a compound derivative composed of a swap and a mirror-image call option; and
5. The terms are typical for those instruments and don't invalidate the assumption of effectiveness.
6. The maturity date of the instrument and the expiration date of the swap match;
7. No floor or ceiling on the variable interest rate of the swap exists; and
8. The interval (three to six months or less) between repricings is frequent enough to assume the variable rate is a market rate.

The fixed rate on the hedged item is not required to exactly match the fixed rate on the swap. The fixed and variable rates on the swap can be changed by the same amount. As an example, a swap payment based on LIBOR and a swap receipt based on a fixed rate of 5% can be changed to a payment based on LIBOR plus 1% and a receipt based on 6%.

Under ASC 815, a "shortcut method" is permitted to be used to compute fair value adjustments, which produces the same reporting results as when the method illustrated above has been applied. This shortcut is only appropriate for a fair value hedge of a fixed-rate asset or liability using an interest rate swap and only with the assumption of no ineffectiveness is appropriate (i.e., if the criteria above have been met).[2] The FASB's decision to redefine interest rate risk (by permitting "benchmark rate" hedging in ASC 815-20-25) necessitated that it also address the effect on the shortcut method for fair value hedges and cash flow hedges.

For fair value hedges, an assumption of no ineffectiveness is invalidated when the interest rate index embodied in the variable leg of the interest rate swap is different from the benchmark interest rate being hedged. In situations in which the interest rate index embodied in the variable leg of the swap has greater credit risk than that embodied in the benchmark interest rate, the effect of the change in the swap's credit sector spread over that in the benchmark interest rate would represent hedge ineffectiveness because it relates to an unhedged risk (credit risk) rather than to the hedged risk (interest rate risk).

In situations in which the interest rate index embodied in the variable leg of the swap has less credit risk than that embodied in the benchmark interest rate, the effect of the change in a certain portion of the hedged item's spread over the swap interest rate would also represent hedge ineffectiveness. In order for an entity to comply with an assumption of no ineffectiveness, the index on which the variable leg of the swap is based must match the benchmark interest rate designated as the interest rate risk being hedged for the hedging relationship.

Discontinuance of a fair value hedge. The accounting for a fair value hedge should not continue if any of the events below occur.

1. The criteria are no longer met;
2. The derivative instruments expire or are sold, terminated or exercised; or
3. The designation is removed.

If the fair value hedge is discontinued, a new hedging relationship may be designated with a different hedging instrument and/or a different hedged item, as long as the criteria established in ASC 815 are met.

Ineffectiveness of a fair value hedge. Unless the shortcut method is applicable, the reporting entity must assess the hedge's effectiveness at the inception of the hedge and at least every three months thereafter. In addition, ASC 815 requires that at the inception of the hedge the method to be used to assess hedge effectiveness must be identified. To comply, the reporting entity should decide which changes in the derivative's fair value will be considered in assessing the effectiveness of the hedge, and the method to be used to assess hedge effectiveness. Regarding the former, some derivative instruments (options) have two com-

---

[2] *The steps in the shortcut method are as follows:*

- *a. Determine the difference between the fixed rate to be received on the swap and the fixed rate to be paid on the bonds.*
- *b. Combine that difference with the variable rate to be paid on the swap.*
- *c. Compute and recognize interest expense using that combined rate and the fixed-rate liability's principal amount. (Amortization of any purchase premium or discount on the liability also must be considered, although that complication is not incorporated in this example.)*
- *d. Determine the fair value of the interest rate swap.*
- *e. Adjust the carrying amount of the swap to its fair value and adjust the carrying amount of the liability by an offsetting amount.*

ponents: intrinsic value and time value. The intrinsic value of a call option is the excess, if any, of the market price over the strike or exercise price; the intrinsic value of an option recognizes that the price of the underlying item may move above the strike price (for a call) or below the strike price (for a put) during the exercise period. The enterprise elects to measure effectiveness either including or excluding time value; it must do so consistently once the designation is made.

Hedge effectiveness must be assessed in two different ways—in *prospective* considerations and in *retrospective* evaluations. ASC 815 provides flexibility in selecting the method the entity will use in assessing hedge effectiveness, but an entity should assess effectiveness for similar hedges in a similar manner and that the use of different methods for similar hedges should be justified.

Prospectively, the entity must, at both inception and on an ongoing basis, be able to justify an expectation that the relationship will he highly effective in achieving offsetting changes in fair value over future periods. That expectation can be based upon regression or other statistical analysis of past changes in fair values or on other relevant information. Retrospectively, the entity must, at least quarterly, determine whether the hedging relationship has been highly effective in having achieved offsetting changes in fair value through the date of periodic assessment. That assessment can also be based upon regression or other statistical analysis of past changes in fair values, as well as on other relevant information. If at inception the entity elects to use the same regression analysis approach for both prospective and retrospective effectiveness evaluations, then during the term of that hedging relationship those regression analysis calculations should generally incorporate the same number of data points. As an alternative to using regression or other statistical analysis, an entity could use the dollar-offset method to perform the retrospective evaluations of assessing hedge effectiveness.

ASC 815 does not define hedging effectiveness quantitatively. However, it is useful in this regard to contemplate the similar international accounting standard, IAS 39. That standard specifies that a hedge is normally regarded as highly effective if, at inception and throughout the life of the hedge, the enterprise can expect that the change in fair values of the hedging instrument and the hedged item will "almost fully offset." In addition, the standard requires that actual results be within a range of 80–125%. Interpretive guidance to that standard suggests that the appropriateness of any method of assessing hedge effectiveness depends on the nature of the risk being hedged and the type of hedging instrument used. Any method of assessing effectiveness must be reasonable and consistent with other similar hedges unless different methods are explicitly justified.

Logic suggests that the approach used under IAS 39 could also be applied under ASC 815, with a range of 80–125% being defined as effectiveness for hedge accounting purposes. This guidance has always appeared reasonable, particularly in the absence of any quantitative criteria for hedge effectiveness under US GAAP. As US GAAP further converges with—or even becomes superseded by—IFRS, applying its guidance regarding hedge effectiveness only makes more sense as time passes.

Impairment. All assets or liabilities designated as fair value hedges are subject to the normal GAAP requirements for impairment. Those requirements are to be applied, however, only after the carrying amounts have been adjusted for the period's hedge accounting. Since the hedging instrument is a separate asset or liability, its fair value is not considered in applying the impairment criteria to the hedged item.

Cash Flow Hedges

The second major subset of hedging arrangements relate to uncertain future cash flows, as contrasted with hedged items engendering uncertain fair values. A derivative instrument may be designated as a hedge to the exposure of fluctuating expected future cash flows produced by a particular risk. The exposure may be connected with an existing asset or liability or with a forecasted transaction.

Qualifications. To qualify as a cash flow hedge, both the hedged items and the designated hedging instruments must meet all of the following criteria:

1. At the hedge's origin, formal documentation exists of the
   a. Hedging relationship;
   b. Risk management objectives;
   c. Strategy for undertaking the hedge; and
   d. Identification of the hedged transaction, the hedging instrument, the nature of the hedged risk, the method of assessing effectiveness and the components (if any) that are excluded (such as time value) from the effectiveness assessment.
2. Documentation must include
   a. All relevant details;
   b. The specific nature of any asset or liability involved;
   c. When (date on or period within) a forecasted transaction is expected to occur; and
   d. The expected currency amount (exact amount of foreign currency being hedged) or expected quantity (specific physical quantities such as number of items, weight, etc.) of a forecasted transaction. If a price risk is being hedged in a forecasted sale or purchase, the hedged transaction cannot
      (1) Be specified solely in terms of expected currency amounts; or
      (2) Be specified as a percentage of sales or purchases.

   The current price of the transaction should be identified and the transaction should be described so that it is evident that a given transaction is or is not the hedged transaction. For instance, a forecasted sale of the first 2,000 units in January is proper, but the forecasted sale of the last 2,000 units is not because they cannot be identified when they occur—the month has to end before the last units sold can be identified.
3. The hedging relationship is expected to be highly effective in producing offsetting cash flows throughout the hedge period. This relationship must be assessed at least every three months and each time financial statements or earnings are reported.
4. If hedging with a written option, the combination must provide at least as much potential for positive cash flow changes as exposure to negative cash flow changes. A derivative that results from the combination of a written option and another nonoption derivative is also considered a written option.
5. A link must be used to modify interest receipts or payments of a recognized financial asset or liability from one variable rate to another variable rate. It has to be between a designated asset (or group of similar assets) and a designated liability (or group of similar liabilities) and it has to be highly effective. A link occurs when the basis of one leg of an interest rate swap is the same as the basis of the interest rate receipt of a designated asset and the basis of the other leg of the swap is the same as the basis of the interest payments for a designated liability.

A nonderivative instrument cannot be designated as a hedging instrument for a cash flow hedge.

In addition to the above, to be eligible for designation as a cash flow hedge, a forecasted transaction must meet all of the following criteria:

1. The single transaction (or group of individual transactions) must be specifically identified. If individual transactions are grouped and hedged, each has to share the same risk exposure that is being hedged (i.e. each individual transaction must respond in a proportionate manner to the change in cash flow). Thus, a forecasted sale and a forecasted purchase cannot both be included in the same group of transactions.
2. The occurrence is probable.
3. It is a transaction with an external party (unless a foreign currency cash flow hedge) and it has an exposure to cash flow changes that could affect earnings.
4. The transaction is not to be remeasured under GAAP with changes reported in earnings; for example, foreign currency denominated items would be excluded for this reason. Forecasted sales on credit and forecasted accrual of royalties on probable future sales are not considered the forecasted acquisition of a receivable. Also, if related to a recognized asset or liability, the asset or liability is not remeasured under GAAP with changes in fair value resulting from the hedged risk reported in earnings.
5. The item is not a held-to-maturity debt security (or similar portfolio) unless the hedged risk is for something other than for cash flow changes in market interest rates, as for example, in a hedge of cash flow changes due to an obligor's creditworthiness or default.
6. It does not involve
   a. A business combination;
   b. A parent company's interest in consolidated subsidiaries;
   c. A minority interest;
   d. An equity-method investment; or
   e. An entity-issued equity interest classified in stockholders' equity.
7. If it involves a purchase or sale of a nonfinancial asset, the hedged risk is
   a. The change in the functional-currency-equivalent cash flows resulting from changes in the related foreign currency rates; or
   b. The change in cash flows relating to the total hedged purchase or sales price (at its actual location, if applicable); for example, the price of a similar item at a different location cannot be used.
8. If it involves a purchase or sale of a financial asset or liability or the variable cash flow of an existing financial asset or liability, the hedged risk is the risk of changes in cash flow of
   a. The total hedged item;
   b. Market interest rates;
   c. Related foreign currency rates;
   d. Obligor's creditworthiness or default; or
   e. Two or more of the above, other than a.

Prepayment risk for a financial asset cannot be hedged.

Gains and losses from cash flow hedges. The accounting for qualifying cash flow hedges' gains and losses is as follows:

1. The effective portion of the gain or loss on the derivative instrument is reported in other comprehensive income.
2. The ineffective portion of the gain or loss on the derivative instrument is reported in earnings.
3. Any component excluded from the computation of the effectiveness of the derivative instrument is reported in earnings.
4. Accumulated other comprehensive income from the hedged transaction should be adjusted to the lesser (in absolute amounts) of the following:
   a. The cumulative gain or loss on the derivative from the creation of the hedge minus any component excluded from the determination of hedge effectiveness and minus any amounts reclassified from accumulated other comprehensive income into earnings;
   b. The portion of the cumulative gain or loss on the derivative needed to offset the cumulative change in expected future cash flow on the transaction from the creation of the hedge minus any amounts reclassified from accumulated other comprehensive income into earnings.

   The adjustment of accumulated other comprehensive income should recognize in other comprehensive income either a part or all of the gain or loss on the adjustment of the derivative instrument to fair value.
5. Any remaining gain or loss is reported in earnings.

Reclassifications to earnings. In the period that the hedged forecasted transaction affects earnings, amounts in accumulated other comprehensive income should be reclassified into earnings. If the transaction results in an asset or liability, amounts in accumulated other comprehensive income should be reclassified into earnings when the asset or liability affects earnings through cost of sales, depreciation, interest expense, etc. Any time that a net loss on the combined derivative instrument and the hedged transaction is expected, the amount that isn't expected to be recovered should immediately be reclassified into earnings.

Example of a "plain vanilla" interest rate swap

On July 1, 2009, Abbott Corp. borrows $5 million with a fixed maturity (no prepayment option) of June 30, 2013, carrying interest at prime + 1/2%. Interest only is due semiannually. At the same date, it enters into a "plain vanilla" type swap arrangement, calling for fixed payments at 8% and receipt of prime + 1/2%, on a notional amount of $5 million. At that date prime is 7.5%, and there is no premium due on the swap arrangement.

This swap qualifies as a cash flow hedge under ASC 815, and it is appropriate to assume no ineffectiveness, since the criteria set forth in that standard are all met.

NOTE: These criteria are that: the notional amount of the swap and the principal amount of the debt are equal; the fair value of the swap at inception is zero; the formula for computing net settlements under the swap is constant during its term; the debt may not be prepaid; all interest payments on the debt are designated as being hedged and no payments beyond the term of the swap are so designated; there is no floor or cap on the variable rate of the debt that is not likewise designated for the swap; the repricing dates of the swap match those of the variable rate debt; and the same index is designated for the hedging instrument and the underlying obligation.

Accordingly, as rates change over the term of the debt and of the swap arrangement, changes in the value of the swap are reflected in other comprehensive income, and the swap will appear on the balance sheet as an asset or liability at fair value. As the maturity of the debt approaches, the value of the swap will converge on zero. Periodic interest expense in the income statement will be at the effective rate of 8%.

Assume that the prime rate over the four-year term of the loan, as of each interest payment date, is as follows, along with the fair value of the remaining term of the interest rate swap at those dates:

Date	Prime rate (%)	Fair value of swap*
December 31, 2009	6.5	$ - 150,051
June 30, 2010	6.0	- 196,580
December 31, 2010	6.5	- 111,296
June 30, 2011	7.0	- 45,374
December 31, 2011	7.5	0
June 30, 2012	8.0	23,576
December 31, 2012	8.5	24,038
June 30, 2013	8.0	0

* *Fair values are determined as the present values of future cash flows resulting from expected interest rate differentials, based on the current prime rate, discounted at 8%.*

Regarding the fair values presented in the foregoing table, it should be assumed that the fair values are precisely equal to the present value, at each valuation date (assumed to be the interest payment dates), of the differential future cash flows resulting from utilization of the swap. Future variable interest rates (prime + 1/2%) are assumed to be the same as the existing rates at each valuation date (i.e., there is no basis for any expectation of rate changes, and therefore the best estimate is that the current rate will persist over time). The discount rate, 8%, is assumed to be constant over time.

Thus, for example, the fair value of the swap at December 31, 2009, would be the present value of an annuity of seven payments (the number of remaining semiannual interest payments due) of $25,000 each (pay 8%, receive 7%, based on then-existing prime rate of 6.5%) to be made to the swap counterparty, discounted at an annual rate of 8% (using 4% for the semiannual discounting, which is a slight simplification). This computation yields a present value of a stream of seven $25,000 payments to the swap counterparty amounting to $150,051 at December 31, 2009, which is a liability to be reported by the entity at that date. The offset is a debit to other comprehensive income, since the hedge is (presumably) judged to be 100% effective in this case. Semiannual accounting entries will be as follows:

December 31, 2009

Interest expense	175,000	
Accrued interest (or cash)		175,000
To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.0%)		
Interest expense	25,000	
Accrued interest (or cash)		25,000
To record net settlement on swap arrangement [8.0 - 7.0%]		
Other comprehensive income	150,051	
Swap contract		150,051
To record the fair value of the swap contract as of this date (a net liability because fixed rate payable to counterparty of 8% exceeds floating rate receivable from counterparty of 7%)		

June 30, 2010

Interest expense	162,500	
Accrued interest (or cash)		162,500
To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (6.5%)		
Interest expense	37,500	
Accrued interest (or cash)		37,500
To record net settlement on swap arrangement [8.0 - 6.5%]		
Other comprehensive income	46,529	
Swap contract		46,529
To record the fair value of the swap contract as of this date (increase in obligation because of further decline in prime rate)		

December 31, 2010

Interest expense	175,000	
Accrued interest (or cash)		175,000
To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.0%)		

Interest expense	25,000	
Accrued interest (or cash)		25,000

To record net settlement on swap arrangement [8.0 - 7.0%]

Other comprehensive income	150,051	
Swap contract		150,051

To record the fair value of the swap contract as of this date (decrease in obligation due to increase in prime rate

June 30, 2011

Interest expense	187,500	
Accrued interest (or cash)		187,500

To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (7.5%)

Interest expense	12,500	
Accrued interest (or cash)		12,500

To record net settlement on swap arrangement [8.0 - 7.5%]

Swap contract	65,922	
Other comprehensive income		65,922

To record the fair value of the swap contract as of this date (decrease in obligation due to further increase in prime rate)

December 31, 2011

Interest expense	200,000	
Accrued interest (or cash)		200,000

To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.0%)

Interest expense	0	
Accrued interest (or cash)		0

To record net settlement on swap arrangement [8.0 - 8.0%]

Swap contract	45,374	
Other comprehensive income		45,374

To record the fair value of the swap contract as of this date (further increase in prime rate to the original rate of inception of the hedge eliminates fair value of the derivative)

June 30, 2012

Interest expense	212,500	
Accrued interest (or cash)		212,500

To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.5%)

Receivable from counterparty (or cash)	12,500	
Interest expense		12,500

To record net settlement on swap arrangement [8.0 – 8.5%], counterparty remits settlement

Swap contract	23,576	
Other comprehensive income		23,576

To record the fair value of the swap contract as of this date (increase in prime rate creates net asset position for derivative)

December 31, 2012

Interest expense	225,000	
Accrued interest (or cash)		225,000

To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (9.0%)

Receivable from counterparty (or cash)	25,000	
Interest expense		25,000

To record net settlement on swap arrangement [8.0 – 9.0%], counterparty remits settlement

Swap contract	462	
Other comprehensive income		462

To record the fair value of the swap contract as of this date (increase in asset value due to further rise in prime rate)

June 30, 2013 (Maturity)

Interest expense	212,500	
Accrued interest (or cash)		212,500

To accrue or pay semiannual interest on the debt at the variable rate of prime + 1/2% (8.5%)

Receivable from counterparty (or cash)	12,500	
Interest expense		12,500
Other comprehensive income	24,038	
Swap contract		24,038

To record the fair value of the swap contract as of this date (value declines to zero as expiration date approaches)

Example of an option on an interest rate swap

The facts of this example are a variation on the previous example. Abbott Corp. anticipates as of June 30, 2009, that as of June 30, 2011, it will become a borrower of $5 million with a fixed maturity four years hence (June 30, 2015). Based on its current credit rating, it expects to be able to borrow at prime + 1/2%. As of June 30, 2009, it is able to purchase, for a single payment of $25,000, a "swaption" (an option on an interest rate swap), calling for fixed pay at 8% and variable receipt at prime + 1/2%, on a notional amount of $5 million, for a term of four years. The option will expire in two years. At June 30, 2009, prime is 7.5%.

NOTE: The interest rate behavior in this example differs somewhat from the prior example, to better illustrate the "one-sidedness" of options, versus the obligation under a swap arrangement or other futures and forwards.

It will be assumed that the time value of the swaption expires ratably over the two years.

This swaption qualifies as a cash flow hedge under ASC 815. However, while the change in fair value of the contract is an effective hedge of the cash flow variability of the prospective debt issuance, the premium paid is a reflection of the time value of money and is thus to be expensed ratably over the period that the swaption is outstanding.

The table below gives the prime rate at semiannual intervals including the two-year period prior to the debt issuance, plus the four years during which the forecasted debt (and the swap, if the option is exercised) will be outstanding, as well as the fair value of the swaption (and later, the swap itself) at these points in time.

Date	Prime rate (%)	Fair value of swaption/swap*
December 31, 2009	7.5	$ 0
June 30, 2010	8.0	77,925
December 31, 2010	6.5	0
June 30, 2011	7.0	- 84,159
December 31, 2011	7.5	0
June 30, 2012	8.0	65,527
December 31, 2012	8.5	111,296
June 30, 2013	8.0	45,374
December 31, 2013	8.0	34,689
June 30, 2014	7.5	0
December 31, 2014	7.5	0
June 30, 2015	7.0	0

* *Fair value is determined as the present value of future expected interest rate differentials, based on the current prime rate, discounted at 8%. An "out of the money" swaption is valued at zero, since the option does not have to be exercised. Since the option is exercised on June 30, 2011, the value at that date is recorded, although negative.*

The value of the swaption contract is only recorded (unless and until exercised, of course, at which point it becomes a contractually binding swap) if it is positive, since if "out of the money" the holder would forego exercise in most instances and thus there is no liability by the holder to be reported. (This example is an illustration of the opposite, however, as despite having a negative value the option holder determines that exercise is advisable.) At June 30, 2010, for example, the swaption is an asset, since the reference variable rate (prime + 1/2% or 8.5%) is greater than the fixed swap rate of 8%, and thus the expectation is that the option will be exercised at expiration.

This would, if present rates hold steady, which is the naïve assumption, result in a series of eight semiannual payments from the swap counterparty in the amount of $12,500. Discounting this at a nominal 8%, the present value as of the debt origination date (to be June 30, 2011) would be $84,159, which, when further discounted to June 30, 2010, yields a fair value of $77,925.

Note that the following period (December 31, 2010) prime drops to such an extent that the value of the swaption evaporates entirely (actually goes negative, which will not be reported since the holder is under no obligation to exercise it), and the carrying value is therefore eliminated. At expiration, the holder does (for this example) exercise, notwithstanding a negative fair value, and from that point forward the fair value of the swap will be reported, whether positive (an asset) or negative (a liability).

As noted above, assume that, at the option expiration date, despite the fact that prime + 1/2% is below the fixed pay rate on the swap, the management of Abbott Corp. is convinced that rates will climb over the four-year term of the loan, and thus exercises the swaption at that date. Accounting journal entries over the six years are as follows:

June 30, 2009

Swaption contract	25,000	
Cash		25,000

To record purchase premium on swaption contract

December 31, 2009

Loss on hedging transaction	6,250	
Swaption contract		6,250

To record change in time value of swaption contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term

June 30, 2010

Swaption contract	77,925	
Other comprehensive income		77,925

To record the fair value of the swaption contract as of this date

Loss on hedging transaction	6,250	
Swaption contract		6,250

To record change in time value of swaption contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term

December 31, 2010

Other comprehensive income	77,925	
Swaption contract		77,925

To record the change in fair value of the swaption contract as of this date; since contract is "out of the money," it is not written down below zero (i.e., a net liability is not reported)

Loss on hedging transaction	6,250	
Swaption contract		6,250

To record change in time value of swaption contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term

June 30, 2011

Other comprehensive	84,159	
Swap contract		84,159

To record the fair value of the swap contract as of this date—a net liability is reported since swap option was exercised

Loss on hedging transaction	6,250	
Swaption contract		6,250

To record change in time value of swaption contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term

December 31, 2011

Account	Debit	Credit
Interest expense	200,000

Swap contract		34,689
To record the decline in the fair value of the swap contract to zero as of this date		

December 31, 2014

Interest expense	200,000	
Accrued interest (or cash)		200,000
To accrue or pay interest on the debt at the variable rate of prime + 1/2% (8.0%)		
Receivable from counterparty (or cash)	0	
Interest expense		0
To record net settlement on swap arrangement [8.0 – 8.0%]		
Swap contract	0	
Other comprehensive income		0
No change to the zero fair value of the swap contract as of this date		

June 30, 2015 (Maturity)

Interest expense	187,500	
Accrued interest (or cash)		187,500
To accrue or pay interest on the debt at the variable rate of prime + 1/2% (7.5%)		
Interest expense	12,500	
Accrued interest (or cash)		12,500
To record net settlement on swap arrangement [8.0 – 7.5%]		
Other comprehensive income	0	
Swap contract		0
No change to the zero fair value of the swap contract, which expires as of this date		

Effectiveness of cash flow hedges. The assumption of no ineffectiveness in a cash flow hedge between an interest-bearing financial instrument and an interest rate swap can be assumed if all of the following conditions are met:

1. The principal amount and the notional amount of the swap match;
2. The fair value of the swap is zero at origin;
3. The net settlements under the swap are computed the same way on each settlement date;
4. The financial instrument is not prepayable; and
5. The terms are typical for those instruments and don't invalidate the assumption of effectiveness.
6. All variable rate interest payments or receipts on the instrument during the swap term are designated as hedged and none beyond that term;
7. No floor or cap on the variable rate of the swap exists unless the variable rate instrument has one. If the instrument does, the swap must have a comparable (not necessarily equal) one;
8. Repricing dates match; and
9. The index base for the variable rates match.

The variable rate on the instrument is not required to exactly match the variable rate on the swap. The fixed and variable rates on the swap can be changed by the same amount.

Example of using options to hedge future purchase of inventory

Friendly Chemicals Corp. uses petroleum as a feedstock from which it produces a range of chemicals for sale to producers of synthetic fabrics and other consumer goods. It is concerned about the rising price of oil and decides to hedge a major purchase it plans to make in mid-2009. Oil futures and options are traded on the New York Mercantile exchange and other markets; Friendly decides to use options rather than futures because it is only interested in protecting itself from a price increase; if prices decline, it wishes to reap that benefit rather than suffer the loss which would result from holding a futures contract in a declining market environment.

At December 31, 2009, Friendly projects a need for ten million barrels of crude oil of a defined grade to be purchased by mid-2010; this will suffice for production through mid-2011. The current world price for this grade of crude is $164.50 per barrel, but prices have been rising recently. Management desires to limit its crude oil costs to no higher than $165.75 per barrel, and accordingly purchases, at a cost of $2 million, an option to purchase up to ten million barrels at a cost of $165.55 per barrel (which, when added to the option premium, would make the total cost $165.75 per barrel if the full ten million barrels are acquired), at any time through December 2010.

Management has studied the behavior of option prices and has concluded that changes in option prices which relate to time value are not correlated to price changes and hence are ineffective in hedging price changes. On the other hand, changes in option prices which pertain to pricing changes (intrinsic value changes) are highly effective as hedging vehicles. The table below reports the value of these options, analyzed in terms of time value and intrinsic value, over the period from December 2009 through December 2010.

Date	*Price of oil/barrel*	*Fair value of option relating to* Time value*	Intrinsic value
December 31, 2009	$164.50	$2,000,000	$ 0
January 31, 2010	164.90	1,900,000	0
February 28, 2010	165.30	1,800,000	0
March 31, 2010	165.80	1,700,000	2,500,000
April 30, 2010	166.00	1,600,000	4,500,000
May 31, 2010	165.85	1,500,000	3,000,000
June 30, 2010**	166.00	700,000	2,250,000
July 31, 2010	165.60	650,000	250,000
August 31, 2010	165.50	600,000	0
September 30, 2010	165.75	550,000	1,000,000
October 31, 2010	165.80	500,000	1,250,000
November 30, 2010	165.85	450,000	1,500,000
December 31, 2010***	165.90	400,000	1,750,000

* *This example does not address how the time value of options would be computed in practice.*
** *Options for five million barrels exercised; remainder held until end of December, then sold.*
*** *Values cited are immediately prior to sale of remaining options.*

At the end of June 2010, Friendly Chemicals exercises options for five million barrels, paying $165.55 per barrel for oil selling on the world markets for $166.00 each. It holds the remaining options until December, when it sells these for an aggregate price of $2.1 million, a slight discount to the nominal fair value at that date.

The inventory acquired in mid-2010 is processed and included in goods available for sale. Sales of these goods, in terms of the five million barrels of crude oil which were consumed in their production, are as follows:

Date	*Equivalent barrels sold in month*	*Equivalent barrels on hand at month end*
June 30, 2010	300,000	4,700,000
July 31, 2010	250,000	4,450,000
August 31, 2010	400,000	4,050,000
September 30, 2010	350,000	3,700,000
October 31, 2010	550,000	3,150,000
November 30, 2010	500,000	2,650,000
December 31, 2010	650,000	2,000,000

Based on the foregoing facts, the journal entries prepared on a monthly basis (for illustrative purposes) for the period December 2009 through December 2010 are as follows:

December 31, 2009

Option contract	2,000,000	
Cash		2,000,000

To record purchase premium on option contract for up to ten million barrels of oil at price of $165.55 per barrel

January 31, 2010

Loss on hedging transaction	100,000	
Option contract		100,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment

Option contract	0	
Other comprehensive income		0

To reflect change in intrinsic value of option contracts (no value at this date)

February 28, 2010

Loss on hedging transaction	100,000	
Option contract		100,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment

Option contract	0	
Other comprehensive income		0

To reflect change in intrinsic value of option contracts (no value at this date)

March 31, 2010

Loss on hedging transaction	100,000	
Option contract		100,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment

Option contract	2,500,000	
Other comprehensive income		2,500,000

To reflect change in intrinsic value of option contracts

April 30, 2010

Loss on hedging transaction	100,000	
Option contract		100,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment

Option contract	2,000,000	
Other comprehensive income		2,000,000

To reflect change in intrinsic value of option contracts (further increase in value)

May 31, 2010

Loss on hedging transaction	100,000	
Option contract		100,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment

Other comprehensive income	1,500,000	
Option contract		1,500,000

To reflect change in intrinsic value of option contracts (decline in value)

June 30, 2010

Loss on hedging transaction	800,000	
Option contract		800,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term and does not qualify for hedge accounting treatment; since one-half the options were exercised in June, the remaining unexpensed time value of that portion is also entirely written off at this time

Option contract	1,500,000	
Other comprehensive income		1,500,000

To reflect change in intrinsic value of option contracts (further increase in value) ***before*** *accounting for exercise of options on five million barrels*

June 30 intrinsic value of options before exercise	4,500,000
Allocation to oil purchased at $165.55	2,250,000
Remaining intrinsic value of option	2,250,000

The allocation to exercised options will be maintained in other comprehensive income until transferred to cost of goods sold as a contra cost, as the five million barrels are sold, at the rate of 45¢ per equivalent barrel ($166.00 – $165.55).

Inventory	827,750,000	
Cash (or accounts payable)		827,750,000

To record purchase of five million barrels of oil at option price of $165.55/barrel

Inventory	2,250,000	
Option contract		2,250,000

To increase the recorded value of the inventory to include the fair value of options given up (exercised) in acquiring the oil (taken together, the cash purchase price and the fair value of options surrendered add to $166 per barrel, the world market price at date of purchase)

Cost of goods sold	49,800,000	
Inventory		49,800,000

To record cost of goods sold (300,000 barrels at $166) before amortizing deferred hedging gain in other comprehensive income

Other comprehensive income	135,000	
Cost of goods sold		135,000

To amortize deferred hedging gain at rate of 45¢ per barrel sold

July 31, 2010

Loss on hedging transaction	50,000	
Option contract		50,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment

To reflect change in intrinsic value of remaining option contracts (further increase in value)

Cost of goods sold	83,000,000	
Inventory		83,000,000

To record cost of goods sold (500,000 barrels at $166) before amortizing deferred hedging gain in other comprehensive income

Other comprehensive income	225,000	
Cost of goods sold		225,000

To amortize deferred hedging gain at rate of 45¢ per barrel sold

December 31, 2010

Loss on hedging transaction	50,000	
Option contract		50,000

To record change in time value of option contract—charge premium to income since this represents payment for time value of money, which expires ratably over two-year term, and does not qualify for hedge accounting treatment

Option contract	250,000	
Other comprehensive income		250,000

To reflect change in intrinsic value of remaining option contracts (further increase in value) before sale of options

Cost of goods sold	107,900,000	
Inventory		107,900,000

To record cost of goods sold (650,000 barrels at $166) before amortizing deferred hedging gain in other comprehensive income

Other comprehensive income	292,500	
Cost of goods sold		292,500

To amortize deferred hedging gain at rate of 45¢ per barrel sold

Cash	2,100,000	
Loss on sale of options	50,000	
Option contract		2,150,000
Other comprehensive income	1,750,000	
Gain on sale of options		1,750,000

To record sale of remaining option contracts; the cash price was $50,000 lower than carrying value of asset sold (options having unexpired time value of $400,000 plus intrinsic value of $1,750,000), but transfer of other comprehensive income to income recognizes formerly deferred gain; since no further inventory purchases are planned in connection with this hedging activity, the unrealized gain is taken into income

Note that at December 31, 2010, other comprehensive income has a remaining credit balance of $900,000, which represents the deferred gain pertaining to the two million equivalent barrels of oil in inventory. As this is sold, the other comprehensive income will be transferred to cost of goods sold as a reduction of cost of sales.

Discontinuance of a cash flow hedge. The accounting for a cash flow hedge should not continue if any of the events below occur.

1. The criteria are no longer met;
2. The derivative instrument expires or is sold, terminated or exercised; or
3. The designation is removed by management.

The net gain or loss in accumulated other comprehensive income should remain there until it is properly reclassified when the hedged transaction affects earnings. If it is probable that the original forecasted transactions won't occur, the net gain or loss in accumulated other comprehensive income should immediately be reclassified into earnings.

If the cash flow hedge is discontinued, a new hedging relationship may be designated with a different hedging instrument and/or a different hedged item as long as the criteria established in ASC 815 are met.

Ineffectiveness of a cash flow hedge. In assessing the effectiveness of a cash flow hedge, the time value of money generally will need to be considered, if significant in the circumstances. Doing so becomes especially important if the hedging instrument involves periodic cash settlements. For example, a *tailing strategy* with futures contracts is a situation in which an entity likely would reflect the time value of money. When employing such a strategy, the entity adjusts the size or contract amount of futures contracts used in a hedge so

that earnings (or expense) from reinvestment (or funding) of daily settlement gains (or losses) on the futures do not distort the results of the hedge. To assess offset of expected cash flows when a tailing strategy has been used, an entity could reflect the time value of money, possibly comparing the present value of the hedged forecasted cash flow with the results of the hedging instrument.

As with fair value hedges, ASC 815 does not provide a quantitative definition of hedging effectiveness for cash flow hedges. Again, it is useful in this regard to contemplate the similar international accounting standard, IAS 39, which specifies that a hedge is regarded as highly effective if, at inception and throughout the life of the hedge, the enterprise can expect that the change in cash flows of the hedging instrument and the hedged item will "almost fully offset." Actual results within a range of 80–125% could reasonably be expected to qualify as effective.

Impairment. All assets or liabilities designated as cash flow hedges are subject to normal GAAP requirements for impairment. Those requirements are to be applied, however, after hedge accounting has been applied for the period. Since the hedging instrument is a separate asset or liability, its expected cash flow or fair value is not considered in applying the impairment criteria to the hedged item. If an impairment loss or recovery on a hedged forecasting asset or liability is recognized, any offsetting amount should be immediately reclassified from accumulated other comprehensive income into earnings.

Expanded application of interest rate hedging. ASC 815 also permits the use of hedge accounting where the interest rate being hedged is the "benchmark interest rate." As used in the standard, this rate will be either the risk-free rate (i.e., that applicable to direct Treasury borrowings) or the LIBOR swap rate. LIBOR-based swaps in fact are the most commonly employed interest rate hedging vehicles, and it was the persistence of requests made to the FASB's derivatives implementation group regarding the application of hedge accounting to such swaps that resulted in this amendment.

The FASB has thus concluded that, with respect to the separation of interest rate risk and credit risk, the risk of changes in credit sector spread and any credit spread attributable to a specific borrower should be encompassed in credit risk rather than interest rate risk. Under such an approach, an entity would be permitted to designate the risk of changes in the risk-free rate as the hedged risk, and any spread above that rate would be deemed to reflect credit risk.

ASC 815 requires that all contractual cash flows be used in determining the changes in fair value of the hedged item when benchmark interest rates are being employed. In other words, cash flows pertaining to the portion of interest payments which is related to the entity's credit risk (the risk premium over the benchmark rate) cannot be excluded from the computation.

The accounting for an interest rate hedge using a benchmark rate is very similar to that illustrated beginning on page 288 of this chapter. However, the variable rate used, rather than reflecting the credit riskiness of the party doing the hedging (which was prime + 1/2% in that illustration), would instead be the benchmark rate (e.g., the rate on Treasury five-year notes). Since changes in the benchmark rate might not exactly track the changes in the underlying instrument (due to changes in the "credit spread" which are a reflection of changes in the underlying party's perceived credit risk), the hedge will likely be imperfect, such that a net gain or loss will be reflected in periodic earnings.

Foreign Currency Hedges

The FASB's basic objectives in hedge accounting for foreign currency exposure are

1. To continue to permit the hedge accounting required under ASC 830; and

2. To increase the consistency of accounting guidance by broadening the scope of hedges that are eligible for this treatment.

Unlike ASC 830, this standard allows hedges of forecasted foreign currency transactions, including some intercompany transactions. Hedging foreign currency intercompany cash flows with foreign currency options is a common practice and was permitted under prior GAAP. ASC 815 modified that accounting rule to permit using other derivative instruments (forward contracts, etc.), on the grounds that the accounting for all derivative instruments should be the same.

ASC 815 precluded hedge accounting for an asset or liability that is remeasured for changes in price attributable to the risk being hedged when those changes are reported currently in earnings. It also precluded fair value or cash flow hedge accounting for foreign currency risk associated with any asset or liability that is denominated in a foreign currency and remeasured into the functional currency under ASC 830. Subsequently, the FASB considered removing the preclusion for any asset or the liability denominated in a foreign currency because, even though the transaction gain or loss on the undesignated asset or liability and the change in fair value of the undesignated derivative were reported currently in earnings, different measurement criteria were used for each instrument, which created volatility in earnings. It eventually decided to permit all recognized foreign-currency-denominated assets and liabilities for which a foreign currency transaction gain or loss is recognized in earnings to be hedged items.

Designated hedging instruments and hedged items qualify for fair value hedge accounting and cash flow hedge accounting only if all of the criteria in ASC 815 for fair value hedge accounting and cash flow hedge accounting are met. The FASB concluded that fair value hedges could be used for all recognized foreign-currency-denominated asset or liability hedging situations and that cash flow hedges could be used for recognized foreign-currency-denominated asset or liability hedging situations in which all of the variability in the functional-currency-equivalent cash flows are eliminated by the effect of the hedge. Remeasurement of the foreign-currency-denominated assets and liabilities will continue to be based on the guidance in ASC 830, which requires remeasurement based on spot exchange rates, regardless of whether a fair value hedging relationship or a cash flow hedging relationship exists.

Foreign currency net investment hedge. Either a derivative instrument or a nonderivative financial instrument (that can result in a foreign currency transaction gain or loss under ASC 830) can be designated as a hedge of a foreign currency exposure of a net investment in a foreign operation. The gain or loss from the designated instrument to the extent that it is effective is reported as a translation adjustment. The hedged net investment is accounted for under ASC 830.

Example of a foreign currency net investment hedge

Auburn Corporation has invested $15 million in a subsidiary in Germany, and for which the euro is the functional currency. The initial exchange rate is €1.2:$1, so the initial investment is worth €18,000,000. Auburn issues a debt instrument for €12 million and designates it as a hedge of the German investment. Auburn's strategy is that any change in the fair value of the loan attributable to foreign exchange risk should offset any translation gain or loss on 2/3 of Auburn's German investment.

At the end of the year, the exchange rate changes to €0.8:$1. Auburn uses the following calculation to determine the translation gain on its net investment:

€18,000,000/$0.8 = $22,500,000 less €18,000,000/$1.2 = $15,000,000 = $7,500,000

Auburn uses the following calculation to determine the translation loss on its euro-denominated debt:

€12,000,000/\$0.8 = \$15,000,000 less €12,000,000/\$1.2 = \$10,000,000 = \$5,000,000

Auburn creates the following entries to record changes in the value of the translation gain on its investment and translation loss in its debt, respectively:

Investment in subsidiary	7,500,000	
Cumulative translation adjustment (equity)		7,500,000
Cumulative translation adjustment (equity)	5,000,000	
Euro-denominated debt		5,000,000

The net effect of these translation adjustments is a net increase in Auburn's investment of \$2,500,000. In the following year, the exchange rates do not change, and Auburn sells its subsidiary for \$17.5 million. Auburn's tax rate is 30%. Its reporting annual gains and losses follows:

	Year 1	*Year 2*
Net income:		
Gain on sale of investment in ABC Company		\$2,500,000
Income tax expense		(750,000)
Net gain realized in net income		1,750,000
Other comprehensive income:		
Foreign currency translation adjustment, net of tax	\$1,750,000	
Reclassification adjustment, net of tax		(1,750,000)
Other comprehensive income net gain/(loss)	\$1,750,000	\$(1,750,000)

Foreign currency unrecognized firm commitment hedge. Either a derivative instrument or a nonderivative financial instrument (that can result in a foreign currency transaction gain or loss under ASC 830) can be designated as a fair value hedge of an unrecognized firm commitment (or a specific portion) attributable to foreign currency. If the criteria are met, this hedging relationship is accounted for as a fair value hedge. (An example appears in Chapter 23.)

Foreign currency available-for-sale security hedge. Only a derivative instrument can be designated as a fair value hedge of an available-for-sale debt security (or a specific portion) attributable to foreign currency. If the criteria are met, this hedging relationship is accounted for as a fair value hedge. For an available-for-sale equity security to be accounted for as a fair value hedge, it must meet all of the fair value hedge criteria and the following two requirements:

1. The security cannot be traded on an exchange (or similar marketplace) denominated in the investor's functional currency; and
2. Dividends (or other cash flows) to the holders must be denominated in the same foreign currency as that expected to be received upon the sale of the security.

If the available-for-sale equity security qualifies as a foreign currency hedge, the change in fair value from foreign exchange risk is reported in earnings and not in other comprehensive income.

Any gain or loss on a designated nonderivative hedging instrument from foreign currency risk is determined under ASC 830 (as the increase or decrease in functional currency cash flows produced by the change in spot exchange rates) and is reported in earnings along with the change in the carrying amount of the hedged firm commitment.

Foreign-currency-denominated forecasted transaction. Only a derivative instrument can be designated as a cash flow hedge of a foreign-currency-denominated forecasted transaction. The parties to this transaction can either be external or intercompany. To qualify for hedge accounting, all of the following criteria must be met:

1. An operating unit with foreign currency exposure is a party to the derivative instrument;
2. The transaction is denominated in a currency that is not the functional currency;

3. All of the criteria for a cash flow hedge are met (with the possible exception of allowing a qualifying intercompany transaction); and
4. If a group of individual transactions is involved, both an inflow and an outflow of foreign currency cannot be included in the same group.

If the foregoing criteria are met, this hedging relationship is accounted for as a cash flow hedge.

Using certain intercompany derivatives as hedging instruments in cash flow hedges of foreign currency risk in the consolidated financial statements. ASC 815 permits the use of intercompany derivatives as the hedging instruments in cash flow hedges of foreign currency risk in the consolidated financial statements, if those intercompany derivatives are offset by unrelated third-party contracts on a net basis. The new standard defines an "internal derivative" as a foreign currency derivative contract that has been entered into with another member of a consolidated group and which can be a hedging instrument in a foreign currency cash flow hedge of a forecasted borrowing, purchase, or sale or an unrecognized firm commitment in the consolidated financial statements only if the following two conditions are satisfied. First, from the perspective of the member of the consolidated group using the derivative as a hedging instrument, specific criteria for foreign currency cash flow hedge accounting are satisfied. Second, the members of the consolidated group who are not using the derivative as a hedging instrument must either (1) enter into a derivative contract with an unrelated third party to offset the exposure that results from that internal derivative or (2) if certain defined conditions are met, enter into derivative contracts with unrelated third parties that would offset, on a net basis for each foreign currency, the foreign exchange risk arising from multiple internal derivative contracts.

Other guidance on accounting for financial instruments. Several specialized areas of the codification offer additional guidance on these matters.

ASC 932-330-55 is directed at the accounting for derivative contracts held for trading purposes and contracts involved in energy trading and risk management activities. It concluded that energy contracts should not be marked to fair value. It determined, as well, that the common practice of carrying energy physical inventories at fair value had no basis under GAAP. Furthermore, net presentation of gains and losses derived from derivatives is required under ASC 815, even if physical settlement occurs, if the derivatives are held for trading purposes (as that term is defined in ASC 320). It was also decided that a derivative held for trading purposes may be designated as a hedging instrument, if the ASC 815 criteria are all met, on a prospective basis (i.e., from date of the consensus), notwithstanding the ASC 815 prohibition on designation of derivative instruments held for trading as "hedges."

ASC 815-10-55 addresses whether realized gains or losses on derivative contracts that are *not* held for trading purposes should be presented gross or net in the income statement irrespective of whether the derivative is designated as a hedging instrument.

It states that determining whether realized gains and losses on physically settled derivative contracts *not* held for trading purposes should be reported in the income statement on a gross or net basis is a matter of judgment that depends on the relevant facts and circumstances. Consideration of the facts and circumstances should be made in the context of the various activities of the entity, and not based solely on the terms of the individual contracts. For making an evaluation of the facts and circumstances in order to determine whether an arrangement should be reported on a gross or net basis, the economic substance of the transaction as well as the guidance set forth in ASC 845 relative to nonmonetary exchanges and the gross versus net reporting indicators provided in ASC 605-45 may be considered. The economic substance of the transaction should be given precedence over its legal form.

ASC 815-20-25 addresses documentation of the method that is used to measure hedge ineffectiveness under ASC 815. ASC 815 implies that an entity must document, at inception of a hedge, the method that will be used to measure hedge ineffectiveness (in addition to the method to be used to assess effectiveness) in order to meet the documentation requirements of the standard. In a staff announcement addressing the documentation requirements for all types of hedges—fair value, cash flow, and net investment hedges, the FASB has stated that formal documentation is required, at the inception of a hedge, of the hedging relationship and the entity's risk management objective and strategy for undertaking the hedge, including identification of

1. The hedging instrument,
2. The hedged item or transaction,
3. The nature of the risk being hedged,
4. The method that will be used to retrospectively and prospectively assess the hedging instrument's effectiveness, and
5. The method that will be used to measure hedge ineffectiveness.

Organizations That Do Not Report Earnings

Not-for-profits or other organizations not reporting earnings recognize gains or losses on nonhedging derivative instruments and hedging instruments as a change in net assets. Changes in the carrying amount of the hedged items are also recognized as a change in net assets.

Organizations that do not report earnings cannot use cash flow hedges. If the hedging instrument is a foreign currency net investment hedge, it is accounted for in the same manner as described above.

Summary of Accounting for Hedges

		Type of hedge—ASC 815	
Attribute	*Fair value*	*Cash flow*	*Foreign currency (FC)*
Types of hedging instruments permitted	Derivatives	Derivatives	Derivatives or nonderivatives depending on the type of hedge
Balance sheet valuation of hedging instrument	Fair value	Fair value	Fair value
Recognition of gain or loss on changes in value of hedging instrument	Currently in earnings	Effective portion currently as a component of other comprehensive income (OCI) and reclassified to earnings in future period(s) that fore-casted transaction affects earnings Ineffective portion currently in earnings	**FC denominated firm commitment** Currently in earnings **Available-for-sale security (AFS)** Currently in earnings **Forecasted FC transaction** Same as cash flow hedge **Net investment in a foreign operation** OCI as part of the cumulative translation adjustment to the extent it is effective as a hedge

		Type of hedge—ASC 815	
Attribute	*Fair value*	*Cash flow*	*Foreign currency (FC)*
Recognition of gain or loss on changes in the fair value of the hedged item	Currently in earnings	Not applicable; these hedges are not associated with recognized assets or liabilities	**FC denominated firm commitment** Currently in earnings **Available-for-sale security (AFS)** Currently in earnings **Forecasted FC transaction** Not applicable; same as cash flow hedge

Disclosures

Financial instrument disclosures.

Fair value disclosures. Certain reporting entities are required to disclose the fair values of all (recognized and unrecognized) financial instruments that it is practicable to estimate, including liabilities. Pertinent descriptive information as to the fair value of the instrument is to be presented if an estimate of fair value cannot actually be made without incurring excessive costs.

These fair value disclosures are optional under ASC 825-10-50 for entities that

1. Have total assets less than $100 million on the balance sheet date; and
2. Did not hold or issue any derivative financial instruments during the reporting period; and
3. Are not considered to be public enterprises under the definition in the Master Glossary.[3]

ASC 820, *Fair Value Measurements and Disclosures*, provides a greatly expanded set of guidelines for determining fair value in a variety of fact circumstances. This standard does not impose fair value requirements beyond what already exists under GAAP, but rather provides the tools with which to make the already-required measurements.

ASC 820 emphasizes that fair value measurements are *not* to be made on an entity-specific basis. Therefore, a fair value measurement is expected to include all of the assumptions that market participants would use in pricing the asset or liability, and exclude factors specific to the reporting entity, if information is available that indicates that market participants would exclude those factors. Simply put, this means that fair value is what the market (if there is one) says an asset or liability is worth, absent unique features or interests that a given holder might bring to its use or satisfaction. ASC 820 applies to all fair value measurements called for under other GAAP except for (1) share-based payment transactions (ASC 718), (2) fair value measurements that prescribe the use of vendor-specific objective

[3] *The definition of a public entity includes reporting entities that are the debtor under conduit debt securities traded in domestic or foreign exchange or over-the-counter market, including local or regional markets. These securities, sometimes referred to as industrial revenue bonds, are defined as certain limited-obligation revenue bonds, certificates of participation, or similar debt instruments that are issued by a state or local governmental entity with the objective of assisting the reporting entity in obtaining financing. While the conduit debt securities bear the name of the governmental authority issuer, the issuer is often not obligated for the repayment of the debt other than providing resources to the obligor under the terms of a separate lease or loan agreement. In addition, the conduit bond obligor is responsible for any future financial reporting requirements imposed as a condition of the issuance of the securities.*

evidence (VSOE) (e.g., multiple-deliverable arrangements under ASC 605-25, software revenue recognition under ASC 985-605), and (3) inventory pricing.

Fair value measurements of assets are to reflect the "highest and best use" value which, depending on the circumstances, might involve an "in-use valuation premise or an "in-exchange valuation premise."

Market-derived prices are not permitted to be adjusted due to the quantity of the position held relative to the trading volume of the security. This is referred to as a "blockage factor" since it is derived from the size of the "block" of securities held by the reporting entity. Notably, this is the first time that GAAP has extended this requirement to fair value measurements made by entities subject to the specialized accounting requirements of ASC 940 for broker-dealers and investment companies.

Guidance is also provided regarding the consideration of the effects of restrictions associated with securities in determining their fair value.

If the carrying amount for trade receivables and payables approximates their fair values (which is normally the case), no disclosure is required.

If an estimate of fair value cannot be made without incurring excessive costs, management is to disclose

1. Information pertinent to estimating fair value such as carrying amount, effective interest rate, and maturities
2. The reasons why estimating fair value is not practicable

Chapter 6 provides comprehensive guidance on measuring and disclosing fair values of financial and nonfinancial instruments, when required or permitted by GAAP.

Derivatives disclosures. ASC 815 imposes requirements for specific disclosures about derivative instruments and nonderivative instruments designated and qualifying as hedging instruments. This requires that the objectives for using derivative instruments be disclosed in terms of underlying risk and accounting designation, which is deemed to better convey the purpose of derivative use in terms of the risks that the reporting entity is intending to manage. The purpose is to communicate with statement users the context needed to understand the objectives, the strategies for achieving them, the risk management policy and a description of items or transactions that are hedged for each of the following:

1. Fair value hedges;
2. Cash flow hedges;
3. Foreign currency net investment hedges; and
4. All other derivatives.

Derivative instruments not designated as hedges are to have the purpose of their activity disclosed. Qualitative disclosures concerning the use of derivative instruments are encouraged, particularly in a context of overall risk management strategies employed by the entity. The FASB also encourages disclosure of similar quantitative information about other nonderivative financial instruments or nonfinancial assets and liabilities related by activity to derivative instruments.

ASC 815 requires disclosing the fair values of derivative instruments and their gains and losses in a tabular format, which should provide a more complete picture of the location in the reporting entity's financial statements of both the derivative positions existing at period end and the effect of using derivatives during the reporting period. Also, disclosing information about credit-risk-related contingent features is expected to provide information on the potential effect on an entity's liquidity from using derivatives. ASC 815 requires cross-referencing within the footnotes, which should help users of financial statements locate important information about derivative instruments.

Hedge disclosures. In addition to the above, for every reporting period for which a complete set of financial statements is issued, there are required disclosures by hedge type.

Fair value hedges. For all designated and qualified instruments and the related hedged items that give rise to foreign currency transaction gains or losses under ASC 830, disclosure is required of the net gain or loss included in earnings, a description of where it is reported, and the amounts due to

1. Hedge ineffectiveness;
2. Components that were excluded from the assessment of effectiveness; and
3. Hedged firm commitments that no longer qualify as hedges.

Cash flow hedges. For all designated and qualified instruments and the related hedged items in cash flow hedges, the following are disclosed:

1. The net gain or loss in earnings, a description of where it is reported, and the amounts due to
   a. Hedge ineffectiveness; and
   b. Components that were excluded from the assessment of effectiveness;
2. A description of events that will result in reclassification of amounts in accumulated other comprehensive income to earnings and the net amount expected to be reclassified during the next twelve months;
3. The maximum length of time of any cash flow hedges of forecasted transactions (excluding those relating to payment of variable interest on existing financial instruments); and
4. The amount reclassified from accumulated other comprehensive income into earnings because a cash flow hedge was discontinued due to it being probable that the original forecasted transactions would not occur.

ASC 815, in addition to the existing requirement for disclosures of information by accounting designation, requires that qualitative information be provided by *underlying risks*. The following illustrates the implementation of these qualitative requirements, including volume of activity, and also includes a nontabular presentation of the quantitative information about the hedged items in fair value hedges.

Example of disclosure of objectives and strategies for using derivative instruments by underlying risk

Utopia Company is exposed to certain risks relating to its ongoing business operations. The primary risks managed by using derivative instruments are commodity price risk and interest rate risk. Forward contracts on various commodities are entered into to manage the price risk associated with forecasted purchases of materials used in Utopia's manufacturing process. Interest rate swaps are entered into to manage interest rate risk associated with the Utopia's fixed-rate borrowings.

ASC 815 requires companies to recognize all derivative instruments as either assets or liabilities at fair value in the statement of financial position. In accordance with such requirements, Utopia designates commodity forward contracts as cash flow hedges of forecasted purchases of commodities and interest rate swaps as fair value hedges of fixed-rate borrowings.

Cash flow hedges. For derivative instruments that are designated and qualify as a cash flow hedge, the effective portion of the gain or loss on the derivative is reported as a component of other comprehensive income and reclassified into earnings in the same period or periods during which the hedged transaction affects earnings. Gains and losses on the derivative representing either hedge ineffectiveness or hedge components excluded from the assessment of effectiveness are recognized in current earnings.

As of December 31, 2009, Utopia had the following outstanding commodity forward contracts that were entered into hedge forecasted purchases:

Commodity	*Number of metric tons*
Copper	30,000
Palladium	6,000
Nickel	75,000

Fair value hedges. For derivative instruments that are designated and qualify as a fair value hedge, the gain or loss on the derivative as well as the offsetting loss or gain on the hedged item attributable to the hedged risk are recognized in current earnings.

Utopia includes the gain or loss on the hedged items (that is, fixed-rate borrowings) in the same line item—interest expense—as the offsetting loss or gain on the related interest rate swaps as follows:

Income statement classification	*Gain/loss on swaps*	*Gain/loss on borrowings*
Interest expense	$350,000	$(22,000)

As of December 31, 2009, the total notional amount of the Utopia's receive-fixed/pay-variable interest rate swaps was $12.6 million.

Example of disclosure in tabular format of fair value amounts, and gains and losses on derivative instruments and related hedged items

[a] *If gains and losses associated with a type of contract (for example, interest rate contracts) are displayed in multiple line items in the income statement, the entity is required to disclose the amount included in each line item.*

[b] *See footnote XX for additional information on the Utopia Company's purpose for entering into derivatives not designated as hedging instruments and its overall risk management strategies.*

[c] *For alternative disclosures about "trading derivatives," see separate table for trading activities in footnotes to the financial statements.*

[d] *The amount of gain or (loss) recognized in income represents $XXX related to the ineffective portion of the hedging relationships and $XXX related to the amount excluded from the assessment of hedge effectiveness.*

Example of tabular disclosure of nondesignated/nonqualifying derivative instruments that are included in an entity's trading activity

When the reporting entity elects the alternative disclosure for gains and losses on derivative instruments included in its trading activities, a format such as the following may be elected for use.

Note that many entities already include the required information about their trading activities in other disclosures within the financial statements, in which case it would now need to provide a cross-reference from the derivative footnote to other footnotes in which trading derivative-related information is included.

The Effect of Trading Activities on the Statement of Financial Performance for the Years Ended December 31, 2009 and 2008

	Trading Revenue	
Type of Instrument	*2009*	*2008*
Fixed income/interest rate	$xx,xxx	$xx,xxx
Foreign exchange	xx,xxx	xx,xxx
Equity	xx,xxx	xx,xxx
Commodity	xx,xxx	xx,xxx
Credit	xx,xxx	xx,xxx
Other	xx,xxx	xx,xxx
Total	$xx,xxx	$xx,xxx

Example of disclosure of contingent features in derivative instruments

This example illustrates the disclosure of credit-risk-related contingent features in derivative instruments.

Contingent Features

Certain of Utopia Company's derivative instruments contain provisions that require Utopia's debt to maintain an investment grade credit rating from each of the major credit rating agencies. If Utopia's debt were to fall below investment grade, it would be in violation of these provisions, and the counterparties to the derivative instruments could request immediate payment or demand immediate and ongoing full overnight collateralization on derivative instruments in net liability positions.

The aggregate fair value of all derivative instruments with credit-risk-related contingent features that are in a liability position on December 31, 2009, is $XX million for which Utopia has posted collateral of $X million in the normal course of business. If the credit-risk-related contin-

gent features underlying these agreements were triggered on December 31, 2009, Utopia would be required to post an additional $XX million of collateral to its counterparties.

Foreign currency net investment hedges. For all such designated and qualified instruments that give rise to foreign currency transaction gains or losses under ASC 830, the net gain or loss that is included in the cumulative translation adjustment.

Comprehensive income. The net gain or loss from cash flow hedges on derivative instruments reported in other comprehensive income must be shown as a separate classification. Accumulated other comprehensive income disclosures should show separately the following:

1. Beginning and ending accumulated derivative instrument gain or loss;
2. Net change from current period hedging transactions; and
3. Net amount of reclassifications to earnings.

PERSPECTIVE AND ISSUES

The accounting for inventories is a major consideration for many entities because of its significance to both the income statement (cost of goods sold) and the balance sheet (current assets). Inventories are defined in ASC 330-10-20 as

> *The aggregate of those items of tangible personal property that have any of the following characteristics: a) held for sale in the ordinary course of business; b) in process of production for such sale; c) to be currently consumed in the production of goods or services to be available for sale.*

The complexity of accounting for inventories arises from factors that include

1. The high volume of activity (or turnover) and the associated challenges of keeping accurate, up-to-date records.
2. Choosing from among various cost flow alternatives that are permitted by GAAP.
3. Ensuring compliance with complex US income tax laws and regulations when electing to use the last-in, first-out (LIFO) method.
4. Monitoring and properly accounting for adjustments necessitated by applying the lower of cost or market method to the inventory.

There are two types of entities for which the accounting for inventories is relevant. The merchandising entity (generally referred to as a retailer, dealer, or wholesaler/distributor) purchases inventory for resale to its customers. The manufacturer buys raw materials, and processes those raw materials using labor and equipment into finished goods that are then sold to its customers. While the production process is progressing, the costs of the raw materials, salaries and wages paid to the labor force (and related benefits), depreciation of the machinery, and an allocated portion of the manufacturer's overhead are accumulated by the accounting system as work in process (WIP). Finished goods inventory is the completed product which is on hand awaiting shipment or sale.

In the case of either type of entity we are concerned with answering the same basic questions.

1. At what point in time should the items be included in inventory (ownership)?
2. What costs incurred should be included in the valuation of inventories?
3. What cost flow assumption should be used?
4. At what value should inventories be reported (determination of the lower of cost or market, or LCM)?

ASC 330 discusses the definition, valuation, and classification of inventory, as well as the measurement and classification of inventories during interim periods. ASC 605-15 governs revenue recognition when the buyer has the right to return the product and is covered in depth in Chapter 10 of this book. ASC 470-40 addresses product financing arrangements. Finally, ASC 845-10-05 addresses exchanges of nonmonetary assets and is covered in Chapter 11.

DEFINITIONS OF TERMS

Base stock. Based on the theory that a minimal level of inventory is a permanent investment, the amount maintained indefinitely on the balance sheet at its historical cost.

Ceiling. In lower of cost or market (LCM) computations, market (replacement cost, as defined below) cannot be higher than the ceiling (net realizable value, as defined below).

Consignments. A marketing method in which the consignor ships goods to the consignee, who acts as an agent for the consignor in selling the goods. The inventory remains the property of the consignor until sold by the consignee.

Cost. The accumulated amount of expenditures and charges incurred directly or indirectly to acquire and/or produce items of inventory and to move them to the location from which they will be sold or held for sale.

Direct (variable) costing. This method includes only variable manufacturing costs in the cost of ending finished goods inventory. This method is not acceptable for financial reporting or income tax purposes.

Dollar-value LIFO. A variation of conventional LIFO in which layers of inventory are priced in dollars adjusted by price indices instead of being priced at unit prices.

Double-extension. A method used to compute the LIFO conversion price index. The index indicates the relationship between the base-year and current prices in terms of a percentage.

Finished goods. A manufacturer's completed but unsold products.

First-in, first-out (FIFO). A cost flow assumption; the first goods purchased or produced are assumed to be the first goods sold.

Floor. In lower of cost or market computations, market is limited to net realizable value less a normal profit, called the floor. Market (replacement cost) cannot be below the floor.

Full absorption (full costing). In accordance with GAAP, this method includes all direct and indirect manufacturing costs (fixed and variable) in the cost of finished goods inventory.

Goods in transit. Merchandise that is in the process of being shipped from seller to buyer and that is en route at a particular point in time.

Gross profit. The result of subtracting cost of sales from net sales. Also referred to as "gross margin."

Gross profit method. A method used in interim periods to estimate the amount of ending inventory based on the cost of goods available for sale, sales, and the expected gross profit percentage.

Inventory. Those items of tangible personal property that are (1) held for sale in the normal course of business (finished goods), (2) in the process of being produced for that purpose (work in process), or (3) to be used in the production of such items (raw materials).

Inventory layer. Under the LIFO method, an increase in inventory quantity during a period.

Last-in, first-out (LIFO). A cost flow assumption; the last goods purchased are assumed to be the first goods sold.

LIFO conformity rule. A statutory requirement that, in the US, if the LIFO method is used for income tax purposes, it must also be used for financial reporting purposes.

LIFO liquidation. The permanent elimination of all or part of the LIFO base or old inventory layers when inventory quantities decrease. This inventory decrement can distort gross profit, operating income, and net income since old costs are being reflected in cost of goods sold and matched against current revenues.

LIFO reserve. The difference, at a specified date, between inventory valued using LIFO and inventory valued using the method the company uses for internal management or reporting purposes.

LIFO retail. An inventory costing method which combines the LIFO cost flow assumption and the retail inventory method.

Link-chain. A method of applying dollar-value LIFO by developing a single cumulative index. This method may be used instead of double-extension only when there are substantial changes in product lines over the years.

Lower of cost or market. Inventories are required to be valued at the lower of cost or market. Market is generally considered to be replacement cost; however, for the purpose of this computation, market is not permitted to exceed the ceiling (net realizable value) or be less than the floor (net realizable value less a normal markup).

Markdown. A decrease in selling price below original retail price.

Markdown cancellation. An increase in selling price after a markdown that does not adjust the selling price to an amount that exceeds the original retail price.

Markup. An increase in selling price above original retail price.

Markup cancellation. A decrease in selling price after a markup to an amount that is not below the original retail price.

Moving or weighted-average. An inventory costing method used in conjunction with a perpetual inventory system. A weighted-average cost per unit is recomputed after every purchase. Cost of goods sold is recorded at the most recent moving average cost.

Net realizable value. The selling price of an item, less selling costs and costs to complete.

Parking transaction. An arrangement which attempts to remove inventory and a current liability from the balance sheet. See **product financing arrangement**.

Periodic inventory system. An inventory system where actual quantities are determined and recorded inventories adjusted as a result of a physical count taken at set intervals.

Perpetual inventory system. An inventory system where records of inventory quantities are maintained and updated as transactions occur.

Product financing arrangement. An arrangement whereby a firm buys inventory for another firm which agrees to purchase the inventory over a certain period at specified prices which include handling and financing costs.

Purchase commitment. A noncancelable commitment to purchase goods. Losses on such commitments are recognized when the contract price exceeds fair value, even if this occurs prior to delivery.

Raw materials. For a manufacturing firm, materials on hand awaiting entry into the production process.

Replacement cost. The cost to reproduce an inventory item by purchase or manufacture. In lower of cost or market computations, the term market means replacement cost, subject to the ceiling and floor limitations defined above.

Retail method. An inventory costing method that uses a cost ratio to reduce ending inventory valued at retail to cost.

Shrinkage. The situation arising when the number of units of an inventory item physically counted at a point in time is less than the number of units purported to be on hand according to the enterprise's perpetual inventory records. Shrinkage can result from a combination of theft, spoilage, and errors in the perpetual records.

Specific identification. An inventory system where the seller identifies which specific items are sold and which remain in ending inventory.

Standard costs. Predetermined unit costs, which are acceptable for financial reporting purposes if adjusted periodically to reflect current conditions and if their use approximates the results that would be obtained by applying one of the recognized cost flow assumptions.

Weighted-average. An inventory costing method where ending inventory and cost of goods sold are priced at the weighted-average cost of all items available for sale.

Work in process (WIP). For a manufacturing firm, the inventory of partially completed products.

CONCEPTS, RULES, AND EXAMPLES

Ownership of Goods

Generally, in order to obtain an accurate measurement of inventory quantity, it is necessary to determine when title legally passes between buyer and seller. The exception to this general rule arises from situations when the buyer assumes the significant risks of ownership of the goods prior to taking title and/or physical possession of the goods. Substance over form in this case would dictate that the inventory is an asset of the buyer and not the seller, and that a purchase and sale of the goods be recognized by the parties irrespective of the party that holds legal title.

The most common error made in this area is to assume that an entity has title only to the goods it physically holds. This may be incorrect in two ways: (1) goods held may not be owned, and (2) goods that are not held may be owned. Four issues affect the determination of ownership: (1) goods in transit, (2) consignment arrangements, (3) product financing arrangements, and (4) sales made with the buyer having the right of return.

Goods in transit. At year-end, any goods in transit from seller to buyer must be included in one of those parties' inventories based on the conditions of the sale. Such goods are included in the inventory of the firm financially responsible for transportation costs. This responsibility may be indicated by shipping acronyms such as FOB, which is used in overland shipping contracts, or FAS, CIF, C&F, and ex-ship, which are used in maritime contracts.

The term FOB is an abbreviation of "free on board." If goods are shipped FOB destination, transportation costs are paid by the seller and title does not pass until the carrier delivers the goods to the buyer. These goods are part of the seller's inventory while in transit. If goods are shipped FOB shipping point, transportation costs are paid by the buyer and title passes when the carrier takes possession of the goods. These goods are part of the buyer's inventory while in transit. The terms FOB destination and FOB shipping point often indicate a specific location at which title to the goods is transferred, such as FOB Cleveland. This means that the seller retains title and risk of loss until the goods are delivered to a common carrier in Cleveland who will act as an agent for the buyer. The rationale for these determinations originates in agency law, since transfer of title is conditioned upon whether the carrier with physical possession of the goods is acting as an agent of the seller or the buyer.

A seller who ships FAS (free alongside) must bear all expense and risk involved in delivering the goods to the dock next to (alongside) the vessel on which they are to be shipped. The buyer bears the costs of loading and shipment. Title passes when the carrier, as agent for the buyer, takes possession of the goods.

In a CIF (cost, insurance, and freight) contract the buyer agrees to pay in a lump sum the cost of the goods, insurance costs, and freight charges. In a C&F (cost and freight) contract, the buyer promises to pay a lump sum that includes the cost of the goods and all freight charges. In either case, the seller must deliver the goods to the buyer's agent/carrier and pay the costs of loading. Both title and risk of loss pass to the buyer upon delivery of the goods to the carrier.

A seller who delivers goods ex-ship bears all expense and risk until the goods are unloaded, at which time both title and risk of loss pass to the buyer.

Examples of goods in transit

The Meridian Vacuum Company is located in Santa Fe, New Mexico, and obtains compressors from a supplier in Hong Kong. The standard delivery terms are free alongside (FAS) a container ship in Hong Kong harbor, so that Meridian takes legal title to the delivery once possession of the goods is taken by the carrier's dockside employees for the purpose of loading the goods on board the ship. When the supplier delivers goods with an invoiced value of $120,000 to the wharf, it e-mails an advance shipping notice (ASN) and invoice to Meridian via an electronic data interchange (EDI) transaction, itemizing the contents of the delivery. Meridian's computer system receives the EDI transmission, notes the FAS terms in the supplier file, and therefore automatically logs it into the company computer system with the following entry:

Inventory	120,000	
Accounts payable		120,000

The goods are assigned an "In Transit" location code in Meridian's perpetual inventory system. When the compressor eventually arrives at Meridian's receiving dock, the receiving staff records a change in inventory location code from "In Transit" to a code designating a physical location within the warehouse.

Meridian's secondary compressor supplier is located in Vancouver, British Columbia, and ships overland using free on board (FOB) Santa Fe terms, so the supplier retains title until the shipment arrives at Meridian's location. This supplier also issues an advance shipping notice by EDI to inform Meridian of the estimated arrival date, but in this case Meridian's computer system notes the FOB Santa Fe terms, and makes no entry to record the transaction until the goods arrive at Meridian's receiving dock.

Consignment arrangements. In consignment arrangements, the consignor ships goods to the consignee, who acts as the agent of the consignor in trying to sell the goods. In some consignments, the consignee receives a commission and is, in effect, acting as an agent of the consignor. In other arrangements, the consignee "purchases" the goods simultaneously with the sale of the goods to the customer. Goods on consignment are included in the inventory of the consignor and excluded from the inventory of the consignee.

Example of a consignment arrangement

The Portable Handset Company (PHC) ships a consignment of its cordless phones to a retail outlet of the Consignee Corporation. PHC's cost of the consigned goods is $3,700. PHC shifts the inventory cost into a separate inventory account to track the physical location of the goods. The entry follows:

Consignment out inventory	3,700	
Finished goods inventory		3,700

A third-party shipping company ships the cordless phone inventory from PHC to Consignee. Upon receipt of an invoice for this $550 shipping expense, PHC charges the cost to consignment inventory with the following entry:

Consignment out inventory	550	
Accounts payable		550

To record the cost of shipping goods from the factory to Consignee

Consignee sells half the consigned inventory during the month for $2,750 in credit card payments, and earns a 22% commission on these sales, totaling $605. According to the consignment arrangement, PHC must also reimburse Consignee for the 2% credit card processing fee, which is $55 ($2,750 × 2%). The results of this sale are summarized as follows:

Sales price to Consignee's customer earned on behalf of PHC	$2,750
Less: Amounts due to Consignee in accordance with arrangement	
22% sales commission	(605)
Reimbursement for credit card processing fee	(55)
	(660)
Due to PHC	$2,090

Upon receipt of the monthly sales report from Consignee, PHC records the following entries:

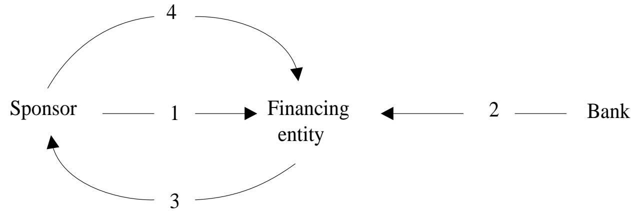
Accounts receivable	2,090	
Cost of goods sold	55	
Commission expense	605	
Sales		2,750

To record the sale made by Consignee acting as agent of PHC, the commission earned by Consignee and the credit card fee reimbursement earned by Consignee in connection with the sale

Costs of goods sold	2,125	
Consignment out inventory		2,125

To transfer the related inventory cost to cost of goods sold, including half the original inventory cost and half the cost of the shipment to consignee [($3,700 + $550 = $4,250) × ½ = $2,125]

Product financing arrangements. ASC 470-40 addresses the issues involved with product financing arrangements. A product financing arrangement is a transaction in which an entity (referred to as the "Sponsor") simultaneously sells and agrees to repurchase inventory to and from a financing entity. The repurchase price is contractually fixed at an amount equal to the original sales price plus the financing entity's carrying and financing costs. The purpose of the transaction is to enable the sponsor enterprise to arrange financing of its original purchase of the inventory. The various steps involved in the transaction are illustrated by the diagram below.



1. In the initial transaction the sponsor "sells" inventoriable items to the financing entity in return for the remittance of the sales price and at the same time agrees to repurchase the inventory at a specified price (usually the sales price plus carrying and financing costs) over a specified period of time.
2. The financing entity borrows from a bank (or other financial institution) using the newly purchased inventory as collateral.
3. The financing entity remits the proceeds of its borrowing to the sponsor and the sponsor presumably uses these funds to pay off the debt incurred as a result of the original purchase.
4. The sponsor then, over a period of time as funds become available, repurchases the inventory from the financing entity for the specified price plus carrying and financing costs.

FASB ruled that the substance of this transaction is that of a borrowing transaction, not a sale. That is, the transaction is, in substance, no different from the sponsor directly obtaining third-party financing to purchase inventory. ASC 470-40 specifies that the proper accounting by the sponsor is to record a liability in the amount of the selling price when the funds are received from the financing entity in exchange for the initial transfer of the inventory. The sponsor proceeds to accrue carrying and financing costs in accordance with its normal accounting policies. These accruals are eliminated and the liability satisfied when the sponsor repurchases the inventory. The inventory is not removed from the balance sheet of the sponsor and a sale is not recorded. Thus, although legal title has passed to the financing entity, for purposes of measuring and valuing inventory, the inventory is considered to be owned by the sponsor.

Example of a product financing arrangement

The Medieval Illumination Company (MIC) has borrowed the maximum amount it has available under its short-term line of credit. MIC obtains additional financing by selling $280,000 of its candle inventory to a third party financing entity. The third party obtains a bank loan at 6% interest to pay for its purchase of the candle inventory, while charging MIC 8% interest and $1,500 per month to store the candle inventory at a public storage facility. As MIC obtains candle orders, it purchases inventory back from the third party, which in turn authorizes the public warehouse to drop ship the orders directly to MIC's customers at a cost of $35 per order. Since this is a product financing arrangement, MIC cannot remove the candle inventory from its accounting records or record revenue from sale of its inventory to the third party. Instead, the following entry records the initial financing arrangement:

Cash	280,000	
Short-term debt		280,000

After one month, MIC records accrued interest of $1,867 ($280,000 × 8% interest × 1/12 year) on the loan, as well as the monthly storage fee of $1,500, as shown in the following entry:

Interest expense	1,867	
Storage expense	1,500	
Accrued interest		1,867
Accounts payable		1,500

On the first day of the succeeding month, MIC receives a prepaid customer order for $3,800. The margin on the order is 40% and, therefore, the related inventory cost is $2,280. MIC pays the third party $2,280 to buy back the required inventory as well as $35 to the public storage facility to ship the order to the customer, and records the following entries:

Short-term debt	2,280	
Cash		2,280
To repurchase inventory from the third-party financing entity		
Cash	3,800	
Sales		3,800
To record the sale to the customer		
Cost of goods sold	2,280	
Inventory		2,280
To record the cost of the sale to the customer		
Freight out	35	
Accounts payable		35
To record the cost of fulfilling the order		

ASC 470-40 identifies variations of the terms of the above arrangement that also meet the criteria for being accounted for as product financing arrangements.

1. The third-party financing entity purchases the inventory directly from the sponsor's supplier (instead of from the sponsor) with a simultaneous agreement to sell the inventory to the sponsor.
2. The sponsor enters into an agreement with a third-party financing entity to control the disposition of product that has been purchased by the third party either from the sponsor or from the sponsor's supplier.

Sales made with the buyer having the right of return. Another issue requiring special consideration exists when a buyer is granted a right of return, as defined by ASC 605-15. The seller must consider the propriety of recognizing revenue at the point of sale under such a situation (this topic is discussed in detail in Chapter 10). The sale is recorded only when six specified conditions are met including the condition that the future amount of returns can be reasonably estimated by the seller. If a reasonable estimate cannot be made, then the sale is not recorded until the earlier of the expiration date of the return privilege or the date when all six conditions are met. Similar to product financing costs, this situation results in the seller continuing to include the goods in its measurement and valuation of inventory even though legal title has passed to the buyer.

Accounting for Inventories

A major objective of accounting for inventories is the matching of appropriate costs to the period in which the related revenues are earned in order to properly compute gross profit, also referred to as gross margin. Inventories are recorded in the accounting records using either a periodic or perpetual system.

In a periodic inventory system, inventory quantities are determined by physical count. The quantity of each item counted is then priced using the cost flow assumption that the enterprise had adopted as its accounting policy for that type of inventory. Cost of goods sold is computed by adding beginning inventory and net purchases (or cost of goods manufactured) and subtracting ending inventory.

Alternatively, a perpetual inventory system keeps a running total of the quantity (and possibly the cost) of inventory on hand by maintaining subsidiary inventory records that reflect all sales and purchases as they occur. When inventory is purchased, inventory (rather than purchases) is debited. When inventory is sold, the cost of goods sold and corresponding reduction of inventory are recorded.

Using a periodic inventory system necessitates the taking of physical inventory counts to determine the quantity of inventory on hand at the end of a reporting period. In order to facilitate accurate annual financial statements, in practice physical counts are performed at least annually on the last day of the fiscal year.

If the enterprise maintains a perpetual inventory system, it must regularly and systematically verify the accuracy of its perpetual records by physically counting inventories and comparing the quantities on hand with the perpetual records. GAAP does not provide explicit requirements regarding the timing and frequency of physical counts necessary to verify the perpetual records; however there is a US income tax requirement (IRC§471[b][1]) that a taxpayer perform "…a physical count of inventories at each location on a regular and consistent basis…." The purpose of this requirement is to enable the taxpayer to support any tax deductions taken for inventory shrinkage if it elects not to take a complete physical inventory at all locations on the last day of the fiscal year. The IRS, in its Rev. Proc. 98-29, provided a "retail safe harbor method" that permits retailers to deduct estimated shrinkage where the retailer takes physical inventories at each location at least annually.

Valuation of Inventories

The primary basis of accounting for inventories is cost. Cost is defined as the sum of the applicable expenditures and charges directly or indirectly incurred in bringing an article to its existing condition and location.

This definition allows for a wide interpretation of the costs to be included in inventory.

Raw materials and merchandise inventory. For raw materials and merchandise inventory which are purchased outright, the identification of cost is relatively straightforward. The cost of these purchased inventories will include all expenditures incurred in bringing the goods to the point of sale and converting them to a salable condition. These costs include the purchase price, transportation costs (freight-in), insurance while in transit, and handling costs charged by the supplier.

Example of recording raw material costs

Aruba Bungee Cords, Inc. (ABC) purchases rubber bands, a raw material that it uses in manufacturing its signature product. The company typically receives delivery of all its raw materials and uses them in manufacturing its finished products during the winter, and then sells its stock of finished goods in the spring. The supplier invoice for a January delivery of rubber bands includes the following line items:

Rubber band (1,681 pounds at $3 per pound)	$5,043
Shipping and handling	125
Shipping insurance	48
Sales tax	193
Total	$5,409

Since ABC is using the rubber bands as raw materials in a product that it resells, it will not pay the sales tax. However, both the shipping and handling charge and the shipping insurance are required for ongoing product acquisition, and so are included in the following entry to record receipt of the goods:

Inventory raw materials	5,216	
Accounts payable		5,216

To record purchase of rubber bands and related costs ($5,043 + $125 + $48)

On February 1, ABC purchases a $5,000, two-month shipping insurance policy (paradoxically, this type of policy is sometimes referred to as "inland marine" coverage) that applies to all incoming supplier deliveries for the remainder of the winter production season, allowing it to refuse shipping insurance charges on individual deliveries. Since the policy insures all inbound raw materials deliveries (not just rubber bands), it is too time-consuming to charge the cost of this pol-

icy to individual raw material deliveries using specific identification, and accordingly, the controller can estimate a flat charge per delivery based on the number of expected deliveries during the two-month term of the insurance policy as follows:

$5,000 insurance premium + 200 expected deliveries during the policy term = $25 per delivery and then charge each delivery with $25 as follows:

Inventory—raw materials	25	
Prepaid insurance		25

To allocate cost of inland marine coverage to inbound insured raw materials shipments

In this case, however, the controller determined that shipments are expected to occur evenly during the two-month policy period and therefore will simply make a monthly standard journal entry as follows:

Inventory—raw materials	2,500	
Prepaid insurance		2,500

To amortize premium on inland marine policy using the straight-line method

Note that the controller must be careful, under either scenario, to ensure that perpetual inventory records appropriately track unit costs of raw materials to include the cost of shipping insurance. Failure to do so would result in an understatement of the cost of raw materials inventory on hand at the end of any accounting period.

Purchases can be recorded at their gross amount or net of any allowable discount. If recorded gross, the discounts taken represent a reduction in the purchase cost for purposes of determining cost of goods sold. On the other hand, if they are recorded net, any lost discounts are treated as a financial expense, not as cost of goods sold. The net method is considered to be theoretically preferable, but the gross method is simpler and, thus, more commonly used. Either method is acceptable under GAAP, provided that it is consistently applied.

Inventory exchanges. Some enterprises enter into transactions to acquire inventory by exchanging items of their inventory with the supplier. Exchange transactions are subject to ASC 845, which requires a test of commercial substance.

Inventory purchases and sales with the same counterparty. Some enterprises sell inventory to another party from which they also acquire inventory in the same line of business. ASC 845 states that such situations should be considered to be a single transaction when there is a legal requirement for an inventory transfer between the parties to be offset by another inventory transfer, irrespective of the use of separate invoices and cash settlements for each individual transaction. The following conditions are indicators that offsetting inventory transactions should be treated as a single transaction, even in the absence of a legal requirement for offsetting inventory transfers.

- There is a specific legal right by both parties to offset their payment and receivable obligations to each other.
- Inventory purchases and sales between the counterparties are simultaneous.
- Inventory purchases and sales between the counterparties are at off-market prices.
- There is a strong likelihood that the counterparties will engage in reciprocal inventory transactions.

Example of counterparty inventory transfers

The Recording Artists Equipment Company (RAEC) maintains an inventory of microphones, preamplifiers, and related recording equipment for its professional musician clientele, while the Podcaster Supply Company (PSC) stocks mixer hardware and software for its customers. The two companies enter into an agreement whereby RAEC ships excess quantities of its microphone and preamplifier inventory to PSC for sale by PSC to its customers, while PSC may ship an equivalent value of its mixers to RAEC for sale by RAEC to its customers. Historically, PSC has always delivered an equivalent quantity of mixers to RAEC. Each transaction is separately documented and

settled in cash at wholesale prices. These transfers should be treated as a single transaction, since there is a strong likelihood that reciprocal inventory transfers will occur, and because RAEC is obligated to accept inventory transfers from PSC that are of an equivalent value to its shipments to PSC.

Inventory hedges. One notable exception to recording inventories at cost is provided by the hedge accounting requirements of ASC 815. If inventory has been designated as the hedged item in a fair value hedge, changes in the fair value of the hedged inventory are recognized on the balance sheet as they occur, with the offsetting charge or credit recognized currently in earnings. Hedging is discussed in detail in Chapter 8.

Manufacturing inventories. Inventory cost in a manufacturing enterprise is to include both acquisition and production costs. This concept is commonly referred to as full absorption or full costing. As a result, the WIP and finished goods inventories include direct materials, direct labor, and an appropriately allocated portion of indirect production costs referred to as indirect overhead.

Under full absorption costing, indirect overhead costs—costs that are incidental to and necessary for production—are allocated to goods produced and, to the extent those goods are uncompleted or unsold at the end of a period, are included in ending WIP or finished goods inventory, respectively. Indirect overhead costs include such costs as

- Depreciation and cost depletion
- Repairs
- Maintenance
- Factory rent and utilities
- Indirect labor
- Normal rework labor, scrap, and spoilage
- Production supervisory wages
- Indirect materials and supplies
- Quality control and inspection
- Small tools not capitalized

Indirect overhead is comprised of two elements, variable and fixed overhead. ASC 330 clarifies that variable overhead is to be allocated to work-in-process and finished goods based on the actual usage of the production facilities. Fixed overhead, however, is to be allocated to work-in-process and finished goods based on the normal expected capacity of the enterprise's production facilities with the overhead rate recomputed in instances when actual production exceeds the normal capacity. Initially, this may appear to be an inconsistent accounting method; however, the use of this convention ensures that the inventory is not recorded at an amount in excess of its actual cost as illustrated in the following example:

Example of allocating fixed overhead to units produced

Brewed Refreshment Plant, Inc. (BRP), located in Washington, D.C., has historically produced between 3,200 and 3,800 barrels of beer annually with its average production approximating 3,500 barrels. This average takes into account its normal number of work shifts and the normal operation of its machinery adjusted for downtime for normal maintenance and recalibration. BRP's average capacity and overhead costs (partial list) are presented below.

(a) Normal expected annual productive capacity		3,500 barrels
Fixed overhead costs (partial list):		
Depreciation of machinery	$600	
Factory rent	800	
Plant superintendent	80	
(b) Total fixed overhead to allocate		$1,480
(c) Fixed overhead rate per barrel produced (b. ÷ a.)		$ 0.4229 per barrel

Scenario 1: The Washington Nationals major-league baseball team outperforms expectations; since BRP's beer is sold at the Nationals' stadium, BRP substantially increases production beyond the normal level expected.

Actual production level	4,500 barrels

If BRP were to apply fixed overhead using the rate based on its normal productive capacity, the calculation would be as follows:

4,500 barrels produced × $0.4229 per barrel = $1,903 of overhead applied

This would result in an over-allocation of $423, the difference between the $1,903 of overhead applied and the $1,480 of overhead actually incurred. This violates the lower of cost or market principle since the inventory would be valued at an amount that exceeded its actual cost. Therefore, BRP applied ASC 330 and recomputed its fixed overhead rate as follows:

1,480 fixed overhead incurred ÷ Revised production level of 4,500 barrels = $0.3289 per barrel

Scenario 2: The Washington Nationals experience a cold, rainy summer and worse-than-expected attendance. If production lags expectations and BRP only produces 2,500 barrels of beer, the original overhead rate is not revised. The fixed overhead is allocated as follows:

2,500 barrels produced × $0.4229 per barrel = $1,057 of overhead applied

Per ASC 330, when production levels decline below the original expectation, the fixed overhead rate is not recomputed. The $423 difference between the $1,480 of actual fixed overhead incurred and the $1,057 of overhead applied is accounted for as an expense in the period incurred.

For the purpose of determining normal productive capacity, it is expected that capacity will vary from period to period based on enterprise-specific or industry-specific experience. Management is to formulate a judgment regarding a reasonable range of normal production levels expected to be achieved under normal operating conditions.

The enterprise may incur unusually large expenses resulting from idle facilities, excessive waste, spoilage, freight, or handling costs. ASC 330 clarifies that when this situation occurs, the abnormal portion of these expenses is to be treated as a cost of the period incurred and not to be allocated to inventory.

Generally, interest costs incurred during the production of inventory are not capitalized under ASC 835-20. A complete discussion regarding the capitalization of interest costs is provided in Chapter 11.

Selling costs do not constitute production costs. General and administrative expenses are typically not allocated to production. However, there may be circumstances in which certain general and administrative expenses are related to the production process and are therefore allocable to the WIP and finished goods inventories.

Example of variable and fixed overhead allocation

The InCase Manufacturing Company (IMC) uses injection molding to create two types of plastic CD cases—regular size and mini, on a seven-day, three-shift production schedule. During the current month, it records the following overhead expenses:

Depreciation of machinery	$232,000	Rent	$36,000
Indirect labor	208,000	Repairs	12,000
Indirect materials	58,000	Small tools	28,000
Maintenance	117,000	Scrap and spoilage	49,000
Production supervisory wages	229,000	Utilities	37,000
Quality control	82,000		

IMC's controller analyzed scrap and spoilage statistics and determined that abnormal losses of $32,000 were incurred due to a bad batch of plastic resin pellets. She adjusted scrap and spoilage expense by charging the cost of those pellets to cost of goods sold during the current period, resulting in a reduced scrap and spoilage expense of $17,000. Also, the rent cost includes a $6,000 lease termination penalty payable to the lessor of a vacant factory. Since this cost is considered an exit or disposal activity under ASC 420, it does not benefit production and is therefore charged directly to expense in the current period.

For allocation purposes, IMC's controller elects to group the adjusted overhead expenses into two cost pools. Pool #1 contains all expenses related to machinery operation, which includes depreciation, indirect labor, indirect materials, maintenance, rent, repairs, small tools, and utilities.

Pool #2 contains all expenses related to production runs, which includes production supervisory wages, quality control, scrap, and spoilage. The following three journal entries record (1) the recognition of excess scrap and unused facilities in the current period, (2) the allocation of costs to the machinery cost pool, and (3) the allocation of costs to the production runs cost pool:

Cost of goods sold expense	38,000	
Scrap and spoilage expense		32,000
Rent expense		6,000
Overhead pool #1—Machinery operation	722,000	
Depreciation		232,000
Indirect labor		208,000
Indirect materials		58,000
Maintenance		117,000
Rent		30,000
Repairs		12,000
Small tools		28,000
Utilities		37,000
Overhead pool #2—Production runs	328,000	
Production supervisory wages		229,000
Quality control		82,000
Scrap and spoilage		17,000

Since the costs in overhead pool #1 are centered on machine usage, the controller elects to use the total operating hours used for the production of each product as the allocation basis for that pool. The accumulated production hours by machine for the past month are as follows:

Machinery type	*Regular CD production hours*	*Mini CD production hours*
50-ton press	0	710
55-ton press	310	290
70-ton press	480	230
85-ton press	690	0
Total hours	1,480	1,230
Percentage of total hours	55%	45%

Since the costs in overhead pool #2 are centered on production volume, the controller decides to use the total pounds of plastic resin pellets used for production during the month as the allocation basis for that cost pool. The total plastic resin usage, adjusted for spoilage, was 114,000 pounds of resin for the regular CD cases and 76,000 pounds for the mini CD cases, which is a percentage split of 60% for regular CD cases and 40% for mini CD cases.

With the calculation of allocation bases completed, the split of overhead costs between the two products follows:

	Total costs in pool	*55% regular CD allocation*	*45% mini CD allocation*
Overhead pool #1	722,000	397,100	324,900

	Total costs in pool	*60% regular CD allocation*	*40% mini CD allocation*
Overhead pool #2	328,000	196,800	131,200

Thus, the total overhead allocated to regular CD cases is $593,900 (397,100 + 196,800), while the total overhead allocated to mini CD cases is $456,100 (324,900 + 131,200). Of the case quantities produced, 85% of the regular CD cases and 70% of the mini CD cases were sold during the month, with the remainder being transferred into finished goods inventory. IMC's controller uses these percentages to apportion the cost of allocated overhead between the cost of goods sold and finished goods inventory, as shown in the following entry:

Cost of goods sold–regular CD cases	504,815	
Cost of goods sold–mini CD cases	319,270	
Finished goods inventory–regular CD cases	89,085	
Finished goods inventory–mini CD cases	136,830	
Overhead pool #1–Machinery operation		722,000
Overhead pool #2–Production runs		328,000

Determining inventory cost. The theoretical basis for valuing inventories and cost of goods sold requires assigning production and/or acquisition costs to the specific goods to which they relate. This method of inventory valuation is usually referred to as specific identification. Specific identification is generally not practical as the product will generally lose its separate identity as it passes through the production and sales process. Exceptions to this would arise in situations involving small inventory quantities with high unit value and low turnover rate such as automobiles or heavy machinery. Because of the limited applicability of specific identification, it is necessary to make certain assumptions regarding the cost flows associated with inventory. Although these cost flow assumptions are used for accounting purposes, they may or may not reflect the actual physical flow of the inventory.

Cost flow assumptions. The most common cost flow assumptions used are specified in ASC 330-10-30: (1) first-in, first-out (FIFO), (2) last-in, first-out (LIFO), and (3) weighted-average. Additionally, there are variations in the application of each of these assumptions which are commonly used in practice.

In selecting which cost flow assumption to adopt as its accounting policy for a particular type of industry, management should consider a variety of factors. First, the industry norm should be examined as this will facilitate intercompany comparison by financial statement users. The appropriateness of using a particular cost flow assumption will vary depending on the nature of the industry and the expected economic climate. The appropriate method in a period of rising prices differs from the method that is appropriate for a period of declining prices. Each of the foregoing assumptions and their relative advantages or disadvantages are discussed below. Examples are provided to enhance understanding of the application.

First-in, first-out (FIFO). The FIFO method of inventory valuation assumes that the first goods purchased are the first goods used or sold, regardless of the actual physical flow. This method is thought to most closely parallel the physical flow of the units in most industries. The strength of this cost flow assumption lies in the inventory amount reported on the balance sheet. Because the earliest goods purchased are the first ones removed from the inventory account, the remaining balance is composed of items priced at more recent cost. This yields results similar to those obtained under current cost accounting on the balance sheet. However, the FIFO method does not necessarily reflect the most accurate income figure as older, historical costs are being charged to cost of goods sold and matched against current revenues.

The following example illustrates the basic principles involved in the application of FIFO:

	Units available	*Units sold*	*Actual unit cost*	*Actual total cost*
Beginning inventory	100	--	$2.10	$210
Sale	--	75	--	--
Purchase	150	--	2.80	420
Sale	--	100	--	--
Purchase	50	--	3.00	150
Total	300	175		$780

Given this data, the cost of goods sold and ending inventory balance are determined as follows:

	Units	*Unit cost*	*Total cost*
Cost of goods sold	100	$2.10	$210
	75	2.80	210
	175		420
Ending inventory	50	3.00	150
	75	2.80	210
	125		360
Totals	300		$780

Notice that the total of the units in cost of goods sold and ending inventory, as well as the sum of their total costs, is equal to the goods available for sale and their respective total costs.

The FIFO method provides the same results under either the periodic or perpetual inventory tracking system.

Last-in, first-out (LIFO). The LIFO method of inventory valuation assumes that the last goods purchased are the first goods used or sold. This allows the matching of current costs with current revenues and provides the best measure of gross profit. However, unless costs remain relatively unchanged over time, the LIFO method will usually misstate the ending inventory balance sheet amount because LIFO inventory usually includes costs of acquiring or manufacturing inventory that were incurred in earlier periods. LIFO does not usually follow the physical flow of merchandise or materials. However, the matching of physical flow with cost flow is not an objective of accounting for inventories.

LIFO accounting is actually an income tax concept. Consequently, the rules regarding the application of the LIFO method are not set forth in US GAAP, but rather, are found in the US Internal Revenue Code (IRC) §472. US Treasury regulations provide that any taxpayer that maintains inventories may select LIFO application for any or all inventoriable items. This election is made with the taxpayer's income tax return on Form 970 after the close of the first tax year that the taxpayer intends to use (or expand the use of) the LIFO method. Partial adoption of LIFO is allowed for both accounting and income tax purposes.

The quantity of ending inventory on hand at the beginning of the year of election is termed the "base layer." This inventory is valued at actual (full absorption) cost, and unit cost for each inventory item is determined by dividing total cost by the quantity on hand. At the end of the initial and subsequent years, increases in the quantity of inventory on hand are referred to as increments, or LIFO layers. These increments are valued individually by applying one of the following costing methods to the quantity of inventory representing a layer:

1. The actual cost of the goods most recently purchased or produced
2. The actual cost of the goods purchased or produced in order of acquisition
3. An average unit cost of all goods purchased or produced during the current year
4. A hybrid method that more clearly reflects income (for income tax purposes, this method must meet with the approval of the IRS Commissioner)

Thus, after using the LIFO method for five years, it is possible that an enterprise could have ending inventory consisting of the base layer and five additional layers (or increments) provided that the quantity of ending inventory increased every year.

The single goods (unit) LIFO approach is illustrated in the following example:

Rose Co. is in its first year of operation and elects to use the periodic LIFO method of inventory valuation. The company sells only one product. Rose applies the LIFO method using the order of current year acquisition cost. The following data are given for years 1 through 3:

		Units			*Purchase cost*	
Year 1	*Beginning inventory*	*Purchased*	*Sold*	*Ending inventory*	*Unit cost*	*Total cost*
Purchase		200			$2.00	$400
Sale			100		--	--
Purchase		200			3.00	600
Sale			150		--	--
	--	400	250	150		

Year 2						
Purchase		300			$3.20	$960
Sale			200		--	--
Purchase		100			3.30	330
	150	400	200	350		
Year 3						
Purchase		100			$3.50	$350
Sale			200		--	--
Sale			100		--	--
	350	100	300	150		

In year 1 the following occurred:

1. The total goods available for sale were 400 units.
2. The total sales were 250 units.
3. Therefore, the ending inventory was 150 units.

The ending inventory is valued at the earliest current year acquisition cost of $2.00 per unit. Thus, ending inventory is valued at $300 (150 × $2.00).

Another way to look at this is to analyze both cost of goods sold and ending inventory.

	Units	*Unit cost*	*Total cost*
Cost of goods sold	200	$3.00	$600
	50	2.00	100
	250		$700
Ending inventory	150	2.00	$300

Note that the base-year cost is $2.00 and that the base-year level is 150 units. Therefore, if ending inventory in the subsequent period exceeds 150 units, a new layer (or increment) will be created.

Year 2	*Units*	*Unit cost*	*Total cost*	
Cost of goods sold	100	$3.30	$330	
	100	3.20	320	
	200		$650	
Ending inventory	150	2.00	$300	Base-year layer
	200	3.20	640	Year 2 increment
	350		$940	

If ending inventory exceeds 350 units in the next period, a third layer (increment) will be created.

Year 3	*Units*	*Unit cost*	*Total cost*	
Cost of goods sold	100	$3.50	$350	
	200	3.20	640	
	300		$990	
Ending inventory	150	2.00	$300	Base-year layer

Notice how the decrease (decrement) of 200 units in year 3 eliminated the entire year 2 increment. Thus, any year 4 increase in the quantity of inventory would result in a **new** increment which would be valued at year 4 prices.

In situations where the ending inventory decreases from the level established at the close of the preceding year, the enterprise experiences a decrement or LIFO liquidation. Decrements reduce or eliminate previously established LIFO layers. Once any part of a LIFO layer has been eliminated, it cannot be reinstated after year-end. For example, if in its first year after the election of LIFO an enterprise establishes a LIFO layer (increment) of ten units, then in the next year inventory decreases by four units leaving the first layer at six units, the enterprise is not permitted in any succeeding year to increase the number of units in the first year layer back up to the original ten units. The quantity in the first layer remains at a maximum of six units subject to further reduction if decrements occur in future years. Any

unit increases in future years will create one or more new layers. The effect of LIFO liquidations in periods of rising prices is to transfer, from ending inventory into cost of goods sold, costs that are below the current cost being paid. Thus, the resultant effect of a LIFO liquidation is to increase income for both accounting and income tax purposes. Because of this, LIFO is most commonly used by companies in industries in which levels of inventories are consistently maintained or increased over time.

LIFO liquidations can be either voluntary or involuntary. A voluntary liquidation occurs when an enterprise deliberately lets its inventory levels drop. Voluntary liquidations may be desirable for a number of reasons. Management might consider the current price of purchasing the goods to be too high, a smaller quantity of inventory might be needed for efficient production due to conversion to a "just-in-time" production model, or inventory items may have become obsolete due to new technology or transitions in the enterprise's product lines.

Involuntary LIFO liquidations stem from reasons beyond the control of management, such as a strike, material shortages, shipping delays, etc. Whether voluntary or involuntary, all LIFO liquidations result in a corresponding increase in income in periods of rising prices.

To determine the effect of the liquidation, management must compute the difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated. The Internal Revenue Service has ruled that this hypothetical reinstatement must be computed under the company's normal pricing procedures for valuing its LIFO increments. In the above example the effect of the year 3 LIFO liquidation would be computed as follows:

Hypothetical inventory reinstatement

200 units @ $3.50 – $3.20 = $60

Hypothetically, if there had been an increment instead of a decrement in year 3 and the year 2 inventory layer had remained intact, 200 more units (out of the 300 total units sold in year 3) would have been charged to cost of goods sold at the year 3 price of $3.50 instead of the year 2 price of $3.20. Therefore, the difference between $3.50 and the actual amount charged to cost of sales for these 200 units liquidated ($3.20) measures the effect of the liquidation.

The following is considered acceptable GAAP disclosure in the event of a LIFO liquidation:

> During 2009, inventory quantities were reduced below their levels at December 31, 2008. As a result of this reduction, LIFO inventory costs computed based on lower prior years' acquisition costs were charged to cost of goods sold. If this LIFO liquidation had not occurred and cost of sales had been computed based on the cost of 2009 purchases, cost of goods sold would have increased by approximately $xxx and net income decreased by approximately $xx or $x per share.

Applying the unit LIFO method requires a substantial amount of recordkeeping. The recordkeeping becomes more burdensome as the number of products increases. For this reason a "pooling" approach is often used to compute LIFO inventories.

Pooling is the process of grouping items which are naturally related and then treating this group as a single unit in determining LIFO cost. Because the ending inventory normally includes many items, decreases in one item can be offset by increases in others, whereas under the unit LIFO approach a decrease in any one item results in a liquidation of all or a portion of a LIFO layer.

Complexity in applying the pooling method arises from the income tax regulations. These regulations require that the opening and closing inventories of each type of good be compared. In order to be considered comparable for this purpose, inventory items must be

similar as to character, quality, and price. This qualification has generally been interpreted to mean identical. The effect of this interpretation is to require a separate pool for each item under the unit LIFO method. To provide a simpler, more practical approach to applying LIFO and allow for increased use of LIFO pools, election of the dollar-value LIFO method is permitted.

Dollar-value LIFO. Dollar-value LIFO may be elected by any taxpayer. Under the dollar-value LIFO method of inventory valuation, the cost of inventories is computed by expressing base-year costs in terms of total dollars rather than specific prices of specific units. The dollar-value method also provides an expanded interpretation of the use of LIFO pools. Increments and decrements are treated the same as under the unit LIFO approach but are reflected only in terms of a *net* increment or liquidation for the entire pool.

Identifying pools. Three alternatives exist for determining pools under dollar-value LIFO: (1) the natural business unit method, (2) the multiple pooling method, and (3) pools for wholesalers, retailers, jobbers, etc.

The natural business unit is defined by the existence of separate and distinct processing facilities and operations and the maintenance of separate income (loss) records. The concept of the natural business unit is generally dependent upon the type of product being produced, not the various stages of production for that product. Thus, the pool of a manufacturer can (and will) contain raw materials, WIP, and finished goods. The three examples below, adapted from the treasury regulations, illustrate the application of the natural business unit concept.

Example 1

A corporation manufactures, in one division, automatic clothes washers and dryers of both commercial and domestic grade as well as electric ranges and dishwashers. The corporation manufactures, in another division, radios and television sets. The manufacturing facilities and processes used in manufacturing the radios and television sets are distinct from those used in manufacturing the automatic clothes washers, etc. Under these circumstances, an enterprise consisting of two business units and two pools would be appropriate: one consisting of all of the LIFO inventories involved with the manufacture of clothes washers and dryers, electric ranges and dishwashers and the other consisting of all the LIFO inventories involved with the production of radios and television sets.

Example 2

A taxpayer produces plastics in one of its plants. Substantial amounts of the production are sold as plastics. The remainder of the production is shipped to a second plant of the taxpayer for the production of plastic toys which are sold to customers. The taxpayer operates its plastics plant and toy plant as separate divisions. Because of the different product lines and the separate divisions, the taxpayer has two natural business units.

Example 3

A taxpayer is engaged in the manufacture of paper. At one stage of processing, uncoated paper is produced. Substantial amounts of uncoated paper are sold at this stage of processing. The remainder of the uncoated paper is transferred to the taxpayer's finishing mill where coated paper is produced and sold. This taxpayer has only one natural business unit since coated and uncoated paper are within the same product line.

The treasury regulations require that a pool consist of all items entering into the entire inventory investment of a natural business unit, unless the taxpayer elects to use the multiple-pooling method.

The multiple-pooling method is the grouping of "substantially similar" items. In determining substantially similar items, consideration is given to the processing applied, the interchangeability, the similarity of use, and the customary practice of the industry. While the

election of multiple pools will necessitate additional recordkeeping, it may result in a better estimation of gross profit and periodic net income.

According to Reg. §1.472-8(c), inventory items of wholesalers, retailers, jobbers, and distributors are to be assigned to pools by major lines, types, or classes of goods. The natural business unit method may be used with permission of the Commissioner.

All three methods of pooling allow for a change in the components of inventory over time. New items which properly fall within the pool may be added, and old items may disappear from the pool, but neither will necessarily cause a change in the total dollar value of the pool.

Computing dollar-value LIFO. The purpose of the dollar-value LIFO method of valuing inventory is to convert inventory priced at end-of-year prices to that same quantity of inventory priced at base-year (or applicable LIFO layer) prices. The dollar-value method achieves this result through the use of a conversion price index. The inventory computed at current year cost is divided by the appropriate index to arrive at its base-year cost. The main computational focus is on the determination of the conversion price index. There are four types of methods that can be used in the computation of the ending inventory amount of a dollar-value LIFO pool: (1) double-extension, (2) link-chain, (3) indexing, and (4) alternative LIFO for automobile dealers.

Double-extension method. This method was originally developed to compute the conversion price index. It involves extending the entire quantity of ending inventory for the current year at both base-year prices and end-of-year prices to arrive at a total dollar value for each, hence the title "double-extension." The dollar total computed at end-of-year prices is then divided by the dollar total computed at base-year prices to arrive at the index, usually referred to as the conversion price index. This index indicates the relationship between the base-year and current prices in terms of a percentage. Each layer (or increment) is valued at its own percentage. Although a representative sample is allowed (meaning that not all of the items need to be double-extended; this is discussed in more detail under indexing), the recordkeeping under this method is very burdensome. The base-year price must be maintained for each inventory item. Depending upon the number of different items included in the inventory of the enterprise, the necessary records may be too detailed to keep past the first year or two.

The following example illustrates the double-extension method of computing the LIFO value of inventory. The example presented is relatively simple and does not attempt to incorporate all of the complexities of LIFO inventory accounting.

Example

Isaacson, Inc. uses the dollar-value method of LIFO inventory valuation and computes its price index using the double-extension method. Isaacson has a single pool which contains two inventory items, A and B. Year 1 is the company's initial year of operations. The following information is given for years 1 through 4:

	Ending inventory	*Ending quantity (units) and current unit price*			
		A		*B*	
Year	*current prices*				
1	$100,000	5,000	$6.00	7,000	$10.00
2	120,300	6,000	6.30	7,500	11.00
3	122,220	5,800	6.40	7,400	11.50
4	133,900	6,200	6.50	7,800	12.00

In year 1 there is no computation of an index; the index is 100%. The LIFO cost is the same as the actual current year cost. This is the base year.

In year 2 the first step is to double-extend the quantity of ending inventory at base-year and current year costs.

Item	*Quantity*	*Base-year cost/unit*	*Extended*	*Current year cost/unit*	*Extended*
A	6,000	$ 6.00	$ 36,000	$ 6.30	$ 37,800
B	7,500	10.00	75,000	11.00	82,500
			$111,000		$ 120,300*

* *When using the double-extension method and extending **all** of the inventory items to arrive at the index, this number must equal the ending inventory at current prices. If a sampling method is used (as discussed under indexing), this number **divided by** your ending inventory at current prices is the percentage sampled.*

Now we can compute the conversion price index which is

$$\frac{\text{Ending inventory at current year prices}}{\text{Ending inventory at base-year prices}}$$

In this case $\frac{120,300}{111,000}$ = 108.4% (rounded)

Next, compute the year 2 layer at base-year cost by taking the current year-ending inventory at base-year prices (if you only extend a sample of the inventory, this number is arrived at by dividing the ending inventory at current year prices by the conversion price index) of $111,000 and subtracting the base-year cost of $100,000. In year 2 we have an increment (layer) of $11,000 valued at base-year costs.

The year 2 layer of $11,000 at base-year cost must be converted so that the layer is valued at the prices in effect when it came into existence (i.e., at year 2 prices). This is done by multiplying the increment at base-year cost ($11,000) by the rounded conversion price index (1.084). The result is the year 2 layer at LIFO prices.

Base-year layer	$100,000
Year 2 layer ($11,000 × 1.084)	11,924
	$111,924

In year 3 the same basic procedure is followed.

Item	*Quantity*	*Base-year cost/unit*	*Extended*	*Current year cost/unit*	*Extended*
A	5,800	$ 6.00	$ 34,800	$ 6.40	$ 37,120
B	7,400	10.00	74,000	11.50	85,100
			$108,800		$122,220

There has been a decrease in the base-year cost of the ending inventory ($111,000 –$108,800 = $2,200) which is referred to as a decrement. A decrement results in the decrease (or elimination) of previously provided layers. In this situation, the computation of the index is not necessary as there is no LIFO layer that requires a valuation. If a sampling approach has been used, the index is needed to arrive at the ending inventory at base-year cost and thus determine if there has been an increment or decrement.

Now the ending inventory at base-year cost is $108,800. The base-year cost layer is still intact at $100,000, so the cumulative increment is $8,800. Since this is less than the $11,000 increment of year 2, no additional increment is established in year 3. The LIFO cost of the inventory is shown below.

Base-year layer	$100,000
Year 2 layer ($8,800 × 1.084)	9,539
	$109,539

The fourth year then follows the same steps.

Items	*Quantity*	*Base-year cost/unit*	*Extended*	*Current year cost/unit*	*Extended*
A	6,200	$ 6.00	$ 37,200	$ 6.50	$ 40,300
B	7,800	10.00	78,000	12.00	93,600
			$115,200		$133,900

The conversion price index is 116.2% (133,900/115,200).

A current year increment exists because the ending inventory at base-year prices in year 4 of $115,200 exceeds the year 3 number of $108,800. The current year increment of $6,400 must be valued at year 4 prices. Thus, the LIFO cost of the year 4 inventory is

Base-year layer	$100,000
Year 2 layer ($8,800 × 1.084)	9,539
Year 4 layer ($6,400 × 1.162)	7,437
	$116,976

It is important to point out that once a layer is reduced or eliminated it is never reinstated (as with the year-2 increment) after year-end.

Link-chain method. Since the double-extension method computations are arduous even if only a few items exist in the inventory, consider the complexity that arises when there is a constant change in the inventory mix or when there is a large number of inventory items. The link-chain method of applying dollar-value LIFO was developed to mitigate the effects of this complexity.

Consider the situation where the components of inventory are constantly changing. The regulations require that any new products added to the inventory be recorded at base-year prices. If these are not available, then the earliest cost available after the base year is used. If the item was not in existence in the base year, the taxpayer may reconstruct the base cost, using a reasonable method to determine what the cost would have been if the item had been in existence in the base year. Finally, as a last resort, the current year purchase price can be used. While this does not appear to be a problem on the surface, imagine a base period which is twenty-five to fifty years in the past. The difficulty involved with finding the base-year cost may require using a more current cost, thus eliminating some of the LIFO benefit. Imagine a situation faced by a company in a "hi-tech" industry where inventory is continually being replaced by newer, more advanced products. The effect of this rapid change under the double-extension method (because the new products did not exist in the base period) is to use current prices as base-year costs. When inventory has such a rapid turnover, the overall LIFO advantage becomes diluted as current and base-year costs are often identical. This situation necessitated the development of the link-chain method.

The link-chain method was originally developed for (and limited to) those companies that wanted to use LIFO but, because of a substantial change in product lines over time, were unable to reconstruct or maintain the historical records necessary to make accurate use of the double extension method. It is important to note that the double-extension and link-chain methods are not elective alternatives for the same situation. For income tax purposes, the link-chain election requires that substantial changes in product lines be evident over the years, and may not be elected solely because of its ease of application. The double-extension and index methods must be demonstrably impractical in order to elect the link-chain method. However, an enterprise may use different computational techniques for financial reporting and income tax purposes. Therefore, the link-chain method could be used for financial reporting purposes even if a different application is used for income tax purposes. Obviously, the recordkeeping burdens imposed by using different LIFO methods for GAAP and income tax purposes (including the deferred income tax accounting that would be required for the temporary difference between the GAAP and income tax bases of the LIFO inventories) would make this a highly unlikely scenario.

The link-chain method is the process of developing a single cumulative index which is applied to the ending inventory amount priced using beginning-of-the-year costs. Thus, the index computed at the end of each year is "linked" to the index from all previous years. A separate cumulative index is used for each pool regardless of the variations in the components of these pools over the years. Technological change is accommodated by the method used to calculate each current year's index. The index is calculated by double-extending a

representative sample of items in the pool at both beginning-of-year prices and end-of-year prices. This annual index is then applied to (multiplied by) the previous period's cumulative index to arrive at the new current year cumulative index.

An example of the link-chain method is shown below. The end-of-year costs and inventory quantities used are the same as those used in the double-extension example.

Assume the following inventory data for years 1-4 for Dickler Distributors, Inc. Year 1 is assumed to be the initial year of operation for the company. The LIFO method is elected on the first income tax return. Assume that A and B constitute a single pool.

	Ending inventory	*Cost per unit*		*Extension*	
Product	*quantity*	*Beg. of yr.*	*End of yr.*	*Beginning*	*End*
Year 1					
A	5,000	N/A	$ 6.00	N/A	$ 30,000
B	7,000	N/A	10.00	N/A	70,000
					$100,000
Year 2					
A	6,000	$ 6.00	6.30	$ 36,000	$ 37,800
B	7,500	10.00	11.00	75,000	82,500
				$111,000	$120,300
Year 3					
A	5,800	6.30	6.40	$ 36,540	$ 37,120
B	7,400	11.00	11.50	81,400	85,100
				$117,940	$122,220
Year 4					
A	6,200	6.40	6.50	$ 39,680	$ 40,300
B	7,800	11.50	12.00	89,700	93,600
				$129,380	$133,900

The initial year (base year) does not require the computation of an index under any LIFO method. The base-year index will always be 1.00.

Thus, the base-year inventory layer is $100,000 (the end-of-year inventory stated at base-year cost). The second year requires the first index computation. Notice that in year 2 our extended totals are

Product	*Beginning-of-year prices*	*End-of-year prices*
A	$ 6,000	$ 37,800
B	75,000	82,500
	$ 111,000	$ 120,300

The year 2 index is 1.084 (120,300/111,000). This is the same as computed under the double-extension method because the beginning-of-the-year prices reflect the base-year price. This will not always be the case, as sometimes new items may be added to the pool, causing a change in the index. Thus, the cumulative index is the 1.084 current year index multiplied by the preceding year index of 1.00 to arrive at a link-chain index of 1.084.

This index is then used to restate the inventory to base-year cost by dividing the inventory at end-of-year prices by the cumulative index: $120,300/1.084 = $111,000. The determination of the LIFO increment or decrement is then basically the same as the double-extension method. In year 2 the increment (layer) at base-year cost is $11,000 ($111,000 – 100,000). This layer must be valued at the prices effective when the layer was created, or extended at the cumulative index for that year. This results in an ending inventory at LIFO cost of

	Base-year cost	*Index*	*LIFO cost*
Base-year layer	$100,000	1.000	$100,000
Year 2 layer	11,000	1.084	11,924
	$111,000		$111,924

The index for year 3 is computed as follows:

	Beginning-of-year prices	End-of-year prices
A	$ 36,540	$ 37,120
B	81,400	85,100
	$117,940	$122,220

122,220/117,940 = 1.036

The next step is to determine the cumulative index which is the product of the preceding year's cumulative index and the current year index, or 1.123 (1.084 × 1.036). The new cumulative index is used to restate the inventory at end-of-year dollars to base-year cost. This is accomplished by dividing the end-of-year inventory by the new cumulative index. Thus, current inventory at base-year cost is $108,833 ($122,220 ÷ 1.123). In this instance we have experienced a decrement (a decrease from the prior year's $111,000). The determination of ending inventory is

	Base-year cost	Index	LIFO cost
Base-year layer	$100,000	1.000	$100,000
Year 2 layer	8,833	1.084	9,575
Year 3 layer	--	1.123	--
	$108,833		$109,575

Finally, the same steps are performed for the year 4 computation. The current year index is 1.035 (133,900/129,380). The new cumulative index is 1.162 (1.035 × 1.123). The base-year cost of the current inventory is $115,232 (133,900/1.162). Thus, LIFO inventory at the end of year 4 is

	Base-year cost	Index	LIFO cost
Base-year layer	$100,000	1.000	$100,000
Year 2 layer	8,833	1.084	9,575
Year 3 layer	--	1.123	--
Year 4 layer	6,399	1.162	7,435
	$115,232		$117,010

Notice how even though the numbers used were the same as those used in the double-extension example, the results were different (year 4 inventory under double-extension was $116,976), however, not by a significant amount. It is much easier to keep track of beginning-of-the-year prices than base-year prices, but perhaps more importantly, it is easier to establish beginning-of-the-year prices for new items than to establish their base-year price. This latter reason is why the link-chain method is so much more desirable than the double-extension method. However, before electing or applying this method, a company must be able to establish a sufficient need as defined in the treasury regulations.

Indexing methods. Indexing methods can basically be broken down into two types: (1) an internal index and (2) an external index.

The internal index is merely a variation of the double-extension method. The regulations allow for the use of a statistically valid representative sample of the inventory to be double-extended. The index computed from the sample is then used to restate the inventory to base-year cost and to value the new layer.

The external index method, referred to in treasury regulations as the Inventory Price Index Computation (IPIC) Method, involves using indices published by the US Department of Labor's Bureau of Labor Statistics (BLS)[1] and applying them to specified categories of inventory included in the taxpayer's LIFO pools.

Alternative LIFO method for automobile dealers. Beginning in 1992, a simplified dollar-value method became available for use by retail automobile dealers for valuing inventory of new automobiles and light-duty trucks. The use of this method and its acceptance for income tax purposes is conditioned on the application of several LIFO submethods, definitions and special rules. The reader is referred to Rev. Proc. 92-79 for a further discussion of this method.

LIFO accounting literature. GAAP for the application of LIFO has been based upon income tax rules rather than on financial accounting pronouncements. LIFO is cited in GAAP as an acceptable inventory method but specific rules regarding its implementation are not provided. The income tax regulations, as discussed below, do provide specific rules for the implementation of LIFO and require financial statement conformity. For this reason, income tax rules have essentially defined the financial accounting treatment of LIFO inventories. In recognition of the lack of authoritative accounting guidelines in the implementation of LIFO, the AICPA's Accounting Standards Division formed a task force on LIFO inventory problems to prepare an Issues Paper on this topic. "Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories," issued in 1984, identifies financial accounting issues resulting from the use of LIFO and includes advisory guidance on resolving them. Issues Papers, however, do not establish authoritative standards of financial accounting. The guidance provided by the task force is described below.

1. **Specific goods vs. dollar-value.** Either the specific goods approach or dollar-value approach to LIFO is acceptable for financial reporting. Disclosure of whether the specific goods or dollar-value approach is used is not required.
2. **Pricing current year purchases.** Three approaches to pricing LIFO inventory increments are available under income tax regulations—earliest acquisition price, latest acquisition price, and average acquisition price. The earliest acquisition price approach is the most compatible with financial reporting objectives, but all three are acceptable for financial reporting.
3. **Quantity to use to determine price.** The price used to determine the inventory increment should be based on the cost of the quantity or dollars of the increment rather than on the cost of the quantity or dollars equal to the ending inventory. Disclosure of which approach is used is not required.
4. **Disclosure of LIFO reserve or replacement cost.** The LIFO reserve or replacement cost and its basis for determination should be disclosed for financial reporting.
5. **Partial adoption of LIFO.** If a company changes to LIFO, it should do so for all of its inventories. Partial adoption should only be allowed if there exists a valid business reason for not fully adopting LIFO. A planned gradual adoption of LIFO over several time periods is considered acceptable if valid business reasons exist (lessening the income statement effect of adoption in any one year is not a valid business reason). Where partial adoption of LIFO has been justified, the extent to which LIFO has been adopted should be disclosed. This can be disclosed by indicating either the portion of the ending inventory priced on LIFO or the portion of cost of sales resulting from LIFO inventories.
6. **Methods of pooling.** An entity should have valid business reasons for establishing its LIFO pools. Additionally, the existence of a separate legal entity that has no economic substance is not reason enough to justify separate pools. Disclosure of details regarding an entity's pooling arrangements is not required.
7. **New items entering a pool.** New items should be added to a pool based on what the items would have cost had they been acquired in the base period (reconstructed cost) rather than based on their current cost. The reconstructed cost should be determined based on the most objective sources available including published vendor price lists, vendor quotes, and general industry indexes. Where necessary, the use of a substitute base year in making the LIFO computation is acceptable. Disclosure of the way that new items are priced is not required.

8. **Dollar-value index.** The required index can be developed using two possible approaches, the unit cost method or the cost component method. The unit cost method measures changes in the index based on the weighted-average increase or decrease in the unit costs of raw materials, work in process, and finished goods inventory. The cost component method, on the other hand, measures changes in the index by the weighted-average increase or decrease in the component costs of material, labor, and overhead that make up ending inventory. Either of these methods is acceptable.
9. **LIFO liquidations.** The effects on income of LIFO inventory liquidations should be disclosed in the notes to the financial statements. A replacement reserve for the liquidation should not be provided. When an involuntary LIFO liquidation occurs, the effect on income of the liquidation should not be deferred.

   When a LIFO liquidation occurs, there are three possible ways to measure its effect on income.

   a. The difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated under the entity's normal pricing procedure
   b. The difference between actual cost of sales and what cost of sales would have been had the inventory been reinstated at year-end replacement cost
   c. The amount of the LIFO reserve at the beginning of the year which was credited to income (excluding the increase in the reserve due to current year price changes)

   The first method is considered preferable. Disclosure of the effect of the liquidation should give effect only to pools with decrements (i.e., there should be no netting of pools with decrements against other pools with increments).
10. **Lower of cost or market.** The most reasonable approach to applying the lower of cost or market rules to LIFO inventory is to base the determination on groups of inventory rather than on an item-by-item approach. A pool constitutes a reasonable grouping for this purpose. An item-by-item approach is permitted by authoritative accounting literature, particularly for obsolete or discontinued items.

    For companies with more than one LIFO pool, it is permissible to aggregate the pools in applying the lower of cost or market test if the pools are similar. Where the pools are significantly dissimilar, aggregating the pools is not appropriate.

    Previous write-downs to market value of the cost of LIFO inventories should be reversed after a company disposes of the physical units of the inventory for which reserves were provided. The reserves at the end of the year should be based on a new computation of cost or market.
11. **LIFO conformity and supplemental disclosures.** A company may present supplemental non-LIFO disclosures within the historical cost framework. If nondiscretionary variable expenses (i.e., profit sharing based on earnings) would have been different based on the supplemental information, then the company should give effect to such changes. Additionally, the supplemental disclosure should reflect the same type of income tax effects as required by generally accepted accounting principles in the primary financial statements.

    A company may use different LIFO applications for financial reporting than it uses for income tax purposes. Any such differences should be accounted for as temporary differences with the exception of differences in the allocation of cost to inventory in a business combination. Any differences between LIFO applications used for financial reporting and those used for income tax purposes need not be disclosed beyond the requirements of ASC 740.

12. **Interim reporting and LIFO.** The Task Force's conclusions on interim reporting of LIFO inventory are discussed in Chapter 21.
13. **Different financial and income tax years.** A company with different fiscal year-ends for financial reporting and income tax reporting should make a separate LIFO calculation for financial purposes using its financial reporting year as a discrete period for that calculation.
14. **Business combinations accounted for by the purchase method.** Inventory acquired in a business combination accounted for by the purchase method will be recorded at fair value at the date of the combination. The acquired company may be able to carry over its prior basis for that inventory for income tax purposes, causing a difference between GAAP and income tax basis. An adjustment should be made to the fair value of the inventory only if it is reasonably estimated to be liquidated in the future. The adjustment would be for the income tax effect of the difference between income tax and GAAP basis.

    Inventory acquired in such a combination should be considered the LIFO base inventory if the inventory is treated by the company as a separate business unit or a separate LIFO pool. If instead the acquired inventory is combined into an existing pool, then the acquired inventory should be considered as part of the current year's purchases.
15. **Changes in LIFO applications.** A change in a LIFO application is a change in accounting principle. LIFO applications refer to the approach (i.e., dollar value or specific goods), computational technique, or the numbers or contents of the pools.

ASC 810-10-55 provides guidance for intercompany transfers. The focus of this section is the LIFO liquidation effect caused by transferring inventories which in turn create intercompany profits. This liquidation can occur when (1) two components of the same taxable entity transfer inventory, for example, when a LIFO method component transfers inventory to a non-LIFO component, or (2) when two separate taxable entities that consolidate transfer inventory, even though both use the LIFO method.

This LIFO liquidation creates profit which must be eliminated along with other intercompany profits.

LIFO income tax rules and restrictions. As discussed previously, most of the rules and regulations governing LIFO originate in the US Internal Revenue Code and the related regulations, revenue rules, revenue procedures, and judicial decisions. Taxpayers electing to use the LIFO inventory method are subject to myriad rules and restrictions such as

1. The inventory is to be valued at cost regardless of market value (i.e., application of the lower of cost or market rule is not allowed).
2. Changes in the LIFO reserve can potentially cause the taxpayer to be subject to alternative minimum tax (AMT) or increase the amount of AMT.
3. Corporations that use the LIFO method whose stockholders subsequently elect to be taxed as an "S" Corporation are required to report as income their entire LIFO reserve resulting in a special tax under IRC §1363(d) that is payable in four annual installments. The "S" Corporation is, however, permitted to retain LIFO as its inventory accounting method after the election.
4. Once elected, the LIFO method must continue to be used consistently in future periods. A taxpayer is permitted, subject to certain restrictions, to revoke its LIFO election in accordance with Rev. Proc. 99-49. After revocation however, the taxpayer is precluded from reelecting LIFO for a period of five taxable years beginning with the year of the change. For GAAP purposes, a change to or from the LIFO method is accounted for as a change in accounting principle under ASC 250 (see Chapter 5).

A unique rule regarding LIFO inventories is referred to as the LIFO Conformity Rule. A taxpayer may not use a different inventory method in reporting profit or loss of the entity for external financial reports. Thus, if LIFO is elected for income tax purposes, it must also be used for accounting purposes.

Treasury regulations permit certain exceptions to this general rule. Among the exceptions allowable under the regulations are the following:

1. The use of an inventory method other than LIFO in presenting information reported as a supplement to or explanation of the taxpayer's primary presentation of income in financial reports to outside parties. [Reg. §1.472-2(e)(1)(i)]
2. The use of an inventory method other than LIFO to determine the value of the taxpayer's inventory for purposes of reporting the value of such inventory as an asset on the balance sheet. [Reg. §1.472-2(e)(1)(ii)]
3. The use of an inventory method other than LIFO for purposes of determining information reported in internal management reports. (Reg. §1.472-2[e][1][iii])
4. The use of an inventory method other than LIFO for financial reports covering a period of less than one year. (Reg. §1.472- 2[e][1][iv])
5. The use of lower of LIFO cost or market to value inventories for financial statements while using LIFO cost for income tax purposes. (Reg. §1.472-2[e][1][v])
6. For inventories acquired by a corporation in exchange for issuing stock to a stockholder that, immediately after the exchange is considered to have control (a section 351 transaction), the use of the transferor's acquisition dates and costs for GAAP while using redetermined LIFO layers for tax purposes. (Reg. §1.472-2[e][1][vii)]
7. The inclusion of certain costs (under full absorption) in inventory for income tax purposes, as required by regulations, while not including those same costs in inventory under GAAP (full absorption). (Reg. §1.472-2[e][8][i])
8. The use of different methods of establishing pools for GAAP purposes and income tax purposes. (Reg. §1.472-2[e][8][ii])
9. The use of different determinations of the time sales or purchases are accrued for GAAP purposes and tax purposes. (Reg. §1.472-2[e][8][xii])
10. In the case of a business combination, the use of different methods to allocate basis for GAAP purposes and income tax purposes. (Reg. §1.472-29[e][8][xiii])

Another important consideration in applying the LIFO conformity rule is the law concerning related corporations. In accordance with the Tax Reform Act of 1984, all members of the same group of financially related corporations are treated as a single taxpayer when applying the conformity rule. Previously, taxpayers were able to circumvent the conformity rule by having a subsidiary on LIFO, while the non-LIFO parent presented combined non-LIFO financial statements. This is a violation of the conformity requirement [Sec. 472(g)].

Weighted-average and moving-average. Another method of inventory valuation involves averaging and is commonly referred to as the weighted-average method. This method is permitted for financial reporting purposes but is not permitted for income tax purposes (Rev. Ruling 71-234).

Under this method the cost of goods available for sale (beginning inventory plus net purchases) is divided by the number of units available for sale to obtain a weighted-average cost per unit. Ending inventory and cost of goods sold are then priced at this average cost. As an example, assume the following data:

	Units available	*Units sold*	*Actual unit cost*	*Actual total cost*
Beginning inventory	100	--	$2.10	$210
Sale	--	75	--	--
Purchase	150	--	2.80	420
Sale	--	100	--	--
Purchase	50	--	3.00	150
Total	300	175		$780

The weighted-average cost per unit is $780/300, or $2.60. Ending inventory is 125 units (300 – 175) at $2.60, or $325; cost of goods sold is 175 units at $2.60, or $455.

When the weighted-average assumption is applied using a perpetual inventory system, the average cost is recomputed after each purchase. This process is referred to as a moving average. Cost of goods sold is recorded using the most recent average. This combination is called the moving-average method and is applied below to the same data used in the weighted-average example above.

	Units on hand	*Purchases in dollars*	*Cost of sales in dollars*	*Inventory total cost*	*Inventory moving-average unit cost*
Beginning inventory	100	$ --	$ --	$210.00	$2.10
Sale (75 units @ $2.10)	25	--	157.50	52.50	2.10
Purchase (150 units, $420)	175	420.00	--	472.50	2.70
Sale (100 units @ $2.70)	75	--	270.00	202.50	2.70
Purchase (50 units, $150)	125	150.00	--	352.50	2.82

Cost of goods sold is 75 units at $2.10 and 100 units at $2.70, or $427.50.

Comparison of cost flow assumptions. Of the three cost flow assumptions, FIFO and LIFO produce the most extreme results, while results from using the weighted-average method generally fall somewhere in between. The selection of one of these methods involves a detailed analysis of the organization's objectives, industry practices, current and expected future economic conditions, and most importantly, the needs of the intended users of the financial statements.

The following table compares the relative effects of using FIFO and LIFO cost assumptions on the balance sheet and statement of income under differing economic conditions:

Changes in	*Relative effect on balance sheet*		*Relative effect on statement of income*	
price levels	*FIFO*	*LIFO*	*FIFO*	*LIFO*
Inflation (i.e., rising prices)	Higher inventory carrying value	Lower inventory carrying value	Lower cost of sales; higher gross profit and net income	Higher cost of sales; lower gross profit and net income
Deflation (i.e., falling prices)	Lower inventory carrying value	Higher inventory carrying value	Higher cost of sales; lower gross profit and net income	Lower cost of sales; higher gross profit and net income

In periods of rising prices the LIFO method is generally thought to best fulfill the objective of providing the clearest measure of periodic net income. It does not, however, provide an accurate estimate of inventory cost in an inflationary environment. However, this shortcoming can usually be overcome by providing additional disclosures in the notes to the financial statements. In periods of rising prices a prudent business should use the LIFO method because it will result in a decrease in the current income tax liability when compared to other alternatives. In a deflationary period, the opposite is true.

FIFO is a balance-sheet-oriented costing method. It gives the most accurate estimate of the current cost of inventory during periods of changing prices. In periods of rising prices, the FIFO method will result in higher income taxes than the other alternatives, while in a deflationary period FIFO provides for a lesser income tax burden. However, a major advantage of the FIFO method is that it is not subject to all of the complex regulations and requirements of the income tax code that govern the use of LIFO.

The average methods do not provide an estimate of current cost information on either the balance sheet or income statement. The average methods are not permitted to be used for income tax purposes and therefore, their use for financial reporting purposes would necessitate the use of FIFO for income tax reporting purposes since LIFO requires financial statement conformity.

Although price trends and underlying objectives are important to consider in selecting a cost flow assumption, other considerations are the risk of experiencing unintended liquidations of LIFO layers, as well as the effects of the chosen method on cash flow, capital maintenance, collateral requirements, and restrictive covenants imposed by lenders, etc.

It should be noted that there is some question about the future of LIFO for inventory costing purposes. Few have ever defended LIFO as a realistic cost flow assumption, and without the LIFO conformity rule imposed under US tax law, most accountants would have supported another method of costing, probably FIFO, as being more representationally faithful for financial reporting purposes. Under International Financial Reporting Standards, LIFO is not permitted. Now that FASB and IASB are formally committed to converge their respective financial reporting standards, there will be pressure on FASB to derecognize LIFO as appropriate for financial reporting purposes. The logical strategy would be to seek repeal of the LIFO conformity rule, thereby permitting LIFO for tax purposes without forcing the financial statements to report under a costing method that does not describe real economic events. To date, there has been little discussion of this issue, which would appear to be an impediment to full convergence of the standards.

Lower of cost or market (LCM). As stated in ASC 330-10-20

> *...as used in the phrase lower of cost or market, the term market means current replacement cost, provided that it meets both the following conditions: a) market shall not exceed the net realizable value, and b) market shall not be less than net realizable value reduced by an allowance for an approximately normal profit margin.*

Inventory can lose value for a variety of reasons including damage, spoilage, obsolescence, changes in market prices, etc. The application of LCM is a means of attempting to measure loss of value and recognize the effects in the period in which this occurs.

The term "market" means current replacement cost not to exceed a ceiling of net realizable value (selling price less reasonably estimable costs of completion and disposal) or be less than a floor of net realizable value adjusted for a normal profit margin.

LCM is not applied in conjunction with the LIFO method of inventory valuation for income tax purposes. However, it is important to note that LCM/LIFO is applied for financial reporting purposes. Such application gives rise to a temporary difference in the carrying value of inventory between financial statements and income tax returns. LCM/LIFO for financial reporting was discussed earlier in this chapter.

LCM may be applied to either the entire inventory or to each individual inventory item. The primary objective for selecting between the alternative methods of applying the LCM rule is to select the one which most clearly reflects periodic income. The rule is most commonly applied to the inventory on an item-by-item basis. The reason for this application is twofold.

1. It is required by income tax purposes unless it involves practical difficulties, and
2. It provides the most conservative valuation of inventories, because decreases in the value of one item are not offset by increases in the value of another.

The application of these principles is illustrated in this example. Assume the following information for products A, B, C, D, and E:

Item	*Cost*	*Replacement cost*	*Est. selling price*	*Cost to complete*	*Normal profit percentage*	*Normal profit amount*
A	$2.00	$1.80	$ 2.50	$0.50	24%	$0.60
B	4.00	1.60	4.00	0.80	24%	0.96
C	6.00	6.60	10.00	1.00	18%	1.80
D	5.00	4.75	6.00	2.00	20%	1.20
E	1.00	1.05	1.20	0.25	12.5%	0.15

First, determine the market value and then compare this to historical cost. Market value is equal to the replacement cost, but cannot exceed the net realizable value (NRV) nor be below net realizable value less the normal profit percentage.

Market Determination

Item	*Cost*	*Replacement cost*	*NRV (ceiling)*	*NRV less profit (floor)*	*Market*	*LCM*
A	$2.00	$1.80	$2.00	$1.40	$1.80	$1.80
B	4.00	1.60	3.20	2.24	2.24	2.24
C	6.00	6.60	9.00	7.20	7.20	6.00
D	5.00	4.75	4.00	2.80	4.00	4.00
E	1.00	1.05	0.95	0.80	0.95	0.95

NRV (ceiling) equals selling price less costs of completion (e.g., item A: $2.50 – .50 = $2.00). NRV less profit (floor) is self-descriptive (e.g., item A: $2.50 – .50 –.60 = $1.40). Market is replacement cost unless lower than the floor or higher than the ceiling. Note that market must be designated before LCM is determined. Finally, LCM is the lower of cost or market value.

Replacement cost is a valid measure of the future utility of the inventory item since increases or decreases in the enterprise's purchase price generally foreshadow related increases or decreases in the price at which it is able to sell the item. The ceiling and the floor provide safeguards against the recognition of either excessive profits or excessive losses in future periods in those instances where the selling price and replacement cost do not move in the same direction in a proportional manner. The ceiling avoids the recognition of additional losses in the future when the selling price is falling faster than replacement cost. Without the ceiling constraint, inventories would be carried at an amount in excess of their net realizable value. The floor avoids the recognition of abnormal profits in the future when replacement cost is falling faster than the selling price. Without the floor, inventories would be carried at a value less than their net realizable value minus a normal profit.

The loss from writing inventories down to LCM is generally reflected on the income statement in cost of goods sold. If material, the loss must be separately captioned in the income statement. While GAAP is not explicit as to presentation, it would appear that this adjustment could either be displayed as a separately identified charge within cost of goods sold, or as an administrative expense. The write-down is recorded as a debit to a loss account and a credit either to an inventory or a valuation allowance account.

Inventory estimation methods. There are instances in which an accountant must estimate the value of inventories without an actual physical count. Some of the estimation methods used to accomplish this are the retail method, the LIFO retail method, and the gross profit method. These methods are not cost flow assumptions like LIFO and FIFO but rather, they are computational methods that have been devised to assist in estimating inventory cost under the relevant cost flow assumption.

Retail method. The retail method is used by retailers to estimate the cost of their ending inventory. The retailer can either take a physical inventory at retail prices or estimate ending retail inventory and then use a computed cost-to-retail ratio to convert the ending inventory priced at retail to its estimated cost. This method eliminates the process of going back to original vendor invoices or other documents in order to determine the original cost for each inventoriable item. The retail method can be used under any of the three cost flow assump-

tions discussed earlier: FIFO, LIFO, or average cost. As with ordinary FIFO or average cost, the LCM rule is also applied when either one of these two cost assumptions is used in conjunction with the retail method.

The key to applying the retail method is determining the cost-to-retail ratio. The calculation of this ratio varies depending upon the cost flow assumption selected. The cost-to-retail ratio provides a measure of the relationship between the cost of goods available for sale and the retail price of these same goods. This ratio is used to convert the ending retail inventory back to cost. The computation of the cost-to-retail ratio for the FIFO and average cost methods is described below. The use of the LIFO cost flow assumption with this method is discussed in the succeeding section.

1. **FIFO cost**—The FIFO method assumes that the ending inventory is made up of the latest purchases. Therefore, beginning inventory is excluded from the computation of the cost-to-retail ratio, and the computation uses the cost of current year net purchases divided by their retail value adjusted for both net markups and net markdowns as will be further explained and illustrated.
2. **FIFO (LCM)**—The computation is basically the same as FIFO cost except that markdowns are excluded from the computation of the cost-to-retail ratio.
3. **Average cost**—Average cost assumes that ending inventory consists of all goods available for sale. Therefore, the cost-to-retail ratio is computed by dividing the cost of goods available for sale (Beginning inventory + Net purchases) by the retail value of these goods adjusted for both net markups and net markdowns.
4. **Average cost (LCM)**—Is computed in the same manner as average cost except that markdowns are excluded from the calculation of the cost-to-retail ratio.

A simple example illustrates the computation of the cost-to-retail ratio under both the FIFO cost and average cost methods in a situation where no markups or markdowns exist.

	FIFO cost		*Average cost*	
	Cost	*Retail*	*Cost*	*Retail*
Beginning inventory	$100,000	$ 200,000	$100,000	$ 200,000
Net purchases	500,000 (a)	800,000 (b)	500,000	800,000
Total goods available for sale	$600,000	1,000,000	$600,000 (c)	1,000,000 (d)
Sales at retail		(800,000)		(800,000)
Ending inventory—retail		$ 200,000		$ 200,000
Cost-to-retail ratio	(a) 500,000 / (b) 800,000 =	62.5%	(c) 600,000 / (d) 1,000,000 =	60%
Ending inventory—cost				
200,000 × 62.5%		$ 125,000		
200,000 × 60%				$ 120,000

Note that the only difference in the two examples is the numbers used to calculate the cost-to-retail ratio.

The lower of cost or market aspect of the retail method is a result of the treatment of net markups and net markdowns. Net markups (markups less markup cancellations) are net increases above the original retail price, which are generally caused by changes in supply and demand. Net markdowns (markdowns less markdown cancellations) are net decreases below the original retail price. An approximation of lower of cost or market is achieved by including net markups but excluding net markdowns from the cost-to-retail ratio.

To understand this approximation, assume a toy is purchased for $6, and the retail price is set at $10. It is later marked down to $8. A cost-to-retail ratio including markdowns would be $6 divided by $8 or 75%, and ending inventory would be valued at $8 times 75%, or $6 (original cost). The logic behind including markdowns in the cost-to-retail ratio is the

assumption that these inventories would eventually be marked down and that markdowns are a normal part of business for this enterprise and/or these types of inventories. A cost-to-retail ratio excluding markdowns would be $6 divided by $10 or 60%, and ending inventory would be valued at $8 times 60%, or $4.80 (LCM). The logic behind excluding markdowns from the cost-to-retail ratio is that the enterprise did not expect to mark these inventory items down and that this is not a normal occurrence. The write-down to $4.80 reflects the loss in utility which is evidenced by the reduced retail price.

The application of the lower of cost or market rule is illustrated for both the FIFO and average cost methods in the example below. Remember, if the markups and markdowns below had been included in the previous example, both would have been included in the cost-to-retail ratio.

	FIFO cost (LCM)			*Average cost (LCM)*		
	Cost		*Retail*	*Cost*		*Retail*
Beginning inventory	$100,000		$ 200,000	$100,000		$ 200,000
Net purchases	500,000 (a)		800,000 (b)	500,000		800,000
Net markups	--		250,000 (b)	--		250,000
Total goods available for sale	$600,000		1,250,000	$600,000 (c)		1,250,000 (d)
Net markdowns			(50,000)			(50,000)
Sales at retail			(800,000)			(800,000)
Ending inventory—retail			$ 400,000			$ 400,000
Cost-to-retail ratio	(a) 500,000 / (b) 1,050,000	=	47.6%	(c) 600,000 / (d) 1,250,000	=	48%
Ending inventory—LCM						
400,000 × 47.6%			$ 190,400			
400,000 × 48%						$ 192,000

Under the FIFO (LCM) method all of the markups are considered attributable to the current period purchases. While this is not necessarily accurate, it provides the most conservative estimate of the ending inventory.

There are a number of additional issues that affect the computation of the cost-to-retail ratio. Purchase discounts and freight-in affect only the cost column in this computation. The sales figure that is subtracted from the adjusted cost of goods available for sale in the retail column must be gross sales after adjustment for sales returns. Sales discounts are not included in the computation. If sales are recorded gross, then deduct the gross sales figure. If sales are recorded net, then both the recorded sales and sales discount must be deducted to give the same effect as deducting gross sales. Normal spoilage is generally allowed for in the enterprise's pricing policies, and for this reason it is deducted from the retail column after the calculation of the cost-to-retail ratio. Abnormal spoilage, on the other hand, is deducted from both the cost and retail columns before the cost-to-retail calculation as it could otherwise distort the ratio. It is then generally reported as a separate loss, either within cost of goods sold or administrative expenses. Abnormal spoilage generally arises from a major theft or casualty, while normal spoilage is usually due to shrinkage or breakage. These determinations and their treatments will vary depending upon the enterprise's policies.

When applying the retail method, separate computations are made for any departments that experience significantly higher or lower gross profit margins. Distortions arise in applying the retail method when a department sells goods with gross profit margins that vary in a proportion different from the gross profit margins of goods purchased during the period. In this case, the cost-to-retail percentage would not be representative of the mix of goods in ending inventory. Also, manipulations of income are possible by planning the timing of markups and markdowns.

The retail method is an acceptable method of estimating inventories under FIFO (LCM) for income tax purposes. Income tax regulations require valuation at lower of cost or market (except for LIFO) and regular and consistent physical counts of inventory at each location.

LIFO retail method. As with other LIFO methods, treasury regulations are the governing force behind the LIFO retail method. The regulations differentiate between a "variety" store which is required to use an internally computed index and a "department" store which is permitted to use a price index published by the Bureau of Labor Statistics. The computation of an internal index was previously discussed in the dollar-value LIFO section. It involves applying the double-extension method to a representative sample of the ending inventory. Selection of an externally published index is to be in accordance with the treasury regulations.

The steps used in computing the value of ending inventory under the LIFO retail method are listed below and then applied in an example for illustrative purposes.

1. Calculate (or select) the current year conversion price index. Recall that in the base year this index will be 1.00.
2. Calculate the value of the ending inventory at both cost and retail. Remember, as with other LIFO methods, income tax regulations do not permit the use of LCM, so both markups and markdowns are included in the computation of the cost-to-retail ratio. However, the beginning inventory is excluded from goods available for sale at cost and at retail.
3. Restate the ending inventory at retail to base-year retail. Divide the current ending inventory at retail by the current year index determined in step 1.
4. Layers are then treated as they were for the dollar-value LIFO example presented earlier. If the ending inventory restated to base-year retail exceeds the previous year's amount at base-year retail, a new layer is established.
5. The computation of LIFO cost is the last step and requires multiplying each layer at base-year retail by the appropriate price index and multiplying this product by the cost-to-retail ratio in order to arrive at the LIFO cost for each layer.

The following example illustrates a two-year period to which the LIFO retail method is applied. The first period represents the first year of operations for the company and is its base year.

Year 1

Step 1—Because this is the base year, there is no need to compute an index, as it will always be 1.00.

Step 2—

	Cost	Retail
Beginning inventory	$ --	$ --
Purchases	582,400	988,600
Markups	--	164,400
Markdowns	--	(113,000)
Subtotal	582,400	1,040,000
Total goods available for sale	$582,400	1,040,000
Sales—at retail		840,000
Ending year 1 inventory—at retail		$ 200,000

Cost-to-retail ratio $\frac{(a)\ 582,400}{(b)\ 1,040,000}$ = 56%

Ending inventory at cost
$200,000 × 56% $112,000

Step 3—Because this is the base year, the restatement to base-year cost is not necessary; however, the computation would be $200,000/1.00 = $200,000.

Steps 4 and 5—The determination of layers is again unnecessary in the base year; however, the computation would take the following format:

	Ending inventory at base-year retail	*Conversion price index*	*Cost-to-retail ratio*	*LIFO cost*
Base year ($200,000/1.00)	$200,000	1.00	0.56	$112,000

Year 2

Step 1—We make the assumption that the computation of an internal index yields a result of 1.12 (obtained by double-extending a representative sample).

Step 2—

	Cost	*Retail*
Beginning inventory	$112,000	$ 200,000
Purchases	716,300	1,168,500
Markups	--	87,500
Markdowns	--	(21,000)
Subtotal	$716,300	1,235,000
Total goods available for sale		1,435,000
Sales—at retail		1,171,800
Ending year 2 inventory—at retail		$ 263,200

Cost-to-retail ratio $\frac{716,300}{1,235,000}$ = 58%

Step 3—The restatement of ending inventory at current year retail to base-year retail is done using the index computed in step 1. In this case it is $263,200/1.12 = $235,000.

Steps 4 and 5—There is a LIFO layer in year 2 because the $235,000 inventory at base-year retail exceeds the year 1 amount of $200,000.

The computation of the LIFO cost for each layer is shown below.

	Ending inventory at base-year retail	*Conversion price index*	*Cost-to-retail ratio*	*LIFO cost*
Base year ($200,000/1.00)	$200,000	1.00	0.56	$112,000
Year 2 layer	35,000	1.12	0.58	22,736
	$235,000			
Ending year 2 inventory at LIFO cost				$134,736

The treatment of subsequent increments and decrements is the same for this method as it is for the regular dollar-value method.

Gross profit method. The gross profit method is used to estimate ending inventory when a physical count is not taken. It can also be used to evaluate the reasonableness of a given inventory amount. Assume the following data:

Beginning inventory	$125,000
Net purchases	450,000
Sales	600,000
Estimated gross profit percentage	32%

Ending inventory is estimated as follows:

Beginning inventory	$125,000
Net purchases	450,000
Cost of goods available for sale	575,000
Cost of goods sold [$600,000 – (32% × $600,000)] or (68% × $600,000)	408,000
Estimated ending inventory	$167,000

The gross profit method is used for interim reporting estimates, for conducting analytical review procedures by independent accountants in audits and review engagements, and for estimating inventory lost in fires or other catastrophes. The method is not acceptable, however, for either income tax or annual financial reporting purposes.

Standard costs. Standard costs are predetermined unit costs used by manufacturing firms for planning and control purposes. Standard costs are often used to develop approximations of GAAP inventories for financial reporting purposes. The use of standard cost approximations in financial reporting is acceptable only if adjustments to the standards are made periodically to reflect current conditions and if their use approximates the results that would be obtained by directly applying one of the recognized cost flow assumptions.

Example of standard costing

The Bavarian Clock Company (BCC) uses standard costing to value its FIFO inventory. One of its products is the Men's Chronometer wristwatch, for which the following bill of materials has been constructed:

Part description	*Quantity*	*Cost*
Titanium watch casing	1	$212.25
Leather strap	1	80.60
Scratch resistant crystal bezel	1	120.15
Double timer shock-resistant movement	1	42.80
Multilingual instruction sheet	1	0.80
Ornamental box	1	2.75
Overhead charge	1	28.00
Total		$487.35

The industrial engineering department designed the following labor routing for assembly of the Men's Chronometer and determined the standard process times:

Labor routing description	*Quantity/ minutes*	*Labor type*	*Cost/ minute*	*Cost*
Quality review of raw materials received	3.5	Quality assurance	$0.42	$ 1.47
Attach strap to casing	7.5	Watch maker	0.79	5.93
Insert movement in casing	10.8	Watch maker	0.79	8.53
Attach bezel	3.2	Watch maker	0.79	2.53
Final quality review and testing	11.0	Quality assurance	0.42	4.62
Insert into packing case	1.5	Assembler	0.13	.20
Total	37.5			$ 23.28

Thus, the total standard cost of the Men's Chronometer is $510.63 ($487.35 material and overhead cost + $23.28 labor cost). At the beginning of December, there are 1,087 Men's Chronometers in finished goods inventory, which are recorded at standard cost, resulting in a beginning inventory valuation of $555,054.81 (= $510.63 × 1,087 units).

During December, BCC records actual material costs of $1,915,312.19, actual labor costs of $111,844.40, and actual overhead costs of $124,831.55 related to the Men's Chronometer, which are charged to the inventory account. During the month, BCC manufactures 4,105 Men's Chronometers and ships 4,385, leaving 807 units in finished goods inventory. At a standard cost of $510.63 per unit, this results in a month-end finished goods inventory balance of $412,078.41. The monthly charge to cost of goods sold is calculated as follows:

Beginning inventory at standard cost	$ 555,054.81
+ Actual material costs incurred	1,915,312.19
+ Actual labor costs incurred	111,844.40
+ Actual overhead costs incurred	124,831.55
– Ending inventory at standard cost	(412,078.41)
= Cost of goods sold	$2,294,964.54

At month-end, the purchasing manager conducts his quarterly review of the bill of materials and determines that the cost of the bezel has permanently increased by $4.82, bringing the total standard bezel cost to $124.97 and therefore the total standard cost of the Men's Chronometer to

$515.45. This increases the value of the ending inventory by $3,889.74 ($4.82 standard cost increase × 807 units in finished goods inventory), to $415,968.15, while reducing the cost of goods sold to $2,291,074.80. The following entry records the month-end inventory valuation at standard cost:

Cost of goods sold	2,291,074.80	
Finished goods inventory		2,291,074.80

As a cross-check, BCC's controller divides the cost of goods sold by the total number of units shipped, and arrives at an actual unit cost of $522.48, as opposed to the standard costs of $515.45. The variance from the standard cost is $7.03 per unit, or a total of $30,826.55. Upon further investigation, she finds that overnight delivery charges of $1,825 were incurred for a shipment of watch casings, while there was a temporary increase in the cost of the leather strap of $2.83 for a 1,000-unit purchase, resulting in an additional charge of $2,830. She elects to separately track these excess material-related costs with the following entry:

Material price variance	4,655.00	
Cost of goods sold		4,655.00

In addition, the production staff incurred overtime charges of $16,280 during the month. Since overtime is not included in the labor routing standard costs, the controller separately tracks this information with the following entry:

Labor price variance	16,280.00	
Cost of goods sold		16,280.00

Finally, the controller determines that some costs comprising the overhead cost pool exceeded the budgeted overhead cost during the month, resulting in an excess charge of $9,891.55 to the Men's Chronometer cost of goods sold. She separates this expense from the cost of goods sold with the following entry:

Overhead price variance	9,891.55	
Cost of goods sold		9,891.55

Her variance analysis has identified all causes of the $30,826.55 cost overage, as noted in the following table:

Total cost of goods sold	$2,291,074.80
– Standard cost of goods sold	(2,260,248.25)
– Material price variance	(4,655.00)
– Labor price variance	(16,280.00)
– Overhead price variance	(9,891.55)
= Remaining unresolved variance	--

As explained previously, variances resulting from abnormal costs incurred are considered period costs and, thus, are not allocated to inventory.

Other valuation methods.

Base stock. The base stock method assumes that a certain level of inventory investment is necessary for normal business activities and is, therefore, permanent. The base stock inventory is carried at historical cost. Decreases in the base stock are considered temporary and are charged to cost of goods sold at replacement cost. Increases are carried at current year costs. The base stock approach is seldom used in practice since it is not allowed for income tax purposes, and the LIFO method yields similar results.

Direct costing. An alternative to full absorption costing is direct costing. Direct costing (also referred to as variable costing) requires classifying only direct materials, direct labor, and variable production overhead as inventory costs. Under this method, all fixed costs are accounted for as period costs. The exclusion of all overhead from inventory costs is not an acceptable accounting method for GAAP or under the US Treasury Regulations for income tax purposes.

Relative sales value. Relative sales (or net realizable) values are used to assign costs to inventory items purchased or manufactured in groups. This method is applicable to joint products, subdivided assets such as real estate lots, and basket purchases.

For example, products A and B have the same processes performed on them up to the split-off point. The total cost incurred to this point is $80,000. This cost can be assigned to products A and B using their relative sales value at the split-off point. If A could be sold for $60,000 and B for $40,000, the total sales value is $100,000. The cost would be assigned on the basis of each product's relative sales value. Thus, A would be assigned a cost of $48,000 (60,000/100,000 × 80,000) and B a cost of $32,000 (40,000/100,000 × 80,000).

Differences between GAAP and Income Tax Accounting for Inventories

Full absorption costing—income tax. Prior to the Tax Reform Act of 1986 (TRA 1986), production costing for GAAP and for income tax purposes were very similar. However, TRA 1986 included provisions referred to as Uniform Capitalization (UNICAP) which changed inventory costing for income tax purposes by requiring certain additional indirect costs that are not capitalizable under GAAP be capitalized rather than expensed for income tax purposes. TRA 1986 requires that manufacturers capitalize rather than expense these additional items:

1. Depreciation and amortization in excess of that reported in financial statements
2. Percentage depletion in excess of cost
3. Rework labor, scrap, and spoilage costs
4. Allocable general and administrative costs related to the production function

For income tax purposes, these costs, as well as the indirect production costs listed above for inventory costing under GAAP, are allocated to the WIP and finished goods inventories. Examples of general and administrative costs that must be allocated include payroll department costs, wages of security guards, and the president's salary. The difference between the GAAP and tax inventory carrying values is a temporary difference, which requires deferred income tax accounting (discussed in Chapter 17).

Uniform capitalization rules—income tax vs. GAAP. TRA 1986 established the UNICAP rules for inventory costs for tax purposes. ASC 330-10-55 states that capitalizing a cost for income tax purposes does not, by itself, indicate that it is preferable or even appropriate to capitalize the cost for financial reporting purposes. Although a cost may be required to be capitalized for income tax purposes, management must analyze the individual facts and circumstances based on the nature of its operations and industry practice to determine whether to capitalize the cost for financial reporting purposes.

Inventory capitalization for retailers/wholesalers—income tax vs. GAAP. Prior to TRA 1986, retailers and wholesalers recorded their inventory as the invoice price plus the cost of applicable sales tax and freight-in under both GAAP and income tax law. TRA 1986 applied UNICAP to certain retailers and wholesalers and introduced a requirement that additional costs be capitalized. Inventories of retailers/wholesalers whose average annual gross receipts for the preceding three years are $10 million or less are exempt from applying UNICAP.

The costs which must be capitalized have been divided into two categories. The first category is direct costs and includes the inventory invoice price plus transportation. Also included in direct costs is the cost of labor for purchasing, storing, and handling inventory items. The second category is indirect costs and consists of any costs that directly benefit or are incurred because of the performance of a resale activity. The following types of indirect costs must be capitalized under UNICAP:

1. Off-site storage or warehousing
2. Purchasing
3. Handling, processing, assembly, and repackaging
4. Allocable general and administrative costs related to the above three functions

The indirect costs are allocated between inventory and cost of goods sold by using traditional methods (specific identification, standard costing methods, etc.) or one of three simplified methods. Temporary differences require deferred income tax accounting as discussed in Chapter 17.

Other Inventory Topics

Purchase commitments. Purchase commitments generally are not recognized in the financial statements because they are executory in nature. However, disclosure in the notes to the financial statements is required for firm purchase commitments that are material in amount.

If at a balance sheet date the contract price of these commitments exceeds the market value, the estimated loss is accrued and reported as a loss in the income statement. This results in recognition of the loss before the inventory is actually purchased.

Inventories valued at selling price. In exceptional cases, inventories may be reported at sales price less estimated disposal costs. Such treatment is justified when cost is difficult to determine, quoted market prices are available, marketability is assured, and units are interchangeable. Precious metals, certain agricultural products, and meat are examples of inventories valued in this manner. When inventory is valued above cost, revenue is recognized before the time of sale. Naturally full disclosure in the financial statements is required.

Stripping costs incurred during production in the mining industry. ASC 930-330 states that stripping costs incurred during a mine's production phase are to be accounted for as variable production costs and therefore allocated to inventory. The ASC is limited to stripping costs incurred during the period when inventory is being produced (i.e., extracted) and did not address the accounting for these costs when incurred during the preproduction phase of the mine.

Interim reporting. The principles used to determine ending inventory and cost of goods sold in annual reports are also used in interim reports, although four exceptions are allowed (under ASC 270). These are

1. The gross profit method may be used to estimate cost of goods sold and ending inventory.
2. When LIFO layers are liquidated during the interim period but are expected to be replaced by year-end, cost of goods sold is adjusted to reflect current costs rather than older LIFO costs.
3. Temporary market declines need not be recognized if substantial evidence exists that market prices will recover. If LCM losses are recorded in one or more interim periods and are recovered by year-end, the recovery is recognized as a fourth-quarter gain.
4. Planned standard cost variances expected to reverse by year-end are not recognized.

See a complete discussion of interim financial reporting in Chapter 21.

REVENUE RECOGNITION — GENERAL PRINCIPLES

Revenue recognition concerns. The principles guiding recognition of revenues for financial reporting purposes are central to GAAP and in most instances are unambiguous and

straightforward. In fact, the underlying principles have not changed in decades, although FASB is deliberating fundamental changes, thereto, grounded in an assets-and-liabilities approach. However, while the basic principles are uncomplicated, it is nonetheless true that a large fraction of financial reporting frauds over the period beginning about 1995 were the result of misapplications, often deliberate, of revenue recognition practices prescribed under GAAP. Apart from outright fraud (e.g., recording nonexistent transactions), there were several factors contributing to this unfortunate state of affairs.

First, business practices have continued to grow increasingly complex, involving, among other things, a marked shift from manufacturing to a services-based economy, where the proper timing for revenue recognition is often more difficult to ascertain. Second, there has been an undeniable increase in the willingness of managers, whose compensation packages are often directly linked to the company's stock price and reported earnings, to "stretch" accounting rules to facilitate earnings management. This has particularly been the case where GAAP requirements have been vague, complex or abstruse. And third, it has been well documented that, too often, independent auditors have been willing to accommodate managements' wishes, particularly in the absence of specific rules under GAAP to support a denial of such requests. These actions have often had disastrous consequences, if not immediately, then in the longer run.

Errors or deliberate distortions involving revenue recognition fall into two categories: situations in which revenue legitimately earned is reported in the incorrect fiscal (financial reporting) period, often referred to as "cutoff" errors, and situations in which revenue is recognized although never actually earned. Given the emphasis on periodic reporting (e.g., quarterly earnings announcements in the case of publicly held entities), even simple "cutoff" errors can have enormous impact, notwithstanding the fact that these should tend to offset over several periods. As a practical matter, all instances of improper revenue recognition are very serious, and these constitute a challenge to all accountants attempting to properly interpret and apply GAAP, including independent auditors.

Revenue recognition—general guidelines. In terms of currently enforceable guidance, under long-established GAAP, revenue, whether from the sale of product or provision of services, is to be recognized only when it has been earned. According to CON 5, *Recognition and Measurement in Financial Statements of Business Enterprises*,

> *...(a)n entity's revenue-earning activities involve delivering or producing goods, rendering services, or other activities that constitute its ongoing major or central operations, and revenues are considered to have been earned when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues.*

In other words, in order to be recognized revenue must be realized or realizable, and it must have been earned.

CON 5 notes that "the two conditions (being realized or realizable, and being earned) are usually met by the time product or merchandise is delivered or services are rendered to customers, and revenues from manufacturing and selling activities and gains and losses from sales of other assets are commonly recognized at time of sale (usually meaning delivery)." Moreover, "if services are rendered or rights to use assets extend continuously over time (for example, interest or rent), reliable measures based on contractual prices established in advance are commonly available, and revenues may be recognized as earned as time passes." In other words, for most traditional and familiar types of transactions, the point at which it is appropriate to recognize revenue will be quite clear.

The SEC, reflecting on the conceptual foundation for revenue recognition, observed first in Staff Accounting Bulletin 101, and then in its replacement, SAB 104, that

> *...revenue generally is realized or realizable and earned when* ***all*** *of the following criteria are met:*
>
> 1. *There is persuasive evidence that an arrangement exists*
> 2. *Delivery has occurred or services have been rendered*
> 3. *The seller's price to the buyer is fixed or determinable, and*
> 4. *Collectibility is reasonably assured*

Note that, while SEC rules and "unofficial" guidance are not necessarily to be deemed GAAP for nonpublic companies, to the extent that these provide insights into standards found in the GAAP hierarchy, they should always be viewed as relevant guidance and followed, absent other, contradictory rules established under GAAP. In the absence of any other source found in the GAAP hierarchy, SEC pronouncements may represent the best thinking on the subject and are considered authoritative for all reporting entities.

With regard to the four criteria set forth above, consideration should be directed at the following discussion, which is drawn partially from SAB 101 and SAB 104.

First, regarding persuasive evidence of an arrangement, attention must be paid to the customary manner in which the reporting entity engages in revenue-producing transactions with its customers or clients. Since these transactions are negotiated between the buyer and seller and can have unique or unusual terms, there are (and can be) no absolute standards. Thus, for an enterprise that traditionally obtains appropriate documentation (purchase orders, etc.) from its customers before concluding sales to them, advance deliveries to customers, even if later ratified by receipt of the proper paperwork, would not be deemed a valid basis for revenue recognition at the time of delivery.

When evaluating purported revenue transactions, the substance of the transactions must always be considered, and not merely their form. It has become increasingly commonplace to "paper over" transactions in ways that can create the basis for inappropriate revenue recognition. For example, transactions that are actually consignment arrangements might be described as "sales" or as "conditional sales," but revenue recognition would not be appropriate until the consigned goods are later sold to a third-party purchaser.

Careful analysis of the rights and obligations of the parties and the risks borne by each at various stages of the transactions should reveal when and whether an actual sale has occurred and whether revenue recognition is warranted. In general, if the buyer has a right to return the product in question, coupled with a deferred or conditional payment obligation and/or significant remaining performance obligations by the seller, revenue will not be recognizable by the seller at the time of initial delivery. Similarly, if there is an implicit or explicit obligation by the seller to repurchase the item transferred, a real sales transaction has not occurred. The buyer must assume the risks of ownership in all cases if revenue is to be recognized.

With regard to whether delivery has occurred or services have been rendered, ownership and risk taking must have been transferred to the buyer if revenue is to be recognized by the seller. Thus, if the seller is holding goods for delivery to the buyer because the buyer's receiving dock workers are on strike and no deliveries are being accepted, revenue generally cannot be recognized in the reporting period, even if these delayed deliveries are made subsequent to period end. (There are limited exceptions to this general principle, typically involving a written request from the buyer for delayed delivery under a "bill and hold" arrangement, having a valid business purpose.)

Delivery, as used here, implies more than simply the physical relocation of the goods to the buyer's place of business. Rather, it means that the goods have actually been accepted by the customer, which, depending on the terms of the relevant contract, could be conditioned on whether inspection, testing, and/or installation have been completed, and the buyer has

committed to pay for the items purchased. For revenue recognition to be justified, substantial performance of the terms of delivery must have occurred, and if any terms remain uncompleted, there should be a basis grounded on historical experience to assume that these matters will be satisfactorily attended to.

In some instances there are multiple "deliverables"; in such cases, revenue is not recognized for any given element if later deliverables are essential for the functionality of the already delivered element. In other situations, such as in various licensing arrangements, physical "delivery" may occur well before product usage by the buyer can take place (e.g., software for the future year's tax preparation delivered before the current year end), and revenue is not to be recognized prior to the initial date of expected use by the buyer.

In the case of many service transactions, large up-front fees are often charged, nominally in recognition of the selling of a membership, the signing of a contract, or for enrolling the customer in a program. (For example, initiation fees to join a health club where the terms of membership also obligate the member to pay ongoing fees.) Unless the services provided to the customer at inception are substantial, the presumption is that the revenue received has not been earned, but rather must be deferred and recognized, usually ratably, over the period that substantive services are provided. Thus, initiation fees are amortized over the membership period.

The seller's price to the buyer is fixed or determinable when a customer does not have the unilateral right to terminate or cancel the contract and receive a cash refund. Depending on customary practice, extended return privileges might imply that this condition has not been met in given circumstances. Prices that are conditional on the occurrence of future events are not fixed or determinable from the perspective of revenue recognition.

In theory, until the refund rights have expired, or the specified future events have occurred, revenue should not be recognized. As a practical matter, however, assuming that the amount of refunds can be reliably estimated (based on past experience, industry data, etc.), revenues, net of expected refunds, can be recognized on a pro rata basis. Absent this ability to reliably estimate, however, revenue recognition is deferred.

The final factor, reasonable assurance of collectibility, implies that the accrual for bad debts (uncollectible accounts receivable) can be estimated with reasonable accuracy, both to accomplish proper periodic matching of revenue and expenses, and to enable the presentation of receivables at net realizable value, as required under GAAP. An inability to accomplish this objective necessitates deferral of revenue recognition—generally until collection occurs, or at least until it becomes feasible to estimate the uncollectible portion with sufficient accuracy.

An extreme situation, calling for not merely accrual of losses from estimated uncollectible receivables, is to defer revenue recognition entirely until collectibility is assured (or actually achieved). The most conservative accounting alternative, as set forth in CON 5, is to record revenue only as collected. It states "(i)f collectibility of assets received for product, services, or other assets is doubtful, revenues and gains *may* be recognized on the basis of cash received." (Emphasis added.) The permissive language, which (it must be assumed) was deliberately selected in preference to a mandatory exhortation (e.g., "must"), suggests that even in such a situation this hyperconservative departure from accrual accounting is not truly prescriptive, but is a possible solution to a fact-specific set of circumstances.

Evolving Problems in Revenue Recognition

Certain of the more attention-getting problems in applying the general principles of revenue recognition are discussed in the following paragraphs.

Financial statement presentation: gross vs. net. In general, it is well established that reporting on a "gross" basis is appropriate when the entity takes ownership of the goods being sold to its customers, with the risks and rewards of ownership accruing to it. For example, if the entity runs the risk of obsolescence or spoilage during the period it holds the merchandise, gross reporting would normally be appropriate. On the other hand, if the entity merely acts as an agent for the buyer or seller from whom it earns a commission, then "net" reporting would be more appropriate.

In recent years there have been increasing reports of enterprises that inflate revenues reported in their income statements by reporting transactions on a "gross" basis, notwithstanding that the entity's real economic role is as an agent for buyer and/or seller. This distortion became widespread in the case of Internet commerce-based "dot-com companies" and other start-up and innovative businesses typically not reporting earnings, for which market valuations were heavily influenced by absolute levels of and trends in gross revenues. Reporting revenues "gross" rather than "net" often had an enormous impact on the perceived value of those enterprises.

Factors to consider in determining whether sales are properly reported "gross" or "net" include

1. Whether the entity acts as a principal or an agent in the transactions
2. Whether the entity takes title to the property
3. Whether the entity has the normal risks and rewards of ownership
4. Whether the entity acts as an agent or broker (including performing services, in substance, as an agent or broker) with compensation on a commission or fee basis

Reporting taxes collected as revenue. Most businesses must collect certain taxes which must subsequently be transmitted to governmental bodies, making the entity in effect an agent of the state. The most obvious example of this situation is the imposition of sales taxes, which are almost universally applicable to retail merchandise transactions and, increasingly, to service transactions as well. Historically accounting practice has varied, with some entities reporting gross revenue inclusive of taxes—which are then later reported as expenses when remitted—while other entities report revenue net of these taxes, treating them as purely a balance sheet event. ASC 605-45 confirms that either methodology is acceptable, and if material, should be defined in the accounting policies note to the financial statements. As an elective accounting policy, accordingly, any change in method should be justified as being warranted as a means of improving financial reporting.

Barter transactions. Barter transactions (nonmonetary exchanges, as described in ASC 845-10) are not a problem, assuming that they represent the culmination of an earnings process. However, in recent years there have been many reports of transactions that appear to have been concocted merely to create the illusion of revenue-generating activities. Examples include advertising swaps engaged in by some entities, most commonly "dot-com" enterprises, and the excess capacity swaps of fiber optic communications concerns under "indefeasible right to use" agreements. Both of these and many other situations involved immediate recognition of revenues coupled with deferred recognition of costs, and typically in aggregate were equal exchanges not providing profits to either party. Furthermore, these examples do not represent culminations of the normal earnings process (e.g., fiber-optic networks were built in order to sell communications services to end users, not for the purpose of swapping capacity with other similar operations).

In hindsight, most observers can see why these and many other aggressive reporting practices deviated from established or implied GAAP; although there are still some who insist that because GAAP failed to explicitly address these precise scenarios, the accounting for the transactions was open to interpretation. Since GAAP (even the highly rules-based US

GAAP) cannot possibly hope to overtly address all the various innovative transaction structures that exist and will be invented, it is necessary to apply basic principles and reason by analogy to newly emerging circumstances. Of great importance to financial statement preparers (and internal and external auditors) is obtaining a thorough understanding of the nature and normal operations of the business enterprise being reported upon, application of "substance over form" reasoning, and the goal of faithfully representing the economics of transactions.

Channel stuffing. Many difficult issues of revenue recognition involve practices that may or may not involve GAAP departures, depending on the situation-specific facts and circumstances. Channel stuffing is a prime example of this issue, where sales are actually made prior to the period-end cutoff but may have been stimulated by "side agreements," such as a promise to customers of extended return privileges or more liberal credit terms. In such circumstances, there might be a greater likelihood that a substantial portion of these sales may be subsequently nullified, as unrealistically large orders inevitably lead to later large returns made for full credit.

For purposes of financial reporting under GAAP, valuation allowances should be established for expected sales returns and allowances. (In practice, however, this is rarely done because the amounts involved are immaterial, unlike the amounts of the more familiar allowances for uncollectible accounts.) The use of valuation accounts for anticipated returns and allowances is dictated by both the matching concept (recording returns and allowances in the same fiscal period in which the revenue is recognized) as well as by the requirement to present accounts receivable at net realizable value. When the potential product returns are not subject to reasonable estimation (as when a sales promotion effort of the type just described is first being attempted by the reporting entity) but could be material, it might not be permissible to recognize revenues at all, pending subsequent developments (ASC 605-15-25). Furthermore, from the SEC's perspective, factors such as the following could require deferral of revenues at the time goods are shipped to customers, pending resolution of material uncertainties.

1. Significant levels of product inventory in the distribution channel
2. Lack of "visibility" into, or the inability to determine or observe, the levels of inventory in a distribution channel and the current level of sales to end users
3. Expected introductions of new products that may result in the technological obsolescence of, and larger than expected returns of, current products
4. The significance of a particular distributor to the company's (or a reporting segment of the company's) business, sales and marketing
5. The newness of a product
6. The introduction of competitors' products with superior technology or greater expected market acceptance could affect market demand and changing trends in that demand for an entity's products

Mischaracterization of extraordinary or unusual transactions as components of gross revenue. Not all revenue recognition errors and frauds involve questions of when or if revenue should be recognized. In some instances, classification in the income statement is of greater concern. While matters in this group often do not result in a distortion of net results of operations, they can seriously distort important indicators of performance trends. When this occurs, it most often involves reporting unusual or infrequent gains on sales of segments or specific assets as revenue from product or service transactions. A variation on this involves reporting unusual gains as offsets to one or more categories of operating expenses, similarly distorting key financial ratios and other indicators, again without necessarily invalidating the net income measure.

Over the years, the range of items for which extraordinary item classification is permitted has been sharply curtailed. FASB is still, as of mid-2008, pursuing a joint project with IASB that will, if it culminates in a standard consistent with current plans, eliminate the extraordinary classification completely. However, while this would eliminate the potential for abuse described in the preceding paragraph, misclassification of income or expense items would continue to constitute a fraud risk.

Mischaracterizing transactions as involving "arm's-length" third parties, thus justifying unwarranted gain recognition. Transfers of inventory or other assets to a related entity typically defers gain or income recognition until subsequent transfer to an "arm's-length" party. In some cases, sales have been disguised as being to unrelated entities with gain being recognized, when in fact the "buyer" was a nominee of the seller, or the financing was provided or guaranteed by the seller, or the "buyer" was a "variable interest entity" that failed to meet the complex and changing requirements under GAAP required for gain recognition. Depending upon the facts of the situation, this can result in gains being improperly recognized, or the gross amount of the transaction being improperly recognized in the seller/transferor's financial statements.

Selling undervalued assets to generate reportable gains. This issue again ranges from deliberate but real economic transactions that have as a goal the inflation of reportable revenues or gains, to misrepresented events having no economic substance but the same objective. Among the former is the deliberate invasion of low-cost LIFO inventory "layers," which boosts gross margins and net profits for the period, albeit at the cost of having to later replenish inventories with higher-cost goods. To the extent that this depletion of lower-cost inventory really occurs, there is no GAAP alternative to reflecting these excess profits currently, although the threat of full disclosure may prove to be somewhat of a deterrent.

Regarding the latter category, in some instances the ability to generate gains could indicate that errors occurred in recording a previous transaction. Thus, large gains flowing from the sale of assets recently acquired in a purchase business combination transaction could well mean the purchase price allocation process was flawed. If this is true, a reallocation of purchase price would be called for, and some or all of the apparent gains would be eliminated.

Related to the foregoing is the strategy of retiring outstanding debt in order to generate reportable gains. In periods of higher-than-historically-typical interest rates, lenders will often agree to early extinguishment of outstanding low-coupon obligations at a discount, hence creating accounting gains for the borrower, albeit replacement debt at current yields will result in higher interest costs over future years. To the extent the debt is really retired, however, this is a real economic event, and the consequent gain is reported in current earnings under GAAP. This issue is discussed in more detail in Chapter 15.

Deliberate misstatement of percentage of completion on long-term construction contracts. Under ASC 605-35 (detailed later in this chapter), profits on certain long-term construction-type contracts are recognized ratably over the period of construction. An obvious and often easy way to distort periodic results of operations is to deliberately over- or understate the degree to which one or more discrete projects has been completed as of period end. This, coupled with the difficulty and importance of estimating remaining costs to be incurred to complete each project, makes profit recognition under this required method of accounting challenging to verify.

Disclosures

ASC 235 requires disclosures of "…important judgments as to appropriateness of principles relating to the recognition of revenue." SAB 101 expressed the opinion of the SEC staff that because revenue recognition generally involves the exercise of judgment, companies are

always required to disclose their revenue recognition policies. SAB 101 also provided that, when applicable, the notes to the financial statements are to include disclosure of

1. The revenue recognition policy for each material type of transaction
2. If the company enters into multiple-element sales arrangements (e.g., bundling of related products and/or services), the method of accounting for each element and the method used to determine each element and value it
3. Material changes in estimates of returns in accordance with ASC 605-15 (e.g., changing the percentage of sales used to establish the allowance).

In addition, SEC Regulation S-X requires that each of the following categories of revenue (and the related costs), if applicable, be stated separately on the face of the income statement:

1. Sales of tangible products (net of discounts, returns, and allowances)
2. Income from rentals
3. Revenue from services
4. Other revenues

In addition to the foregoing, the financial statement preparer should consider the applicability of ASC 850 (*Related-Party Disclosures*) and ASC 275 (*Risks and Uncertainties*). (See Chapter 2.)

Specialized Applications

The remainder of this chapter discusses specialized principles that have been established for accounting for the following types of transactions:

1. Long-term construction contracts
2. Service revenues
3. Sales when collection is uncertain
4. Revenue recognition when right of return exists
5. Profit recognition on real estate sales
6. Real estate operations
7. Franchising
8. Other special accounting and reporting issues

Each of these sections may be read as an individual unit.

LONG-TERM CONSTRUCTION CONTRACTS

PERSPECTIVE AND ISSUES

Accounting for long-term construction contracts involves questions as to when revenue is to be recognized and how to measure the revenue to be recorded. The basic GAAP governing the recognition of long-term contract revenue is contained in ASC 605-35 and ASC 910.

The accounting for long-term construction contracts is complicated by the need to rely upon estimates of revenues, costs to be incurred, and progress toward completion.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue

605-35	Construction-Type and Production-Type Contracts

Expenses

720-15	Start-Up Costs

Industry

910	Contractors—Construction

DEFINITIONS OF TERMS

Back charges. Billings for work performed or costs incurred by one party (the biller) that, in accordance with the agreement, should have been performed or incurred by the party billed.

Change order. A legal document executed by a contractor and customer (which can be initiated by either) that modifies selected terms of a contract (e.g., pricing, timing and scope of work) without the necessity of redrafting the entire contract.

Claims. Amounts in excess of the agreed contract price that a contractor seeks to collect from customers for customer-caused delays, errors in specifications and designs, unapproved change orders, or other causes of unanticipated costs. (ASC 605-35)

Combining contracts. Grouping two or more contracts into a single profit center for accounting purposes.

Completed-contract method. A method of accounting that recognizes revenue only after the contract is complete.

Cost-to-cost method. A percentage-of-completion method used to determine the extent of progress toward completion on a contract. The ratio of costs incurred from project inception through the end of the current period (numerator) to the total estimated costs of the project (denominator) is applied to the contract price (as adjusted for change orders) to determine total contract revenue earned to date.

Estimated cost to complete. The anticipated additional cost of materials, labor, subcontracting costs, and indirect costs (overhead) required in order to complete a project at a scheduled time.

Percentage-of-completion method. A method of accounting that recognizes revenue on a contract as work progresses.

Precontract costs. Costs incurred before a contract has been accepted (e.g., architectural designs, purchase of special equipment, engineering fees, and start-up costs).

Profit center. A unit for the accumulation of revenues and costs for the measurement of contract performance.

Progress billings on long-term contracts. Requests for partial payments sent to the customer in accordance with the terms of the contract at agreed-upon intervals as various project milestones are reached.

Segmenting contracts. Dividing a single contract or group of contracts into two or more profit centers for accounting purposes.

Subcontractor. A second-level contractor who enters into a contract with a prime (general) contractor to perform a specific part or phase of a construction project.

Substantial completion. The point at which the major work on a contract is completed and only insignificant costs and potential risks remain.

Work-in-progress (WIP). The accumulated construction costs of the project that have been incurred since project inception.

CONCEPTS, RULES, AND EXAMPLES

Long-term construction contract revenue is recognizable over time as construction progresses rather than at the completion of the contract. This "as earned" approach to revenue recognition is justified because under most long-term construction contracts both the buyer and the seller (contractor) obtain legally enforceable rights. The buyer has the legal right to require specific performance from the contractor and, in effect, has an ownership claim to the contractor's work in progress. The contractor, under most long-term contracts, has the right to require the buyer to make progress payments during the construction period. The substance of this business activity is that revenue is earned continuously as the work progresses.

Methods of Accounting

ASC 605-35 describes the two generally accepted methods of accounting for long-term construction contracts.

The percentage-of-completion method.

> *The percentage-of-completion method recognizes income as work on a contract (or group of closely related contracts) progresses. The recognition of revenues and profits is generally related to costs incurred in providing the services required under the contract.*

Under this method, *work-in-progress* (WIP) is accumulated in the accounting records. At any point in time if the cumulative billings to date under the contract exceed the amount of the WIP plus the portion of the contract's estimated gross profit attributable to that WIP, then the contractor recognizes a current liability captioned "billings in excess of costs and estimated earnings." This liability recognizes the remaining obligation of the contractor to complete additional work prior to recognizing the excess billing as revenue.

If the reverse is true, that is, the accumulated WIP and gross profit earned exceed billings to date, then the contractor recognizes a current asset captioned "costs and estimated earnings in excess of billings." This asset represents the portion of the contractor's revenues under the contract that have been earned but not yet billed under the contract provisions. Where more than one contract exists, these assets and liabilities are determined on a project-by-project basis, with the accumulated assets and liabilities being separately stated on the balance sheet. Assets and liabilities are not offset unless a right of offset exists. Thus, the net debit balances for certain contracts are not ordinarily offset against net credit balances for other contracts. An exception may exist if the balances relate to contracts that meet the criteria for combining described in ASC 605-35 and discussed later in this section.

Under the percentage-of-completion method, income is not based on cash collections or interim billings. Cash collections and interim billings are based upon contract terms that do not necessarily measure contract performance.

The completed-contract method. Per ASC 605-35

> *The completed-contract method recognizes income only when the contract is complete, or substantially complete.*

Under this method, contract costs and related billings are accumulated in the accounting records and reported as deferred items on the balance sheet until the project is complete or substantially complete. A contract is regarded as substantially complete if remaining costs of completion are immaterial. When the accumulated costs (WIP) exceed the related billings, the excess is presented as a current asset (inventory account). If billings exceed related costs, the difference is presented as a current liability. This determination is also made on a project-by-project basis with the accumulated assets and liabilities being separately stated on the balance sheet. An excess of accumulated costs over related billings is presented as a cur-

rent asset, and an excess of accumulated billings over related costs is presented in most cases as a current liability.

Preferability assessment. ASC 605-35 deems the percentage-of-completion method to be preferable when estimates are reasonably dependable and the following conditions exist:

1. Contracts executed by the parties include provisions that clearly specify the enforceable rights regarding goods or services to be provided and received by the parties, the consideration to be exchanged, and the manner and terms of settlement.
2. The buyer can be expected to satisfy his or her obligations under the contract.
3. The contractor can be expected to perform his or her contractual obligations.

ASC 605-35 presumes that contractors generally have the ability to produce estimates that are sufficiently dependable to justify the use of the percentage-of-completion method of accounting. Persuasive evidence to the contrary is necessary to overcome this presumption.

The principal advantage of the completed-contract method is that it is based on final results, whereas the percentage-of-completion method is dependent upon estimates for unperformed work. The principal disadvantage of the completed-contract method is that when the period of a contract extends into more than one accounting period, there will be an irregular recognition of income.

These two methods are not equally acceptable alternatives for the same set of circumstances. ASC 605-35 states that, in general, when estimates of costs to complete and extent of progress toward completion of long-term contracts are reasonably dependable, the percentage-of-completion method is preferable. When lack of dependable estimates or inherent hazards cause forecasts to be doubtful, the completed-contract method is preferable.

The completed-contract method may also be acceptable when a contractor has numerous relatively short-term contracts and when results of operations do not vary materially from those that would be reported under the percentage-of-completion method.

Based on the contractor's individual circumstances, a decision is made as to whether to apply completed-contract or percentage-of-completion accounting as the entity's basic accounting policy. If warranted by different facts and circumstances regarding a particular contract or group of contracts, that contract or group of contracts is to be accounted for under the other method with accompanying financial statement disclosures of this departure from the normal policy.

Costs Incurred

Precontract costs. Precontract costs are costs incurred before a contract has been entered into, with the expectation of the contract being accepted and thereby recoverable through future billings. Precontract costs include architectural designs, costs of learning a new process, and any other costs that are expected to be recovered if the contract is accepted. ASC 720-15 requires that precontract costs be expensed as incurred, as they are the equivalent of start-up costs in other types of businesses. Consequently, precontract costs are not permitted to be included in WIP. Contract costs incurred after the acceptance of the contract are costs incurred towards the completion of the project and are accumulated in work-in-progress (WIP).

If precontract costs are incurred in connection with a current contract in anticipation of obtaining additional future contracts, those costs are nevertheless accounted for as costs of the current contract. If such costs are not incurred in connection with a current contract, then they must be expensed as incurred. There is no look-back provision in this standard. A contractor may not retroactively record precontract costs as WIP if a contract is subsequently executed.

Contract costs. Contract costs are costs identifiable with or allocable to specific contracts. Generally, contract costs include all direct costs such as direct materials, direct labor, and any indirect costs (overhead) allocable to the contracts. Contract costs can be broken down into two categories: costs incurred to date and estimated costs to complete.

The company may choose to defer costs related to producing excess goods in anticipation of future orders of the same item. Costs associated with excess production can be treated as inventory if the costs are considered recoverable.

Estimated costs to complete. These are the anticipated costs required to complete a project at a scheduled time. They are comprised of the same elements as the original total estimated contract costs and are based on prices expected to be in effect when the costs will be incurred.

The latest estimates are used to determine the progress towards completion. ASC 605-35 provides the practices to be followed when estimating costs to complete.

Systematic and consistent procedures are to be used. These procedures are to be correlated with the cost accounting system in order to facilitate a comparison between actual and estimated costs. Additionally, the determination of estimated total contract costs is to identify the significant cost elements.

Estimated costs are to reflect any expected price increases. These expected price increases are not "blanket provisions" for all contract costs, but rather specific provisions for each specific type of cost. Expected increases in each of the cost elements such as wages, materials, and overhead items are considered separately.

Finally, estimates of costs to complete are to be reviewed periodically to reflect new information. Estimates of costs are to be examined for price fluctuations and reviewed for possible future problems, such as labor strikes or direct material delivery delays.

Accounting for contract costs is similar to accounting for inventory. Costs necessary to ready the asset for sale (transfer of possession and occupancy by the customer) are recorded in WIP as incurred. WIP includes both direct and indirect costs but not general and administrative expenses or selling expenses since, by definition, they are not identifiable with a particular contract and are therefore treated as period costs. However, general and administrative expenses may be included in contract costs under the completed contract method since this could result in better matching of revenues and costs, especially in years when no contracts were completed.

Subcontractor costs. Since a contractor may not be able to perform all facets of a construction project, one or more subcontractors may be engaged. Amounts earned by the subcontractor are included in contract costs as the work is completed. These amounts are directly attributable to the project and included in WIP, similar to direct materials and direct labor.

Back charges. Contract costs may require adjustment for back charges. A back charge is a billing by the contractor to a subcontractor (or a reduction in the amount due to that subcontractor under the subcontract) for costs incurred by the contractor to complete or correct work that the contract stipulated was to have been performed by the subcontractor. These charges are often disputed by the parties involved.

Example of a back charge situation

The subcontract (the contract between the general contractor and the subcontractor) obligates the subcontractor to raze a building and prepare the land for construction of a replacement building. The general contractor had to clear away debris left by the subcontractor before construction could begin. The general contractor expects to be reimbursed for the work since it was required to be performed by the subcontractor. The contractor back charges the subcontractor for the costs of debris removal.

The contractor treats the back charge as a receivable from the subcontractor (or a reduction in the amount payable to the subcontractor) and reduces contract costs by the amount recoverable. If the subcontractor disputes the back charge, the cost becomes a claim. Claims are an amount in excess of the agreed contract price or amounts not included in the original contract price that the contractor seeks to collect. Claims are only recorded as additional contract revenue if the requirements set forth in ASC 605-35 are met.

The subcontractor records the back charge as a payable and as additional contract costs if it is probable the amount will be paid. If the amount or validity of the liability is disputed, the subcontractor considers the probable outcome in order to determine the proper accounting treatment.

Types of Contracts

Four types of contracts are distinguished based on their pricing arrangements: (1) fixed-price or lump-sum contracts, (2) time-and-materials contracts, (3) cost-type contracts, and (4) unit-price contracts.

Fixed-price contracts are contracts for which the price is not usually subject to adjustment because of costs incurred by the contractor. The contractor bears the risks of cost overruns.

Time-and-materials contracts are contracts that provide for payments to the contractor based on direct labor hours at fixed rates and the contractor's cost of materials.

Cost-type contracts provide for reimbursement of allowable or otherwise defined costs incurred plus a fee representing profits. Some variations of cost-plus contracts are (1) cost-without-fee: no provision for a fee, (2) cost-plus-fixed-fee: contractor reimbursed for costs plus provision for a fixed fee, and (3) cost-plus-award-fee: same as (2) plus provision for an award based on performance. The contract price on a cost-type contract is determined by the sum of the reimbursable expenditures and a fee. The fee is the profit margin (revenue less direct expenses) to be earned on the contract.

Unit-price contracts are contracts under which the contractor is paid a specified amount for every unit of work performed.

Contract costs (incurred and estimated to complete) are used to compute the gross profit or loss recognized. Under the percentage-of-completion method, gross profit or loss is recognized each period. The revenue recognized is matched against the contract costs incurred (similar to cost of goods sold) to determine gross profit or loss. Under the completed contract method, the gross profit or loss is determined at the substantial completion of the contract, and no revenue or contract costs are recognized until this point.

Additionally, inventoriable costs (accumulated in WIP) are never to exceed the net realizable value (NRV) of the contract. When contract costs exceed their NRV, they must be written down, requiring a contract loss to be recognized in the current period (this will be discussed in greater detail later). This is similar to accounting for inventory.

Example of contract types

Domino Construction Inc. enters into a government contract to construct an early warning radar dome. The contract amount is for $1,900,000, on which Domino expects to incur costs of $1,750,000 and earn a profit of $150,000. Costs expected to be incurred on the project are

Concrete pad	$ 175,000
Pad installation labor	100,000
Radar dome	1,150,000
Dome installation labor	325,000
Total cost	$1,750,000

This is a two-month project, where a concrete pad is installed during the first month and a prefabricated dome is assembled on the pad during the second month. To comply with bank loan agreements, complete GAAP-basis financial statements are prepared by Domino at each month-end. Domino encounters problems pouring the concrete pad, requiring its removal and reinstalla-

tion. The extra cost incurred is $175,000. During the second month, in order to meet the completion deadline, Domino spends an extra $35,000 on overtime for the dome construction crew. Domino records different billable amounts and profits under the following five contract scenarios:

1. *Fixed-price contract.* At the end of the first month of work, Domino has already lost all of its profit and expects to incur an additional loss of $25,000. It then incurs an additional loss of $35,000 in the second month. Domino issues one billing upon completion of the project. Its calculation of losses on the contract follows:

	Month 1	*Month 2*
Total billing at completion	$1,900,000	$1,900,000
– Expected total costs	(1,750,000)	(1,925,000)
– Additional costs	(175,000)	(35,000)
+ Loss already recorded	--	25,000
= Loss to record in current period	$ (25,000)	$ (35,000)

2. *Cost-plus-fixed fee.* Domino completes the same project, but bills it to the government at cost at the end of each month, as well as a $150,000 fixed fee at the end of the project that is essentially a project management fee and which comprises all of Domino's profit. The project completion entry follows:

	Month 1	*Month 2*	*Totals*
Expected material costs	$175,000	$1,150,000	$1,325,000
+ Additional material costs	175,000	--	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	--	35,000	35,000
+ Fixed fee	--	150,000	150,000
= Total billing	$450,000	$1,660,000	$2,110,000

3. *Cost-plus-award.* Domino completes the same cost-plus-fixed-fee contract just described, but also bills the government an additional $50,000 for achieving the stipulated construction deadline, resulting in a total profit of $200,000. The project completion entry follows:

	Month 1	*Month 2*	*Totals*
Expected material costs	$175,000	$1,150,000	$1,325,000
+ Additional material costs	175,000	--	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	--	35,000	35,000
+ Fixed fee	--	150,000	150,000
+ Timely completion bonus	--	50,000	50,000
= Total billing	$450,000	$1,710,000	$2,160,000

4. *Time-and materials contract with no spending cap.* Domino completes the same project, but bills all costs incurred at the end of each month to the government. The additional material cost of the concrete pad is billed at cost, while the overtime incurred is billed at a standard hourly rate with a 25% markup. Domino's profit is contained within the markup on its labor billings. Domino records a profit on the project of $115,000 on total billings of $2,075,000. Its calculation of profits on the contract follows:

	Month 1	*Month 2*	*Totals*
Expected material costs	$175,000	$1,150,000	$1,325,000
+ Additional material costs	175,000	--	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	--	35,000	35,000
+ 25% profit on labor costs billed	25,000	90,000	115,000
= Total billing	$475,000	$1,600,000	$2,075,000

5. *Time and material contract with spending cap.* Domino completes the same time-and-materials project just described, but the contract authorization is divided into two task orders; one authorizes a spending cap of $450,000 on the concrete pad installation, while the second task order caps spending on the radar dome at $1,500,000. Domino records a loss of $10,000 on total billings of $1,950,000. Its calculation of profits on the contract follows:

	Month 1	*Month 2*	*Totals*
Expected material costs	$175,000	$1,150,000	$1,325,000
+ Additional material costs	175,000	--	175,000
+ Expected labor costs	100,000	325,000	425,000
+ Additional labor costs	--	35,000	35,000
+ 25% profit on labor costs billed	25,000	90,000	115,000
– Spending cap limitation	(25,000)	(100,000)	(125,000)
= Total billing	$450,000	$1,500,000	$1,950,000

Revenue Measurement

In practice, various methods are used to measure the extent of progress toward completion. The most common methods are the cost-to-cost method, efforts-expended method, units-of-delivery method, and units-of-work-performed method. Each of these methods of measuring progress on a contract can be identified as either an input or output measure.

The input measures attempt to identify progress on a contract in terms of the efforts devoted to it. The cost-to-cost and efforts-expended methods are examples of input measures. Under the cost-to-cost method, the percentage of completion is estimated by comparing total costs incurred from the inception of the job to date (numerator) to total costs expected for the entire job (denominator).

Output measures are made in terms of results by attempting to identify progress toward completion by physical measures. The units-of-delivery and units-of-work-performed methods are examples of output measures. Under both of these methods, an estimate of completion is made in terms of achievements to date.

Both input and output measures have drawbacks in certain circumstances. A significant problem of input measures is that the relationship between input and productivity is only indirect; inefficiencies and other factors can cause this relationship to change. A particular drawback of the cost-to-cost method is that costs of uninstalled materials and other up-front costs may produce higher estimates of the percentage-of-completion because of their early incurrence. These costs are excluded from the cost-to-cost computation or allocated over the contract life when it appears that a better measure of contact progress will be obtained.

A significant problem of output measures is that the cost, time, and effort associated with one unit of output may not be comparable to that of another. For example, because of the cost of the foundation, the costs to complete the first story of a twenty-story office building can be expected to be greater than the costs of the remaining nineteen floors.

Because ASC 605-35 recommends that "recognized income [is to] be that percentage of estimated total income...that incurred costs to date bear to estimated total costs," the cost-to-cost method has become one of the most popular measures used to determine the extent of progress toward completion.

Under the cost-to-cost method, the percentage of revenue to recognize can be determined by the following formula:

$$\left(\frac{\text{Cost to date}}{\text{Cost to date} + \text{Estimated costs to complete}} \times \begin{array}{c}\text{Contract}\\\text{price}\end{array}\right) - \begin{array}{c}\text{Revenue}\\\text{previously recognized}\end{array} = \begin{array}{c}\text{Current}\\\text{revenue recognized}\end{array}$$

By slightly modifying this formula, current gross profit can also be determined.

$$\left(\frac{\text{Cost to date}}{\text{Cost to date} + \text{Estimated costs to complete}} \times \begin{array}{c}\text{Expected total}\\\text{gross profit}\end{array}\right) - \begin{array}{c}\text{Gross profit}\\\text{previously recognized}\end{array} = \begin{array}{c}\text{Current gross}\\\text{profit earned}\end{array}$$

Example of percentage-of-completion (cost-to-cost) and completed-contract methods with profitable contract

Assume a $500,000 contract that requires three years to complete and incurs a total cost of $405,000. The following data pertain to the construction period:

	Year 1	*Year 2*	*Year 3*
Costs incurred during the period	$150,000	$210,000	$ 45,000
Cumulative costs incurred to date	150,000	360,000	405,000
Estimated costs yet to be incurred at year-end	300,000	40,000	--
Estimated total costs	450,000	400,000	--
Progress billings made during the year	100,000	370,000	30,000
Cumulative billings to date	100,000	470,000	500,000
Collections of billings	75,000	300,000	125,000

Income Statement Presentation

	Year 1	*Year 2*	*Year 3*	*Total*
Percentage-of-completion				
Contract revenues earned	$166,667*	$283,333**	$ 50,000***	$ 500,000
Cost of revenues earned	(150,000)	(210,000)	(45,000)	(405,000)
Gross profit	$ 16,667	$ 73,333	$ 5,000	$ 95,000
Completed-contract				
Contract revenues earned	--	--	$ 500,000	$ 500,000
Cost of revenues completed	--	--	(405,000)	(405,000)
Gross profit	--	--	$ 95,000	$ 95,000

$$* \quad \frac{\$150,000}{450,000} \times 500,000 = \$166,667$$

$$** \quad \left(\frac{\$360,000}{400,000} \times 500,000\right) - 166,667 = \$283,333$$

$$*** \quad \left(\frac{\$405,000}{405,000} \times 500,000\right) - 166,667 - 283,333 = \$50,000$$

Balance Sheet Presentation

		Year 1	*Year 2*	*Year 3*
Percentage-of-completion				
Current assets:				
Contract receivables		$25,000	$ 95,000	*
Costs and estimated earnings in excess of billings on uncompleted contracts		66,667		
Current liabilities:				
Billings in excess of costs and estimated earnings on uncompleted contracts, year 2			20,000	
Completed-contract				
Current assets:				
Contract receivables		$25,000	$ 95,000	*
Costs in excess of billings on uncompleted contracts				
Work-in-progress	150,000			
Less billings on long-term contracts	(100,000)	$50,000		
Current liabilities:				
Billings in excess of costs on uncompleted contracts, year 2 ($470,000 – 360,000)			$110,000	

* *Since the contract was completed, there are no balance sheet amounts at the end of year 3.*

Some contractors adopt an accounting policy of not recognizing any gross profit on a contract that is less than 10% complete. This election is usually made for two reasons.

1. The contractor is qualified to make and has made the election permitted by Internal Revenue Code §460(b)(5) to defer the recognition of such gross profit for US federal income tax purposes and wishes to avoid computational differences between applying the percentage-of-completion method for financial reporting and tax purposes, and
2. The contractor believes that this policy is prudent given the uncertainties associated with a contract that is so close to inception.

The GAAP effect of such a policy is usually immaterial and the accountant normally need not be concerned about it being a departure from GAAP.

Contract Losses

When the current estimate of total contract costs exceeds the current estimate of total contract revenues, a provision for the entire loss on the entire contract is made. Losses are recognized in the period in which they become evident under either the percentage-of-completion method or the completed-contract method. The loss is computed on the basis of the total estimated costs to complete the contract, including the contract costs incurred to date plus estimated costs (use the same elements as contract costs incurred) to complete. The loss is presented as a separately captioned current liability on the balance sheet.

In any year when a percentage-of-completion contract has an expected loss, the amount of the loss reported in that year is computed as follows:

Reported loss = Total expected loss + All profit previously recognized

Example of percentage-of-completion and completed-contract methods with loss contract

Using the previous information, if the estimated costs yet to be incurred at the end of year two were $148,000, the total expected loss is $8,000 [$500,000 – (360,000 + 148,000)], and the total loss reported in year two would be $24,667 ($8,000 + 16,667). Under the completed-contract method, the loss recognized is simply the total expected loss, $8,000.

Journal entry at end of year 2	*Percentage-of-completion*		*Completed-contract*	
Loss on uncompleted long-term contract (expense)	24,667		8,000	
Estimated loss on uncompleted contract (liability)		24,667		8,000

Profit or Loss Recognized on Contract
(Percentage-of-Completion Method)

	Year 1	*Year 2*	*Year 3*
Contract price	$500,000	$500,000	$500,000
Estimated total costs:			
Costs incurred contract-to-date	$150,000	$360,000	$506,000*
Estimated costs yet to be incurred	300,000	148,000	--
Estimated total costs for the three-year period, actual for year 3	$450,000	$508,000	$506,000
Estimated gross profit (loss), actual for year 3	50,000	(8,000)	(6,000)
Summary of Effect on Results of Operations			
Current end-of-year estimate of gross profit (loss) actual for year 3	--	$ (8,000)	$ (6,000)
Accumulated effect of gross profit (loss) recognized in prior years	--	16,667	(8,000)
Effect on gross profit (loss) recognized in current year	--	$ (24,667)	$ 2,000

* *Assumed*

Profit or Loss Recognized on Contract
(Completed-Contract Method)

	Year 1	*Year 2*	*Year 3*
Contract price	$500,000	$500,000	$500,000
Estimated total costs:			
Costs incurred to date	$150,000	$360,000	$506,000*
Estimated cost yet to be incurred	300,000	148,000	--
Estimated total costs for the three-year period, actual for year 3	$450,000	$508,000	$506,000
Estimated profit (loss), inception-to-date, actual for year 3	$ 50,000	$ (8,000)	$ (6,000)
Loss previously recognized	--	--	$ (8,000)
Amount of estimated income (loss) recognized in the current period, actual for year 3	--	$ (8,000)	$ 2,000

* *Assumed*

Upon completion of the project during year 3, it can be seen that the actual loss was only $6,000 ($500,000 – $506,000); therefore, the estimated loss provision was overstated in previous years by $2,000. However, since this is a change of an estimate, the $2,000 difference must be handled prospectively; consequently, $2,000 of income is recognized in year 3 ($8,000 loss previously recognized – $6,000 actual loss).

Combining and Segmenting Contracts

The profit center for accounting purposes is usually a single contract, but under some circumstances the profit center may be a combination of two or more contracts, a segment of a contract or a group of combined contracts. The contracts must meet requirements in ASC 605-35 in order to combine, or segment; otherwise, each individual contract is presumed to be the profit center.

For accounting purposes, a group of contracts may be combined if they are so closely related that they are, in substance, parts of a single project with an overall profit margin. Per ASC 605-35, a group of contracts may be combined if the contracts

1. Are negotiated as a package in the same economic environment with an overall profit margin objective.
2. Constitute an agreement to do a single project.

3. Require closely interrelated construction activities.
4. Are performed concurrently or in a continuous sequence under the same project management.
5. Constitute, in substance, an agreement with a single customer.

Segmenting a contract is a process of breaking up a larger unit into smaller units for accounting purposes. If the project is segmented, revenues are assigned to the different elements or phases to achieve different rates of profitability based on the relative value of each element or phase to the estimated total contract revenue. According to ASC 605-35, a project may be segmented if all of the following steps were taken and are documented and verifiable:

1. The contractor submitted bona fide proposals on the separate components of the project and on the entire project.
2. The customer had the right to accept the proposals on either basis.
3. The aggregate amount of the proposals on the separate components approximated the amount of the proposal on the entire project.

A project that does not meet the above criteria may still be segmented if all of the following are applicable:

1. The terms and scope of the contract or project clearly call for the separable phases or elements.
2. The separable phases or elements of the project are often bid or negotiated separately in the marketplace.
3. The market assigns different gross profit rates to the segments because of factors such as different levels of risk or differences in the relationship of the supply and demand for the services provided in different segments.
4. The contractor has a significant history of providing similar services to other customers under separate contracts for each significant segment to which a profit margin higher than the overall profit margin on the project is ascribed.
5. The significant history with customers who have contracted for services separately is one that is relatively stable in terms of pricing policy rather than one unduly weighted by erratic pricing decisions (responding, for example, to extraordinary economic circumstances or to unique customer-contractor relationships).
6. The excess of the sum of the prices of the separate elements over the price of the total project is clearly attributable to cost savings incident to combined performance of the contract obligations (for example, cost savings in supervision, overhead, or equipment mobilization). Unless this condition is met, segmenting a contract with a price substantially less than the sum of the prices of the separate phases or elements is inappropriate even if the other conditions are met. Acceptable price variations are allocated to the separate phases or elements in proportion to the prices ascribed to each. In all other situations a substantial difference in price (whether more or less) between the separate elements and the price of the total project is evidence that the contractor has accepted different profit margins. Accordingly, segmenting is not appropriate, and the contracts are the profit centers.
7. The similarity of services and prices in the contract segments and services and the prices of such services to other customers contracted separately are documented and verifiable.

Note that the criteria for combining and segmenting are to be applied consistently to contracts with similar characteristics and in similar circumstances.

Joint Ventures and Shared Contracts

Especially large or risky contracts are sometimes shared by more than one contractor. When the owner of the contract requests competitive bids, many contractors will form syndicates or joint ventures in order to bid on and successfully obtain a contract that each contractor individually could not perform.

When this occurs, a separate set of accounting records is maintained for the joint venture. If the percentages of interest for each of the participants are identical in more than one contract, the joint venture might keep its records in the same manner as it would if it was simply another construction company. Usually, the joint venture is for a single contract and ends upon completion of that contract.

A joint venture is a type of partnership, organized for a limited purpose. An agreement of the parties and the terms of the contract successfully bid upon will determine the nature of the accounting records. Income statements are usually cumulative statements showing totals from date of contract inception until reporting date. Each participant records its share of the amount from the venture's income statement less its previously recorded portion of the venture's income as a single line item similar to the equity method for investments. Similarly, balance sheets of each participant present a single line asset balance, "investment in and advances to joint ventures." In most cases, footnote disclosure is similar to the equity method and presents condensed financial statements of material joint ventures.

Accounting for Change Orders

Change orders are modifications of specifications or provisions of an original contract. Contract revenue and costs are adjusted to reflect change orders that are approved by the contractor and customer. According to ASC 605-35, accounting for a change order depends on the scope and price of the change.

If the scope and price have both been agreed to by the customer and contractor, contract revenue and cost are both adjusted to reflect the change order.

According to ASC 605-35, accounting for unpriced change orders depends on their characteristics and the circumstances in which they occur. Under the completed-contract method, costs attributable to unpriced change orders are deferred as contract costs if it is probable that total contract costs, including costs attributable to the change orders, will be recovered from contract revenues. Recovery is deemed probable if the future event or events are likely to occur.

Per ASC 605-35, the following guidelines apply when accounting for unpriced change orders under the percentage-of-completion method:

1. If it is not probable that the costs will be recovered through a change in the contract price, costs attributable to unpriced change orders are treated as costs of contract performance in the period in which the costs are incurred.
2. If it is probable that the costs will be recovered through a change in the contract price, the costs are deferred (excluded from the costs of contract performance) until the parties have agreed on the change in contract price, or alternatively, treated as costs of contract performance in the period in which they are incurred with a corresponding increase to contract revenue in the amount of the costs incurred.
3. If it is probable that the contract price will be adjusted by an amount that exceeds the costs attributable to the change order and both of the following apply:

   a. The amount of the excess can be reliably estimated, and
   b. Realization of the full contract price adjustment is probably beyond a reasonable doubt,

the original contract price is adjusted for the full amount of the adjustment as the costs are recognized.

However, since the substantiation of the amount of future revenue is difficult, satisfaction of the condition of "realization beyond a reasonable doubt" should only be considered satisfied in circumstances in which an entity's historical experience provides such assurance or in which an entity has received a bona fide pricing offer from a customer and records only the amount of the offer as revenue.

Accounting for Contract Options

Per ASC 605-35, an addition or option to an existing contract is treated as a separate contract if any of the following circumstances exist:

1. The product or service to be provided differs significantly from the product or service provided under the original contract.
2. The price of the new product or service is negotiated without regard to the original contract and involves different economic judgments.
3. The products or services to be provided under the exercised option or amendment are similar to those under the original contract, but the contract price and anticipated contract cost relationship are significantly different.

If the addition or option does not meet the above circumstances, the contracts are combined unless the addition or option does not meet the criteria for combining, in which case it is treated as a change order.

Accounting for Claims

Claims represent amounts in excess of the agreed-upon contract price that a contractor seeks to collect from customers for unanticipated additional costs. The recognition of additional contract revenue relating to claims is appropriate if it is probable that the claim will result in additional revenue and if the amount can be reliably estimated. ASC 605-35 specifies that all of the following conditions must exist in order for the probable and estimable requirements to be satisfied:

1. The contract or other evidence provides a legal basis for the claim; or a legal opinion has been obtained, stating that under the circumstances there is a reasonable basis to support the claim.
2. Additional costs are caused by circumstances that were unforeseen at the contract date and are not the result of deficiencies in the contractor's performance.
3. Costs associated with the claim are identifiable or otherwise determinable and are reasonable in view of the work performed.
4. The evidence supporting the claim is objective and verifiable, not based on management's "feel" for the situation or on unsupported representations.

When the above requirements are met, revenue from a claim is recorded only to the extent that contract costs relating to the claim have been incurred.

When the above requirements are not met, ASC 605-35 states that a contingent asset is disclosed in accordance with ASC 450.

Accounting Changes

ASC 250 requires retroactive restatement as the standard methodology to be used for accounting for changes in accounting principle, including changes in the accounting for long-term construction contracts. (See Chapter 5 for further discussion.)

Revisions in revenue, cost, and profit estimates or in measurements of the extent of progress toward completion are changes in accounting estimates. These changes are accounted for prospectively in order for the financial statements to fully reflect the effects of the latest available estimates.

Deferred Income Taxes

Deferred income taxes resulting from temporary differences are classified in accordance with ASC 740, *Income Taxes*. Contract-related deferred income taxes result from the use of a method of income recognition for income tax purposes different from the method used for financial reporting purposes. (Refer to Chapter 17 for further discussion of deferred income taxes.)

SERVICE REVENUES

PERSPECTIVE AND ISSUES

Services represent over half of the transactions completed in the US economy, but there is no official codification that provides specific accounting standards for them. Accounting for service transactions has evolved primarily through industry practice, and as a result, different accounting methods have developed to apply the fundamental principles of revenue and cost recognition. In fact, different accounting methods are used by similar entities for practically identical transactions.

FASB is currently pursuing a major project addressing revenue recognition, which would resolve the accounting for service transactions. It is anticipated that this project will be ongoing through 2008. In the interim, until definitive standards regarding revenue recognition are promulgated, this section can still provide relevant guidance on service industry issues. In addition, the guidance provided by the SEC in Staff Accounting Bulletin 101 and its replacement, SAB 104, discussed in the introductory materials to this chapter, is highly relevant to accounting for service transactions and should be deemed pertinent to accounting even by nonpublic reporting entities, inasmuch as it reflects the current thinking by an authoritative source of GAAP.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue	
605-20-25	Revenue Recognition—Services
605-45-15	Revenue Recognition—Principal Agent Considerations

DEFINITIONS OF TERMS

Collection method. A method that recognizes revenue when cash is collected.

Completed performance method. A method that recognizes revenue after the last significant act has been completed.

Direct costs. Costs that are related specifically to the performance of services under a contract or other arrangement.

Indirect costs. Costs that are incurred as a result of service activities that are not directly allocable to specific contracts or customer arrangements.

Initiation fee. A onetime, up-front charge that gives the purchaser the privilege of using a service or facilities.

Installation fee. A onetime, up-front charge for making equipment operational so that it functions as intended.

Out-of-pocket costs. Costs incurred incidental to the performance of services that are often reimbursable to the service firm by the customer either at actual cost or at an agreed-upon rate (e.g., meals, lodging, airfare, taxi fares, etc.).

Precontract or preengagement costs. Costs incurred prior to execution of a service contract or engagement letter.

Product transaction. A transaction between a seller and a purchaser in which the seller supplies tangible merchandise to the purchaser.

Proportional performance method. A method that recognizes revenue on the basis of the number of acts performed in relation to the total number of acts to be performed.

Service transaction. A transaction between a seller and a purchaser in which the seller performs work, or agrees to maintain a readiness to perform work, for the purchaser.

Specific performance method. A method that recognizes revenue after one specific act has been performed.

CONCEPTS, RULES, AND EXAMPLES

The AICPA has defined service transactions as follows:

> *...transactions between a seller and a purchaser in which, for a mutually agreed price, the seller performs, agrees to perform, agrees to perform at a later date, or agrees to maintain readiness to perform an act or acts, including permitting others to use enterprise resources that do not alone produce a tangible commodity or product as the principal intended result.*

Generally accepted accounting principles require that revenue generally be recognized when (1) it is realized or realizable and (2) it has been earned. With respect to service transactions, the AICPA concluded

> *...revenue from service transactions [is to] be based on performance, because performance determines the extent to which the earnings process is complete or virtually complete.*

In practice, performance may involve the execution of a defined act, a set of similar or identical acts, or a set of related but not similar or identical acts. Performance may also occur with the passage of time. Accordingly, one of the following four methods can serve as a guideline for the recognition of revenue from service transactions:

1. The specific performance method
2. The proportional performance method
3. The completed performance method
4. The collection method

Service vs. Product Transactions

Many transactions involve the sale of a tangible product and a service; therefore, for proper accounting treatment, it must be determined whether the transaction is primarily a service transaction accompanied by an incidental product, primarily a product transaction accompanied by an incidental service, or a sale in which both a service transaction and a product transaction occur. The following criteria apply:

1. **Service transactions.** If the seller offers both a service and a product in a single transaction and if the terms of the agreement for the sale of the service are worded in such a manner that the inclusion or exclusion of the product would not change the total transaction price, the product is incidental to the rendering of the service; the transaction is a service transaction that is accounted for in accordance with one of the four methods presented. For example, fixed-price equipment maintenance contracts that include parts at no additional charge are service transactions.

2. **Product transactions.** If the seller offers both a service and a product in a single transaction and if the terms of the agreement for the sale of the product are worded in such a manner that the inclusion or exclusion of the service would not change the total transaction price, the rendering of the service is incidental to the sale of the product; the transaction is a product transaction that is accounted for as such. For example, the sale of a product accompanied by a guarantee or warranty for repair is considered a product transaction.
3. **Service and product transactions.** If the seller offers both a product and a service and the agreement states the product and service are separate elements such that the inclusion or exclusion of the service would vary the total transaction price, the transaction consists of two components: a product transaction that is accounted for separately as such, and a service transaction that is accounted for in accordance with one of the four accepted methods.

Revenue Recognition Methods

Once a transaction is determined to be a service transaction, one of the following four methods is used to recognize revenue. The method chosen is to be based on the nature and extent of the service(s) to be performed.

1. **Specific performance method.** The specific performance method is used when performance consists of the execution of a single act. Revenue is recognized at the time the act takes place. For example, a stockbroker records sales commissions as revenue upon the sale of a client's investment.
2. **Proportional performance method.** The proportional performance method is used when performance consists of a number of identical or similar acts.

   a. If the service transaction involves a specified number of identical or similar acts, an equal amount of revenue is recorded for each act performed. For example, a refuse disposal company recognizes an equal amount of revenue for each weekly removal of a customer's garbage.

   b. If the service transaction involves a specified number of defined but not identical or similar acts, the revenue recognized for each act is based on the following formula:

   $$\frac{\text{Direct cost of individual act}}{\text{Total estimated direct costs of the transaction}} \times \text{Total revenues from complete transaction}$$

   For example, a correspondence school that provides lessons, examinations, and grading would use this method. If the measurements suggested in the preceding equation are impractical or not objectively determinable, revenue is recognized on a systematic and rational basis that reasonably relates revenue recognition to service performance.

   c. If the service transaction involves an unspecified number of acts over a fixed time period for performance, revenue is recognized over the period during which the acts will be performed by using the straight-line method unless a better method of relating revenue and performance is appropriate. For example, a health club might recognize revenue on a straight-line basis over the term of a member's membership. Many professional service firms record revenues on their engagements on an "as-performed basis" by valuing labor time, as expended, at a standard hourly billing rate and accumulating these amounts as an asset, work-in-progress (WIP). For periodic reporting, ending balances of WIP

(and the related revenue recognized) must be adjusted by recording valuation allowances for unbillable or unrealizable WIP.

Example of proportional performance revenue recognition

The Cheyenne Snow Removal Company enters into a contract with the Western Office Tower to plow its parking lot. The contract states that Cheyenne will receive a fixed payment of $500 to clear Western's central parking lot whenever snowfall exceeds two inches. Following an unusually snowy winter, Western elects to cap its snow removal costs by tying Cheyenne into an annual $18,000 fixed price for snow removal, no matter how many snow storms occur. Snowfall is not predictable by month, and can occur over as much as a six-month period. Western pays the full amount in advance, resulting in the following entry by Cheyenne:

Cash	18,000	
Customer advances		18,000

Though Cheyenne could recognize revenue on a straight-line basis though the contract period, it chooses to tie recognition more closely to actual performance with the proportional performance method. Its total estimated direct cost through the contract period is likely to be $12,600, based on its average costs in previous years. There is one snowstorm in October, which costs Cheyenne $350 for snow removal under the Western contract. Cheyenne's revenue recognition calculation in October is

$$\frac{\$350 \text{ direct cost}}{\$12{,}600 \text{ total direct cost}} \times \$18{,}000 \text{ total revenue} = \$500 \text{ revenue recognition}$$

Thus, Cheyenne recognizes a gross margin of $150 during the month. By the end of February, Cheyenne has conducted snow removal 28 times at the same margin, resulting in revenue recognition of $14,000 and a gross margin of $4,200. Cheyenne's cumulative entry for all performance under the Western contract to date is as follows:

Customer advances	14,000	
Direct labor expense	9,800	
Revenue		14,000
Cash		9,800

In March, Cheyenne removes snow 12 more times at a cost of $4,200. Its initial revenue recognition calculation during this month is

$$\frac{\$4{,}200 \text{ direct cost}}{\$12{,}600 \text{ total direct cost}} \times \$18{,}000 \text{ total revenue} = \$6{,}000 \text{ revenue recognition}$$

However, this would result in total revenue recognition of $20,000, which exceeds the contract fixed fee by $2,000. Accordingly, Cheyenne only recognizes sufficient revenue to maximize the contract cap, resulting in a loss of $200 for the month.

Customer advances	4,000	
Direct labor expense	4,200	
Revenue		4,000
Cash		4,200

3. **Completed performance method.** The completed performance method is used when more than one act must be performed and when the final act is so significant to the entire transaction taken as a whole that performance cannot be considered to have taken place until the performance of that final act occurs. For example, a moving company packs, loads, and transports merchandise; however, the final act of delivering the merchandise is so significant that revenue is not recognized until the goods reach their intended destination. If the services are to be performed in an indeterminable number of acts over an indeterminable period of time and if an objective measure for estimating the degree to which performance has taken place cannot be found, revenue is recognized under the completed performance method.

4. **Collection method.** The collection method is used in circumstances when there is a significant degree of uncertainty surrounding the collection of service revenue. Under this method, revenue is not recognized until the cash is collected. For example, personal services may be provided to a customer whose ability to pay is uncertain.

Expense Recognition

GAAP, in general, requires that costs be recognized as expense in the period that the revenue with which they are associated is recognized (the matching principle). Costs are deferred only when they are expected to be recoverable from future revenues. When applying these principles to service transactions, special consideration must be given to the different types of costs that might arise. The major classifications of costs arising from service transactions are as follows:

1. **Precontract or preengagement costs.** These are costs that are incurred before the service contract (or engagement letter in many professional services firms) has been executed between the parties. They can include legal fees for negotiating contract terms, costs of credit investigations, and the salaries and benefits of individuals involved in negotiating contracts with prospective clients. (See the related discussion in the long-term construction contracts section of this chapter.)
2. **Direct costs.** Costs that are specifically attributable to providing service under a specific contract or contracts. For example, service labor and repair parts on a fixed-price maintenance contract.
3. **Indirect costs.** Costs that are incurred as a result of all service activity but that are not directly allocable to any specific contracts or engagements.
4. **Out-of-pocket costs.** Costs incurred incidental to the performance of services that are often reimbursable to the service firm by the customer either at actual cost or at an agreed-upon rate (e.g., meals, lodging, airfare, taxi fare, etc.).
5. **Overhead.** General costs of running the business that do not fall into any of the above categories, often referred to as selling, general, and administrative expenses. These include uncollectible receivables, advertising, sales commissions, and facilities costs (depreciation, rent, maintenance, etc.).

Accounting treatment. The costs listed above are accounted for as follows:

1. **Precontract or preengagement costs.** Expense as incurred as start-up costs under SOP 98-5 under all of the service revenue recognition methods.
2. **Direct costs.** Expense as incurred under all of the service revenue recognition methods because of the close correlation between the amount of direct costs incurred and the extent of performance achieved. Direct costs incurred prior to performance, referred to as initial direct costs (e.g., expendable materials purchased for use on the job/engagement that are purchased and held by the service enterprise as a form of inventory), are deferred and recorded as prepayments (or supplies inventory, depending on the nature of the item). Under the specific performance or completed performance methods, these costs are recognized as expenses at the time of service performance at the point that revenue is recognized. Under the proportional performance method, initial direct costs are charged to expense in proportion to the recognition of service revenue (i.e., by applying the ratio of revenues recognized in the period to total expected revenues over the life of the contract).
3. **Indirect costs.** Under all of the revenue recognition methods, indirect costs are expensed as incurred.

4. **Out-of-pocket costs.** Under all of the revenue recognition methods, out-of-pocket costs are expensed as incurred with the related client billings presented as revenue in the statement of income.
5. **Overhead.** Under all of the revenue recognition methods, overhead is expensed as incurred.

Losses on service transactions are recognized when direct costs incurred to date plus estimated remaining direct costs of performance exceed the current estimated net realizable revenue from the contract. The loss (given as the Direct costs incurred to date + Estimated remaining direct costs – Estimated realizable revenue) is first applied to reduce any recorded deferred costs to zero, with any remaining loss recognized on the income statement and credited to an estimated liability.

Initiation and Installation Fees

Many service transactions also involve the charging of a nonrefundable initiation or activation fee with subsequent periodic payments for future services and/or a nonrefundable fee for installation of equipment essential to providing future services with subsequent periodic payments for the services. These nonrefundable fees may, in substance, be partly or wholly advance charges for future services.

Initiation or activation fees. If there is an objectively determinable value for the right or privilege granted by the fee, that value is recognized as revenue on the initiation date. Any related direct costs are recognized as expense on the initiation date. If the value of the right or privilege cannot be objectively determined, the fee is recorded as a liability for future services and recognized as revenue in accordance with one of the revenue recognition methods.

Installation fees. If the equipment and its installation costs are essential for the service to be provided and if customers cannot normally purchase the equipment in a separate transaction, the installation fee is considered an advance charge for future services. The fee is recognized as revenue over the estimated service period. The costs of installation and the installed equipment are amortized over the period the equipment is expected to generate revenue. If customers can normally purchase the equipment in a separate transaction, the installation fee is part of a product transaction that is accounted for separately as such.

Example of installation fees

Vintner Corporation has invented a nitrogen injection device for resealing opened wine bottles, calling it NitroSeal. The device is especially useful for restaurants, which can seal wine bottles opened for customers who want to take home unfinished wine. Because the NitroSeal device is massive, Vintner pays a third party to install each unit for a fixed fee of $200, charging restaurants a $300 nonrefundable installation fee plus a monthly fee for a 20-month cancelable contract. The initial entries to record an installation charge from a supplier and related installation billing to a customer are as follows:

Installation asset	200	
Accounts payable		200
Accounts receivable	300	
Unearned installation fees (liability)		300

Vintner recognizes the installation revenue and associated installation expense for each installation in 1/20 increments to match the contract length, each with the following entry:

Unearned installation fees	15	
Installation revenue		15
Installation expense	10	
Installation asset		10

A customer cancels its contract with Vintner after 5 months. As a result, Vintner accelerates all remaining amortization on the installation asset and recognizes all remaining unearned installation fees at once, using the following entries:

Unearned installation fees	225	
Installation revenue		225
Installation expense	150	
Installation asset		150

If the service contract had included a clause for a refundable installation fee, then cancellation after five months would still have resulted in immediate acceleration of amortization on the installation asset. However, the unearned installation revenue could not be recognized. Instead, the following entry would have recorded the return of the installation fee:

Unearned installation fees	225	
Cash		225

Recommended Disclosures—Not Required by GAAP

1. The revenue recognition method used and its justification
2. Information concerning unearned revenues
3. Information concerning deferred costs
4. Periods over which services are to be performed

Other Guidance to Accounting for Service Transactions

Some elements of the accounting codification provide guidance to the accounting for service transactions. These are discussed in the following paragraphs.

Freight services in process. ASC 605-20-25 addresses the manner in which revenue and expense pertaining to freight services in process as of the balance sheet date are to be given financial statement recognition. It holds that recognition of revenue when freight is received from the shipper or when freight leaves the carrier's terminal, with expenses recognized as incurred, is not acceptable accounting.

Reporting reimbursable costs. While not limited to service providers, a common situation for many professional service providers is the incurrence of costs that are later billed to clients, with or without a mark-up over actual cost. Examples of out-of-pocket expenses include meals, lodging, airfare, taxi fares, etc. Prior practice had been varied, with many reporting entities showing reimbursements, implicitly as offsets to expenses; others reported such reimbursements as revenue. While the net effect on reported earnings was the same under either approach, certain key performance measures, such as gross revenue, could vary considerably depending on choice of accounting method. ASC 605-45-15 mandates that any billings for out-of-pocket costs are to be classified as revenue in the statement of income and not as a reduction in expenses. This guidance is equally applicable whether expenses are billed to clients (1) as a pass-through, (i.e., at actual cost to the service firm without a mark-up), (2) at a marked-up amount, or (3) are included in the billing rate or negotiated price for the services.

Separately priced extended warranties. Extended warranties provide additional protection beyond that of the manufacturer's original warranty, lengthen the period of coverage specified in the manufacturer's original warranty, or both. Similarly, a product maintenance contract is an agreement for services to maintain a product for a certain length of time. Clearly, revenue recognition at inception is not acceptable, and it is often impossible to estimate the actual pattern of service that will be provided to the customers over the terms of the contracts. ASC 605-20-25 directs that revenue from these contracts be deferred and recognized on a straight-line basis unless evidence exists that costs are incurred on some other

basis. If so, revenue is allocated to each period using the ratio of the period's cost to estimated total cost.

Direct costs of obtaining extended warranty or maintenance contracts are to be capitalized and recognized as expense in the ratio that revenues recognized each period bear to total anticipated revenues from the respective contracts. Any other costs are charged to expense as incurred. Losses on these contracts are recognized immediately if the sum of the future costs and remaining unamortized direct acquisition costs exceed the related unearned revenue. When recognizing a loss, any unamortized acquisition costs are first charged to expense, and a liability for any remaining loss is then recorded.

Example of a separately priced product maintenance contract

Salomon Heating enters into a four-year product maintenance contract with Everly Manufacturing, under which Salomon will conduct preventive maintenance and repairs to Everly's heating systems. Under the contract terms, Salomon bills Everly $1,000 during each month of the contract period, and recognizes the billed amount as revenue at once. This equates to straight-line recognition of the total contract amount.

Salomon incurred a $4,000 legal expense in writing the contract with Everly, as well as a $1,600 commission, both of which it defers and amortizes over the contract period. During the first month of work, Salomon incurs direct costs of $650 in wages, as well as $200 of repair-related materials. Its charge to expense entry follows:

Cost of goods sold—materials	200	
Cost of goods sold—labor	650	
Legal expense	83	
Commission expense	33	
Inventory—spare parts		200
Cash		650
Deferred legal costs		83
Deferred commission costs		33

At the end of two years, Salomon realizes that it must rebuild Everly's boiler. The rebuild will cost $10,000, while all expected future maintenance work will cost an additional $20,000. Unamortized legal costs equal $2,000 and unamortized commissions equal $800, while unearned revenue is $24,000. Salomon must recognize a loss of $8,800, which is the difference between all expected costs of $32,800 and unearned revenue of $24,000. To do so, Salomon accelerates all remaining amortization of the capitalized legal and commission assets, and recognizes a liability for the remainder of the loss with the following entry:

Commission expense	800	
Legal expense	2,000	
Loss on contractual obligation	6,000	
Deferred commission costs		800
Deferred legal costs		2,000
Unfulfilled contractual obligations (liability)		6,000

Salomon rebuilds Everly's boiler at the expected cost of $10,000. Since this is one-third of the remaining costs to be incurred under the contract, Salomon recognizes one-third of the $6,000 unfulfilled contractual obligation that was used to offset the loss, and charges the rest of the cost to expense with the following entry:

Unfulfilled contractual obligations (liability)	2,000	
Cost of goods sold—labor	8,000	
Cash		10,000

SALES WHEN COLLECTION IS UNCERTAIN

PERSPECTIVE AND ISSUES

Under GAAP, revenue recognition customarily does not depend upon the collection of cash. Accrual accounting techniques normally record revenue at the point of a credit sale by

establishing a receivable. When uncertainty arises surrounding the collectibility of this amount, the receivable is appropriately adjusted by establishing a valuation allowance. In some cases, however, the collection of the sales price may be so uncertain that an objective measure of ultimate collectibility cannot be established. When such circumstances exist, the seller either uses the installment method or the cost recovery method to recognize the transaction (ASC 605-10-25). Both of these methods allow for a deferral of gross profit until cash has been collected.

An installment transaction occurs when a seller delivers a product or performs a service and the buyer makes periodic payments over an extended period of time. Under the installment method, revenue recognition is deferred until the period(s) of cash collection. The seller recognizes both revenues and cost of sales at the time of the sale; however, the related gross profit is deferred to those periods in which cash is collected. Under the cost recovery method, both revenues and cost of sales are recognized at the time of the sale, but none of the related gross profit is recognized until the entire cost of sales has been recovered. Once the seller has recovered all cost of sales, any additional cash receipts are recognized as revenue. ASC 605-10-25 does not specify when one method is preferred over the other. However, the cost recovery method is more conservative than the installment method because gross profit is deferred until all costs have been recovered; therefore, it is appropriate for situations of extreme uncertainty.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue	
605-10-25	Revenue Recognition

DEFINITIONS OF TERMS

Cost recovery method. The method of accounting for an installment basis sale whereby the gross profit is deferred until all cost of sales has been recovered.

Deferred gross profit. The gross profit from an installment basis sale that will be recognized in future periods.

Gross profit rate. The percentage computed by dividing gross profit by revenue from an installment sale.

Installment method. The method of accounting for a sale whereby gross profit is recognized in each period in which cash from the sale is collected.

Installment sale. A sales transaction for which the sales price is collected through the receipt of periodic payments over an extended period of time.

Net realizable value. The portion of the recorded amount of an asset expected to be realized in cash upon its liquidation in the ordinary course of business.

Realized gross profit. The gross profit recognized in the current period.

Repossessions. Merchandise sold by a seller under an installment arrangement that the seller physically takes back after the buyer defaults on the payments.

CONCEPTS, RULES, AND EXAMPLES

The Installment Method

The installment method was developed in response to the increasing incidence of sales contracts that allowed buyers to make payments over several years. As the payment period becomes longer, the risk of loss resulting from uncollectible accounts increases; consequently, circumstances surrounding a receivable may lead to considerable uncertainty as to whether payments will actually be received. Under these circumstances, the uncertainty of cash collection dictates that revenue recognition be deferred until the actual receipt of cash.

The installment method can be used in most sales transactions for which payment is to be made through periodic installments over an extended period of time and the collectibility of the sales price cannot be reasonably estimated. This method is applicable to the sales of real estate (covered in the last section of this chapter), heavy equipment, home furnishings, and other merchandise sold on an installment basis. Installment method revenue recognition is not in accordance with accrual accounting because revenue recognition is not normally based upon cash collection; however, its use is justified in certain circumstances on the grounds that accrual accounting may result in "front-end loading" (i.e., all of the revenue from a transaction being recognized at the point of sale with an improper matching of related costs). For example, the application of accrual accounting to transactions that provide for installment payments over periods of ten, twenty, or thirty years may underestimate losses from contract defaults and other future contract costs.

Applying the installment method. When a seller uses the installment method, both revenue and cost of sales are recognized at the point of sale, but the related gross profit is deferred to those periods during which cash will be collected. As receivables are collected, a portion of the deferred gross profit equal to the gross profit rate times the cash collected is recognized as income. When this method is used, the seller must compute each year's gross profit rate and also must maintain records of installment accounts receivable and deferred revenue that are separately identified by the year of sale. All general and administrative expenses are normally expensed in the period incurred.

The steps to use in accounting for sales under the installment method are as follows:

1. During the current year, record sales and cost of sales in the regular manner. Record installment sales transactions separately from other sales. Set up installment accounts receivable identified by the year of sale (e.g., Installment Accounts Receivable—2009).
2. Record cash collections from installment accounts receivable. Care must be taken so that the cash receipts are properly identified as to the year in which the receivable arose.
3. At the end of the current year, transfer installment sales revenue and installment cost of sales to deferred gross profit properly identified by the year of sale. Compute the current year's gross profit rate on installment sales as follows:

$$\text{Gross Profit rate} = 1 - \left(\frac{\text{Cost of installment sales}}{\text{Installment sales revenue}}\right)$$

   Alternatively, the gross profit rate can be computed as follows:

$$\text{Gross profit rate} = \frac{\text{Installment sales revenue} - \text{Cost of installment sales}}{\text{Installment sales revenue}}$$

4. Apply the current year's gross profit rate to the cash collections from the current year's installment sales to compute the realized gross profit from the current year's installment sales.

$$\text{Realized gross profit} = \begin{array}{c}\text{Cash collections from the}\\ \text{current year's installment sales}\end{array} \times \begin{array}{c}\text{Current year's}\\ \text{gross profit rate}\end{array}$$

5. Separately apply each of the previous years' gross profit rates to cash collections from those years' installment sales to compute the realized gross profit from each of the previous years' installment sales.

$$\text{Realized gross profit} = \begin{array}{c}\text{Cash collections from the}\\ \text{previous years' installment sales}\end{array} \times \begin{array}{c}\text{Previous years'}\\ \text{gross profit rate}\end{array}$$

6. Defer the current year's unrealized gross profit to future years. The deferred gross profit to carry forward to future years is computed as follows:

$$\text{Deferred gross profit (2009)} = \text{Ending balance installment account receivable (2009)} \times \text{Gross profit rate (2009)}$$

Example of the installment method of accounting

	2009	2010	2011
Sales on installment	$400,000	$450,000	$600,000
Cost of installment sales	(280,000)	(337,500)	(400,000)
Gross profit on sales	$120,000	$112,500	$200,000
Cash collections:			
2009 sales	$150,000	$175,000	$ 75,000
2010 sales		$200,000	$125,000
2011 sales			$300,000

Accounting entries are made for steps 1 and 2 above using this data; the following computations are required for steps 3-6:

Step 3 — Compute the current year's gross profit rate.

	2009	2010	2011
Gross profit on sales	$120,000	$112,500	$200,000
Installment sales revenue	$400,000	$450,000	$600,000
Gross profit rate	30%	25%	33 1/3%

Step 4 — Apply the current year's gross profit rate to cash collections from current year's sales.

Year	Cash collections		Gross profit rate		Realized gross profit
2009	$150,000	×	30%	=	$ 45,000
2010	200,000	×	25%	=	50,000
2011	300,000	×	33 1/3%	=	100,000

Step 5 — Separately apply each of the previous years' gross profit rates to cash collections from that year's installment sales.

In Year 2010

From year	Cash collections		Gross profit rate		Realized gross profit
2009	$175,000	×	30%	=	$52,500

In Year 2011

From year	Cash collections		Gross profit rate		Realized gross profit
2009	$ 75,000	×	30%	=	$22,500
2010	125,000	×	25%	=	31,250
					$53,750

Step 6 — Defer the current year's unrealized gross profit to future years.

12/31/09		
Deferred gross profit (2009) = ($400,000 – 150,000) × 30%	=	$ 75,000
12/31/10		
Deferred gross profit (2010) = ($450,000 – 200,000) × 25%	=	$ 62,500
Deferred gross profit (2009) = ($400,000 – 150,000 – 175,000) × 30%	=	22,500
		$ 85,000
12/31/11		
Deferred gross profit (2011) = ($600,000 – 300,000) × 33 1/3%	=	$100,000
Deferred gross profit (2010) = ($450,000 – 200,000 – 125,000) × 25%	=	31,250
		$131,250

Financial statement presentation. If installment sales transactions represent a significant portion of the company's total sales, the following three items of gross profit would, theoretically, be reported on the company's income statement:

1. Total gross profit from current year's sales
2. Realized gross profit from current year's sales
3. Realized gross profit from prior years' sales

An income statement using the previous example would be presented as follows (assume all sales are accounted for by the installment method):

Jordan Equipment Company
Partial Income Statement
For the Years Ending December 31

	2009	2010	2011
Sales	$400,000	$450,000	$600,000
Cost of sales	(280,000)	(337,500)	(400,000)
Gross profit on current year's sales	120,000	112,500	200,000
Less deferred gross profit on current year's sales	(75,000)	(62,500)	(100,000)
Realized gross profit on current year's sales	45,000	50,000	100,000
Plus gross profit realized on prior years' sales	--	52,500	53,750
Total gross profit on sales	$ 45,000	$102,500	$153,750

However, when a company recognizes only a small portion of its revenues using the installment method, the illustrated presentation of revenue and gross profit may be confusing. Therefore, in practice, some companies simply report the realized gross profit from installment sales by displaying it as a single line item on the income statement as follows:

Stevens Furniture Company
Partial Income Statement
For the Year Ended December 31, 2009

Sales	$ 2,250,000
Cost of sales	(1,350,000)
Gross profit on sales	900,000
Gross profit realized on installment sales	35,000
Total gross profit on sales	$ 935,000

The balance sheet presentation of installment accounts receivable depends upon whether installment sales are a normal part of operations. If a company sells most of its products on an installment basis, installment accounts receivable are classified as a current asset because the operating cycle of the business (the length of which is to be disclosed in the notes to the financial statements) is the average period of time covered by its installment contracts. If installment sales are not a normal part of operations, installment accounts receivable that are not to be collected for more than a year (or the length of the company's operating cycle, if different than a year) are reported as noncurrent assets. In all cases, to avoid confusion, it is desirable to fully disclose the year of maturity next to each group of installment accounts receivable as illustrated by the following example:

Current assets:		
Accounts receivable		
Customers	$180,035	
Less allowance for uncollectible accounts	(4,200)	
	175,835	
Installment accounts—collectible in 2010	26,678	
Installment accounts—collectible in 2011	42,234	$244,747

Accounting for deferred gross profit is addressed in CON 6 which states that deferred gross profit is not a liability. The reason is that the seller company is not obligated to pay cash or provide services to the customer. Rather, the deferral arose because of the uncertainty surrounding the collectibility of the sales price. CON 6 goes on to say, "deferred gross profit on installment sales is conceptually an asset valuation—that is, a reduction of an asset." However, in practice, deferred gross profit is generally presented either as unearned

revenue classified in the current liability section of the balance sheet or as a deferred credit displayed between liabilities and equity.

Following the guideline in CON 6, the current asset section would be presented as follows (using information from the Jordan Equipment example and assuming a 12/31/11 balance sheet):

Installment accounts receivable	(2010)	$125,000		
Installment accounts receivable	(2011)	300,000	$ 425,000	
Less: Deferred gross profit	(2010)	$ 31,250		
Deferred gross profit	(2011)	100,000	(131,250)	$293,750

Interest on installment method receivables. The previous examples ignored interest, a major component of most installment sales contracts. It is customary for the seller to charge interest to the buyer on the unpaid installment receivable balance. Generally, installment contracts call for equal payments, each with an amount attributable to interest on the unpaid balance and the remainder to the installment receivable balance. As the maturity date nears, a smaller amount of each installment payment is attributable to interest and a larger amount is attributable to principal. Therefore, to determine the amount of gross profit to recognize, the interest must first be deducted from the installment payment and then the difference (representing the principal portion of the payment) is multiplied by the gross profit rate as follows:

$$\text{Realized gross profit} = (\text{Installment payment} - \text{Interest portion}) \times \text{Gross profit rate}$$

The interest portion of the installment payment is recorded as interest revenue at the time of the cash receipt. Appropriate accounting entries are required to accrue interest revenue when the collection dates do not correspond with the period end.

To illustrate the accounting for installment sales contracts involving interest, assume that Genrich Equipment Company sells a machine for $5,000 on December 31, 2008, to a customer with a dubious credit history. The machine cost Genrich $3,750. The terms of the agreement require a $1,000 down payment on the date of the sale. The remaining $4,000 is payable in equal annual installments of $1,401.06, including 15% annual interest, at the end of each of the next four years.

For each payment it receives, Genrich must compute the portion to record as interest revenue with the remaining portion of the payment (the principal) to be applied to reduce the installment account receivable balance. Gross profit is only recognized on the principal portion of each payment that is applied to reduce the installment receivable balance. The following schedule illustrates that gross profit is recognized on the entire down payment (which contains no element of interest revenue), whereas the annual installment payments are separated into their interest and principal portions with gross profit only being recognized on the latter portion.

Schedule of Cash Receipts

Date	*Cash (debit)*	*Interest revenue (credit)*	*Installment accounts receivable (credit)*	*Installment accounts receivable balance*	*Realized gross profit*
12/31/08				$5,000.00	
12/31/08	$1,000.00	$ --	$1,000.00	4,000.00	$ 250.00*a*
12/31/09	1,401.06	600.00*b*	801.06*c*	3,198.94*d*	200.27*e*
12/31/10	1,401.06	479.84	921.22	2,277.72	230.31
12/31/11	1,401.06	341.66	1,059.40	1,218.32	264.85
12/31/12	1,401.06	182.74	1,218.32	--	304.57
	$6,604.24	$1,604.24	$5,000.00		
			Total realized gross profit		$1,250.00

Gross profit rate = 1 – ($3,750/5,000) = 25%

[a] *$1,000 × 25% = $250*
[b] *$4,000 × 15% = $600*
[c] *$1,401.06 – 600 = $801.06*
[d] *$4,000 – 801.06 = $3,198.94*
[e] *$801.06 × 25% = $200.27*

Bad debts and repossessions. The standard accounting treatment for uncollectible accounts is to accrue a bad debt loss in the year of sale by estimating the amount expected to be uncollectible. This treatment is consistent with the accrual and matching concepts. However, just as revenue recognition under the accrual basis is sometimes abandoned for certain installment basis sales, the accrual basis of recognizing bad debts is also sometimes abandoned.

When the installment method is used, it is usually appropriate to recognize bad debts by the direct write-off method (i.e., bad debts are not recognized until the receivable has been determined to be uncollectible). This practice is acceptable because most installment contracts contain a provision that allows the seller to repossess the merchandise when the buyer defaults on the installment payments. The loss on the account may be eliminated or reduced because the seller has the option of reselling the repossessed merchandise. To write off an uncollectible installment receivable, the following three steps are followed:

1. The installment account receivable and the deferred gross profit are eliminated.
2. The repossessed merchandise is recorded as used inventory at its net realizable value. Net realizable value is resale value less any selling or reconditioning costs. The repossessed asset is recorded at this fair value because any asset acquired is recorded at the best approximation of its fair value.
3. Bad debt expense and a gain or loss on repossession are recognized. The bad debt expense or repossession gain or loss is the difference between the unrecovered cost (installment account receivable minus deferred gross profit) and the net realizable value of the repossessed merchandise.

To illustrate, assume that Marcie Company determined that a $3,000 installment receivable is uncollectible. The deferred gross profit ratio on the original sale was 30%; thus, $900 deferred gross profit exists ($3,000 × 30%). If the repossessed equipment has a $1,500 net realizable value, a $600 repossession loss (or bad debt expense) should be recorded.

Installment account receivable	$ 3,000
Less deferred gross profit	(900)
Unrecovered cost	2,100
Less net realizable value of repossessed equipment	(1,500)
Repossession loss	$ 600

Marcie Company would record this loss by making the following entry:

Deferred gross profit	900	
Inventory—repossessed merchandise	1,500	
Repossession loss	600	
Installment account receivable		3,000

The Cost Recovery Method

The cost recovery method does not recognize any income on a sale until the cost of the item sold has been fully recovered through cash receipts. Once the seller has recovered all costs, any subsequent cash receipts are included in income. The cost recovery method is used when the uncertainty of collection of the sales price is so great that even use of the installment method cannot be justified.

Under the cost recovery method, both revenues and cost of sales are recognized at the point of sale, but the related gross profit is deferred until all costs of sales have been recovered. Each installment must also be divided between principal and interest, but unlike the

installment method where a portion of the principal recovers the cost of sales and the remainder is recognized as gross profit, all of the principal is first applied to recover the cost of the asset sold. After all costs of sales have been recovered, any subsequent cash receipts are realized as gross profit. The cost recovery method can be illustrated by using the information from the Genrich Company example used in the section "interest on installment method receivables." If Genrich used the cost recovery method, gross profit would be realized as follows:

Schedule of Cash Receipts

Date	*Cash (debit)*	*Deferred interest income (credit)**	*Installment accounts receivable (credit)*	*Installment accounts receivable balance*	*Unrecovered cost*	*Realized gross profit*	*Realized interest revenue*
12/31/08				$5,000.00	$3,750.00		
12/31/08	$1,000.00	$ --	$1,000.00	4,000.00	2,750.00	$ --	$ --
12/31/09	1,401.06	600.00	801.06	3,198.94	1,948.94	--	--
12/31/10	1,401.06	479.84	921.22	2,277.72	1,027.72	--	--
12/31/11	1,401.06	(31.68)	1,059.40	1,218.32	--	--	373.34**
12/31/12	1,401.06	(1,048.16)	1,218.32	--	--	1,250.00	1,230.90***
	$6,604.24		$5,000.00			$1,250.00	$1,604.24

* *Interest received in 2009 and 2010 is credited to deferred interest income since the cost of the asset was not recovered until 2011.*

** *Computed as cash received of $1,401.06 less the portion representing unrecovered cost of $1,027.72 = $373.34. Since this amount exceeds the interest paid by the customer for the year of $341.66, the remaining $31.68 reduces deferred interest income.*

*** *Computed as cash received of $1,401.06 less the portion applied to principal of $1,218.32 = $182.74 plus the remaining deferred interest income of $1,048.16.*

The accounting entries to record the foregoing are as follows (in whole dollars):

Debit (Credit)

	2008	*2009*	*2010*	*2011*	*2012*	*Totals*
Initial Sale and Down Payment:						
Cash	1,000					
Installment accounts receivable	4,000					
Inventory	(3,750)					
Deferred gross profit	(1,250)					
Annual Payments:						
Cash		1,401	1,401	1,401	1,401	5,604
Installment accounts receivable		(801)	(921)	(1,059)	(1,219)	(4,000)
Deferred interest income		(600)	(480)	32	1,048	--
Interest income				(374)	(1,230)	(1,604)
Deferred gross profit					1,250	1,250
Recognized gross profit (revenue)					(1,250)	(1,250)

REVENUE RECOGNITION WHEN RIGHT OF RETURN EXISTS

PERSPECTIVE AND ISSUES

In some industries it is common practice for customers to have the right to return a product to the seller for a credit or refund. However, for companies that experience a high ratio of returned merchandise to sales, the recognition of the original sale as revenue is questionable. In fact, certain industries have found it necessary to defer revenue recognition until the return privilege has substantially expired. Sometimes the return privilege expires soon after the sale, as in the newspaper and perishable food industries. In other cases, the return privilege may last over an extended period of time, as in magazine and textbook publishing and equipment manufacturing. The rate of return normally is directly related to the length of the return privilege. An accounting issue arises when the recognition of revenue occurs in one period while substantial returns occur in later periods.

ASC 605-15-25, reduced the diversity in the accounting for revenue recognition when such rights exist.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue

605-15-25	Revenue Recognition—Products

Liabilities

450	Contingencies

DEFINITIONS OF TERMS

Deferred gross profit. The gross profit from a sale that is recognized in future periods because of the uncertainty surrounding the collection of the sales price.

Return privilege. A right granted to a buyer by express agreement with a seller or by customary industry practice that allows the buyer to return merchandise to the seller within a stated period of time.

CONCEPTS, RULES, AND EXAMPLES

ASC 605-15-25 provides criteria for recognizing revenue on a sale in which a product may be returned (as a matter of contract or a matter of industry practice), either by the ultimate consumer or by a party who resells the product to others. Paragraph 25-1 states the following:

> *If an enterprise sells its product but gives the buyer the right to return the product, revenue from the sales transaction [is] recognized at time of sale only if all of the following conditions are met:*
>
> *a. The seller's price to the buyer is substantially fixed or determinable at the date of sale.*
> *b. The buyer has paid the seller, or the buyer is obligated to pay the seller and the obligation is not contingent on resale of the product.*
> *c. The buyer's obligation to the seller would not be changed in the event of theft or physical destruction or damage of the product.*
> *d. The buyer acquiring the product for resale has economic substance apart from that provided by the seller.*
> *e. The seller does not have significant obligations for future performance to directly bring about the resale of the product by the buyer.*
> *f. The amount of future returns can be reasonably estimated. For purposes of this statement "returns" do not include exchanges by ultimate customers of one item for another of the same kind, quality, and price.*

If all of the above conditions are met, the seller recognizes revenue from the sales transaction at the time of the sale and any costs or losses expected in connection with returns are accrued in accordance with ASC 450, *Contingencies*. ASC 450 states that estimated losses from contingencies are accrued and charged to income when it is both probable that an asset has been impaired or a liability has been incurred, and the amount of loss can be reasonably estimated.

The interplay between ASC 605-15 and ASC 450 needs further explanation. Although ASC 605-15 requires under condition f. that the amount of returns be reasonably estimated, it does not reference the standard to the ASC 450 loss accrual criteria (see Chapter 14). Accordingly, a strict interpretation of both ASC 605-15 and ASC 450 would indicate that only when the conditions for loss accrual under ASC 450 are met (i.e., the loss is both probable and reasonably estimable) would the condition f. above under ASC 605-15 also be met, and both sales and estimated returns can be recognized. However, a more literal interpretation of ASC 605-15 indicates that, by not cross-referencing ASC 450, the FASB intended that the

sole criterion for return accrual under ASC 605-15 be the "reasonably estimated" condition f. Then, whether losses are probable or reasonably possible, they would be accrued under ASC 605-15 and the sales would also be recognized. If the likelihood of losses is remote, no disclosure is required under ASC 450, and condition f. under ASC 605-15 would be achieved and revenue would be recognized with no need to record an allowance for estimated returns. Under this theory, only if returns cannot be reasonably estimated, would recognition of revenue be precluded under ASC 605-15, regardless of whether losses are probable or reasonably possible.

Example of sale with right of return

Assume that Lipkis, Inc. began the sale of its new textbook on computer programming in 2009 with the following results: On December 1, 2009, 2,000 textbooks with a sales price of $45 each and total manufacturing costs of $30 each are delivered to school bookstores on account. The bookstores have the right to return the textbooks within four months of delivery date. Payments when the books are sold. Payments and returns for the initial deliveries are as follows:

	Cash receipts		*Returns*	
	Units	*Amount*	*Units*	*Amount*
November 2009				
December 2009	600	$27,000	--	--
January 2010	500	22,500	40	$1,800
February 2010	400	18,000	90	4,050
March 2010	300	13,500	30	1,350
	1,800	$81,000	160	$7,200

Lipkis, Inc. has had similar agreements with the bookstores in the past and has experienced a 15% return rate on similar sales.

Requirements for revenue recognition met. If all six of the requirements were met, the following journal entries would be appropriate:

Date	Account	Debit	Credit
12/1/09	Accounts receivable	90,000	
	Sales (2,000 units × $45 per unit)		90,000
	To record sale of 2,000 textbooks		
12/31/09	Cash (600 units × $45 per unit)	27,000	
	Accounts receivable		27,000
	To record cash receipts for the month		
	Cost of sales	60,000	
	Inventory (2,000 units × $30 per unit)		60,000
	To record cost of goods sold for the month		
	Sales (15% × 2,000 units × $45 per unit)	13,500	
	Cost of sales (15% × 2,000 units × $30 per unit)		9,000
	Deferred gross profit on estimated returns (15% × 2,000 units × $15 per unit)		4,500
	To record estimate of returns		
1/1/10 to 3/31/10	Cash	54,000	
	Accounts receivable		54,000
	To record cash receipts		
	Inventory (160 units × $30 per unit)	4,800	
	Deferred gross profit on estimated returns	2,400	
	Accounts receivable (160 units × $45 per unit)		7,200
	To record actual returns		
3/31/10	Cost of sales (140 units × $30 per unit)	4,200	
	Deferred gross profit on estimated returns	2,100	
	Sales (140 units × $45 per unit)		6,300
	To record expiration of return privileges and adjust estimate to actual		

The revenue and cost of goods sold recognized in 2009 are based on the number of units expected to be returned, 300 (15% × 2,000 units). The net revenue recognized is $76,500 (85% × 2,000 units × $45 per unit) and the cost of goods sold recognized is $51,000 (85% × 2,000 units × $30 per unit). The deferred gross profit balance is carried forward until either the textbooks are returned or the return privilege expires.

Requirements for revenue recognition not met. If all of the six conditions are not met, revenue and cost of sales from the sales transactions must be deferred until either the return privilege has substantially expired or the point when all the conditions are subsequently met is reached, whichever comes first.

If the facts in the Lipkis case were altered so that the bookstores were not required to pay Lipkis until the later of the date the books were actually sold, or the expiration date of the return privilege, condition b. would not be met until the store remitted payment. The following entries would be required. The return privilege is, of course, assumed to be lost by the store when the books are sold to final customers.

Date	Account	Debit	Credit
12/1/09	Inventory on consignment	60,000	
	Inventory		60,000
	To record shipment of 2,000 units to retail bookstores on consignment (2,000 units × $30 = $60,000)		
12/31/09	Cash (600 units × $45 per unit)	27,000	
	Sales		27,000
	To record cash receipts for December		
	Cost of sales (600 units × $30 per unit)	18,000	
	Inventory on consignment		18,000
	To record cost of goods sold for December		
1/1/10	Cash	54,000	
to	Sales (1,200* units × $45 per unit)		54,000
3/31/10	*To record cash receipts*		
	Cost of sales (1,200 units × $30 per unit)	36,000	
	Inventory on consignment		36,000
	To record cost of goods sold on cash receipts		
	Inventory (160 units × $30 per unit)	4,800	
	Inventory on consignment		4,800
	To record product returns		
3/31/10	Accounts receivable (40 units × $45 per unit)	1,800	
	Sales		1,800
	To record expiration of return privilege on remaining units		
	Cost of sales (40** units × $30 per unit)	1,200	
	Inventory on consignment		1,200
	To record cost of goods sold on products for which return privilege expired		

* *1,800 units paid for – 600 units paid for in December*
** *2,000 units sold – 160 units returned – 1,800 units paid for*

PROFIT RECOGNITION ON REAL ESTATE SALES

PERSPECTIVE AND ISSUES

The substance of a sale of any asset is that the transaction unconditionally transfers the risks and rewards of ownership to the buyer. However, the economic substance of many real estate sales is that the risks and rewards of ownership have not been clearly transferred. The turbulent and cyclical environments in the real estate and debt markets have led to the evolution of many complex methods of financing real estate transactions. For example, in some transactions the seller, rather than an independent third party, finances the buyer, while in others, the seller may be required to guarantee a minimum return to the buyer or continue to

operate the property for a specified period of time. In many of these complex transactions, the seller still has some association with the property even after the property has been sold. The question that must be answered in these transactions is: At what point does the seller become disassociated enough from the property that profit may be recognized on the transaction?

Accounting for sales of real estate is governed by ASC 976. Due to the complex nature of these real estate transactions, ASC 976 is very detailed and complex. The purpose of this section is to present the guidelines that need to be considered when analyzing nonretail real estate transactions. ASC 840-40 dealing with sales-type real estate leases and sales-leaseback real estate transactions is covered in Chapter 16.

A specialized situation involving the sale of real estate pertains to time-share projects, which are addressed by ASC 978, as discussed in this chapter.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
310-40	Receivables—Troubled Debt Restructurings by Creditors
360-20	Property, Plant, and Equipment—Real Estate Sales
360-970	Property, Plant, and Equipment—Real Estate-General
Broad Transactions	
840-40	Leases—Sale-Leaseback Transactions
Industry	
970-323	Real Estate—Investments-Equity Method and Joint Ventures
970-360	Real Estate—Property, Plant, and Equipment
970-605	Real Estate—Revenue Recognition
976	Real Estate—Retail Land
978	Real Estate—Time-Sharing Activities

DEFINITIONS OF TERMS

Buy-sell agreement. A contractual arrangement that gives both investors in a jointly owned entity the ability to offer to buy the other's interest.

Continuing investment. Payments that the buyer is contractually required to pay on its total debt for the purchase price of the property.

Cost recovery method. A method which defers the recognition of gross profit on a real estate sale until the seller recovers the cost of the property sold.

Deposit method. A method which records payments by the buyer as deposits rather than a sale. The seller continues to report the asset and related debt on the balance sheet until the contract is canceled or until the sale has been achieved.

First mortgage (primary debt). The senior debt the seller has on the property at the time the buyer purchases the property. A first mortgage lender (mortgagee) has foreclosure rights superior to those of second (or junior) mortgage lenders (i.e., proceeds from sale of the foreclosed property are used first to repay the first mortgage lender in full with only the remainder available to satisfy the junior lenders' balances).

Full accrual method. A method that recognizes all profit from a real estate sale at the time of sale.

Initial investment. The sales value received by the seller at the time of sale. It includes a cash down payment, buyer's notes supported by an irrevocable letter of credit, and payments by the buyer to third parties to reduce or eliminate the seller's indebtedness on the property.

Installment method. A method that recognizes revenue on the basis of payments made by the buyer on debt owed to the seller and payments by the buyer to the holder of primary debt. Each payment is apportioned between profit and cost recovery.

Lien. A claim or charge a creditor has on property which serves as security for payment of debt by the debtor.

Minimum initial investment. The minimum amount that an initial investment must equal or exceed so that the criterion for using the full accrual method is met.

Partial sale. A sale in which the seller retains an equity interest in the property or has an equity interest in the buyer.

Property improvements. An addition made to real estate, usually consisting of buildings but that may also include any permanent structure such as streets, sidewalks, sewers, utilities, etc.

Reduced profit method. A method which recognizes profit at the point of sale, but only a reduced amount. The remaining profit is deferred to future periods.

Release provision. An agreement that provides for the release of property to the buyer. This agreement releases the property to the buyer free of any previous liens.

Sales value. The sales price of the property increased or decreased for other consideration in the sales transaction that are, in substance, additional sales proceeds to the seller.

Subordination. The process by which a party's rights are ranked below the rights of others.

CONCEPTS, RULES, AND EXAMPLES

Real Estate Sales other than Retail Land Sales

ASC 976 scope. ASC 976, *Real Estate—Retail Land*, established standards applicable to all real estate sales for all types of businesses.

ASC 360-20-15 explicitly states that real estate sales transactions under ASC 976 include real estate with property enhancements or integral equipment. This defines property improvements and integral equipment as "any physical structure or equipment attached to real estate or other parts thereof, that cannot be removed and used separately without incurring significant cost." Examples include an office building or manufacturing plant.

This interpretation also identifies transactions excluded from the provisions of ASC 976 as follows:

1. A sale of improvements or integral equipment with no sale or plans for a sale of the land.
2. A sale of stock, net assets of a business, or a segment of a business which contain real estate except in cases in which an "in-substance" real estate sale occurs.
3. Securities accounted for under ASC 320.

Profit recognition methods. Profit from real estate sales is recognized in full, provided the following:

1. The profit is determinable (i.e., the collectibility of the sales price is reasonably assured or the amount that will not be collectible can be estimated).
2. The earnings process is virtually complete, that is, the seller is not obliged to perform significant activities after the sale to earn the profit.

When both of these conditions are satisfied, the method used to recognize profits on real estate sales is referred to as the full accrual method. If both of these conditions are not satisfied, recognition of all or part of the profit is postponed.

For real estate sales, the collectibility of the sales price is reasonably assured when the buyer has demonstrated a commitment to pay. This commitment is supported by a substantial initial investment, along with continuing investments that give the buyer a sufficient stake in the property such that the risk of loss through default motivates the buyer to honor

its obligations to the seller. Collectibility of the sales price is also assessed by examining the conditions surrounding the sale (e.g., credit history of the buyer; age, condition, and location of the property; and history of cash flows generated by the property).

The full accrual method is appropriate and profit is recognized in full at the point of sale for real estate transactions when all of the following criteria are met:

1. A sale is consummated.
2. The buyer's initial and continuing investments are adequate to demonstrate a commitment to pay for the property.
3. The seller's receivable is not subject to future subordination.
4. The seller has transferred to the buyer the usual risks and rewards of ownership in a transaction that is in substance a sale, and the seller does not have a substantial continuing involvement in the property.

On sales in which an independent third party provides all of the financing for the buyer, the seller is most concerned that criterion 1. is met. For such sales, the sale is usually consummated on the closing date. When the seller finances the buyer, the seller must analyze the economic substance of the agreement to ascertain that criteria 2., 3., and 4. are also met (i.e., whether the transaction clearly transfers the risks and rewards of ownership to the buyer).

ASC 360-20 provides the following guidelines for a seller of real estate to follow when considering the various forms of financing that may be applicable to the transaction:

1. The ASC 976 conditions for obtaining sufficient initial and continuing investment from the buyer before full accrual profit recognition is allowed must be applied unless the seller receives as the full sales value of the property
   a. Cash without any seller contingent liability on any debt on the property incurred or assumed by the buyer,
   b. The buyer's assumption of the seller's existing nonrecourse debt on the property,
   c. The buyer's assumption of all recourse debt on the property with the complete release of the seller from those obligations, or
   d. Any combination of such cash and debt assumption.
2. In computing the buyer's initial investment, debt incurred by the buyer that is secured by the property is not considered part of the buyer's initial investment. This is true whether the debt was incurred directly from the seller or other parties or indirectly through assumption. Payments to the seller from the proceeds of such indebtedness are not included as part of the buyer's initial investment.
3. If the transaction does not qualify for full accrual accounting and, consequently, is being accounted for using installment, cost recovery or reduced profit methods, payments made on debt described in 2. above are not considered to be buyer's cash payments. However, if the profit deferred under the applicable method exceeds the outstanding amount of seller financing and the outstanding amount of buyer's debt secured by the property for which the seller is contingently liable, the seller recognizes the excess in income.

Consummation of a sale. A sale is considered consummated when the following conditions are met:

1. The parties are bound by the terms of a contract.
2. All consideration has been exchanged.

3. Any permanent financing for which the seller is responsible has been arranged.
4. All conditions precedent to closing have been performed.

When a seller is constructing office buildings, condominiums, shopping centers, or similar structures, item 4. may be applied to individual units rather than the entire project. These four conditions are usually met on or after closing, not at the point the agreement to sell is signed or at a preclosing meeting. Closing refers to the final steps of the transaction (i.e., when consideration is paid, the mortgage is secured, and the deed is delivered or placed in escrow). If the consummation criteria have not been satisfied, the seller uses the deposit method of accounting until all of the criteria are met (i.e., the sale has been consummated).

Adequacy of the buyer's initial investment. Once the sale is consummated, the next step is to determine whether the buyer's initial investment adequately demonstrates a commitment to pay for the property and the reasonable likelihood that the seller will collect it. This determination is made by comparing the buyer's initial investment to the sales value of the property. ASC 976 specifically details items that are includable as the initial investment and the minimum percentages that the initial investment must bear to the sales value of the property. In order to make the determination of whether the initial investment is adequate, the sales value of the property must also be computed.

Computation of sales value. The sales value of property in a real estate transaction is computed as follows:

	Stated sales price
+	Proceeds from the issuance of an exercised purchase option
+	Other payments that are, in substance, additional sales proceeds (e.g., management fees, points, prepaid interest, or fees required to be maintained in advance of the sale that will be applied against amounts due to the seller at a later point)
–	A discount that reduces the buyer's note to its present value
–	Net present value of services seller agrees to perform without compensation
–	Excess of net present value of services seller performs over compensation that seller will receive
=	Sales value of the property

Composition of the initial investment. Sales transactions are characterized by many different types of payments and commitments made between the seller, buyer, and third parties; however, the buyer's initial investment only includes the following:

1. Cash paid to the seller as a down payment
2. Buyer's notes given to the seller that are supported by irrevocable letters of credit from independent lending institutions
3. Payments by the buyer to third parties that reduce existing indebtedness the seller has on the property
4. Other amounts paid by the buyer that are part of the sales value
5. Other consideration received by the seller that can be converted to cash without recourse to the seller; for example, other notes of the buyer

ASC 976 specifically states that the following items are not included as initial investment:

1. Payments by the buyer to third parties for improvements to the property
2. A permanent loan commitment by an independent third party to replace a loan made by the seller
3. Funds that have been or will be loaned, refunded, or directly or indirectly provided to the buyer by the seller or loans guaranteed or collateralized by the seller for the buyer

Size of initial investment. Once the initial investment is computed, its size must be compared to the sales value of the property. To qualify as an adequate initial investment, the

initial investment must be equal to at least a major part of the difference between usual loan limits established by independent lending institutions and the sales value of the property. The minimum initial investment requirements for real estate sales (other than retail land sales) vary depending upon the type of property being sold. The following table from ASC 976 provides the limits for the various properties:

Type of property	*Minimum initial investment expressed as a percentage of sales value*
Land	
Held for commercial, industrial, or residential development to commence within two years after sale	20
Held for commercial, industrial, or residential development to commence more than two years after sale	25
Commercial and Industrial Property	
Office and industrial buildings, shopping centers, and so forth:	
Properties subject to lease on a long-term lease basis to parties with satisfactory credit rating; cash flow currently sufficient to service all indebtedness	10
Single-tenancy properties sold to a buyer with a satisfactory credit rating	15
All other	20
Other income-producing properties (hotels, motels, marinas, mobile home parks, and so forth):	
Cash flow currently sufficient to service all indebtedness	15
Start-up situations or current deficiencies in cash flow	25
Multifamily Residential Property	
Primary residence:	
Cash flow currently sufficient to service all indebtedness	10
Start-up situations or current deficiencies in cash flow	15
Secondary or recreational residence:	
Cash flow currently sufficient to service all indebtedness	15
Start-up situations or current deficiencies in cash flow	25
Single-Family Residential Property (including condominium or cooperative housing)	
Primary residence of the buyer	5[a]
Secondary or recreational residence	10[a]

[a] *If collectibility of the remaining portion of the sales price cannot be supported by reliable evidence of collection experience, the minimum initial investment [is to] be at least 60% of the difference between the sales value and the financing available from loans guaranteed by regulatory bodies such as the Federal Housing Authority (FHA) or the Veterans Administration (VA), or from independent, established lending institutions. This 60% test applies when independent first-mortgage financing is not utilized and the seller takes a receivable from the buyer for the difference between the sales value and the initial investment. If independent first mortgage financing is utilized, the adequacy of the initial investment on sales of single-family residential property [is] determined [as described in the next paragraph].*

Lenders' appraisals of specific properties often differ. Therefore, if the buyer has obtained a permanent loan or firm permanent loan commitment for maximum financing of the property from an independent lending institution, the minimum initial investment must be the greater of the following:

1. The minimum percentage of the sales value of the property specified in the above table or
2. The lesser of
   a. The amount of the sales value of the property in excess of 115% of the amount of a newly placed permanent loan or firm loan commitment from a primary lender that is an independent established lending institution
   b. 25% of the sales value

To illustrate the determination of whether an initial investment adequately demonstrates a commitment to pay for property, consider the following example:

Example determining adequacy of initial investment

Marcus, Inc. exercised a $2,000 option for the purchase of an apartment building from Rubin, Inc. The terms of the sales contract required Marcus to pay $3,000 of delinquent property taxes, pay a $300,000 cash down payment, assume Rubin's recently issued first mortgage of $1,200,000, and give Rubin a second mortgage of $500,000 at a prevailing interest rate.

Step 1 —	Compute the sales value of the property.	
	Payment of back taxes to reduce Rubin's liability to local municipality	$ 3,000
	Proceeds from exercised option	2,000
	Cash down payment	300,000
	First mortgage assumed by Marcus	1,200,000
	Second mortgage given to Rubin	500,000
	Sales value of the apartment complex	$2,005,000
Step 2 —	Compute the initial investment.	
	Cash down payment	$300,000
	Payment of back taxes to reduce Rubin's liability to local municipality	3,000
	Proceeds from exercised option	2,000
		$ 305,000

Step 3 — Compute the minimum initial investment required.

a. The minimum percentage of the sales value of the property as specified in the table is $200,500 (= $2,005,000 × 10%).

b. 1. The amount of the sales value of the property in excess of 115% of the recently placed permanent mortgage is $625,000 (sales value of $2,005,000 – $1,380,000 [= 115% of $1,200,000]).

   2. 25% of the sales value ($2,005,000) is $501,250.

The lesser of b.1 and b.2 is b.2, $501,250. The greater of a. and b. is b., $501,250. Therefore, to record this transaction under the full accrual method (assuming all other criteria are met), the minimum initial investment must be equal to or greater than $501,250. Since the actual initial investment is only $305,000, all or part of the recognition of profit from the transaction must be postponed.

If the sale has been consummated but the buyer's initial investment does not adequately demonstrate a commitment to pay, the transaction is accounted for using the installment method when the seller is reasonably assured of recovering the cost of the property if the buyer defaults. However, if the recovery of the cost of the property is not reasonably assured should the buyer default or if the cost has been recovered and the collection of additional amounts is uncertain, the cost recovery or deposit method is used.

Adequacy of the buyer's continuing investments. The collectibility of the buyer's receivable must be reasonably assured; therefore, for full profit recognition under the full accrual method, the buyer must be contractually required to pay each year on its total debt for the purchase price of the property an amount at least equal to the level annual payment that would be needed to pay that debt (both principal and interest) over a specified period. This period is no more than twenty years for land, and no more than the customary amortization term of a first mortgage loan by an independent lender for other types of real estate. For continuing investment purposes, the contractually required payments must be in a form that is acceptable for an initial investment. If the seller provides funds to the buyer, either directly or indirectly, these funds must be subtracted from the buyer's payments in determining whether the continuing investments are adequate.

The indebtedness on the property does not have to be reduced proportionately. A lump-sum (balloon) payment will not affect the amortization of the receivable as long as the level annual payments still meet the minimum annual amortization requirement. For example, a land real estate sale may require the buyer to make level annual payments at the end of each

of the first five years and then a balloon payment at the end of the sixth year. The continuing investment criterion is met provided the level annual payment required in each of the first five years is greater than or equal to the level annual payment that would be made if the receivable were amortized over the maximum twenty-year (land's specified term) period.

Continuing investment not qualifying. If the sale has been consummated and the minimum initial investment criteria have been satisfied but the continuing investment by the buyer does not meet the stated criterion, the seller recognizes profit by the reduced profit method at the time of sale if payments by the buyer each year will at least cover both of the following:

1. The interest and principal amortization on the maximum first mortgage loan that could be obtained on the property
2. Interest, at an appropriate rate, on the excess of the aggregate actual debt on the property over such a maximum first mortgage loan

If the payments by the buyer do not cover both of the above, the seller recognizes profit by either the installment or cost recovery method.

Release provisions. An agreement to sell real estate may provide that part or all of the property sold will be released from liens by payment of an amount sufficient to release the debt or by an assignment of the buyer's payments until release. In order to meet the criteria of an adequate initial investment, the investment must be sufficient both to pay the release on property released and to meet the initial investment requirements on property not released. If not, profit is recognized on each released portion as if it were a separate sale when a sale has been deemed to have taken place.

Seller's receivable subject to future subordination. The seller's receivable should not be subject to future subordination. Future subordination by a primary lender would permit the lender to obtain a lien on the property, giving the seller only a secondary residual claim. This subordination criterion does not apply if either of the following occur:

1. A receivable is subordinate to a first mortgage on the property existing at the time of sale.
2. A future loan, including an existing permanent loan commitment, is provided for by the terms of the sale and the proceeds of the loan will be applied first to the payment of the seller's receivable.

If the seller's receivable is subject to future subordination, profit is recognized using the cost recovery method. The cost recovery method is justified because the collectibility of the sales price is not reasonably assured in circumstances when the receivable may be subordinated to amounts due to other creditors.

Seller's continuing involvement. Sometimes sellers continue to be involved with property for periods of time even though the property has been legally sold. The seller's involvement often takes the form of profit participation, management services, financing, guarantees of return, construction, etc. The seller does not have a substantial continuing involvement with property unless the risks and rewards of ownership have been clearly transferred to the buyer.

If the seller has some continuing involvement with the property and does not clearly transfer substantially all of the risks and rewards of ownership, profit is recognized by a method other than the full accrual method. The method chosen is determined by the nature and extent of the seller's continuing involvement. As a general rule, profit is only recognized at the time of sale if the amount of the seller's loss due to the continued involvement with the property is limited by the terms of the sales contract. In this event, the profit recognized at this time is reduced by the maximum possible loss from the continued involvement.

Leases involving real estate. ASC 840-40 dealing with sales-type real estate leases and sale-leaseback real estate transactions is covered in Chapter 16.

Profit-sharing, financing, and leasing arrangements. In real estate sales, it is often the case that economic substance takes precedence over legal form. Certain transactions, though possibly called sales, are in substance profit-sharing, financing, or leasing arrangements and are accounted for as such. These include situations in which

1. The seller has an obligation to repurchase the property, or the terms of the transaction allow the buyer to compel the seller to repurchase the property or give the seller an option to do so.
2. The seller is a general partner in a limited partnership that acquires an interest in the property sold and holds a receivable from the buyer for a significant part (15% of the maximum first-lien financing) of the sales price.
3. The seller guarantees the return of the buyer's investment or a return on that investment for an extended period of time.
4. The seller is required to initiate or support operations, or continue to operate the property at its own risk for an extended period of time.

Options to purchase real estate property. Often a buyer will buy an option to purchase land from a seller with the hopeful intention of obtaining a zoning change, building permit, or some other contingency specified in the option agreement. Proceeds from the issue of an option by a property owner (seller) are accounted for by the deposit method. If the option is exercised, the seller includes the option proceeds in the computation of the sales value of the property. If the option is not exercised, the seller recognizes the option proceeds as income at the time the option expires.

Partial sales of property. Per ASC 976, "a sale is a partial sale if the seller retains an equity interest in the property or has an equity interest in the buyer." Profit on a partial sale may be recognized on the date of sale if the following occur:

1. The buyer is independent of the seller.
2. Collection of the sales price is reasonably assured.
3. The seller will not be required to support the operations of the property on its related obligations to an extent greater than its proportionate interest.

If the buyer is not independent of the seller, the seller may not be able to recognize any profit that is measured at the date of sale (see the following Buy-sell agreements section).

If the seller is not reasonably assured of collecting the sales price, the cost recovery or installment method is used to recognize profit on the partial sale.

A seller who separately sells individual units in condominium projects or time-sharing interests recognizes profit by the percentage-of-completion method on the sale of individual units or interests if all of the following criteria are met:

1. Construction is beyond a preliminary stage (i.e., engineering and design work, execution of construction contracts, site clearance and preparation, excavation, and completion of the building foundation have all been completed).
2. The buyer is unable to obtain a refund except for nondelivery of the units or interest.
3. Sufficient units have been sold to assure that the entire property will not revert to being rental property.
4. Sales prices are collectible.
5. Aggregate sales proceeds and costs can be reasonably estimated.

The deposit method is used to account for these sales up to the point all the criteria are met for recognition of a sale.

Buy-sell agreements. A buy-sell clause is not a prohibited form of continuing involvement precluding partial sales treatment, but only if (1) the buyer can act independently from the seller, or if (2) the seller is not compelled to reacquire the other investor's interest in the jointly owned entity. The decision is judgmental, requiring consideration of numerous factors.

Factors to consider in determining whether the buyer cannot act independently from the seller are (1) the presence of a predetermined buy-sell price, (2) the seller has a strategic necessity barring it from relinquishing its ownership rights to the buyer, (3) the seller has business arrangements with the jointly owned entity that economically require it to reacquire the real estate to avoid losing economic benefits or escaping negative consequences of the arrangements, or (4) tax implications compelling the seller to acquire the buyer's interest in the entity.

Factors to consider in determining if the buyer can compel the seller to repurchase the property include (1) the buyer is financially unable to acquire the seller's interest, (2) the buy-sell clause contains a specified rate of return for either party, (3) the buyer has a strategic necessity requiring it to sell its interest to the seller, (4) the buyer is legally restricted from acquiring the seller's interest, (5) the buyer cannot realize its economic interest by sale to a third party, due to the integration of the real estate into the seller's business, or (6) tax implications compelling the buyer to sell its interest to the seller.

Selection of method. If a loss is apparent (e.g., the carrying value of the property exceeds the sum of the deposit, fair value of unrecorded note receivable, and the debt assumed by the buyer), then immediate recognition of the loss is required.

The installment method is used if the full accrual method cannot be used due to an inadequate initial investment by the buyer, provided that recovery of cost is reasonably assured if the buyer defaults. The cost recovery method or the deposit methods are used if such cost recovery is not assured.

The reduced profit method is used when the buyer's initial investment is adequate but the continuing investment is not adequate, and payments by the buyer at least cover the sum of (1) the amortization (principal and interest) on the maximum first mortgage that could be obtained on the property and (2) the interest, at an appropriate rate, on the excess of aggregate debt over the maximum first mortgage.

Methods of Accounting for Real Estate Sales other than Retail Land Sales

Full accrual method. This method of accounting for nonretail sales of real estate is appropriate when all four of the recognition criteria have been satisfied. The full accrual method is simply the application of the revenue recognition principle. A real estate sale is recognized in full when the profit is determinable and the earnings process is virtually complete. The profit is determinable when the first three criteria have been met (the sale is consummated, the buyer has demonstrated a commitment to pay, and the seller's receivable is not subject to future subordination). The earnings process is virtually complete when the fourth criterion has been met (the seller has transferred the risks and rewards of ownership and does not have a substantial continuing involvement with the property). If all of the criteria have not been met, the seller records the transaction by one of the following methods as indicated by ASC 976:

1. Deposit
2. Cost recovery
3. Installment
4. Reduced profit

5. Percentage-of-completion (see the section on Long-Term Construction Contracts in this chapter)

Profit under the full accrual method is computed by subtracting the cost basis of the property surrendered from the sales value given by the buyer. Also, the computation of profit on the sale includes all costs incurred that are directly related to the sale, such as accounting and legal fees.

Installment method. Under the installment method, each cash receipt and principal payment by the buyer on debt assumed with recourse to the seller consists of part recovery of cost and part recovery of profit. The apportionment between cost recovery and profit is in the same ratio as total cost and total profit bear to the sales value of the property sold. Therefore, under the installment method, the seller recognizes profit on each payment that the buyer makes to the seller and on each payment the buyer makes to the holder of the primary debt. When a buyer assumes debt that is without recourse to the seller, the seller recognizes profit on each payment made to the seller and on the entire debt assumed by the buyer. The accounting treatment differs because the seller is subject to substantially different levels of risk under the alternative conditions. For debt that is without recourse, the seller recovers a portion, if not all, of the cost of the asset surrendered at the time the buyer assumes the debt.

Example of the installment method

Assume Tucker sells to Price a plot of undeveloped land for $2,000,000. Price will assume, with recourse, Tucker's existing first mortgage of $1,000,000 and also pay Tucker a $300,000 cash down payment. Price will pay the balance of $700,000 by giving Tucker a second mortgage payable in equal installments of principal and interest over a ten-year period. The cost of the land to Tucker was $1,200,000 and Price will commence development of the land immediately.

1. Computation of sales value:

Cash down payment	$ 300,000
First mortgage	1,000,000
Second mortgage	700,000
Sales value	$2,000,000

2. Computation of the initial investment:

Cash down payment	$ 300,000

3. Computation of the minimum required initial investment:

   a. $400,000 ($2,000,000 × 20%)
   b. 1) $850,000 [$2,000,000 – (115% × 1,000,000)]
      2) $500,000 ($2,000,000 × 25%)

The minimum initial investment is $500,000 since b.2) is less than b.1) and b.2) is greater than a.

The initial investment criterion has not been satisfied because the actual initial investment is less than the minimum initial investment. Therefore, assuming the sale has been consummated and Tucker is reasonably assured of recovering the cost of the land from Price, the installment method is to be used. The gross profit to be recognized over the installment payment period by Tucker is computed as follows:

Sales value	$ 2,000,000
Cost of land	(1,200,000)
Gross profit	$ 800,000

The gross profit percentage to apply to each payment by Price to Tucker and the primary debt holder is 40% ($800,000/$2,000,000).

If Price also pays $50,000 of principal on the first mortgage and $70,000 of principal on the second mortgage in the year of sale, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment ($300,000 × 40%)	$120,000
Profit recognized on the principal payments:	
First mortgage ($50,000 × 40%)	20,000
Second mortgage ($70,000 × 40%)	28,000
Total profit recognized in year of sale	$168,000

Note that Tucker recognizes profit only on the payment applicable to the first mortgage. This is because Tucker may be called upon to satisfy the liability on the first mortgage if Price defaults.

If Tucker's first mortgage was assumed without recourse, Tucker would recognize the following profit in the year of sale:

Profit recognized on the down payment ($300,000 × 40%)	$120,000
Profit recognized on Price's assumption of Tucker's first mortgage without recourse ($1,000,000 × 40%)	400,000
Profit recognized on the principal payment of the second mortgage ($70,000 × 40%)	28,000
Total profit recognized in year of sale	$548,000

The income statement (or related footnotes) for the period of sale includes the sales value received, the gross profit recognized, the gross profit deferred, and the costs of sale. In future periods when further payments are made to the buyer, the seller realizes gross profit on these payments. This amount is presented as a single line item in the revenue section of the income statement.

If, in the future, the transaction meets the requirements for the full accrual method of recognizing profit, the seller may change to that method and recognize the remaining deferred profit as income at that time.

Cost recovery method. When the cost recovery method is used (e.g., when the seller's receivable is subject to subordination or the seller is not reasonably assured of recovering the cost of the property if the buyer defaults), no profit is recognized on the sales transaction until the seller has recovered the cost of the property sold. If the buyer assumes debt that is with recourse to the seller, profit is not recognized by the seller until the cash payments by the buyer, including both principal and interest on debt due the seller and on debt assumed by the buyer, exceed the seller's cost of the property sold. If the buyer assumes debt that is without recourse to the seller, profit may be recognized by the seller when the cash payments by the buyer, including both principal and interest on debt due the seller, exceed the difference between the seller's cost of the property and the nonrecourse debt assumed by the buyer.

For the cost recovery method, principal collections reduce the seller's related receivable, and interest collections on such receivable increase the deferred gross profit on the balance sheet.

Example of the cost recovery method

Assume that on January 1, 2009, Simon, Inc. purchased undeveloped land with a sales value of $365,000 from Davis Co. The sales value is represented by a $15,000 cash down payment, Simon assuming Davis's $200,000 first mortgage (10%, payable in equal annual installments over the next twenty years), and Simon giving Davis a second mortgage of $150,000 (12%, payable in equal annual installments over the next ten years). The sale has been consummated, but the initial investment is below the minimum required amount and Davis is not reasonably assured of recovering the cost of the property if Simon defaults. The cost of the land to Davis was $300,000. The circumstances indicate the cost recovery method is appropriate. The transaction is recorded by Davis as follows:

1/1/09	Notes receivable	150,000	
	First mortgage payable	200,000	
	Cash	15,000	
	Revenue from sale of land		365,000
	Revenue from sale of land	365,000	
	Land		300,000
	Deferred gross profit		65,000

Case 1 — The first mortgage was assumed with recourse to Davis. Immediately after the sale, the unrecovered cost of the land is computed as follows:

Land	$300,000
Less: Cash down payment	(15,000)
Unrecovered cost	$285,000

The note (second mortgage) is reported as follows:

Note receivable	$150,000	
Less: Deferred gross profit	(65,000)	$ 85,000

At the end of the year Simon pays $26,547.64 ($8,547.64 principal and $18,000.00 interest) on the second mortgage note and $23,491.94 ($3,491.94 principal and $20,000.00 interest) on the first mortgage. At 12/31/09 the unrecovered cost of the land is computed as follows:

Previous unrecovered cost		$285,000.00
Less: Note receivable payment	$26,547.64	
First mortgage payment	23,491.94	(50,039.58)
Unrecovered cost		$234,960.42

The receivable is reported on the 12/31/09 balance sheet as follows:

Note receivable ($150,000 – 8,547.64)	$141,452.36	
Less: Deferred gross profit ($65,000 + 18,000)	83,000.00	$58,452.36

Case 2 — The first mortgage is assumed without recourse to Davis. The reporting of the note is the same as Case 1; however, the unrecovered cost of the property is different. Immediately after the sale, the unrecovered cost of the property is computed as follows:

Land	$300,000
Less: Cash down payment	(15,000)
Nonrecourse debt assumed by Simon	(200,000)
Unrecovered cost	$ 85,000

After Simon makes the payments at the end of the year, the unrecovered cost is computed as follows:

Previous unrecovered cost	$85,000.00
Less: Notes receivable payment	26,547.64
Unrecovered cost	$58,452.36

For the cost recovery method, the income statement for the year the real estate sale occurs includes the sales value received, the cost of the property given up, and the gross profit deferred. In future periods, after the cost of the property has been recovered, the income statement includes the gross profit earned as a separate revenue item.

If, after accounting for the sale by the cost recovery method, circumstances indicate that the criteria for the full accrual method are satisfied, the seller may change to the full accrual method and recognize any remaining deferred gross profit in full.

Deposit method. When the deposit method is used (e.g., when the sale is, in substance, the sale of an option and not real estate), the seller does not recognize any profit, does not record a receivable, continues to report in its financial statements the property and the related existing debt even if the debt has been assumed by the buyer, and discloses that those items are subject to a sales contract. The seller also continues to recognize depreciation expense on the property for which the deposits have been received, unless the property has been classified as held for sale (per ASC 360-10). Cash received from the buyer (initial and continuing investments) is reported as a deposit on the contract. However, some amounts of cash may be received that are not subject to refund, such as interest on the unrecorded principal. These amounts are used to offset any carrying charges on the property (e.g., property taxes and interest on the existing debt). If the interest collected on the unrecorded receivable is refund-

able, the seller records this interest as a deposit before the sale is consummated and then includes it as a part of the initial investment once the sale is consummated. If deposits on retail land sales are eventually recognized as sales, the interest portion of the deposit is separately recognized as interest income. For contracts that are cancelled, the nonrefundable amounts are recognized as income and the refundable amounts returned to the depositor at the time of cancellation.

As stated, the seller's balance sheet continues to present the debt assumed by the buyer (this includes nonrecourse debt) among its other liabilities. However, the seller reports any principal payments on the mortgage debt assumed as additional deposits, while correspondingly reducing the carrying amount of the mortgage debt.

Example of a deposit transaction

Elbrus Investments enters into two separate property acquisition transactions with the Buena Vista Land Company.

1. Elbrus pays a $50,000 deposit and promises to pay an additional $800,000 to buy land and a building in an area not yet properly zoned for the facility Elbrus intends to construct. Final acquisition of the property is contingent upon these zoning changes. Buena Vista does not record the receivable, and records the deposit with the following entry:

Cash	50,000	
Customer deposits		50,000

Part of the purchase agreement stipulates that Buena Vista will retain all interest earned on the deposit, and that 10% of the deposit is nonrefundable. Buena Vista earns 5% interest on Elbrus' deposit over a period of four months, resulting in $208 of interest income that is offset against the property tax expenses of the property with the following entry:

Cash	208	
Property tax expense		208

Immediately thereafter, the required zoning changes are turned down, and Elbrus cancels the sales contract. Buena Vista returns the refundable portion of the deposit to Elbrus and records the nonrefundable portion as income with the following entry:

Customer deposits	50,000	
Income from contract cancellation		10,000
Cash		40,000

2. Elbrus pays a $40,000 deposit on land owned and being improved by Buena Vista. Elbrus immediately begins paying $5,000/month under a four-year, 7% loan agreement totaling $212,000 of principal payments, and agrees to pay an additional $350,000 at closing, subject to the land being approved for residential construction. After two months, Buena Vista has earned $167 of refundable interest income on Elbrus' deposit and has been paid $7,689 of refundable principal and $2,311 of refundable interest on the debt. Buena Vista records these events with the following entry:

Cash	10,167	
Customer deposits		10,167

The land is approved for residential construction, triggering sale of the property. Buena Vista's basis in the property is $520,000. Buena Vista uses the following entry to describe completion of the sale:

Cash	350,000	
Note receivable	204,311	
Customer deposits	50,167	
Gain on asset sale		84,478
Land		520,000

Reduced profit method. The reduced profit method is appropriate when the sale has been consummated and the initial investment is adequate but the continuing investment does not clearly demonstrate the buyer's willing commitment to pay the remaining balance of the receivable. For example, a buyer may purchase land under an agreement in which the seller will finance the sale over a thirty-year period. ASC 976 specifically states twenty years as the maximum amortization period for the purchase of land; therefore, the agreement fails to meet the continuing investment criteria.

Under the reduced profit method, the seller recognizes a portion of the profit at the time of sale with the remaining portion recognized in future periods. The amount of reduced profit recognized at the time of sale is determined by discounting the receivable from the buyer to the present value of the lowest level of annual payments required by the sales contract over the maximum period of time specified for that type of real estate property (twenty years for land and the customary term of a first mortgage loan set by an independent lending institution for other types of real estate). The remaining profit is recognized in the periods that lump-sum or other payments are made.

Example of the reduced profit method

Assume Levinson, Inc. sells a parcel of land to Raemer Co. Levinson receives sales value of $2,000,000. The land cost $1,600,000. Raemer gave Levinson the following consideration:

Cash down payment	$ 500,000
First mortgage note payable to an independent lending institution (payable in equal installments of principal and 12% interest, $133,887 payable at the end of each of the next twenty years)	1,000,000
Second mortgage note payable to Levinson (payable in equal installments of principal and 10% interest, $53,039 payable at the end of each of the next thirty years)	500,000
Total sales value	$2,000,000

The amortization term of the second mortgage (seller's receivable) exceeds the twenty-year maximum permitted by ASC 976. It is assumed that the payments by the buyer will cover the interest and principal on the maximum first mortgage loan that could be obtained on the property and interest on the excess aggregate debt on the property over such a maximum first mortgage loan; consequently, the reduced profit method is appropriate. It is also assumed that the market interest rate on similar agreements is 14%.

The present value of $53,039 per year for twenty years at the market rate of 14% is $351,278 ($53,039 × 6.623).

The gross profit on the sale ($400,000) is reduced by the difference between the face amount of the seller's receivable ($500,000) and the reduced amount ($351,278) or $148,722. The profit recognized at the time of sale is the sales value less the cost of the land less the difference between the face amount of the receivable and the reduced amount. Therefore, the reduced profit recognized on the date of sale is computed as follows:

Sales value		$ 2,000,000
Less:	Cost of land	(1,600,000)
	Excess	(148,722)
Reduced profit		$ 251,278

Under the reduced profit method, the seller amortizes its receivable at the market rate, not the rate given on the second mortgage. The receivable's carrying balance is zero after the specified term expires (in this case, twenty years). The remaining profit of $148,722 is recognized in the years after the specified term expires as the buyer makes payments on the second mortgage (years twenty-one through thirty).

Profit Recognition on Retail Land Sales

A single method of recognizing profit is applied to all consummated sales transactions within a project.

Full accrual method. The full accrual method of accounting is applied if all of the following conditions are met and a sale can be recorded:

1. **Expiration of refund period.** The buyer has made the down payment and each required subsequent payment until the period of cancellation with refund has expired. That period is the longest period of those required by local law, established by the seller's policy, or specified in the contract.
2. **Sufficient cumulative payments.** The cumulative payments of principal and interest equal or exceed 10% of the contract sales price.
3. **Collectibility of receivables.** Collection experience for the project in which the sale is made or for the seller's prior projects indicates that at least 90% of the contracts in the project in which the sale is made that are in force six months after sale will be collected in full. The collection experience with the seller's prior projects may be applied to a new project if the prior projects have

   a. The same characteristics (type of land, environment, clientele, contract terms, sales methods) as the new project
   b. A sufficiently long collection period to indicate the percentage of current sales of the new project that will be collected to maturity

   A down payment of at least 20% is an acceptable indication of collectibility.
4. **Nonsubordination of receivables.** The receivable from the sale is not subject to subordination to new loans on the property except that subordination by an individual lot buyer for home construction purposes is permissible if the collection experience on those contracts is the same as on contracts not subordinated.
5. **Completion of development.** The seller is not obligated to complete improvements of lots sold or to construct amenities or other facilities applicable to lots sold.

Percentage-of-completion method. The percentage-of-completion method is used if criteria 1., 2., 3., and 4. above are met, and full accrual criteria are not met (criterion 5. is not satisfied). However, additional criteria (6. and 7.) must be satisfied.

6. **There has been progress on improvements.** The project's improvements progressed beyond preliminary stages and the work apparently will be completed according to plan. Some indications of progress are

   a. The expenditure of funds
   b. Initiation of work
   c. Existence of engineering plans and work commitments
   d. Completion of access roads and amenities such as golf courses, clubs, and swimming pools

   Additionally, there should be no indication of significant delaying factors, such as the inability to obtain permits, contractors, personnel, or equipment. Finally, estimates of costs to complete and extent of progress toward completion should be reasonably dependable.
7. **Development is practical.** There is an expectation that the land can be developed for the purposes represented and the properties will be useful for those purposes; restrictions, including environmental restrictions, will not seriously hamper development; and that improvements such as access roads, water supply, and sewage treatment or removal are feasible within a reasonable time period.

Installment method. The installment method is appropriate if criteria a. and b. are met, full accrual criteria are not met, and the seller is financially capable, as shown by capital

structure, cash flow, or borrowing capacity. If the transaction subsequently meets the requirements for the full accrual method, the seller is permitted to change to that method. This would be a change in accounting estimate. This method may be changed to the percentage-of-completion method when all of the criteria are met.

Deposit method. If a retail land sale transaction does not meet any of the above criteria, the deposit method is appropriate.

Time-Share Transactions

A major segment of the real estate industry has evolved in recent decades to market and sell time-shares, whereby parties acquire the right to use property (typically, resort condominiums or other vacation-oriented property) for a fixed number of weeks per year (known as intervals). While a vast variety of property types and transaction structures exist, there are certain common features and complexities that have challenged the accounting profession. Time-sharing transactions are characterized by the following:

1. Volume-based, homogeneous sales
2. Seller financing
3. Relatively high selling and marketing costs
4. Upon default, recovery of the time-sharing interval by the seller and some forfeiture of principal by the buyer.

Time-share transactions are to be accounted for as nonretail land sales, while time-share transactions are excluded from certain provisions otherwise applicable to incidental rental operations.

Accounting for time-share transactions. ASC 978, *Real Estate—Time-Sharing Activities,* provides guidance for a seller's accounting for real estate time-sharing transactions, including

1. Fee simple transactions in which nonreversionary title and ownership of the real estate pass to the buyer or an SPE
2. Transactions in which title and ownership of all or a portion of the real estate remain with the seller
3. Transactions in which title and ownership of all or a portion of the real estate pass to the buyer and subsequently revert to the seller or transfer to a third party
4. Transactions by a time-share reseller

The major conclusions of this very detailed, specialized standard are as follows:

Profit recognition. A time-share seller should recognize profit on time-sharing transactions as set forth by the provisions of ASC 978 that specify the accounting for other than retail land sales. In order to justify recognizing profit, nonreversionary title must be transferred. If title transfer is reversionary, on the other hand, the seller must account for the transaction as if it were an operating lease.

For a time-sharing transaction to be accounted for as a sale, it must meet the following criteria:

1. The seller transfers nonreversionary title to the time-share;
2. The transaction is *consummated*;
3. The buyer makes cumulative payments (excluding interest) of at least 10% of the sales value of the time-share; and
4. Sufficient time-shares would have been sold to reasonably assure that the units will not become rental property.

Effect of sales incentives. The codification requires that certain sales incentives provided by a seller to a buyer to consummate a transaction are to be recorded separately, by reducing the stated sales price of the time-share by the excess of the fair value of the incentive over the amount paid by the buyer. For purposes of testing for buyer's financial commitment as set forth under ASC 978, the seller must reduce its measurement of the buyer's initial and continuing investments by the excess of the fair value of the incentive over the stated amount the buyer pays, except in certain situations in which the buyer is required to make specific payments on its note in order to receive the incentive.

Reload transactions. A reload transaction is considered to be a separate sale of a second interval, and the second interval is accounted for in accordance with the profit recognition guidance of ASC 978. For an upgrade transaction, that guidance is applied to the sales value of the new (upgrade) interval, and the buyer's initial and continuing investments from the original interval are included in the profit recognition tests related to the new interval.

Uncollectibles. The term uncollectibles is used in ASC 978 to include all situations in which, as a result of credit issues, a time-share seller collects less than 100% of the contractual cash payments of a note receivable, except for certain transfers of receivables to independent third parties by the seller. An estimate of uncollectibility that is expected to occur should be recorded as a reduction of revenue at the time that profit is recognized on a time-sharing sale recorded under the full accrual or percentage-of-completion method. Historical and statistical perspectives are used in making such a determination of anticipated uncollectible amounts. Subsequent changes in estimated uncollectibles should be recorded as an adjustment to estimated uncollectibles and thereby as an adjustment to revenue. Under the relative sales value method, the seller effectively does not record revenue, cost of sales, or inventory relief for amounts not expected to be collected. There generally is no accounting effect on inventory when, as expected, a time-share is repossessed or otherwise reacquired.

Cost of sales. The seller should account for cost of sales and time-sharing inventory in accordance with the relative sales value method.

Costs charged to current period expense. All costs incurred to sell time-shares would be charged to expense as incurred except for certain costs that are

- Incurred for tangible assets used directly in selling the time-shares;
- Incurred for services performed to obtain regulatory approval of sales; or
- Direct and incremental costs of successful sales efforts under the percentage-of-completion, installment, reduced profit, or deposit methods of accounting.

Incidental operations. Rental and other operations during holding periods, including sampler programs and minivacations, should be accounted for as incidental operations. This requires that any excess of revenue over costs be recorded as a reduction of inventory costs.

VIEs and other complex structures. The accounting treatment for more complex time-sharing structures such as time-sharing special-purpose entities (VIEs, which were formerly known as *special-purpose entities*, or SPEs), points systems, and vacation clubs should be determined using the same profit recognition guidance as for simpler structures, provided that the time-sharing interest has been sold to the end user. For balance sheet presentation purposes, a VIE should be viewed as an entity lacking economic substance and established for the purpose of facilitating sales if the VIE structure is legally required for purposes of selling intervals to a class of nonresident customers, and the VIE has no assets other than the time-sharing intervals and has no debt. In those circumstances, the seller should present on its balance sheet as time-sharing inventory the interests in the VIE not yet sold to end users.

Continuing involvement by seller or related entities. If the seller, seller's affiliate, or related party operates an exchange, points, affinity, or similar program, the program's operations constitute continuing involvement by the seller, and the seller should determine its ac-

counting based on an evaluation of whether it will receive compensation at prevailing market rates for its program services.

Other Guidance to Accounting for Real Estate Sales Transactions

Sales of integral equipment are within the scope of ASC 976, and thus the determination of whether equipment is integral is an important one. A determination of whether equipment to be leased is integral is also necessary to enable lessors to determine the proper accounting for sales-type leases. ASC 360-20-15 states that this determination is to be made based on two factors. The first is the significance of the cost to remove the equipment from its existing location (which would include any costs of repairing the damage done to that location by the act of removal). The second is the decrease in value of the equipment that results from its removal (which is, at a minimum, the cost to ship and reinstall the equipment at a new site). The nature of the equipment and whether others can use it is considered in determining whether there would be any further diminution in fair value. When the combined total of the cost to remove and any further diminution of value exceeds 10% of the fair value of the equipment (installed), the equipment is to be deemed integral equipment, and thus accounted for under the provisions of ASC 976.

ASC 310-40-55 deals with the question of whether a valuation allowance previously established for a loan which is collateralized by a long-lived asset should be carried forward after the asset is foreclosed due to loan default. It holds that, when such a loan is foreclosed, any valuation allowance established for the foreclosed loan should not be carried over as a separate element of the cost basis for purposes of accounting for the long-lived assets under ASC 360. Rather, upon foreclosure the lender must measure the long-lived asset received in full satisfaction of a receivable at fair value less cost to sell as prescribed by ASC 310-40. Application of ASC 310-40 results in the identification of a new cost basis for the long-lived asset received in full satisfaction of a receivable.

ASC 310-40-55 also addresses the limitation on gain recognition when an impaired asset obtained by means of foreclosure later recovers some value. ASC 360 states that "a loss shall be recognized for any initial or subsequent write-down to fair value less cost to sell. A gain shall be recognized for any subsequent increase in fair value less cost to sell, but not in excess of the cumulative loss previously recognized (for a write-down to fair value less cost to sell)." Thus gain recognition is limited to the cumulative extent that losses have been recognized while the assets were accounted for as long-lived assets under ASC 360. Put differently, ASC 360 does not allow the lender to "look back" to lending impairments measured and recognized under ASC 450 or ASC 310, for purposes of measuring the cumulative loss previously recognized. "Recovery" of losses not recognized is thus not permitted.

ASC 360-20-40-35 discusses the application of ASC 976 to graduated payment mortgages. Graduated payment mortgages for which negative principal amortization is recognized do not meet the continuing investment tests in ASC 976 and thus full profit is not to be recognized immediately. Mortgage insurance is not to be considered the equivalent of an irrevocable letter of credit in determining whether profit is to be recognized, and the purchase of such insurance is not in itself a demonstration of commitment by the buyer to honor its obligation to pay for the property. The sole exception to this rule is that for all FHA (Federal Housing Administration) and VA (Veteran's Administration) insured loans, profits may be recognized under the full accrual method.

ASC 360-20-40-39 deals with antispeculation clauses sometimes found in land sale agreements, requiring the buyer to develop the land in a specific manner or within a specific period of time and giving the seller the right, but not the obligation, to reacquire the property

when the condition is not met. This option does not preclude recognition of a sale if the probability of the buyer not complying is remote.

ASC 970-360-55 addresses the timing of income recognition when a homebuilder enters into a contract to build a home on its own lot, relinquishing title to both the lot and the home at closing. It states that profit recognition is not appropriate until the conditions specified in ASC 976 have been met. Deposit accounting is to be used for both the land and building activity until the conditions are met.

ASC 360-20-55-66 addresses the situation in which a homeowner's equity interest in property is pledged as security for a note and finds that this cannot be included as part of the buyer's initial investment in determining whether profit can be recognized under ASC 976.

ASC 360-20-40-15 deals with a range of possible forms of financing and the implications of each for profit recognition under ASC 976. The following guidelines are to be used by a seller of real estate in applying ASC 976:

1. In determining whether a transaction qualifies for accounting using the full accrual method of profit recognition, the initial and continuing investment requirements of ASC 976 must be considered unless the seller has unconditionally received all amounts due and is not at risk related to the financing.
2. In determining the buyer's initial investment, payments made on debt incurred by the buyer that is secured by the property (irrespective of whether the debt is incurred directly from the seller or other parties or indirectly by assumption) is not part of the initial investment. Also excluded from the initial investment are payments made to the seller out of the proceeds from debt described in the preceding sentence.
3. Under the installment method, cost recovery method, and reduced-profit recognition methods, payments described in 2. above are not considered to be cash payments from the buyer. If, however, the deferred profit under the method applied under ASC 976 exceeds the sum of (1) the outstanding amount of seller financing, and (2) the outstanding amount of the buyer's debt secured by the property for which the seller is contingently liable, the excess amount is recognized as income by the seller.

ASC 310-40-40-7 deals with the proper valuation for repossessed real estate which is recorded at the lower of the net receivable due to the seller at foreclosure or the fair value of the property.

ASC 974-810-30 addresses the proper treatment of minority interests in certain real estate investment trusts. It holds that the net equity of the operating partnership (after the contributions of the sponsor and the REIT) multiplied by the sponsor's ownership percentage in the operating partnership represents the amount to be initially reported as the minority interest in the REIT's consolidated financial statements. Also, if a minority interest balance is negative, the related change in the REIT's income statement would be the greater of the minority interest holder's share of current earnings or the amount of distributions to the minority interest holder during the year. Any excess is to be credited directly to equity until elimination of the minority interest deficit that existed at the formation of the REIT. Other REIT accounting matters are also addressed in the codification; for example, subsequent acquisitions by the REIT, for cash, of a sponsor's minority interest in an operating partnership are accounted for consistent with the accounting for formation of the REIT.

The matter of appropriate accounting for transfers of investments that are in substance real estate was addressed by ASC 360-20-15-3, which held that in such circumstances the accounting is to follow ASC 976. Thus transfers of acquisition, development, and construction loans (ADC loans), which are deemed in substance real estate under ASC 815-15-55-10,

are subject to this consensus, and transfers of marketable investments in a REIT which are accounted for under ASC 320 are to be accounted for per ASC 860.

ASC 360-20-40 addresses the applicability of a buyer's continuing investment to an entity's recognition of revenue when selling condominium units. An entity can assess the collectibility of the sales price as per ASC 976 by requiring the buyer to either make additional payments during the construction term at least equal to the level annual payments that would be required to fund principal and interest on a customary mortgage for the remaining purchase price of the property, or increase the minimum initial investment by an equivalent aggregate amount. If these criteria cannot be met, then the seller should record the transaction under the deposit method.

ASC 970-323, specifying the accounting for investments in real estate ventures, has been widely applied in practice—even to the extent that its guidance has been analogized to other equity investment situations. It requires that owners of real estate ventures should generally use the equity method of accounting to account for their investments. However, limited partners may have such a minor interest and have no influence or control, in which case the cost method would instead be appropriate.

According to ASC 970-323, if losses exceed the investment, the losses are to be recognized regardless of any increase in the estimated fair value of the venture's assets. Losses in excess of the amount of the investment are a liability. Losses which cannot be borne by certain investors require the remaining investors to use ASC 450 to determine their share of any additional loss. Limited partners are not required to record losses in excess of investment. As usual, if investors do not recognize losses in excess of investment, the equity method is resumed only after the investor's share of net income exceeds the cumulative net losses not recognized previously.

The codification also notes that venture agreements may designate different allocations for profits, losses, cash distributions and cash from liquidation. Accounting for equity in profits and losses therefore requires careful consideration of allocation formulas because the substance over form concept requires equity method accounting to follow the ultimate cash allocations.

Contributions of real estate to a venture as capital are recorded by the investor at cost, and cannot result in the recognition of a gain, since a capital contribution does not represent the culmination of the earnings process.

ASC 970-323 states that interest on loans and advances that are, in substance, capital contributions and so are accounted for as distributions and not interest.

In ASC 970-605, the related topic of appropriate accounting for real estate syndication income is addressed. This applies to all income recognition from real estate syndication activities. ASC 976 applies to profit and loss recognition on sales of real estate by syndicators to partnerships. ASC 970-605 requires that the same concepts be applied to the syndicators—even though they may have never owned the property.

Under the provisions of ASC 970-605, all fees charged by syndicators are includable in the determination of sales value, as required by ASC 976, except for syndication fees and fees for which future services must be performed. Syndication fees are recognized as income when the earning process is complete and collectibility is reasonably assured. If fees are unreasonable, they are to be adjusted, and the sales price of the real estate is to be appropriately adjusted as well. If a partnership interest is received by the syndicator, the value is included in the test of fee reasonableness. If it is part of the fee, the syndicators are to account for this interest as a retained interest from the partial sale of real estate in conformity with ASC 976. Fees for future services are recognized when the service is rendered.

Fees received from blind pool transactions are recognized ratably as the syndication partnership invests in property but only to the extent that the fees are nonrefundable. If syn-

dicators are exposed to future losses from material involvement or from uncertainties regarding collectibility, income is deferred until the losses can be reasonably estimated. For purposes of determining the ASC 976 requirement concerning the buyer's initial and continuing investment for profit recognition, before cash received by syndicators can be allocated to initial and continuing investment, it is allocated to (1) unpaid syndication fees until such fees are paid in full, and (2) amounts previously allocated to fees for future services (to the extent such services have already been performed when the cash is collected). If syndicators receive or retain partnership interests that are subordinated, these are accounted for as participations in future profits without risk of loss.

REAL ESTATE OPERATIONS

PERSPECTIVE AND ISSUES

ASC 970, *Real Estate—General,* specifies the accounting for various costs in acquiring and developing real estate projects. It does not apply to

1. Real estate developed by an entity for its own use rather than for sale or rental
2. Initial direct costs of leases (discussed in Chapter 16)
3. Costs directly related to manufacturing, merchandising or service activities rather than real estate activities
4. Rental operations in which the predominant rental period is less than a month

ASC 970 does address the accounting for costs of real estate whether rented or sold.

Major Topics and Subtopics in the FASB Accounting Standards Codification

Assets	
360	Property, Plant, and Equipment
Broad Transactions	
810	Consolidation
Industry	
970	Real Estate—General

DEFINITIONS OF TERMS

Amenities. Features of or enhancements made to real estate projects that enhance the attractiveness of the property to potential tenants or purchasers. Amenities include golf courses, utility plants, clubhouses, swimming pools, tennis courts, indoor recreational facilities, and parking facilities.

Common costs. Costs that relate to two or more units within a real estate project.

Costs incurred to rent real estate projects. Includes costs of model units and their furnishings, rental facilities, semipermanent signs, rental brochures, advertising, "grand openings," and rental overhead including rental salaries.

Costs incurred to sell real estate projects. Includes costs of model units and their furnishings, sales facilities, sales brochures, legal fees for preparation of prospectuses, semipermanent signs, advertising, "grand openings," and sales overhead including sales salaries.

Fair value. The amount in cash or cash equivalent value of other consideration that a real estate parcel would yield in a current sale between a willing buyer and a willing seller (other than in a forced or liquidation sale). The fair value of a parcel is affected by its physical characteristics, ultimate use, and the time required to make such use of the property considering access, development plans, zoning restrictions, and market absorption factors.

Incidental operations. Revenue-producing activities engaged in during the holding or development period to reduce the cost of developing the property for its intended use, as distinguished from activities designed to generate a profit or a return from the use of the property.

Incremental costs of incidental operations. Costs that would not be incurred except in relation to the conduct of incidental operations. Interest, taxes, insurance, security, and similar costs that would be incurred during the development of a real estate project regardless of whether incidental operations were conducted are not incremental costs.

Incremental revenue from incidental operations. Revenues that would not be earned except in relation to the conduct of incidental operations.

Indirect project costs. Costs incurred after the acquisition of the property, such as construction administration, legal fees, and various office costs, that clearly relate to projects under development or construction.

Net realizable value. The estimated selling price in the ordinary course of business less estimated costs of completion, holding, and disposal.

Phase. A parcel on which units are to be constructed concurrently.

Preacquisition costs. Costs related to a property that are incurred for the express purpose of, but prior to, obtaining that property. Examples may be costs of surveying, zoning or traffic studies, or payments to obtain an option on the property.

Project costs. Costs clearly associated with the acquisition, development, and construction of a real estate project.

Relative fair value before construction. The fair value of each land parcel in a real estate project in relation to the fair value of the other parcels in the project, exclusive of value added by on-site development and construction activities.

CONCEPTS, RULES, AND EXAMPLES

Preacquisition Costs

Payments are generally capitalized if they relate to an option to obtain the real property or if all of the following conditions are met:

1. Costs are directly identified with the property.
2. Costs would be capitalized if the property already were acquired.
3. Acquisition of the option or property is probable. The purchaser wants the property and believes it to be available for sale and has the ability to finance its acquisition.

Once capitalized, these costs are project costs which, if not receivable in the future, or if the property is not acquired are to be recognized as expense.

Taxes and Insurance

Real estate taxes and insurance are capitalized as property costs only when the property is undergoing activities necessary to get the property ready for its intended use. After the property is substantially complete and ready for its intended use such items are expensed.

Project Costs

Costs that are identifiable and clearly associated with acquisition, development, and construction of a real estate project are capitalized as a cost of the project.

Indirect costs that relate to several projects are capitalized and allocated to these projects. Overhead costs that do not clearly relate to any project (i.e., general and administrative expenses) are expensed as incurred.

Amenities

The costs in excess of anticipated proceeds of amenities that are to be sold or transferred in connection with the sale of individual units are treated as common costs of the project.

The costs of amenities that are to be sold separately or retained by the developer are capitalized with those costs in excess of estimated fair value treated as common costs. Fair value is determined as of the expected date of substantial physical completion and the amounts allocated to the amenity are not to be revised later. The sale of the amenity results in a gain or loss when the selling price differs from the fair value less accumulated depreciation.

Costs of amenities are allocated among land parcels benefited for which development is probable. The fair value of a parcel is affected by its physical characteristics, its highest and best use, and the time and cost required to make such use of the property. Before completion and availability for use, operating income or loss is an adjustment to common costs. After such date, operating income or loss is included in the income statement.

Incidental Operations

Revenue from incidental operations is netted with the costs of such operations and any excess of incremental revenue over incremental costs reduces capitalized project costs. If such costs exceed revenues, the excess is recognized as expense as incurred.

Allocation of Costs

Capitalized costs are allocated by specific identification. If this is not feasible, then costs prior to construction are allocated by the relative fair value of each parcel before construction and construction costs are allocated by the relative sales value of each unit.

If estimation of relative values is impractical, allocation may be based on square footage or another area method, or by using other appropriate methods.

Revisions of Estimates

Estimates made and cost allocations are to be reviewed at least annually until the project is substantially complete and available for sale. Costs are revised and reallocated as required for changes in current estimates.

Abandonment and Change in Use

Abandonment of a project requires all capitalized costs to be expensed and not reallocated to other components of the project or other projects. Real estate dedicated to governmental units is not deemed abandoned and its costs are treated as project common costs.

Changes in use require that costs incurred and expected to be incurred that exceed the estimated value of the required project (when substantially complete and ready for intended use) be charged to expense. If no formal plan for the project exists, then project costs in excess of current net realizable value are expensed.

Selling Costs

Costs incurred to sell are capitalized if they are

1. Reasonably expected to be recovered from sale of the project or from incidental operations, and
2. Incurred for tangible assets used directly throughout the selling period to assist the selling process or incurred for services required to obtain regulatory approval of sales.

Other costs may be capitalized as prepaid expenses if directly associated with sales, cost recovery is reasonably expected from sales and the full accrual method cannot be used.

All other costs are expensed in the period incurred. Capitalized costs are expensed in the period in which the related revenue is earned.

Rental Costs

Costs related to and reasonably expected to be recoverable from future rental operations are capitalized. This excludes initial direct costs as defined and described in accounting for leases. Costs that do not qualify for capitalization are expensed as incurred.

Capitalized costs are amortized over the term of the lease, if directly related to a specific operating lease, or over the period of expected benefit. Amortization begins when the project is substantially completed and available for occupancy. Estimated unrecoverable amounts are expensed when it is probable that the lease will be terminated.

A project is substantially completed and available for occupancy when tenant improvements are completed or after one year from the end of major construction activity. Then normal operations take place with all revenues and costs (including depreciation and other amortized costs) recognized in the income statement. If part of a project is occupied but other parts are not yet complete, completed portions are considered separate projects.

Impairment and Recoverability

As discussed in Chapter 11, real estate projects must be evaluated, when warranted by events and circumstances, to determine whether their carrying value is recoverable from estimated future cash flows. ASC 360 provides guidance on grouping assets that are being held and used into "asset groups" and assets being held for sale into "disposal groups" for the purpose of the evaluation of recoverability and impairment computations. ASC 360 applies to real estate held for development and sale, property to be developed in the future, and property currently undergoing development.

Generally, under ASC 360, recoverability is evaluated at the "lowest level for which identifiable cash flows are largely independent of the cash flows of other assets and liabilities." If a project has identifiable elements with separate cash flows such as residential and commercial, or houses and condominiums, then each element is evaluated separately and not combined for the whole project. Projects are not combined in order to avoid recognizing impairment of one of the components.

Once impairment losses are recognized on property, similar to inventory, a new cost basis is adopted and future recoveries in value are not recognized.

Other Guidance to Accounting for Real Estate Operations

ASC 970-360 holds that when a seller of real estate agrees to make up any rental shortfalls for a period of time, payments to and receipts from the seller are adjustments to the cost of the property and will affect future depreciation charges.

ASC 974-323-25 addresses the accounting by a real estate investment trust (REIT) in a service corporation (SC). In determining a REIT's accounting for its investment in an SC, the SC must be evaluated as a potential variable interest entity (VIE) under ASC 810 (discussed in detail in Chapter 13). If the SC is subject to ASC 810, this codification does not apply to the determination of the REIT's accounting. If, however, the SC is not subject to ASC 810, this consensus continues to apply to the determination of the method of accounting that the REIT should use to record its investment (consolidation, equity method, or cost method). The codification includes a list of factors that indicate that the equity method of accounting is to be used. Regardless of the method of accounting used by a REIT for its in-

vestment in an SC, the SC is not considered an independent third party for the purpose of capitalizing lessor initial direct costs under ASC 310-20. Consequently, leasing costs capitalized by a REIT as initial direct costs may not exceed the amounts allowable if the REIT had incurred the costs directly.

As noted in the preceding section of this chapter, ASC 978 addresses the accounting for time-share operations. ASC 978 also establishes accounting requirements for incidental operations. In particular, rental and other operations during holding periods, including sampler programs and minivacations, are to be accounted for as incidental operations. The excess, if any, of revenue over costs of such operations is to be recorded as a reduction of inventory costs.

FRANCHISING: ACCOUNTING BY FRANCHISORS

PERSPECTIVE AND ISSUES

Franchising has become a popular growth industry with many businesses seeking to sell franchises as their primary income source and individuals seeking to buy franchises and become entrepreneurs. How to recognize revenue on the individual sale of franchise territories and on the transactions that arise in connection with the continuing relationship between the franchisor and franchisee are prime accounting issues.

Franchise fees are governed by ASC 952, *Franchisors.*

Major Topics and Subtopics in the FASB Accounting Standards Codification

Industry	
952	Franchisors

DEFINITIONS OF TERMS

Area franchise. An agreement that transfers franchise rights within a geographical area permitting the opening of a number of franchised outlets. The number of outlets, specific locations, and so forth are decisions usually made by the franchisee.

Bargain purchase. A transaction in which the franchisee is allowed to purchase equipment or supplies for a price that is significantly lower than their fair value.

Continuing franchise fee. Consideration for the continuing rights granted by the franchise agreement and for general or specific services during its term.

Franchise agreement. A written business agreement that meets the following principal criteria:

1. The relation between the franchisor and franchisee is contractual, and an agreement, confirming the rights and responsibilities of each party, is in force for a specified period.
2. The continuing relation has as its purpose the distribution of a product or service, or an entire business concept, within a particular market area.
3. Both the franchisor and the franchisee contribute resources for establishing and maintaining the franchise. The franchisor's contribution may be a trademark, a company reputation, products, procedures, labor, equipment, or a process. The franchisee usually contributes operating capital as well as the managerial and operational resources required for opening and continuing the franchised outlet.
4. The franchise agreement outlines and describes the specific marketing practices to be followed, specifies the contribution of each party to the operation of the business, and sets forth certain operating procedures that both parties agree to comply with.
5. The establishment of the franchised outlet creates a business entity that will, in most cases, require and support the full-time business activity of the franchisee.

6. Both the franchisee and the franchisor have a common public identity. This identity is achieved most often through the use of common trade names or trademarks and is frequently reinforced through advertising programs designed to promote the recognition and acceptance of the common identity within the franchisee's market area.

Franchisee. The party who has been granted business rights (the franchise) to operate the franchised business.

Franchisor. The party who grants business rights (the franchise) to the party (the franchisee) who will operate the franchised business.

Initial franchise fee. Consideration for establishing the franchise relationship and providing some agreed-upon initial services. Occasionally, the fee includes consideration for initially required equipment and inventory, but those items usually are the subject of separate consideration. The payment of an initial franchise fee or a continuing royalty fee is not a necessary criterion for an agreement to be considered a franchise agreement.

Initial services. Common provision of a franchise agreement in which the franchisor usually will agree to provide a variety of services and advice to the franchisee, such as the following:

1. Assistance in the selection of a site. The assistance may be based on experience with factors such as traffic patterns, residential configurations, and competition.
2. Assistance in obtaining facilities, including related financing and architectural and engineering services. The facilities may be purchased or leased by the franchisee, and lease payments may be guaranteed by the franchisor.
3. Assistance in advertising, either for the individual franchisee or as part of a general program
4. Training of the franchisee's personnel
5. Preparation and distribution of manuals and similar material concerning operations, administration, and recordkeeping
6. Bookkeeping and advisory services, including setting up the franchisee's records and advising the franchisee about income taxes, real estate taxes, and other taxes, or about local regulations affecting the franchisee's business
7. Inspection, testing, and other quality control programs

CONCEPTS AND RULES

Franchise Sales

Franchise operations are generally subject to the same accounting principles as other commercial enterprises. Special issues arise out of franchise agreements, however, which require the application of special accounting rules.

Revenue is recognized, with an appropriate provision for bad debts, when the franchisor has substantially performed all material services or conditions. Only when revenue is collected over an extended period of time and collectibility cannot be predicted in advance would the use of the cost recovery or installment methods of revenue recognition be appropriate. Substantial performance means

1. The franchisor has no remaining obligation to either refund cash or forgive any unpaid balance due.
2. Substantially all initial services required by the agreement have been performed.
3. No material obligations or conditions remain.

Even if the contract does not require initial services, the pattern of performance by the franchisor in other franchise sales will impact the time period of revenue recognition. This can delay such recognition until services are either performed or it can reasonably be assured

they will not be performed. The franchisee operations will be considered as started when such substantial performance has occurred.

If initial franchise fees are large compared to services rendered and continuing franchise fees are small compared to services to be rendered, then a portion of the initial fee is deferred in an amount sufficient to cover the costs of future services plus a reasonable profit, after considering the impact of the continuing franchise fee.

Example of initial franchise fee revenue recognition

Shanghai Oriental Cuisine sells a Quack's Roast Duck franchise to Toledo Restaurants. The franchise is renewable after two years. The initial franchise fee is $50,000, plus a fixed fee of $500 per month. In exchange, Shanghai provides staff training, vendor relations support, and site selection consulting. Each month thereafter, Shanghai provides $1,000 of free local advertising. Shanghai's typical gross margin on franchise startup sales is 25%.

Because the monthly fee does not cover the cost of monthly services provided, Shanghai defers a portion of the initial franchise fee and amortizes it over the two-year life of the franchise agreement, using the following calculation:

Cost of monthly services provided $1000 × 24 months	=	$24,000
÷ Markup to equal standard 25% gross margin	=	.75
= Estimated revenue required to offset monthly services provided	=	$32,000
Less: Monthly billing to franchise $500 × 24 months	=	$12,000
= Amount of initial franchise fee to be deferred	=	$20,000

Shanghai's entry to record the franchise fee deferral follows:

Franchise fee revenue	20,000	
Unearned franchise fees (liability)		20,000

Shanghai recognizes 1/24 of the unearned franchise fee liability during each month of the franchise period on a straight-line basis, which amounts to $833.33 per month.

Area Franchise Sales

Sometimes franchisors sell territories rather than individual locations. In this event, the franchisor may render services to the area independent of the number of individual franchises to be established. Under this circumstance, revenue recognition for the franchisor is the same as stated above. If, however, substantial services are performed by the franchisor for each individual franchise established, then revenue is recognized in proportion to mandatory service. The general rule is that when the franchisee has no right to receive a refund, all revenue is recognized. It may be necessary for revenue recognition purposes to treat a franchise agreement as a divisible contract and allocate revenue among existing and estimated locations. Future revisions to these estimates will require that remaining unrecognized revenue be recorded in proportion to remaining services expected to be performed.

Example of revenue recognition for area franchise sales

Shanghai Oriental Cuisine sells an area Quack's Roast Duck franchise to Canton Investments for $40,000. Under the terms of this area franchise, Shanghai is solely obligated to provide site selection consulting services to every franchise that Canton opens during the next twelve months, after which Canton is not entitled to a refund. Canton estimates that it will open 12 outlets sporadically throughout the year. Shanghai estimates that it will cost $2,500 for each site selection, or $30,000 in total. Based on the initial $40,000 franchise fee, Shanghai's estimated gross margin is 25%. Canton's initial payment of $40,000 is recorded by Shanghai with the following entry:

Cash	40,000	
Unearned franchise fees (liability)		40,000

After six months of preparation, Canton requests that four site selection surveys be completed. Shanghai completes the work at a cost of $10,000 and uses the following entry to record both the expenditure and related revenue:

Unearned franchise fees (liability)	13,333	
Franchise fee revenue		13,333
Site survey expense	10,000	
Accounts payable		10,000

By the end of the year, Shanghai has performed ten site selection surveys at a cost of $25,000 and recognized revenue of $33,333, leaving $6,667 of unrecognized revenue. Since Canton is no longer entitled to a refund, Shanghai uses the following entry to recognize all remaining revenue, with no related expense:

Unearned franchise fees (liability)	6,667	
Franchise fee revenue		6,667

Other Relationships

Franchisors may guarantee debt of the franchisee, continue to own a portion of the franchise, or control the franchisee's operations. Revenue is not recognized until all services, conditions, and obligations have been performed.

In addition, the franchisor may have an option to reacquire the location. Accounting for initial revenue is to consider the probability of exercise of the option. If the expectation at the time of the agreement is that the option is likely to be exercised, the entire franchise fee is deferred and not recognized as income. Upon exercise, the deferral reduces the recorded investment of the franchisor.

An initial fee may cover both franchise rights and property rights, including equipment, signs, and inventory. A portion of the fee applicable to property rights is recognized to the extent of the fair value of these assets. However, fees relating to different services rendered by franchisors are generally not allocated to these different services because segregating the amounts applicable to each service could not be performed objectively. The rule of revenue recognition when all services are substantially performed is generally upheld. If objectively determinable separate fees are charged for separate services, then recognition of revenue can be determined and recorded for each service performed.

Franchisors may act as agents for the franchisee by issuing purchase orders to suppliers for inventory and equipment. These are not recorded as sales and purchases by the franchisor; instead, consistent with the agency relationship, receivables from the franchisee and payables to the supplier are reported on the balance sheet of the franchisor. There is, of course, no right of offset associated with these amounts, which are to be presented gross.

Continuing Franchise and Other Fees

Continuing franchise fees are recognized as revenue as the fees are earned. Related costs are expensed as incurred. Regardless of the purpose of the fees, revenue is recognized when the fee is earned and receivable. The exception is when a portion of the fee is required to be segregated and used for a specific purpose, such as advertising. The franchisor defers this amount and records it as a liability. This liability is reduced by the cost of the services received.

Sometimes, the franchisee has a period of time where bargain purchases of equipment or supplies are granted by the contract. If the bargain price is lower than other customers pay or denies a reasonable profit to the franchisor, a portion of the initial franchise fee is deferred and accounted for as an adjustment of the selling price when the franchisee makes the purchase. The deferred amount is either the difference in the selling price among customers and the bargain price, or an amount sufficient to provide a reasonable profit to the franchisor.

Costs

Direct and incremental costs related to franchise sales are deferred and recognized when revenue is recorded. However, deferred costs cannot exceed anticipated future revenue, net of additional expected costs.

Indirect costs are expensed as incurred. These usually are regular and recurring costs that bear no relationship to sales.

Repossessed Franchises

If, for any reason, the franchisor refunds the franchise fee and obtains the location, previously recognized revenue is reversed in the period of repossession. If a repossession is made without a refund, there is no adjustment of revenue previously recognized. However, any estimated uncollectible amounts are to be provided for and any remaining collected funds are recorded as revenue.

Business Combinations

Business combinations where the franchisor acquires the business of a franchisee are accounted for in accordance with the requirements of ASC 805.

No adjustment of prior revenue is made since the financial statements are not retroactively consolidated in recording a business combination. Care must be taken to ensure that the purchase is not a repossession. If the transaction is deemed to be a repossession, it is accounted for as described in the above section.

OTHER SPECIAL ACCOUNTING AND REPORTING ISSUES

Major Topics and Subtopics in the FASB Accounting Standards Codification

Revenue	
605-25	Revenue Recognition—Multiple Element Arrangements
605-45	Revenue Recognition—Principal Agent Considerations
605-50	Revenue Recognition—Customer Payments and Incentives
Expenses	
718	Compensation

The major categories of revenue-generating transactions, for which specialized accounting standards have been developed, have been addressed in the earlier sections of this chapter. In the following paragraphs, various miscellaneous requirements are discussed.

Reporting revenue gross as a principal vs. net as an agent. A longstanding issue in financial reporting has been whether certain entities more accurately convey the nature of their operations by reporting as revenue only the "net" amount they retain when acting effectively as an agent for another entity. While in some situations the answer is obvious, in other cases it has been less clear. Historically this may not have been an urgent issue to be resolved, since users of financial statements were deemed capable of deriving correct inferences regardless of the manner of presentation of the income statement. However, in recent years an unfortunate trend developed, whereby analysts and others cited only revenue growth as an indicator of the entity's success, making the question of income statement presentation of revenue somewhat more important.

ASC 605-45 provides guidance on whether an entity is an agent for a vendor-manufacturer, and thus recognizes the net retainage (commission) for serving in that capacity, or whether that entity is a seller of goods (i.e., acting as a principal), and thus should recognize revenue for the gross amount billed to a customer and an expense for the amount paid to the vendor-manufacturer.

The codification identifies the following factors to be considered when determining whether revenue is to be reported as the net retainage (hereinafter, "net") or the gross amount billed to a customer ("gross"). None of the indicators are presumptive or determinative, although the relative strength of each indicator is to be considered.

- Is the company the primary obligor in the arrangement; that is, is the company responsible for the fulfillment of the order, including the acceptability of the product or service to the customer? If the company, rather than a supplier, is responsible, that fact is a strong indicator that the company record revenue gross. Responsibility for arranging transportation for the product is not responsibility for fulfillment. If a supplier is responsible for fulfillment, including the acceptability to the customer, that fact indicates that the company recognizes only the net retainage.
- Does the company have general inventory risk? General inventory risk exists if a company takes title to a product before the product is ordered by a customer or will take title to the product if the customer returns it (provided that the customer has a right of return). In considering this indicator, arrangements with a supplier that reduce or mitigate the company's risk level are to be considered. Unmitigated general inventory risk is a strong indicator that the company recognizes revenue gross.
- Does the company have physical loss inventory risk? Physical loss inventory risk exists if the title to the product is transferred to the company at the shipping point and then transferred to the customer upon delivery. Physical loss inventory risk also exists if a company takes title to the product after the order is received but before the product is transferred to the shipper. While less persuasive than general inventory risk, this indicator provides some evidence that a company record revenue gross.
- Does the company establish the selling price? If a company establishes the selling price, that fact may indicate that the company recognizes revenue gross.
- Is the amount earned by the company fixed? If a company earns a fixed amount per transaction or if it earns a percentage of the selling price, that fact may indicate that the company report revenue net.
- Does the company change the product or perform part of the service? If a company changes the product (beyond packaging) or performs part of the service ordered by the customer such that the selling price is greater as a result of the company's efforts, that fact is indicative that a company recognize revenue gross. Marketing skills, market coverage, distribution system, or reputation are not to be evaluated in determining whether the company changes the product or performs part of the service.
- Does the company have multiple suppliers for the product or service ordered by the customer? If a company has the discretion to select the supplier, that fact may indicate that the company record revenue gross.
- Is the company involved in determining the nature, type, characteristics or specifications of the product or service by the customer? If so, that fact may indicate that the company record revenue gross.
- Does the company have credit risk for the amount billed to the customer? Credit risk exists if a company must pay the supplier after the supplier performs, regardless of whether the customer has paid. If the company has credit risk, this fact provides weak evidence that the company record revenue gross. If the supplier assumes the credit risk, the company is to record revenue net.

ASC 605-45 includes thirteen examples to assist in implementation.

Accounting by a grantee for an equity instrument to be received in conjunction with providing goods or services. The accounting for such equity issuances by the report-

ing entity is addressed by ASC 718, discussed in Chapter 19. ASC 505-50 has resolved the proper accounting by the recipient of such payments.

In exchange for goods or services, an entity (the grantee) may receive equity instruments that have conversion or exercisability terms that vary based on future events, such as attainment of sales levels or a successful initial public offering. This issue describes the appropriate accounting if ASC 718 does not apply because the instruments received have underlyings based on either the grantee's or issuer's performance.

The grantee measures the fair value of the equity instruments received using the stock price and measurement assumptions as of the earlier of two dates. The first date is the date on which the grantee and the issuer reach a mutual understanding of both the terms of the equity-based compensation and the goods to be delivered (or services to be performed). The second date is the date at which the performance necessary to earn the equity is completed by the grantee, that is, the grantee's rights have vested.

If the terms of the equity agreement are dependent on the achievement of a market condition, the fair value of the instrument is to include the effects on fair value of the commitment to change the terms if the market condition is met. Pricing models are available to value path-dependent equity instruments.

If the terms of the equity agreement are dependent on the achievement of certain performance goals (beyond those that initially established the goods to be delivered or services to be performed), the fair value of the instrument is computed without the effects of the commitment to change the terms if the goals are met. If those goals are subsequently met, the fair value is adjusted to reflect the new terms and the adjustment is reported as additional revenue (as described in the Share-Based Payments section in Chapter 19).

Revenue arrangements with multiple deliverables. Another longstanding difficulty has been identifying authoritative guidance germane to the accounting for revenue arrangements (product or service sales) having more than one "deliverable." Many instances of aggressive accounting—where all or most of the total revenue was recognized at the time of delivery of the first of multiple deliverables—came to light in the financial reporting abuses of the late 1990s and early 2000s. ASC 605-25 comprehensively addressed these complex issues, and represents the only universally applicable guidance extant.

Perspective and issues. Vendors may offer customers many related and unrelated products and services sold together ("bundled") or separately. The prices assigned to the various elements of a particular transaction or series of transactions on the seller's invoices and the timing of issuing those invoices are not always indicative of the actual earning of revenue on the various elements of these transactions. This consensus provides guidance on how to measure consideration received from complex, multi-element arrangements and how to allocate that consideration between the different deliverables contained in the arrangement.

Terms used in ASC 605-25. The guidance in the standard is extensive and complex, due to the complex nature of the underlying revenue transactions. A number of key terms are used in the standard, defined as follows:

- **Contingent amount.** The portion of the total consideration to be received by a vendor under a multiple deliverable arrangement that would be realized by the vendor only if specified performance conditions were met or additional deliverables were provided to the customer.
- **Noncontingent amount.** The portion of the total consideration to be received by a vendor under a multiple deliverable arrangement that is not subject to any additional performance requirements that the vendor must meet.

- **Refund rights.** The legal right of a customer to obtain a concession or recover all or a portion of the consideration paid to a vendor under a multiple deliverable arrangement.
- **Relative fair value method.** A technique for allocating the total consideration to be received by a vendor under a multiple deliverable arrangement to each separate unit of accounting based on the ratio of the fair value of each separate unit of accounting to the total fair values of all of the separate units of accounting.
- **Residual method.** A technique for determining the portion of the total consideration to be received by a vendor under a multiple deliverable arrangement to be allocated to the units of accounting that have been delivered by subtracting the fair values of the undelivered items from the total consideration to be received.
- **Stand-alone value.** The value that a specific product or service (deliverable) has to a customer without considering other products or services that might accompany it as part of a multiple deliverable arrangement. In order to have value to a customer on a stand-alone basis, a deliverable must be either sold separately by any vendor or be separately resalable by the customer whether or not there is an observable market for the deliverable.
- **Vendor-specific objective evidence (VSOE).** The price that a vendor charges for a specific product or service (deliverable) when it is sold separately. If the deliverable is not currently being sold separately, a price that is established by management possessing the authority may be used under the condition that it is considered probable that the established price will not change prior to the separate market introduction of the deliverable.

Summary of guidance provided by ASC 605-25. Arrangements between vendors and their customers often include the sale of multiple products and services (deliverables). A multiple deliverable arrangement (MDA) can be structured using fixed, variable, or contingent pricing or combinations thereof. Product delivery and service performance can occur at different times, and in different locations and customer acceptance can be subject to various return privileges, or performance guarantees.

ASC 605-25 provides guidance on

1. How a vendor determines whether an MDA consists of a single unit of accounting or multiple units of accounting
2. Allocating MDA consideration to multiple units of accounting
3. Measuring MDA consideration

In applying the consensuses, it is to be presumed that separate contracts executed at or near the same time with the same entity or related parties were negotiated as a package and are to be considered together in determining how many units of accounting are contained in an MDA. That presumption can be overcome by sufficient contradictory evidence.

The consensuses collectively apply to all deliverables (i.e., products, services, and rights to use assets) covered by contractually binding written, oral, or implied arrangements.

Excluded from the scope of the consensus are the following:

1. Criteria for the timing of revenue recognition for a unit of accounting. Existing authoritative literature governs these determinations.
2. Arrangements where, conditioned upon the vendor's revenue from the customer exceeding certain cumulative levels or the customer continuing its relationship with the vendor for a specified time period
   a. The vendor offers free or discounted products or services in the future or
   b. The vendor provides specified future cash rebates or refunds.

3. Arrangements involving the sale of award credits by a "broad-based loyalty program operator." (Presumably this exception refers to airline frequent-flyer or similar customer loyalty programs.)
4. Accounting for the direct costs incurred by a vendor relative to an MDA.

Basic principles established. ASC 605-25 set forth three basic principles, the application of which are the subject of the discussion that follows:

1. MDA are divided into separate *units of accounting* if the deliverables included in the arrangement meet all three of the criteria presented in the table below.
2. Subject to certain limits regarding contingent amounts to be received under the MDA, *relative fair values* are used to allocate MDA proceeds to the separate units of accounting.
3. The revenue recognition criteria to be applied are determined *separately* for each unit of accounting.

Units of accounting. The following table summarizes the criteria used in determining units of accounting for MDA within the scope of these consensuses and is adapted from a decision diagram contained in the EITF Abstract:

	Criteria	Outcome	Result
1.	Does the delivered item have stand-alone value to the customer?	Yes	Go to criteria 2
		No	Do not separate item
2.	Does objective and reliable evidence exist regarding the fair value of the undelivered items?	Yes	Go to criteria 3
		No	Do not separate item
3.	If the MDA includes a general right of return with respect to the delivered item, is delivery of the undelivered items probable and substantially controlled by the vendor?	Yes or Not Applicable	Delivered item is a separate unit of accounting
		No	Do not separate item

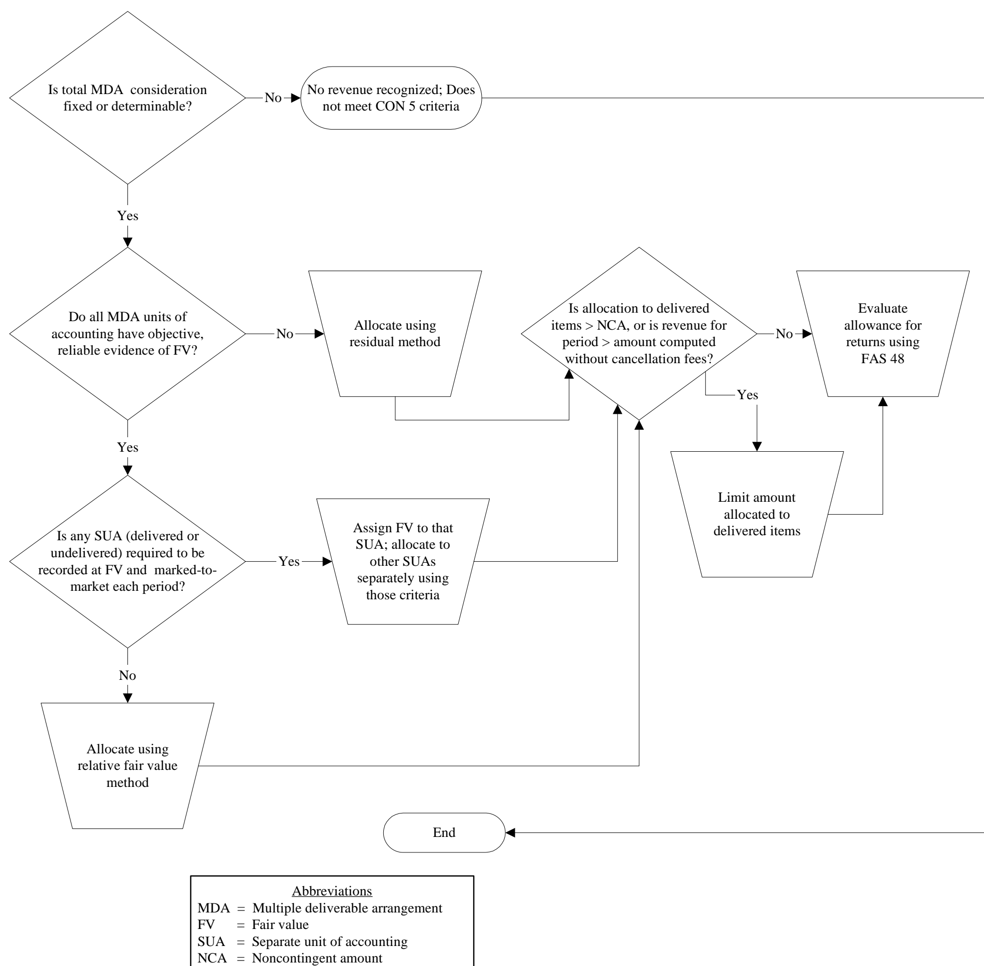
This separability evaluation is to be applied consistently to MDA that arise under similar circumstances or that possess similar characteristics. The evaluation is to be performed at the inception of the MDA and upon delivery of each item.

If consideration is allocated to a deliverable that does not qualify as a separate unit of accounting, then the reporting entity is required to

1. Combine the amount allocated to the deliverable with the amounts allocated to all other undelivered items included in the MDA and
2. Determine revenue recognition for the combined items as a single unit of accounting.

Measurement and allocation of MDA consideration. The following decision diagram summarizes the factors to consider in measuring and allocating MDA consideration:

Measuring and Allocating MDA Consideration



The determination of whether total MDA consideration is fixed or determinable disregards the effects of refund rights or performance bonuses, if any.

After applying the criteria set forth in the decision diagram, the vendor may recognize an asset representing the cumulative difference, from inception of the MDA, between amounts recognized as revenue and amounts received or receivable from the customer (this is analogous to the asset "costs and estimated earnings in excess of billings" which is used in long-term construction accounting). The amount of such assets may not exceed the total amounts to which the vendor is legally entitled under the MDA including fees that would be earned upon customer cancellation. The amount recognized as an asset would be further limited if the vendor did not intend to enforce its contractual rights to obtain such cancellation fees from the customer.

In measuring fair value, it is presumed that a separately stated sales price included in the sales contract for a deliverable is not representative of that deliverable's separate fair value. Rather, the best evidence of fair value is vendor-specific objective evidence (VSOE) of the sales price of the deliverable on a stand-alone basis. Use of VSOE, when available, to

determine fair value is always preferable. Otherwise, third-party evidence of fair value is an acceptable substitute.

Disclosures. The financial statements of a vendor are to include the following disclosures, when applicable:

1. The nature of the vendor's MDAs including provisions relative to performance, cancellation, termination, or refund.
2. The vendor's accounting policy with respect to the recognition of revenue from MDAs (e.g., whether deliverables are separable into units of accounting).

Accounting for consideration given by a vendor to a customer. ASC 605-50 provides guidance regarding the recognition, measurement, and income statement display of consideration given by a vendor to purchasers of the vendor's products. This consideration can be provided to a purchaser at any point along the distribution chain, irrespective of whether the purchaser receiving the consideration is a direct or indirect customer of the vendor. Examples of arrangements include, but are not limited to, sales incentive offers labeled as discounts, coupons, rebates, and "free" products or services as well as arrangements referred to as slotting fees, cooperative advertising, and buydowns. The issue does not apply to

1. Coupons, rebates, and other forms of rights for free or significantly discounted products or services received by a customer in a prior exchange transaction that were accounted for by the vendor as a separate deliverable in that prior exchange, or
2. An offer to a customer, in connection with a current revenue transaction, for free or discounted products or services that is redeemable by the customer at a future date without a further exchange transaction with the vendor. Covered by ASC 605-25, summarized above.

The issue also does not discuss the accounting for offers of free or discounted products or services that are exercisable after a customer has completed a specified cumulative level of revenue transactions or remained a customer for a specified time period (for example, "point" and loyalty programs).

ASC 605-50 contains the following separately addressed issues:

1. Cash consideration given by a vendor to a customer is presumed to be a reduction of selling price and is classified as a reduction of revenue when recognized in the vendor's income statement. That presumption is overcome and the consideration is classified as a cost incurred if, and to the extent that, both of the following conditions are met:

   a. The vendor receives, or will receive, an identifiable benefit (goods or services) in exchange for the consideration. In order to meet this condition, the identified benefit must be of a type that the vendor could have acquired in an exchange transaction with a party other than a purchaser of its products or services, that is, that the benefit must be separable from the sale of the vendor's goods or services, and
   b. The vendor can reasonably estimate the fair value of that identifiable benefit. If the amount of consideration paid by the vendor exceeds the estimated fair value of the benefit received, that excess amount is classified as a reduction of revenue when recognized in the vendor's income statement.

   If the consideration is a "free" product or service or anything other than cash (including "credits" that the customer can apply against trade amounts owed to the vendor) or equity instruments, the cost of the consideration is characterized as an

expense (as opposed to a reduction of revenue) when recognized in the vendor's income statement. The consensus contains fifteen examples of the application of this issue to various fact scenarios.

2. The amounts representing reduced revenue are classified as expense only if a vendor can demonstrate that classification of those amounts as a reduction of revenue results in negative revenue for a specific customer on a cumulative basis (that is, since the inception of the overall relationship between the vendor and the customer). However, classification as an expense would not be appropriate if a supply arrangement exists that either
   a. Provides the vendor with the right to be a provider of a certain type or class of goods or services for a specified period of time and it is probable that the customer will order the vendor's goods or services, or
   b. Requires the customer to order a minimum amount of goods or services from the vendor in the future, except to the extent that the consideration given exceeds future revenue from the customer under the arrangement.
3. If the consideration (in the form of products, services, or cash) offered voluntarily by a vendor and without charge to customers can be used or becomes exercisable by a customer as a result of a single exchange transaction, and that consideration will not result in a loss on the sale, the vendor recognizes the "cost" of the consideration at the later of the following:
   a. The date the related revenue is recognized by the vendor, or
   b. The date the sales incentive is offered. (For example, a vendor recognizes a liability for a mail-in rebate coupon that requires proof of purchase, based on the estimated amount of refunds or rebates that will be claimed by customers.)
4. If the consideration (in the form of products, services, or cash) offered voluntarily by a vendor and without charge to customers can be used or becomes exercisable by a customer as a result of a single exchange transaction, and that consideration results in a loss on the sale, a vendor does not recognize a liability prior to the date on which the related revenue is recognized (this would be improper matching). However, the offer of consideration in an amount that will result in a loss on the sale of a product may indicate an impairment of existing inventory.
5. If a vendor offers a customer a rebate or refund of a specified amount of cash consideration that is redeemable only if the customer completes a specified cumulative level of purchases or remains a customer for a specified time, the vendor recognizes the cost of the offer in a systematic and rational manner over the period in which the underlying revenue transactions that qualify the customer for the rebate or refund take place. Measurement of the total rebate or refund obligation is based on the estimated number of customers that will ultimately earn and claim rebates or refunds under the offer. If the amount cannot be reasonably estimated, the maximum potential amount is to be recognized.

Accounting by a customer (including a reseller) for certain consideration received from a vendor. ASC 605-50 also addresses accounting issues from the standpoint of how the vendor's customer—either the end user or a reseller of the vendor's products or services—is to account for cash consideration it receives from its vendor.

In general, there is a rebuttable presumption that cash consideration received from a vendor is a purchase-price concession that should be recognized by the customer as a reduction of cost of goods sold (and/or the inventory of unsold units). This presumption is overcome if payment of the consideration is for either

1. **Delivery of goods and/or services.** Payment to the customer in exchange for goods or services delivered to the vendor is accounted for by the customer as revenue. In order for the customer to recognize revenue, the goods and/or services must be "sufficiently separable" from the customer's purchase of the vendor's products by meeting two criteria.
   a. The customer would have obtained the goods and/or services from a party other than the vendor and
   b. The customer is able to reasonably estimate the fair value of the goods and/or services provided to the vendor.

   Any excess of cash consideration received by the customer over the fair value of the goods and/or services delivered to the vendor reduces the customer's cost of sales.
2. **Reimbursement of costs.** A reimbursement of the customer's specific incremental, identifiable costs incurred to sell the vendor's products or services which is accounted for by the customer as a reduction of that cost. To the extent the cash consideration received exceeds the actual cost being reimbursed, the excess reduces cost of sales and/or inventory.

Vendors sometimes enter into binding arrangements that offer customers specified amounts of cash rebates or refunds payable in the future only if the customer remains a customer for a specified period of time, or purchases a specified cumulative dollar amount of goods or services from the vendor. In general, these arrangements are to be recorded by the customer as reductions of cost of sales by systematically allocating a portion of the benefits to be received to each transaction that results in progress toward meeting the target that results in earning the benefit. In order to use this pro rata accounting, however, the amount of the refund must be both probable and reasonably estimable (as those terms are defined in ASC 450). The codification provided indicators that, if present, may impair the customer's ability to determine that the refund is both probable and estimable.

1. The rebate or refund applies to purchases that are to occur over a "relatively long period" (undefined in the consensus)
2. An absence of historical experience with similar products or changed circumstances that make historical experience irrelevant
3. A past history of significant adjustments to expected rebates or refunds
4. Susceptibility of the product to significant external factors such as technological obsolescence or changes in demand

If the rebate or refund is not considered both probable and estimable, it is not recognized by the customer until it is fully earned by reaching the specified milestone (e.g., the dollar amount of cumulative purchases is reached or the time period for remaining a customer has expired).

Changes in a customer's estimate of the amount of future rebates or refunds, and retroactive changes by a vendor to a previous offer are recognized using a "cumulative catch-up adjustment." This is accomplished by the customer immediately charging or crediting cost of sales in an amount that will adjust the cumulative amounts recognized under the arrangement to the changed terms. Of course, if any portion of the adjustment impacts goods still in the customer's inventory, that portion would adjust the valuation of the inventory and not cost of sales.

The SEC observer cautioned registrants to consider whether certain transactions between vendors and customers (e.g., simultaneous agreements between the parties to purchase equal

amounts of each other's goods) are covered by the provisions of ASC 845 regarding non-monetary exchanges that are not the culmination of an earning process.

Applying the foregoing guidance to sales incentives offered by manufacturers to consumers. The standard described immediately above is applicable to situations in which cash consideration is received by a customer from a vendor, and is presumed to be a reduction of the prices of the vendor's products or services. Such incentives are to be characterized as a reduction of cost of sales when recognized in the customer's income statement. There are other instances, however, where consideration is a reimbursement for incentives offered to end users (e.g., retail customers) honored by the vendor's customer (retailer). The common example is coupons given to end users to be redeemed at the retailers offering the vendor's products for sale.

ASC 605-50-45-19 states that this guidance is limited to a vendor's incentive that meets all of the following criteria:

1. The incentive can be tendered by a consumer at resellers that accept manufacturer's incentives in partial (or full) payment of the price charged by the reseller for the vendor's product;
2. The reseller receives a direct reimbursement from the vendor (or a clearinghouse authorized by the vendor) based on the face amount of the incentive;
3. The terms of reimbursement to the reseller for the vendor's sales incentive offered to the consumer are not influenced by or negotiated in conjunction with any other incentive arrangements between the vendor and the reseller, but rather, may only be determined by the terms of the incentive offered to consumers; and
4. The reseller is subject to an agency relationship with the vendor, whether expressed or implied, in the sales incentive transaction between the vendor and the consumer.

Sales incentives that do not meet all of the foregoing criteria are subject to the guidance in ASC 605-50-45-2 through 45-3, and ASC 605-50-45-12 through 45-14, as applicable.

Accounting for consideration given by a service provider to a manufacturer or reseller. There are cases, such as in the cell phone service industry, where companies provide services to their customers under arrangements that require the customers to purchase equipment in order to utilize those services. In order to spur demand, the companies provide incentives to the equipment manufacturers or resellers to reduce the selling price of the equipment. The accounting for this situation is addressed by ASC 605-50, which states that, if the consideration given by the service provider to the manufacturer or reseller can be linked contractually to the benefit received by the service provider's customers, then the service provider can use the guidance noted above in ASC 605-50 to properly characterize the consideration paid. If the form of consideration to be paid to the service provider's customers is not cash or the service provider does not control the type of consideration paid, then the service provider should record such payments as an expense. If the form of consideration to be paid to the service provider's customers is cash (such as a mail-in rebate), then the service provider should record such payments as a reduction of revenue. The service provider should disclose the nature of the incentive program and the amounts recognized in the statement of operations for the incentive program and their classification for each period presented.

Research and Development Costs—ASC 805 497
Nonrefundable advance payments related to future R&D activities 497
Sponsored research and development activities 498

PERSPECTIVE AND ISSUES

Long-lived assets are those expected to provide an economic benefit to the reporting entity for a number of future periods. GAAP regarding long-lived assets involves the determination of the appropriate amounts at which to initially record the assets—which amounts will include costs associated with any legal obligations to eventually retire the assets and the cost of interest incurred during construction. In addition, determinations must be made of the appropriate method to be used to allocate those amounts over the periods to be benefited, subsequent increases in carrying value attributable to changes in the estimates of retirement costs to be incurred, the measurement of impairment losses, and the accounting for assets to be disposed of rather than kept in service.

Long-lived assets are primarily operational assets and are classified into two basic types: tangible and intangible. Tangible assets have physical substance and are categorized as follows:

1. Depreciable
2. Depletable
3. Other tangible assets

Intangible assets have no physical substance. Their value is based on the rights or privileges to which the reporting entity is entitled.

Most of the accounting issues associated with long-lived assets involve proper measurement and timing of the transactions. Adequate consideration must be given to the economic substance of the transaction.

All entities are required to review long-lived assets and certain identifiable intangible assets for impairment whenever circumstances and situations change such that there is an indication that the carrying amount may not be recoverable. If, upon review, the undiscounted future cash flows (without interest charges) are less than the carrying amount, the carrying amount is reduced to fair value and an impairment loss is recognized. This fair value is considered the new cost basis and is not subject to subsequent adjustment except for depreciation and further impairment. Thus, there is no restoration of previously recognized impairment losses. With some exceptions, this standard also applies to rate-regulated assets. Thus, costs excluded by a regulator from the reporting entity's rate base would be recognized as impairment costs.

Long-lived assets to be disposed of by sale are presented on the balance sheet as "held for sale" and valued at their carrying amount, or their fair value less cost to sell, whichever is less. In subsequent periods, increases in value may be recognized but only to the extent of cumulative losses recognized in the past. Depreciation is not recorded for assets held for sale.

DEFINITIONS OF TERMS

Amortization. The periodic charge to income that results from a systematic and rational allocation of cost over the life of an intangible asset. Analogous to depreciation of tangible assets.

Asset acquisition. A transaction whereby the assets purchased and liabilities assumed do not constitute a business (defined below).

Asset group. The lowest level for which identifiable cash flows are largely independent of the cash flows associated with other assets and liabilities.

Asset retirement obligation. A legal obligation associated with the retirement of a tangible long-lived asset that results from its acquisition, construction, development, and/or normal operation.

Book value. The cost of a long-lived asset less the related accumulated depreciation or amortization to the date of measurement. Sometimes referred to as *net* book value.

Boot. The monetary consideration given or received in an asset exchange.

Business. An integrated set of activities and assets capable of being conducted and managed in order to provide a return directly to investors, members, participants, or other owners in the form of dividends, lower costs, or other economics benefits. An entity in its development stage that has not yet commenced its planned principal operations that meets this definition is considered to be a business.

Depreciation. The periodic charge to income that results from a systematic and rational allocation of cost over the life of a tangible asset. Analogous to amortization of intangible assets. Depreciation is only a method of cost allocation, not a means of determining or presenting current valuation of assets.

Disposal group. A group of assets to be disposed of in a single transaction as a group, and the liabilities directly associated with those assets that will be transferred with them.

Dividends-in-kind. Dividends paid to stockholders from assets of the corporation other than cash.

Exchange. A reciprocal transfer between the reporting entity and another entity that results in the acquisition of assets or services, or the satisfaction of liabilities through a transfer of assets, services, or obligations. In order for a transfer to be considered an exchange transaction, the transferor is not permitted to have substantial continuing involvement in the transferred asset that results in the transferee not obtaining the usual risks and rewards of ownership of the transferred asset.

Fixed assets. Those assets that are used in a productive capacity, are tangible (have physical substance), are relatively long-lived, and provide future benefit that is readily measurable. Sometimes referred to as property, plant, and equipment.

Foreclosure. A legal action taken by a party that holds a security interest in one or more assets to terminate the owner's interest in those assets. Upon termination of the owner's interest, the secured party obtains legal title to the assets in order to sell them, with the sales proceeds applied to partially or fully satisfy the secured debt.

Goodwill. An asset that represents the future economic benefits that arise from other assets acquired in a business combination that are not identified individually or recognized separately. Under ASC 805, goodwill is measured as the excess of (1) the aggregate of the fair value of consideration transferred plus the fair value of any noncontrolling interest over (2) the fair value of the net amount of identifiable assets acquired less liabilities assumed.

Impairment. The condition that exists when a long-lived asset's carrying amount is not expected to be recoverable over the remainder of its expected life. Fixed assets and intangibles with a finite useful life are evaluated for impairment under ASC 360. Goodwill and indefinite life intangibles are evaluated for impairment under ASC 350.

Implied fair value. The excess of the fair value of a reporting unit, as a whole, over the fair values that would be assigned to its assets and liabilities in a purchase business combination at the date of measurement.

Intangible assets. Those assets that provide future economic benefit but have no physical substance. Examples include goodwill, patents, copyrights, etc.

Legal obligation. An obligation that a party is required to settle as a result of an existing or enacted law, statue, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of promissory estoppel (see definition below).

Monetary assets. Assets whose amounts are fixed in terms of units of currency. Examples are cash, accounts receivable, and notes receivable.

Nonmonetary assets. Assets other than monetary assets. Examples are inventories; investments in common stock; and property, plant, and equipment.

Nonmonetary transactions. Exchanges and nonreciprocal transfers that involve little or no monetary assets or liabilities.

Nonreciprocal transfer. A transfer of assets or services in one direction, either from the reporting entity to its owners or to another entity, or from owners or another entity to the reporting entity. A reporting entity's reacquisition of its own outstanding stock is a nonreciprocal transfer.

Primary asset. The depreciable long-lived asset (or amortizable intangible asset) that is the most significant component asset from which an asset group derives its cash-flow generating capacity.

Productive assets. Assets held for or used in the production of goods or services. Productive assets include an investment in another entity if the investment is accounted for by the equity method but exclude an investment not accounted for by that method.

Promissory estoppel. A legal doctrine whereby a court of law will enforce a promise made by one party (the promisor) to another party who relied on the promise (the promisee) even though no formal contract exists between the two parties or no consideration was exchanged.

Retirement. The removal from service of a long-lived asset by sale, abandonment, recycling, or other disposal on an other-than-temporary basis. Retirement can occur before or at the end of the asset's useful life. However, retirement does not include the temporary idling of an asset.

Similar productive assets. Productive assets that are of the same general type, that perform the same function, or that are employed in the same line of business.

CONCEPTS, RULES, AND EXAMPLES

Fixed Assets

Fixed assets (sometimes referred to as "property, plant, and equipment," "tangible long-lived assets," or as "plant assets") are tangible property used in a productive capacity that will benefit the reporting entity for a period longer than one year.

Among the accounting issues that can arise in accounting for fixed assets are

1. Determination of the amounts at which to initially record the assets, whether acquired through purchase or nonmonetary exchange; or through construction by the

reporting entity. Fixed assets can be acquired individually, in groups, or as a part of a business combination. They can also be acquired through foreclosure.
2. Whether management capitalizes discrete assets in groups or separately capitalizes the major individual components of individual assets (unit of account)
3. The proper accounting for postacquisition costs incurred with respect to the assets during their useful lives
4. The rate and pattern of allocation of amounts capitalized to the proper periods, including, if applicable, periods during which the assets become impaired
5. Events that cause the assets to be reclassified to or from categories such as held and used, held for sale, or idle
6. Derecognition—the recording of sale, exchange, retirement and/or disposal of the assets at or before the end of their productive life

Cost considerations.

Initial acquisition cost. Upon acquisition, the reporting entity capitalizes all the costs necessary to deliver the asset to its intended location and prepare it for its productive use. Examples of such costs relative to personal property include

1. Sales, use, excise, and other taxes imposed on the purchase
2. Import duties
3. Finders' fees
4. Freight costs and related shipping insurance
5. Storage and handling costs
6. Installation and setup costs
7. Testing and breaking-in costs
8. Foundations and other costs related to providing proper support for the asset
9. Costs of reconditioning assets that are purchased used in order to prepare them for use

When the asset consists of one or more buildings, capitalized costs include such expenditures as

1. Demolition of preexisting structures occupying the land as well as costs related to excavating, grading, or filling the land to ready it for the new structure
2. Contract price paid to the general contractor and subcontractors
3. Architectural and engineering costs
4. Building permits
5. Costs of renovating a preexisting purchased building to convert it for use by the buyer

Accounting for assets acquired in a group. It is important to differentiate the acquisition of assets in a group from a business combination. To aid the practitioner in this endeavor, ASC 805, *Business Combinations*, provides that, if the assets acquired and liabilities assumed constitute a "business," the transaction is a business combination; otherwise, it is accounted for as an asset acquisition.

The definition of a business is

> *…an integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing a return in the form of dividends, lower costs, or other economic benefits directly to investors or other owners, members, or participants.*

Significantly, the definition does not

1. Require that outputs be present, although they frequently are present

2. Require that a business be self-sustaining. Rather it emphasizes that the activities and assets be *capable* of providing a return. Thus, an entity that is in its development stage and has not yet commenced its planned principal operations that otherwise meets the definition is considered to be a business. Development State Enterprises are discussed in greater detail in Chapter 3.

ASC 805, discussed in detail in Chapter 13, is to be applied prospectively to business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after December 15, 2008. Earlier application is not permitted.

When a reporting entity acquires assets and assumes liabilities that do not constitute a business, the transaction is accounted for as an asset acquisition. Assets acquired in an asset acquisition are initially recognized at their cost to the acquirer including related transaction costs. The cost of assets acquired as a group is allocated to the individual assets acquired or liabilities assumed based on their relative fair values. Goodwill is not to be recognized in a transaction of this nature.

If assets are transferred between entities under common control, the entity receiving the net assets or equity interests initially recognizes the assets and liabilities transferred at their carrying amounts to the transferring entity at the transfer date. If there is a difference between the carrying amounts of the net assets transferred and their historical cost of the parent company because, for example, push-down accounting had not been applied, then the financial statements of the recipient entity are to reflect the transferred assets and liabilities at the historical cost of the parent of the entities under common control.

Unit of accounting. No specific guidance is provided in GAAP as to the unit of accounting to be used by management in capitalizing long-lived assets. Management might choose, with respect to assets it acquires or constructs, to aggregate individually identifiable assets and record them as if they were a single asset, and then depreciate them accordingly. Conversely, management might choose, with respect to longer-lived assets such as buildings or aircraft, to disaggregate the purchase price and separately record and depreciate the asset's major components over each component's own, individually determined estimated useful life. (Note that there may be significant tax advantages to separately accounting for components.)

Absent specific guidance regarding such practices, it is important that the financial statements provide sufficient information regarding the reporting entity's policies regarding capitalization of fixed assets and the criteria used by management to determine whether to record specified categories of assets in groups and/or by component. These policies are to be followed consistently, once adopted, with any future voluntary, postadoption changes in the policies subject to ASC 250, *Accounting Changes and Error Corrections*.

Postacquisition costs. Many different terms are used to describe costs that occur subsequent to initial acquisition including, but not limited to, the following:

Addition	Overhaul	Rehabilitation	Retrofitting
Alteration	Planned major maintenance	Renovation	Turnaround
Betterment	Rearrangement	Repair	
Improvement	Redevelopment	Replacement	
Maintenance	Refurbishment	Retooling	

Irrespective of the terminology used to describe a cost, the proper accounting treatment depends on a careful analysis of whether the cost is expected to provide future benefits to the reporting entity and, if so, the nature of those expected benefits.

Costs that increase the value of the asset. If the cost adds to the existing asset, in effect a new asset has been acquired that is subject to the same capitalization considerations applied

in recognizing the original asset. As a practical expedient, most reporting entities establish a dollar threshold under which such costs are charged to expense, irrespective of their purpose (e.g., all costs under $1,500 are charged to expense). This is done under the assumption that the costs of capitalizing and depreciating the item far exceed the benefits to users of the financial statements. In effect, these items are considered to be immaterial to the financial statements, both individually and in the aggregate.

Costs that increase the future service potential of the asset. If the cost increases the future service potential of the asset, it is accounted for in one of the following manners, depending on the individual facts and circumstances:

1. *Costs that do not extend the overall useful life of the asset.* If a portion of the original asset is being replaced, theoretically, the carrying value, if any, of the corresponding portion of the asset that is being replaced (cost less accumulated depreciation and less any impairment charges recognized in prior periods) should be removed from the accounting records and recorded as a loss in the period of the replacement. This accounting is seldom used in practice because, in general, accounting records for fixed assets are not maintained in the painstaking detail necessary to determine the carrying value of the individual components that comprise each asset. Instead, most companies will capitalize the replacement components under the rationale that the portion of the asset being replaced would have been depreciated sufficiently based on the useful life of the host asset so that at the time of replacement, little or no carrying value would remain to be removed.
2. *Costs that extend the overall useful life of the asset.* If, as a result of incurring a cost, the useful life of the host asset is extended without increasing its productivity or capacity, it has been suggested that the costs be recorded as a charge to accumulated depreciation, rather than capitalizing them as additions to fixed assets. Recording the transaction in this manner effectively recovers previously recognized depreciation and has the same effect on the net carrying value as capitalizing the addition. This treatment is seldom used in practice and has little theoretical appeal unless it is accompanied by a prospective change in the remaining estimated useful life of the host asset.

Planned major maintenance activities. ASC 908, *Airlines,* had permitted airlines to estimate and accrue the future costs of overhauling engines and airframes as required by regulations of the US Federal Aviation Administration (FAA). Following this method, an air carrier would, upon acquisition of an aircraft, estimate the number of hours from inception until when the first major overhaul would be required to be performed in order to recertify the aircraft with the FAA. As those hours were flown, the carrier would use an hourly rate to accrue the estimated overhaul cost and charge the cost to expense. Upon actual performance of the overhaul, the actual costs would be charged to the accrued overhaul cost with any difference between estimate and actual being charged or credited to expense.

FASB concluded that application of this method resulted in recognition of a liability in periods prior to the occurrence of an event that obligated the entity to perform the overhaul. Until the performance of the overhaul is actually required to be performed, the reporting entity will not have incurred a present obligation to perform the overhaul and, therefore, under the CON 6 definition of a liability, the liability had not yet been incurred as the hours were flown.

FASB was also concerned that other commercial enterprises were applying a similar accrue-in-advance method by analogizing their own facts and circumstances to the air carriers whose accounting was prescribed by the standard. Consequently, it revised the standard, which now prohibits the use, in both interim and annual financial statements, of the accrue-

in-advance method of accounting for planned major maintenance activities. The scope of the revision includes the airline industry and all other industries. Thus, this method of accounting is no longer permitted.

Reinstallations and rearrangements. If, as a result of these activities, the reporting entity expects to obtain benefits that extend into future years arising from improved production efficiency or reduced production costs, the reinstallation or rearrangement costs can be capitalized and depreciated. If the activities are not expected to provide those future benefits, the costs are to be recognized as expense as incurred.

Relocation. The costs of moving a fixed asset to a new location at which it will operate in the same manner and with the same functionality as it did at its former location does not result in any future benefits, and therefore the costs of dismantlement, packaging/crating, shipping, and reinstallation are to be recognized as expenses as incurred.

Repairs and maintenance. If a cost does not extend an asset's useful life, increase its productivity, improve its operating efficiency, or add additional production capacity, the cost is to be recognized as an expense as incurred.

Construction of tangible assets for internal use. All direct costs (labor, materials, payroll, and related benefit costs) of constructing an entity's own tangible fixed assets are capitalized. However, a degree of judgment is involved in allocating costs between indirect costs—a reasonable portion of which are allocable to construction costs—and general and administrative costs, which under GAAP must be treated as period costs.

The FASB has not addressed this issue, and the AICPA has issued conflicting guidance regarding cost capitalization. In ASC 605-35, the AICPA (in the context of long-term construction contracts) indicated that, in order for costs to be capitalized (rather than be treated as period costs), they should be "… clearly related to production either directly or by an allocation based on their discernible future benefits." Later in that same pronouncement, illustrative examples of capitalizable costs are provided with a qualifier "in *some circumstances*, support costs such as central preparation and processing of payrolls [are allocable as indirect costs]."

Subsequently, in ASC 350-40, (addressing the capitalization of costs of software self-developed for internal use), the AICPA indicated that "general and administrative costs *and overhead costs* should not be capitalized as costs of internal-use software." The distinction between the two conflicting rules may be due to the former being applicable to tangible assets and the latter to intangible software costs, although both types of internally constructed assets are subject to interest capitalization during the production period.

Prudence suggests that management establish a carefully reasoned policy that is consistently followed and fully disclosed in the notes to the financial statements, in sufficient detail to unambiguously inform the user about the methods used and amounts involved.

Preproduction costs of molds, dies, and other tools. Manufacturers often incur costs referred to as preproduction costs, related to products that they will provide to their customers under long-term supply arrangements. ASC 340-10-25 states the following with respect to these costs:

1. Costs of design and development of products to be sold under long-term supply arrangements are expensed as incurred.
2. Costs of design and development of molds, dies, and other tools that the supplier will own and that will be used in producing the products under the long-term supply arrangement are capitalized as part of the molds, dies, and other tools (subject to an ASC 360 recoverability assessment when one or more impairment indicators is present, as discussed later in this chapter). There is an exception, however, for

molds, dies, and other tools involving new technology, which are expensed as incurred as research and development costs under ASC 730.

3. If the molds, dies, and other tools described in 2. above are *not to be owned* by the supplier, then their costs are expensed as incurred unless the supply arrangement provides the supplier the noncancelable right (as long as the supplier is performing under the terms of the supply arrangement) to use the molds, dies, and other tools during the term of the supply arrangement.
4. If there is a legally enforceable contractual guarantee for reimbursement of design and development costs that would otherwise be expensed under these consensuses, the costs are recognized as an asset as incurred. Such a guarantee must contain reimbursement provisions that are objectively measurable and verifiable. The consensus contains examples illustrating this provision.

Under these consensuses, preparers are encouraged (and SEC registrants are required) to disclose the following information:

1. The accounting policy for preproduction design and development costs.
2. The aggregate amounts of
   a. Assets recognized pursuant to agreements providing for contractual reimbursement of preproduction design and development costs.
   b. Assets recognized for molds, dies, and other tools that the supplier owns.
   c. Assets recognized for molds, dies, and other tools that the supplier does not own.

It is important to note that the above provisions do not apply to assets acquired in a business combination that are used in research and development activities. Instead, such assets are accounted for in accordance with ASC 805, which permits recognition of in-process research and development assets.

Interest cost. The recorded amount of an asset includes all of the costs necessary to get the asset set up and functioning properly for its intended use, including interest.

The principal purposes accomplished by the capitalization of interest costs are

1. To obtain a more accurate measurement of the costs associated with the investment in the asset
2. To achieve a better matching of costs related to the acquisition, construction, and development of productive assets to the future periods that will benefit from the revenues that the assets generate

All assets that require a time period to get ready for their intended use should include a capitalized amount of interest. However, accomplishing this level of capitalization would usually violate a reasonable cost/benefit test because of the added accounting and administrative costs that would be incurred. In many such situations, the effect of interest capitalization would be immaterial. Accordingly, interest cost is only capitalized as a part of the historical cost of the following qualifying assets when such interest is considered to be material, which normally implies that construction or creation occurs over extended periods of time. Common examples include

1. Assets constructed for an entity's own use or for which deposit or progress payments are made
2. Assets produced as discrete projects that are intended for lease or sale
3. Equity-method investments when the investee is using funds to acquire qualifying assets for principal operations that have not yet begun

Generally, inventories and land that are not undergoing preparation for intended use are not qualifying assets. When land is being developed, it is a qualifying asset. If land is developed for lots, the capitalized interest cost is added to the cost of the land. The capitalized interest will then be properly matched against revenues when the lots are sold. If, however, the land is developed for a building, then the capitalized interest cost is added to the cost of the building, in which case the capitalized interest will be matched against related revenues as the building is depreciated.

The capitalization of interest costs does not apply to the following situations:

1. When routine inventories are produced in large quantities on a repetitive basis
2. When the effects of capitalization would not be material, compared to the effect of expensing interest
3. When qualifying assets are already in use or ready for use
4. When qualifying assets are not being used and are not awaiting activities to get them ready for use
5. When qualifying assets are not included in a consolidated balance sheet
6. When principal operations of an investee accounted for under the equity method have already begun
7. When regulated investees capitalize both the cost of debt and equity capital
8. When assets are acquired with grants and gifts restricted by the donor to the extent that funds are available from those grants and gifts

The amount of interest to be capitalized. Interest cost includes the following:

1. Interest on debt having explicit interest rates (fixed or floating)
2. Interest related to capital leases
3. Interest required to be imputed on payables (i.e., those due in over one year, per ASC 835-30)

The most appropriate rate to use as the capitalization rate is the rate applicable to specific new debt resulting from the need to finance the acquired assets. If there is no specific new debt, the capitalization rate is a weighted-average of the rates of the other borrowings of the entity. This latter case reflects the fact that the previously incurred debt of the entity could be repaid if not for the acquisition of the qualifying asset. Thus, indirectly, the previous debt is financing the acquisition of the new asset and its interest is part of the cost of the new asset. The selection of borrowings to be used in the calculation of the weighted-average of rates requires judgment. The amount of interest to be capitalized is that portion which could have been avoided if the qualifying asset had not been acquired. Thus, the capitalized amount is the incremental amount of interest cost incurred by the entity to finance the acquired asset.

If the reporting entity uses derivative financial instruments as fair value hedges to affect its borrowing costs, ASC 815-25-35 specifies that the interest rate to use in capitalizing interest is to be the effective yield that takes into account gains and losses on the effective portion of a derivative instrument that qualifies as a fair value hedge of fixed interest rate debt. The amount of interest subject to capitalization could include amortization of the adjustments of the carrying amount of the hedged liability under ASC 815, if the entity elects to begin amortization of those adjustments during the period in which interest is eligible for capitalization. Any ineffective portion of the fair value hedge is not reflected in the capitalization rate. During the deliberations with respect to ASC 815-25-35, the FASB staff expressed a belief that when variable-rate interest on a specific borrowing is associated with an asset under construction and capitalized as part of the cost of that asset, the amounts in accumulated other comprehensive income related to a cash flow hedge of the variability of

that interest are to be reclassified into earnings over the depreciable life of the constructed asset, since that depreciable life coincides with the amortization period for the capitalized interest cost on the debt.

Once the appropriate rate has been established, the base to which that rate is to be applied is the average amount of accumulated net capital *expenditures* incurred for qualifying assets during the relevant time frame. Capitalized costs and expenditures are not the same terms. Theoretically, a capitalized cost financed by a trade payable for which no interest is recognized is not a capital expenditure to which the capitalization rate is applied. Reasonable approximations of net capital expenditures are acceptable, however, and capitalized costs are generally used in place of capital expenditures unless there is expected to be a material difference.

If the average capitalized expenditures exceed the specific new borrowings for the time frame involved, then the *excess* expenditures are multiplied by the weighted-average of rates and not by the rate associated with the specific debt. This requirement more accurately reflects the interest cost incurred by the entity to acquire the fixed asset.

The interest being paid on the debt may be simple or compound. Simple interest is computed on the principal alone, whereas compound interest is computed on the principal *and* on any interest that has not been paid. Most fixed assets will be acquired with debt subject to compound interest. Compound interest can be computed using compound interest tables or computer software.

The total amount of interest actually incurred by the entity is the ceiling for the amount of interest cost capitalized. The amount capitalized cannot exceed the amount actually incurred during the period involved. On a consolidated basis, the ceiling is defined as the total of the parent's interest cost plus that of the consolidated subsidiaries. If financial statements are issued separately, the interest cost capitalized is limited to the amount that the separate entity has incurred, and that amount includes interest on intercompany borrowings. The interest incurred is a gross amount and is not netted against interest earned except in cases involving externally restricted tax-exempt borrowings.

Example of accounting for capitalized interest costs

1. On January 1, 2009, Daniel Corp. contracted with Rukin Company to construct a building for $2,000,000 on land that Daniel had purchased years earlier.
2. Daniel Corp. was to make five payments in 2009 with the last payment scheduled for the date of completion, December 31, 2009.
3. Daniel Corp. made the following payments during 2009:

January 1, 2009	$ 200,000
March 31, 2009	400,000
June 30, 2009	610,000
September 30, 2009	440,000
December 31, 2009	350,000
	$2,000,000

4. Daniel Corp. had the following debt outstanding at December 31, 2009:

a.	A 12%, three-year note dated 1/1/09 with interest compounded quarterly. Both principal and interest due 12/31/12 (relates specifically to building project).	$850,000
b.	A 10%, ten-year note dated 12/31/03 with simple interest payable annually on December 31.	$600,000
c.	A 12%, five-year note dated 12/31/05 with simple interest payable annually on December 31.	$700,000

The amount of interest to be capitalized during 2009 is computed as follows:

Average Accumulated Expenditures

Date	Expenditure	Capitalization period*	Average accumulated expenditures
1/1/09	$ 200,000	12/12	$200,000
3/31/09	400,000	9/12	300,000
6/30/09	610,000	6/12	305,000
9/30/09	440,000	3/12	110,000
12/31/09	350,000	0/12	--
	$2,000,000		$915,000

* *The number of months between the date expenditures were made and the date interest capitalization stops (December 31, 2009).*

Potential Interest Cost to Be Capitalized

($850,000 × 1.12551)* – $850,000	=	$106,684
65,000 × .1108**	=	7,202
$915,000		$113,886

* *The principal, $850,000, is multiplied by the factor for the future amount of $1 for four periods (quarterly compounding) at 3% to determine the amount of principal and interest due in 2009.*

** *Weighted-average interest rate:*

	Principal	Interest
10%, ten-year note	$ 600,000	$60,000
12%, five-year	700,000	84,000
	$1,300,000	$144,886

$$\frac{\text{Total interest}}{\text{Total principal}} = \frac{\$144{,}000}{\$1{,}300{,}000} = \underline{\underline{11.08}}\% \text{ weighted-average interest rate}$$

The actual interest is

12%, three-year note [($850,000 × 1.12551) – $850,000]	=	$106,684
10%, ten-year note ($600,000 × 10%)	=	60,000
12%, five-year note ($700,000 × 12%)	=	84,000
Total interest		$250,684

The interest cost to be capitalized is the lesser of $113,886 (avoidable interest) or $250,684 (actual interest), which is $113,886. The remaining $136,798 ($250,684 – $113,886) is expensed during 2009.

Determining the time period for interest capitalization. Three conditions must be met before capitalization commences.

1. Necessary activities are in progress to get the asset ready to function as intended
2. Qualifying asset expenditures have been made
3. Interest costs are being incurred

As long as these conditions continue, interest costs are capitalized.

Necessary activities are interpreted in a very broad manner. They start with the planning process and continue until the qualifying asset is substantially complete and ready to function. Brief, normal interruptions do not stop the capitalization of interest costs. However, if the entity intentionally suspends or delays the activities for some reason, interest costs are not capitalized from the point of suspension or delay until substantial activities regarding the asset resume.

If the asset is completed in parts, the capitalization of interest costs stops for each part as it becomes ready. An asset that must be entirely complete before the parts can be used capitalizes interest costs until the total asset becomes ready.

Interest costs continue to be capitalized until the asset is ready to function as intended, even in cases where lower of cost or market rules are applicable and market is lower than cost. The required write-down is increased accordingly.

Capitalization of interest costs incurred on tax-exempt borrowings. If qualifying assets have been financed with the proceeds from tax-exempt, externally restricted borrowings, and

if temporary investments have been purchased with those proceeds, a modification is required. The interest costs incurred from the date of borrowing must be reduced by the interest earned on the temporary investment in order to calculate the ceiling for the capitalization of interest costs. This procedure is followed until the assets financed in this manner are ready. When the specified assets are functioning as intended, the interest cost of the tax-exempt borrowing becomes available to be capitalized by other qualifying assets of the entity. Portions of the tax-exempt borrowings that are not restricted are eligible for capitalization in the normal manner.

Assets acquired with gifts or grants. Qualifying assets that are acquired with externally restricted gifts or grants are not subject to capitalization of interest. The principal reason for this treatment is the concept that there is no economic cost of financing when a gift or grant is used in the acquisition.

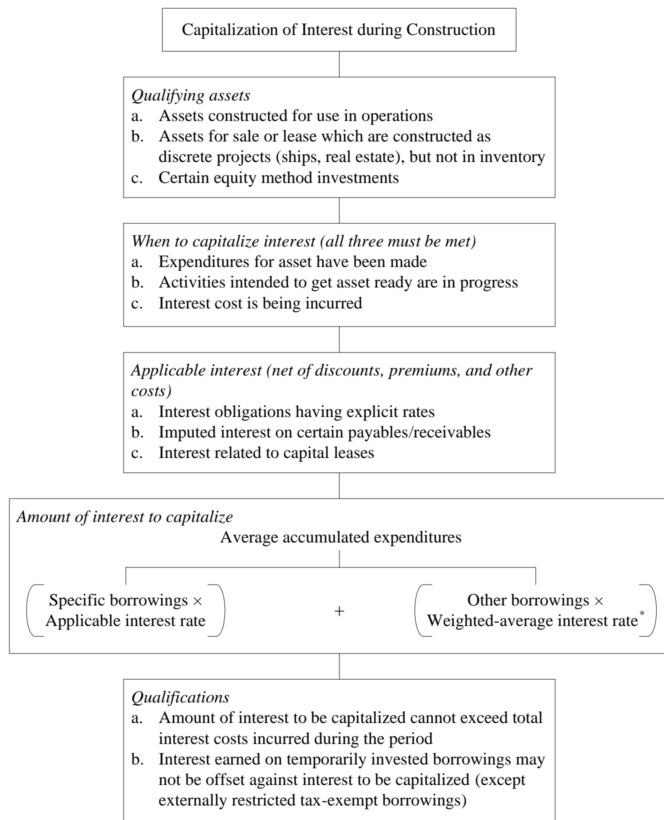
Summary of interest capitalization requirements. The diagram on the following page summarizes the accounting for interest capitalization.

Real estate special assessments. The laws of various states permit the formation of Tax Increment Financing Entities (TIFEs). Although their structure and characteristics differ between jurisdictions, TIFEs are generally special taxing districts established to finance and operate infrastructure owned by the municipality, such as roads, water mains, electric lines, sewers, etc. These infrastructure improvements are used to revitalize a discrete geographic area by facilitating the private development of adjoining residential and commercial real estate. The TIFE or, absent a TIFE, the municipality typically issues bonds to finance the construction of the infrastructure improvements. The bonds may offer investors favorable after-tax yields by qualifying for tax-exempt status under IRC §141. Generally, the bonds are repaid from special assessments specifically designated for this purpose by the TIFE (or the municipality) such as user fees, tolls, sales taxes, real estate taxes, hotel bed taxes, etc.

Besides paying for the debt service, these special assessments also fund ongoing operating costs such as routine infrastructure repairs and maintenance. The infrastructure improvements made with the bond proceeds directly benefit the adjoining property owners and, in fact, the terms of these arrangements are often jointly negotiated between residential and commercial real estate developers and the municipality as an inducement to the developer to invest in a local development project.

Depending on an analysis of the specific facts and circumstances including the relevant statute, ordinance, bond indenture, and other legal documents, the property owner or developer may potentially be required to record a liability for

1. A liability for a special assessment by the TIFE or municipality if that assessment is levied on each individual property owner at an amount that is fixed or determinable and that covers a determinable period of time (ASC 970-470).
2. A guarantee liability under ASC 460 if, for example, it has
    a. Contractually agreed to cover all or a portion of any shortfalls in the required annual debt service of the bond obligations of the issuing TIFE or municipality.
    b. Pledged company assets as collateral for the bond obligations.
    c. Provided a letter of credit or other credit enhancements to support all or a portion of the bond obligations.



*Weighted-average interest rate = $\frac{\textit{Total interest on other borrowings}}{\textit{Average outstanding principal during period}}$

NOTE:

1. *ASC 460-10-30 provides that, at the inception of the guarantee, the guarantor may be required under ASC 450 to recognize a liability for a contingent loss. In the circumstances described here, this would result in the developer or property owner recording the TIFE or municipality debt as their own obligation. In fact, ASC 970-470 specifies that if the property owner is constructing facilities for its own use or operation, the presence of any of the factors a. – c. would create a presumption that the TIFE debt be recognized as a company obligation.*
2. *Consolidation of the TIFE by the property owner or developer will most likely be prohibited under ASC 810 since governmental organizations and financing entities established by governmental organizations are exempt from consolidation unless the property owner or developer is using the arrangement in an attempt to circumvent ASC 810.*

The literature cited above is silent regarding how to record the offsetting debit associated with recording these obligations and whether or not the debt represents an amount to be capitalized as a long-lived asset. During the deliberations on this topic, alternative views were expressed. For example, one view was to treat a debit to record the TIFE debt as an

investment in the TIFE and amortize the investment as a charge to expense as the bonds are repaid and/or the related development is sold.

In the authors' opinion, the accounting for the debit depends on whether the property is being developed for sale or lease by a real estate developer or is being developed for the reporting entity's own use.

Real estate developers follow the guidance in ASC 970, *Real Estate*. Under ASC 970, the developer capitalizes any portion allocable to the production period as part of the cost of the property being developed. The remaining portion is charged to expense because it is attributable to the period after the project is substantially complete and ready for intended use.

Reporting entities developing the property for their own use are not included in the scope of ASC 970 and, therefore need to consider the best of the available alternatives. The authors favor analogizing from ASC 970 and the literature on interest capitalization on self-constructed assets, and accordingly following the same accounting as described in the previous paragraph.

Asset retirement obligations. ASC 410 established standards for measuring the future cost to retire an asset and recognizing that cost in the financial statements as a liability, and correspondingly, as part of the depreciable cost of the asset.

The provisions of the statement do not apply to

1. Temporary idling of long-lived assets
2. Obligations arising solely from a plan to sell or otherwise dispose of long-lived assets covered by ASC 360 (discussed later in this chapter)
3. Obligations resulting from the improper operation of assets (e.g., penalties and fines such as those described in ASC 410-30, *Environmental Obligations*)
4. Minimum lease payments or contingent rentals of a lessee under ASC 840
5. Costs of activities required to prepare an asset for an alternative use
6. The costs of replacement parts (unless there is a legal obligation to dispose of them)

The standard applies to *legal obligations* associated with the *retirement* of tangible long-lived assets that result from their acquisition, construction, development, and/or normal operation. Lessee capital lease assets and lessor assets that are leased under operating leases are also subject to these rules.

For the purposes of applying ASC 410, a legal obligation is "an obligation that a party is required to settle as a result of an existing or enacted law, statute, ordinance, or written or oral contract or by legal construction of a contract under the doctrine of *promissory estoppel*." Promissory estoppel is a legal doctrine whereby a court of law will enforce a promise made by one party (the promisor) to another party (the promisee) even though no formal contract exists between the two parties or no consideration was exchanged. This situation can arise when a party (the promisee) relies on a promise to his or her detriment and the person making the promise (the promisor) should have reasonably expected the promisee to rely on the promise. The court will, in these cases, "estop" (prevent) the promisor from asserting that s/he has no obligation because s/he should have anticipated that the promise would be relied upon.

Asset retirement obligations requiring recognition. When an entity acquires, constructs, and operates assets, it often incurs obligations that are unavoidable. Much of the discussion in ASC 410 pertains to specialized industry applications such as offshore oil platforms, nuclear power plants, mining operations, landfills, and underground storage tanks. However, the criteria of the statement are intended to apply to situations encountered more frequently in practice, such as in the following examples.

Examples of the scope of ASC 410

Example 1—Leased premises. In accordance with the terms of a lease, the lessee is obligated to remove its specialized machinery from the leased premises prior to vacating those premises, or to compensate the lessor accordingly. The lease imposes a legal obligation on the lessee to remove the asset at the end of the asset's useful life or upon vacating the premises, and therefore this situation would be covered by ASC 410.

Example 2—Owned premises. The same machinery described in example 1 is installed in a factory that the entity owns. At the end of the useful life of the machinery, the entity will either incur costs to dismantle and remove the asset or will leave it idle in place. If the entity chooses to do nothing and not remove the equipment, this would adversely affect the fair value of the premises should the entity choose to sell the premises on an "as is" basis. Conceptually, to apply the matching principle in a manner consistent with example 1, the cost of asset retirement should be recognized systematically and rationally over the productive life of the asset and not in the period of retirement. However, in this example, there is no *legal obligation* on the part of the owner of the factory and equipment to retire the asset and, thus, this would *not* be covered by ASC 410.

Example 3—Promissory estoppel. Assume the same facts as in example 2. In this case, however, the owner of the property sold to a third party an option to purchase the factory, exercisable at the end of five years. In offering the option to the third party, the owner verbally represented that the factory would be completely vacant at the end of the five-year option period and that all machinery, furniture and fixtures would be removed from the premises. The property owner would reasonably expect that the purchaser of the option relied to the purchaser's detriment (as evidenced by the financial sacrifice of consideration made in exchange for the option) on the representation that the factory would be vacant. This would trigger promissory estoppel and the owner's obligation would be covered by ASC 410.

Example of timing of recognition

Phyl Corporation owns and operates a chemical company. At its premises, it maintains underground tanks used to store various types of chemicals. The tanks were installed when Phyl Corporation purchased its facilities seven years prior. On February 1, 2009, the governor of the state signed a law requiring removal of such tanks when they are no longer being used. Since the law imposes a legal obligation on Phyl Corporation, upon enactment, recognition of an asset retirement obligation (ARO) would be required.

Example of ongoing additions to the obligation

Joyce Manufacturing Corporation (JMC) operates a factory. As part of its normal operations it stores production byproducts and used cleaning solvents on site in a reservoir specifically designed for that purpose. The reservoir and surrounding land, all owned by JMC, are contaminated with these chemicals. On February 1, 2009, the governor of the state signed a law requiring cleanup and disposal of hazardous waste from an already existing production process upon retirement of the facility. Upon enactment of the law, immediate recognition would be required for the ARO associated with the contamination that had already occurred. In addition, liabilities will continue to be recognized over the remaining life of the facility as additional contamination occurs.

Accounting considerations. This standard and the interpretation of it in ASC 410-20-25 raise several important accounting issues that require careful consideration.

Recognition and allocation. Upon initial recognition, the entity records an increase to the carrying amount of the related long-lived asset and an offsetting liability. The entity then depreciates the combined cost of the asset and the capitalized asset retirement obligation using a systematic and rational allocation method over the period during which the long-lived asset is expected to provide benefits, taking into consideration any expected salvage value. Conceptually, this standard is an application of the matching principle in that the total investment in the asset, including the cost of its eventual retirement, is charged to expense over the periods benefited. Depending on the pattern and timing of obligating events, an entity could, under this standard, capitalize an amount of asset retirement cost during a period and,

in the same period, allocate an equal amount to depreciation expense. It is important to note that, for the purpose of capitalizing interest under ASC 835-20, these additions to the carrying amounts of long-lived assets are not considered expenditures.

Impairment. Retirement obligations added to the carrying amounts of long-lived assets must be included in those carrying amounts for the purpose of testing those assets for impairment. In estimating future cash flows under the impairment standard, the cash flows related to settling the liability for an asset retirement obligation are to be excluded from both the undiscounted cash flows used to assess the recoverability of the asset's carrying amount and the discounted cash flows used to measure the asset's fair value.

Measurement. Asset retirement obligations are initially measured at fair value. Fair value (as defined in ASC 820, *Fair Value Measurements and Disclosures*, and discussed in detail in Chapter 6) is the price that would be paid to transfer the liability in an orderly transaction between market participants at the measurement date. This measurement is not based on the amount that the reporting entity (the obligor) would be required to pay to settle the liability on the measurement date (which would be difficult, if not impossible, to estimate in the absence of a market for the transfer of such obligations). Rather, the measurement assumes that the reporting entity remains the obligor under the ARO and that the obligee has transferred its rights by selling them to a hypothetical market participant on the measurement date. In determining the price it would be willing to pay for the rights associated with the ARO, a third-party market participant would consider the risk of nonperformance of the reporting entity, since that entity will continue to be the obligor after the measurement date. Thus, the fair value measurement of the obligation, under ASC 820, takes into consideration the reporting entity's own risk of nonperformance that includes, but is not limited to, the effect of its own credit standing.

ASC 820 amended ASC 410 to conform its fair value guidance to the new, uniform guidance regarding measuring fair value that is applicable throughout GAAP. In this amendment FASB acknowledges that

> *Rarely, if ever, would there be an observable rate of interest for a liability that has cash flows similar to an asset retirement obligation being measured. In addition, an asset retirement obligation usually will have uncertainties in both timing and amount. In that circumstance, employing a discount rate adjustment technique, where uncertainty is incorporated into the rate, will be difficult, if not impossible.*

This lack of observability means that management, in order to estimate the ARO, will be required to use an expected present value technique that uses its own assumptions regarding the necessary adjustment for market risk. These are referred to as "Level 3 inputs" by ASC 820.

At the time this publication went to press, FASB was engaged in redeliberating a proposed Staff Position, FSP FAS 157-c, the purpose of which is to clarify the application of FAS 157 to liabilities. The authors strongly encourage the reader/researcher to monitor the status of this project on the FASB Web site (www.fasb.org) as it progresses to ensure that any effect a final Staff Position might have on the application of fair value measurement principles to ARO and other liabilities is fully considered in applying the guidance we provide in this and other affected chapters.

Initially applying an expected present value method. ASC 820-10-55 provides two alternative methods for determining expected present value that are discussed in detail in Chapter 6. To apply Method 1, management adjusts the expected cash flows for market risk by incorporating a cash risk premium in them and uses a risk-free interest rate to discount the risk-adjusted expected cash flows. To apply Method 2, management does not adjust the expected cash flows, but instead adjusts the risk-free interest rate by incorporating a risk premium in it.

As discussed later in this section, Method 1 cannot be used to estimate the expected present value of an ARO due to computational difficulties that cannot be overcome. As a result, the following discussion, adapted from ASC 410, uses Method 2 to illustrate the estimation of expected present value.

Management begins by estimating a series of cash flows that reflect its marketplace estimates of the cost and timing of performing the required retirement activities. Marketplace amounts are those amounts that would be expended by the entity to hire a third party to perform the work or that a third-party would pay for the right to receive the cash flows should a market exist for the transfer of such obligations. Explicit assumptions are to be developed and incorporated in the estimates about all of the following matters:

1. The costs that a third party would incur in performing the necessary tasks associated with retiring the asset.
2. Additional amounts that the third party would include in pricing the work (or the transfer price it would pay for the right to receive the cash flows) related to such factors as inflation, overhead, equipment charges, profit margins, anticipated technological advances, and offsetting cash inflows, if any.
3. The extent to which the amount of the third party's costs or their timing might differ under various future scenarios and the relative probabilities of those scenarios actually occurring.
4. The price that the third party would demand and could expect to receive for bearing the uncertainties and unforeseeable circumstances inherent in the obligation. This is referred to as a *market-risk premium*.

If data is available regarding assumptions that marketplace participants would make that contradicts management's own assumptions, management must adjust its assumptions accordingly. For example, if the costs of labor in the marketplace exceed those of the entity, the higher marketplace costs are to be used in the cash flow estimates. Even if the entity can and will retire the asset using internal resources, the obligation must be computed as if a third party will be retained to perform the work, including provisions for recovery of the contractor's overhead and profit.

The discount rate to be used in the present value calculations is the *credit-adjusted risk-free rate* that adjusts a risk-free rate of interest for the effects of the entity's own credit standing. The risk-free interest rate is the interest rate on monetary assets with maturity dates or durations that coincide with the period covered by the estimated cash flows associated with the ARO. When the measurement involves cash flows denominated in US dollars, the yield curve for US Treasury securities is used.

In adjusting the risk-free rate for the entity's credit standing, the entity takes into account the effects on the fair value estimate of all terms, collateral, and existing guarantees. In ASC 820, FASB indicated that it believed, when it issued ASC 410, that it would be more practical for management to reflect an estimate of its own credit standing as an adjustment to the risk-free rate rather than as an adjustment to the expected cash flows. In fact, based on the model FASB chose to account for subsequent upward and downward changes in the ARO, ASC 410 would not be operational unless the adjustment for credit-standing was made to the risk-free interest rate.

As a practical matter, for companies whose debt is not rated by a bond-rating agency, the adjustment for credit standing may be difficult to establish. For such companies, the incremental borrowing rate used for lease testing (see Chapter 16) may serve as an acceptable approximation of the credit-adjusted risk-free rate.

The ARO may be incurred in one or more of the entity's reporting periods. Each period's incremental liability incurred is recognized as a separate liability and is estimated us-

ing these principles based on market and interest rate assumptions existing in the period of subsequent recognition.

ASC 410-20 clarified that an asset retirement obligation is required to be recognized when incurred (or acquired), even if uncertainty exists regarding the timing and/or method of eventually settling the obligation. In effect, ASC 410-20 distinguishes between a contingency and an uncertainty. If the obligation to perform the retirement activities is unconditional, the fact that uncertainty exists regarding the timing and/or method of retirement does not relieve the reporting entity of the requirement to estimate and record the obligation if, in fact, it is reasonably estimable. The assumptions regarding the probabilities of the various outcomes used in the computation are to take into account that uncertainty. An ARO is considered reasonably estimable if

1. It is evident that the obligation's fair value is included in an asset's acquisition price,
2. An active market exists for the transfer of the obligation, or
3. Sufficient information is available to enable the use of the CON 7 expected present value technique to estimate the obligation.

Sufficient information is considered to be available to reasonably estimate the obligation if either

1. The settlement date and method of settlement have been specified by others (e.g., the end of a lease term or the end of a statutory period) or
2. Information is available to reasonably estimate
    a. The settlement date or range of potential settlement dates
    b. The settlement method or potential settlement methods
    c. The probabilities of occurrence of the dates and methods in a. and b.

The information necessary to make these estimates can be based on the reporting entity's own historical experience, industry statistics or customary practices, management's own intent, or estimates of the asset's economic useful life. In the authors' opinion, it would be difficult for management to credibly justify that reasonable estimates of these matters cannot be made. Even if management concludes that this is not the case, and that sufficient information does not exist to record the obligation at inception, management is expected to continuously consider whether this remains true in future accounting periods, and to recognize the obligation in the first period when sufficient information becomes available to enable the fair value estimate.

Accounting in subsequent periods. After the initial period of ARO recognition, the liability will change as a result of either the passage of time or revisions to the original estimates of either the amounts of estimated cash flows or their timing. Such changes can arise due to the effects of inflation, changes in the probabilities used in the original estimate, changes in interest rates, changes in laws, regulations, statutes, and contracts.

The entity recognizes these changes to the liability by first adjusting the carrying amount of the liability for changes due to the passage of time and then, if applicable, for changes due to revisions in either amounts or timing of estimated cash flows. Changes due to the passage of time increase the carrying amount of the liability because there are fewer periods remaining from the initial measurement date until the settlement date and, thus, the present value of the discounted future settlement amount increases. These changes are recorded as a period cost called *accretion expense* and classified separately in the operating section of the statement of income (or not-for-profit statement of activities). Accretion is computed using an interest method of allocation which results in periodic accretion expense that represents a level effective interest rate applied to the carrying amount of the liability at the beginning of

each period. The effective interest rate used to calculate accretion is the credit-adjusted risk-free rate or rates (or incremental borrowing rate) applied when the liability or portion of the liability (as explained below) was initially measured and recognized. Accretion expense is not combined with interest expense, and is not considered interest cost for the purpose of applying the interest capitalization criteria of ASC 835-20.

Changes in the ARO that result from changes in the estimates of the timing or amounts of future cash flows are accounted for differently for increases and decreases. If the expected present value increases, the increase gives rise to a new obligation accounted for separately just as the ARO was originally measured but using current market value assumptions, and the current credit-adjusted risk-free rate. Thus, over time, a particular long-lived asset may have multiple layers of obligations associated with it which are based on different assumptions measured at different dates during the asset's useful life. The incremental obligation is recorded by increasing the recorded ARO and capitalizing the additional cost as a part of the carrying amount of the related long-lived asset. If multiple layers have been recorded and it is not practical to separately identify the period (or layer) to which subsequent revisions in estimated cash flows relate, the statement permits the use of a *weighted-average credit-adjusted risk-free rate* to measure the change in the liability resulting from that revision.

If, however, the expected present value subsequently decreases, the difference between the remeasured amount and the carrying amount of the liability (after adjustment for inception-to-date accretion) is recorded as a gain in the current period. In this case, the previously recognized layers of liabilities are reduced pro rata so as not to affect the overall effective rate of accretion over the remaining life of the obligation.

For the purposes of measurement in subsequent periods, in the unlikely event that an entity originally determined its ARO based on available market prices rather than using the expected present value method, it would be required to determine the undiscounted cash flows embedded in that market price. This process is analogous to computing the rate of interest implicit in a lease.

ASC 410 does not require detailed cash flow estimates every reporting period but rather allows the entity to exercise judgment as to when facts and circumstances indicate that the initial estimate requires updating.

If the increase in carrying amount of the affected long-lived asset resulting from the remeasurement of ARO in a subsequent period impacts only that period, then the increase is fully depreciated in that period. Otherwise, the increase is depreciated in the period of change and future periods as a change in estimate in accordance with ASC 250 (see Chapter 5). Both depreciation and accretion are classified as operating expenses in the statement of income.

Other provisions. Other provisions of ASC 410 affect the calculation of the credit-adjusted rate as well as how it is to be applied by rate-regulated entities.

Funding and assurance provisions. Factors such as laws, regulations, public policy, the entity's creditworthiness, or the sheer magnitude of the future obligation may cause an entity to be required to provide third parties with assurance that the entity will be able to satisfy its ARO in the future. Such assurance is provided using such instruments as surety bonds, insurance policies, letters of credit, guarantees by other entities, establishment of trust funds, or by custodial arrangements segregating other assets dedicated to satisfying the ARO. Although providing such means of assurance does not satisfy the underlying obligation, the credit-adjusted interest rate used in calculating the expected present value is adjusted for the effect on the entity's credit standing of employing one or more of these techniques.

Rate-regulated entities. Many rate-regulated entities (as defined in ASC 980 and discussed in Chapter 25) follow current specialized accounting that capitalizes costs not other-

wise afforded that treatment under GAAP. These entities recover these additional costs in the rates that they charge their customers. These additional capitalized costs may or may not meet the definition of ARO under ASC 410. The differences in the amounts and timing of assets and liabilities between GAAP and regulatory accounting used for rate-making purposes give rise to temporary differences and the resultant deferred income tax accounting.

ASC 410 provides that, if the criteria in ASC 980 are met, the rate-regulated entity is to recognize a regulatory asset or liability for differences in the timing of recognition of the period costs associated with ARO for financial reporting and rate-making purposes. Accounting for the ARO arising from closed or abandoned long-lived assets of rate-regulated entities is covered by ASC 980-360.

Disclosures. The following information about ARO is required to be disclosed in the financial statements.

1. A general description of the ARO and the related long-lived assets
2. A description of how the fair value of the ARO was determined (e.g., by using an expected present value method or some other market-based valuation technique)
3. The funding policy, if any, for ARO
4. The fair value of assets dedicated to satisfy the liability, if any
5. A reconciliation of the beginning and ending aggregate carrying amount of the liability showing separately the changes attributable to
   a. The liability incurred in the current period
   b. The liability settled in the current period
   c. Accretion expense, and
   d. Revisions in expected cash flows
6. An explanation of any significant changes in the ARO not otherwise apparent in other disclosures required by the statement
7. If the fair value of an ARO is not considered reasonably estimable, that fact and the reasons why management believes this to be the case

To supplement the disclosures described above, ASC 820, *Fair Value Measurements and Disclosures*, requires additional disclosures with respect to assets and liabilities measured at fair value on a nonrecurring basis. These additional disclosures are set forth in detail in Chapter 6 and in the Disclosure Checklist in Appendix A.

When ASC 820 was originally issued, it was to be effective for interim and annual financial statements issued for fiscal years beginning after November 15, 2007. Subsequent to its issuance, however, FASB received feedback that implementation difficulties were arising with respect to fair value measurements of nonfinancial assets and liabilities acquired or incurred in connection with business combinations. Further difficulties were reported with respect to determining impairment since these determinations often rely on inputs that are not observable in active markets.

In response to these concerns, FASB deferred as of February 12, 2008, for one year the application of FAS 157 to nonfinanical assets and liabilities recognized or disclosed at fair value in an entity's financial statements on a nonrecurring basis.

It is important to note, however, that

1. The delay does not apply to entities that had already issued interim or annual financial statements that applied the ASC 820 measurement and disclosure provisions. These entities are required to continue applying all of the provisions of ASC 820.
2. Entities that avail themselves of the delay are required to make the following supplemental disclosures until ASC 820 is fully applied:

a. The fact that management has only partially applied ASC 820, and
b. Each major category of assets and liabilities recognized or disclosed at fair value for which management has not yet applied ASC 820.

Example—initial measurement and recognition

Gerald Corporation constructs and places into service on January 1, 2009, specialized machinery on premises that it leases under a fifteen-year lease. The machinery cost $1,750,000 and has an estimated useful life of ten years. Gerald Corporation is contractually obligated, under the terms of the lease, to remove the machinery from the premises when it is no longer functional. Gerald is unable to obtain current market-related information regarding the costs of settling the liability at inception and, therefore, chooses to estimate the initial fair value of the ARO using an expected present value technique. The significant assumptions used by Gerald in applying this technique are as follows:

1. Labor costs are based on prevailing wage rates in that geographic area that a contractor would pay to hire qualified workers. Gerald assigns probability assessments to the range of cash flow estimates as follows:

Cash flow estimate	*Probability assessment*	*Expected cash flows for labor costs*
$40,000	25%	$10,000
60,000	50	30,000
75,000	25	18,750
	100%	$58,750

2. Based on its own experience, which Gerald believes is indicative of local market conditions, Gerald estimates that a contractor will apply a 75% rate to labor costs to charge for overhead and equipment usage and that, based on published industry statistics for the region, a contractor would add a markup of 8% to the combined labor, overhead, and equipment costs.
3. Since the eventual dismantlement and removal will be occurring ten years later, Gerald expects that a contractor would receive a market-risk premium of 5% of the expected cash flows adjusted for inflation. This premium is to compensate the contractor for assuming the risks and uncertainties of contracting now for a project ten years later.
4. The risk-free rate of interest as evidenced by the price of zero-coupon US Treasury instruments that mature in ten years is 4.5%. Gerald adjusts that rate by 2.5% to reflect the effect of its credit standing as evidenced by its incremental borrowing rate of 7%. Therefore, the credit-adjusted risk-free rate used to compute the expected present value is 7%.
5. Gerald assumes an average rate of inflation of 3.5% over the ten-year period.

The ARO is initially measured as follows as of January 1, 2009:

	Expected cash flows as of January 1, 2009
Expected cash flows for labor costs	$ 58,750
Allocated overhead and equipment charges (75% × $58,750)	44,063
Contractor's markup [8% × ($58,750 + $44,063)]	8,225
Expected cash flows before inflation adjustment	111,038
Average annual compounded inflation rate of 3.5% for 10 years (1.035^{10})	× 1.4106
Expected cash flows adjusted for inflation	156,630
Market-risk premium (5% × $156,630)	7,832
Expected cash flows adjusted for market risk	164,462
Present value using credit-adjusted risk-free rate of 7% for 10 years, compounded annually	$ 83,604

On January 1, 2009, Gerald would record the initial ARO as follows:

Machinery and equipment	83,604	
ARO liability		83,604

Example—accounting in subsequent periods

Assuming the same facts as above, during the ten year life of the machinery, Gerald would record entries to recognize accretion and depreciation as follows (assuming no remeasurement of the ARO is required):

Year	*Liability balance as of January 1*	*Annual accretion*	*Liability balance as of December 31*
2009	$ 83,604	$ 5,852	$ 89,456
2010	89,456	6,262	95,718
2011	95,718	6,700	102,418
2012	102,418	7,169	109,587
2013	109,587	7,671	117,258
2014	117,258	8,208	125,466
2015	125,466	8,783	134,249
2016	134,249	9,397	143,646
2017	143,646	10,055	153,701
2018	153,701	10,761	164,462

Entries to record annual accretion

The accretion for each year presented in the table is recorded as follows:

Accretion expense (presented on the income statement as part of operating expense)	xx,xxx	
Asset retirement obligation		xx,xxx

Depreciation computations

Acquisition cost of asset	$ 1,750,000
Capitalized ARO	83,604
Adjusted carrying amount of asset	$ 1,833,604
Estimated salvage value (assumed)	100,000
	$ 1,733,604
Estimated useful life	÷ 10 years
Annual depreciation expense	$ 173,360

Entry to record annual depreciation

Depreciation expense	173,360	
Accumulated depreciation		173,360

Settlement of ARO

On December 31, 2018, Gerald uses its internal workforce to dismantle and dispose of the machinery and incurred costs as follows:

Labor	$ 70,000
Internally allocated overhead and equipment charges (75% of labor)	52,500
Total costs incurred	122,500
ARO liability	164,462
Gain on settlement of ARO	$ 41,962

Note that, because Gerald chose to perform the retirement activities using its own workforce, the "market approach" mandated by ASC 410 and ASC 820 does not achieve an even matching of the total costs of acquisition and retirement to the periods benefited. The period of the retirement reflects a gain on settlement that would not have occurred had Gerald hired a contractor to perform the work instead of using its own employees.

Electronic equipment waste obligations. ASC 720-40 prescribes the proper treatment of electronic equipment waste obligations. It addresses a directive issued by the European Union, under which the electronic equipment waste management obligation for products put on the market on or prior to August 13, 2005, resides with the commercial user until the equipment is replaced, at which time the waste management obligation may be shifted to the producer of the replacement equipment. If the user does not replace the equipment, then the obligation remains with the user. The waste obligation for electronic equipment acquired subsequent to August 13, 2005, shall be borne solely by the producers of the new electronic equipment.

The statement requires that a commercial user of electronic equipment acquired on or prior to August 13, 2005, must capitalize an asset retirement cost, as outlined in ASC 410, by increasing the carrying amount of the related asset by the same amount as the liability associated with the waste disposal obligation. If the asset is subsequently replaced, the obligation is shifted to the producer of the replacement equipment, so the user must calculate that portion of the payment to the replacement equipment producer relating to the transfer of the ARO, and eliminate the associated liability from its balance sheet, while recognizing a gain or loss based on the difference between the liability on the sale date and that portion of the payment related to the ARO. Meanwhile, the producer of the new asset recognizes revenue for the total amount of the sale, less the fair value of the ARO.

Environmental remediation costs. Environmental remediation costs, the costs of cleaning up environmental contamination, are generally expensed as incurred as operating expenses (ASC 410-30). The exceptions to this general rule that result in capitalizing these costs are as follows:

1. If the costs result from legal obligations associated with the eventual retirement of an asset or group of assets they will be capitalized as an asset retirement obligation (ARO) as discussed and illustrated in the previous section of this chapter (FAS 143).
2. If the costs do not qualify as ARO, but they meet one of the following criteria, they may be capitalized subject to reduction for impairment, if warranted:
   a. The costs extend the life, increase the capacity, or improve the safety or efficiency of property owned by the reporting entity.
   b. The costs mitigate or prevent future environmental contamination while also improving the property compared with its condition when originally constructed or acquired by the reporting entity.
   c. The cost of treating property acquired with a known asbestos problem is capitalized as part of the acquisition cost of the property if the costs are incurred within a reasonable time period after acquisition.
   d. The costs of treating an already owned property for asbestos are capitalized as a betterment.
   e. The costs are incurred in preparing for sale a property that is currently held for sale (the application of this criterion must be balanced with the limitation in ASC 360 regarding assets held for sale being carried at the lower of carrying value or, fair value less cost to sell).

With respect to c. and d. above, SEC registrants are required to disclose any significant exposure for asbestos treatment in the management discussion and analysis (MD&A).

Environmental costs associated with the improper operation or use of an asset (e.g., penalties and fines) are specifically excluded from the accounting guidance with respect to ARO and, should they be incurred, under ASC 410-30, they would most likely not qualify to be capitalized under GAAP.

Nonmonetary transactions. Several variants of noncash transactions are governed by ASC 845.

Scope. The following types of transactions are not treated as nonmonetary transactions:

1. Exchanges of businesses required to be accounted for as business combinations under ASC 805.
2. Transfers between reporting entities under common control such as between a parent company and its subsidiaries; between two subsidiaries of the same parent; or between a corporate joint venture and the venturers.

3. Issuance of equity in the reporting entity in exchange for nonmonetary assets or the performance of services (governed, instead, by the provisions of ASC 505-50).
4. Stock dividends or stock splits.
5. Involuntary conversions where monetary proceeds are received for the nonmonetary assets stolen, seized, or destroyed, irrespective of whether the proceeds are reinvested in other nonmonetary assets.
6. Assets of the reporting entity exchanged for equity interests in another entity.
7. Certain types of transactions of oil and gas producing companies whose accounting is included in the scope of ASC 932-360, *Extractive Activities—Oil and Gas*.
8. Transfers of financial assets within the scope of ASC 860, *Transfers and Servicing*.

Types of nonmonetary transactions. There are three types of nonmonetary transactions identified in ASC 845.

1. *Nonreciprocal transfers to owners*—Examples include dividends-in-kind, nonmonetary assets exchanged for common stock, split-ups, and spin-offs.
2. *Nonreciprocal transfers with nonowners*—Examples include charitable donations of property either made or received by the reporting entity, and contributions of land by a state or local government to a private enterprise for the purpose of construction of a specified structure.
3. *Nonmonetary exchanges*—Examples include exchanges of inventory for productive assets, exchanges of inventory for similar products, and exchanges of productive assets.

General rule. The primary accounting issue in nonmonetary transactions is the determination of the amount to assign to the nonmonetary assets transferred to or from the reporting entity.

The general rule is that the accounting for nonmonetary transactions is based on the fair values of the assets involved. The definition of fair value in ASC 845 has been conformed to the uniform definition prescribed by ASC 820. ASC 820 appended guidance to ASC 845 that provides that when one of the parties to a nonmonetary transaction could have elected to receive cash in lieu of the nonmonetary asset, the amount of cash that would have been received may be the best evidence of the fair value of the nonmonetary assets exchanged. ASC 820 left intact, however, the guidance in ASC 845 that, in general, the fair value of the asset surrendered should be used to value the exchange unless the fair value of the asset received is more clearly evident of the fair value.

Exceptions to the general rule. If either of the following conditions applies, the accounting for the nonmonetary transaction is based on the recorded amount (i.e., book value) of the nonmonetary asset relinquished, reduced, if applicable, by any preexchange impairment in its value.

1. If both the fair value of the asset being relinquished and the fair value of the asset being received are not reasonably determinable, the recorded amount (i.e., book value adjusted for any applicable impairment) of the asset being relinquished may be the only amount available to objectively measure the transaction. The fair value is not considered determinable within reasonable limits if there are major uncertainties with respect to the amount that would be realized for an asset.
2. An exchange of a product or property held for sale in the ordinary course of business for a product or property to be sold in the same line of business to facilitate sales to customers other than the parties to the exchange.

   NOTE: ASC 845 states that a transfer of a nonmonetary asset will not qualify as an exchange if the transferor has substantial continuing involvement in the transferred assets that results in the transferee not obtaining the usual risks and rewards associated with ownership of the transferred assets.

Nonreciprocal transfers. The valuation of most nonreciprocal transfers is based upon the fair value of the nonmonetary asset given up, unless the fair value of the nonmonetary asset received is more clearly evident. This will result in recognition of gain or loss on the difference between the fair value assigned to the transaction and the carrying value of the asset surrendered.

The valuation of nonmonetary assets distributed to owners of the reporting entity in a spin-off or other form of reorganization or liquidation is based on the recorded amounts, again after first recognizing any warranted reduction for impairment. Other nonreciprocal transfers to owners are accounted for at fair value if (1) the fair value of the assets distributed is objectively measurable, and (2) that fair value would be clearly realized by the distributing reporting entity in an outright sale at or near the time of distribution to the owners.

Example of accounting for a nonreciprocal transfer with a nonowner

1. Jacobs Corporation donated depreciable property with a book value of $10,000 (cost of $25,000 less accumulated depreciation of $15,000) to a charity during the current year.
2. The property had a fair value of $17,000 at the date of the transfer.

The transaction is valued at the fair value of the property transferred, and any gain or loss on the transaction is recognized on the date of the transfer. Thus, Jacobs recognizes a gain of $7,000 ($17,000 – $10,000) in the determination of the current period's net income. The entry to record the transaction would be as follows:

Charitable donations	17,000	
Accumulated depreciation	15,000	
Property		25,000
Gain on donation of property		7,000

Note that the gain on disposition of the donated property is reported as operating income in accordance with ASC 420 and is not to be presented in the "other income" section of the income statement.

Nonmonetary exchanges. Prior to ASC 845, a distinction was made between nonmonetary exchanges involving dissimilar or similar assets, the accounting for which differed quite dramatically. For the most part, such a distinction is no longer critical, since ASC 845 mandates a universal fair value measurement strategy, with limited exceptions.

Dissimilar assets. If an exchange involves dissimilar assets, it is to be considered the culmination of the earnings process. The general rule is to value the transaction at the *fair value* of the asset given up, *unless the fair value of the asset received is more clearly evident,* and to recognize gain or loss on the difference between the fair value and carrying value of the asset. If cash is given in addition to the nonmonetary asset, that is referred to as "boot."

Example of an exchange involving dissimilar assets and no boot

1. Brian, Inc. exchanges a forklift with a book value of $2,500 (original cost of $4,800, less accumulated depreciation of $2,300 at the transaction date) with Emma & Co. for tooling with a fair value of $3,200.
2. No boot is exchanged in the transaction.
3. The fair value of the forklift is not readily determinable.

In this case, Brian, Inc. has a realized gain of $700 ($3,200 – $2,500) on the exchange, using the fair value of the asset received, since the value of the asset given up cannot be ascertained. Because the exchange involves dissimilar assets, the earnings process is deemed to have been culminated. The gain is included in the determination of Brian's net income and income from operations (i.e., it does not qualify for extraordinary treatment). The entry to record the transaction is as follows:

Tooling	3,200	
Accumulated depreciation—forklift	2,300	
Forklift		4,800
Gain on exchange of forklift (operating income)		700

Commercial substance. A nonmonetary exchange is subjected to a test to determine whether or not it has "commercial substance." If determined to have commercial substance, the exchange is recorded at the fair value of the transferred asset. If the transaction is determined not to have commercial substance, the exchange is recognized using the recorded amount of the exchanged asset or assets, reduced for any applicable impairment of value.

To determine commercial substance, the reporting entity estimates whether, after the exchange, it will experience changes in (1) its expected cash flows because of changes in amounts, timing, and/or risks (these factors are collectively referred to as the "configuration" of the expected future cash flows), *or* (2) the entity-specific value of the assets received differs from the entity-specific value of the assets transferred. If the changes in either (1) or (2) are significant relative to the fair values of the assets exchanged, the transaction is considered to have commercial substance. *Entity-specific value* is a concept defined in CON 7 that substitutes assumptions that an entity makes with respect to its own future cash flows for the corresponding assumptions that marketplace participants would make with respect to cash flows. The commercial substance criterion is *not* met if a transaction is structured to achieve income tax benefits in order to achieve a specific outcome for financial reporting purposes.

Example of an exchange involving similar assets and no boot

Company presidents Able and Baker agree to swap copiers, since each needs certain printing features only available on the other company's copier. Able's copier has a book value of $18,000 (cost of $24,000 less depreciation of $6,000). Both copiers have a fair value of $24,000. In testing for the commercial substance of the transaction, there is no difference in the fair values of the assets exchanged, nor are Able's future cash flows expected to significantly change as a result of the transfer. Under ASC 845, exchanges of similar assets which do not alter expected future cash flows are deemed to lack commercial substance, and are accounted for at book value. As a result of the trade, Able has the following *unrecognized* gain:

Fair value of Able copier given to Baker	$24,000
Book value of Able copier to be given to Baker	18,000
Total gain (unrecognized)	$ 6,000

The entry by Able to record this transaction is as follows:

Fixed assets—Office equipment	18,000	
Accumulated depreciation—Office equipment	6,000	
Fixed assets—Office equipment		24,000

Able elects to depreciate its newly acquired copier over four years with an assumed salvage value of zero, which computes to monthly depreciation of $375. If Able had recorded the fair value of the incoming copier at $24,000, this would have required a higher monthly depreciation rate of $500. Thus, the unrecognized gain on the transaction is actually being recognized through ongoing reduced monthly depreciation charges.

Able immediately exchanges its newly-acquired copier for one owned by Charlie. However, the fair value of the copier owned by Charlie is $30,000, as compared to the $24,000 fair value of Able's copier (which is being carried at $18,000, the carryforward basis of its predecessor). In testing for the commercial substance of the transaction, there is determined to be a significant difference in the entity-specific values of the assets exchanged, so in accordance with the provisions of ASC 845 Able must record a gain on the transaction based on the difference in the fair values of the exchanged assets. This is done with the following entry:

Fixed assets—Office equipment	30,000	
Fixed assets—Office equipment		18,000
Gain on disposal of office equipment		12,000

Note that the full gain from both exchanges is now being recognized, since the carryforward book value of the original copier was used as the book value of the first-acquired trade, and that carryforward amount is now being compared to the fair value of the latest trade.

Able elects to depreciate the newly acquired copier over four years with no salvage value, resulting in monthly depreciation of $625. After ten months, Able trades his newly acquired copier to Echo. The book value has now dropped to $23,750 (cost of $30,000 less depreciation of $6,250); however, due to technology advances, its fair value has declined to $20,000. This final trade has no commercial substance, in the ASC 845-defined sense, since cash flows will not materially vary as between the use of these two machines. While, under ASC 845, fair value accounting would not be employed in an exchange of similar assets lacking commercial substance, impairments must be recognized per ASC 360. Were this not done, the new asset would be recognized at an amount in excess of its realizable amount (fair value). Able has the following impairment loss resulting from the transaction, which must be fully recognized in the current period:

Fair value of Able copier to be given to Echo	$20,000
Book value of Able copier to be given to Echo	(23,750)
Total loss (recognized)	$ (3,750)

The entry by Able to record this transaction is as follows:

Fixed assets—Office equipment	20,000	
Accumulated depreciation—Office equipment	6,250	
Loss on asset disposal	3,750	
Fixed assets—Office equipment		30,000

A single exception to the nonrecognition rule for similar assets occurs when the exchange involves both a monetary and nonmonetary asset being exchanged for a similar nonmonetary asset. The monetary portion of the exchange is termed *boot*. When boot is at least 25% of the fair value of the exchange, the exchange is considered a monetary transaction and both parties record the exchange at fair value. When boot less than 25% is received in an exchange, only the boot portion of the earnings process is considered to have culminated. The portion of the gain applicable to the boot is considered realized and is recognized in the determination of net income in the period of the exchange.

The formula for the recognition of the gain in an exchange involving boot of less than 25% of fair value is expressed as follows:

$$\frac{\text{Boot}}{\text{Boot + Fair value of nonmonetary asset received}} \times \text{Total gain indicated} = \text{Gain recognized}$$

Example of an exchange involving similar assets and boot

Amanda Excavating exchanges one of its underutilized front loaders with Dorothy Diggers, another excavator, for a bulldozer.

These assets are carried on the respective companies' balance sheets as follows:

	Amanda (front loader)	*Dorothy (bulldozer)*
Cost	$75,000	$90,000
Accumulated depreciation	7,500	15,000
Net book value	$67,500	$75,000
Fair (appraised) value	$60,000	$78,000

The terms of the exchange require Amanda to pay Dorothy $18,000 cash (boot). Boot represents approximately 23% of the fair value of the exchange computed as follows:

	Amount	*Percent of total*
Fair value of front loader	$60,000	77%
Cash consideration (boot)	18,000	23%
Total consideration	$78,000	100%

Note that as the payer of boot, Amanda does not recognize a gain. As a receiver of boot that is less than 25% of the fair value of the consideration received, Dorothy recognizes a pro rata gain that is computed as follows:

Total gain = $78,000 consideration – $75,000 net book value of bulldozer = $3,000

Portion of gain to be recognized by Dorothy

$$\frac{\$18{,}000 \text{ boot}}{\$18{,}000 \text{ boot} + \$60{,}000 \text{ fair value of nonmonetary asset received} = \$78{,}000} = 23\% \times \$3{,}000 \text{ gain} = \$690 \text{ gain recognized}$$

The accounting entries to record this transaction by Amanda and Dorothy are as follows:

	Amanda		*Dorothy*	
	Debit	*Credit*	*Debit*	*Credit*
Excavating equipment	10,500			32,310
Accum. depreciation—excavating equipment	7,500		15,000	
Cash		$18,000	18,000	
Recognized gain	--	--	--	690
	18,000	$18,000	33,000	33,000

Amanda records the increase in the carrying value of its excavating equipment to account for the difference between the $78,000 fair value of the bulldozer received and the $67,500 carrying value of the front loader exchanged. The accumulated depreciation on the front loader is reversed since, from the standpoint of Amanda, it has no accumulated depreciation on the bulldozer at the date of the exchange.

Dorothy records the cash received, removes the previously recorded accumulated depreciation on the bulldozer, records the $690 gain attributable to the boot as computed above and records the difference as an adjustment to the carrying value of its excavating equipment.

After recording the entries above, the carrying values of the exchanged equipment would be as follows:

	Amanda (bulldozer)	*Dorothy (front loader)*
Net book value exchanged	$67,500	$75,000
Cash paid (received)	18,000	(18,000)
Gain recognized		$ 690
Carrying value of asset received	$85,500	$57,690

Exchange of product or property held for sale for productive assets. An exchange of goods held for sale in the ordinary course of business for property and equipment to be used in the production process, even if they pertain to the same line of business, is recorded at fair value.

Exchanges involving monetary consideration (boot). As noted above, if boot is 25% or more of the fair value of an exchange, the transaction is considered a monetary transaction. In that case, both parties record the transaction at fair value. If the boot is less than 25%, the payer of the boot does not recognize a gain and the receiver of the boot must follow the pro rata recognition guidance in ASC 845-10-30-6. See below for rules regarding exchanges with boot involving real estate.

Gain on a *monetary* exchange that involves transfer by one entity of its ownership of a controlled asset, group of assets, or business to another entity in exchange for a noncontrolling ownership interest in the other entity is accounted for consistent with the guidance above for similar *nonmonetary* exchanges.

Exchanges of real estate involving monetary consideration (boot). A transaction that involves the exchange of similar real estate and boot of 25% or more of the fair value of the exchange is recorded with two separate components, a monetary component and a nonmonetary component. The allocation is made based on the relative fair values of the monetary and nonmonetary portions at the time of the transaction. The party that receives the boot accounts for the monetary component of the transaction under ASC 360-20 as the equivalent of a sale of an interest in the underlying real estate and the nonmonetary component of the transaction based on the recorded amount (reduced, if applicable, for any impairment in value) of the nonmonetary asset relinquished. For the party that pays the boot, the monetary component is accounted for as an acquisition of real estate, and the nonmonetary component

is accounted for based on the recorded amount (reduced, if applicable, for any impairment in value).

There had been some difficulty noted in practice in distinguishing exchanges of similar assets (and also simple acquisitions of productive assets not involving exchanges) from exchanges of businesses (and direct purchase of businesses). The rules governing accounting for exchanges or purchases of productive assets materially differ from acquisitions of businesses (e.g., goodwill would only be recognized in connection with the latter class of transaction, and under ASC 845 certain nonmonetary exchanges are recorded at book value) and thus clarification was required.

The Master Glossary defines a business as a self-sustaining integrated set of activities and assets conducted and managed for the purpose of providing a return to investors. A business consists of (1) inputs, (2) processes applied to those inputs, and (3) resulting outputs that are used to generate revenues. For a transferred set of activities and assets to have been deemed a business, it must have contained essentially all of the inputs and processes necessary for it to continue to conduct normal operations after the transferred asset is separated from the transferor, which included the ability to sustain a revenue stream by providing its outputs to customers. If these criteria were not satisfied, the assets did not comprise a business and ASC 805 would not have applied to the acquisition.

ASC 805, discussed in detail in Chapter 13, is to be applied prospectively to business combinations for which the acquisition date is on or after the beginning of the first annual reporting period beginning on or after December 15, 2008. Earlier application is not permitted.

Barter transactions. Through third-party barter exchanges, many commercial enterprises exchange their goods and services to obtain barter credits that can be used in lieu of cash to obtain goods and services of other members of the barter exchange.

ASC 845-10-30 specifies that ASC 845 applies to barter transactions and that the basis for recording them is the fair value of the nonmonetary asset given up. Ordinarily, this fair value measurement should not be higher than its carrying value.

Impairment, if applicable, is to be recorded before the exchange. Thus, a new cost basis is established and a loss is recognized on the income statement. If an operating lease is involved, impairment is measured as the amount of remaining lease costs in excess of the fair value of the probable sublease rentals for the remaining lease term. ASC 820 provides guidance with respect to the determination of fair value.

The value of barter credits assigned to the transaction by the exchange are not used to measure fair value unless they can be converted to cash in the short term or there are independent existing market prices available for items to be received for the barter credits.

After the exchange, impairment is recorded if the carrying amount exceeds the fair value of the barter credits or if the business determines that the barter credits will expire unused.

Involuntary conversions. An involuntary conversion results from the forced disposition of property due to casualty, theft, condemnation, or threat of condemnation. Upon involuntary conversion, the owner of the asset forfeits it and potentially receives proceeds from filing a property/casualty insurance claim or from condemnation awards.

Certain conditions may occur which necessitate the involuntary conversion of a nonmonetary asset into a monetary asset. ASC 605-40, *Revenue Recognition—Gains and Losses,* specifies that involuntary conversions of nonmonetary assets to monetary assets are monetary transactions, and the resulting gain or loss is recognized in the period of conversion. It makes no difference that the monetary assets received are immediately reinvested in nonmonetary assets.

This rule does not apply to an interim period involuntary conversion of LIFO inventories that are intended to be replaced but have not yet been replaced by year-end (discussed in detail in Chapter 21).

Deferred income taxes. A difference between the amount of gain or loss recognized for financial reporting purposes and that recognized for income tax purposes constitutes a temporary difference. The difference in the gain or loss recognized results in a difference between the income tax basis and the financial reporting basis of the asset received. The difference in the gain or loss reverses as a result of the annual charge to depreciation. The proper treatment of temporary differences is discussed in Chapter 17.

Summary. In some situations, the fair value of the asset cannot be determined. If the fair value is not determinable, the book values of the assets involved are to be used as the valuation measure.

The situations involving the exchange of nonmonetary assets are summarized in the following diagram.

Depreciation and depletion. The costs of fixed assets are allocated to the periods they benefit through depreciation or depletion. The method of depreciation chosen is that which results in a systematic and rational allocation of the cost of the asset (less its residual or salvage value) over the asset's expected useful life. The estimation of useful life takes a number of factors into consideration, including technological change, normal deterioration, and actual physical usage. The method used is to be selected based on either a function of time (e.g., technological change or normal deterioration) or as a function of actual physical usage.

Depreciation methods based on time. Each of the examples below is based on the following facts:

> Michele Corporation purchased a production machine and placed it in service on January 1, 2009. The machine cost $100,000, has an estimated salvage value of $10,000, and an estimated useful life of five years.

1. Straight-line method—Depreciation expense is recognized evenly over the estimated useful life of the asset.

   Formula

   a. Compute the straight-line depreciation rate as

   $$\frac{1}{\text{Estimated useful life}}$$

   b. Multiply the depreciation rate by the cost less estimated salvage value.

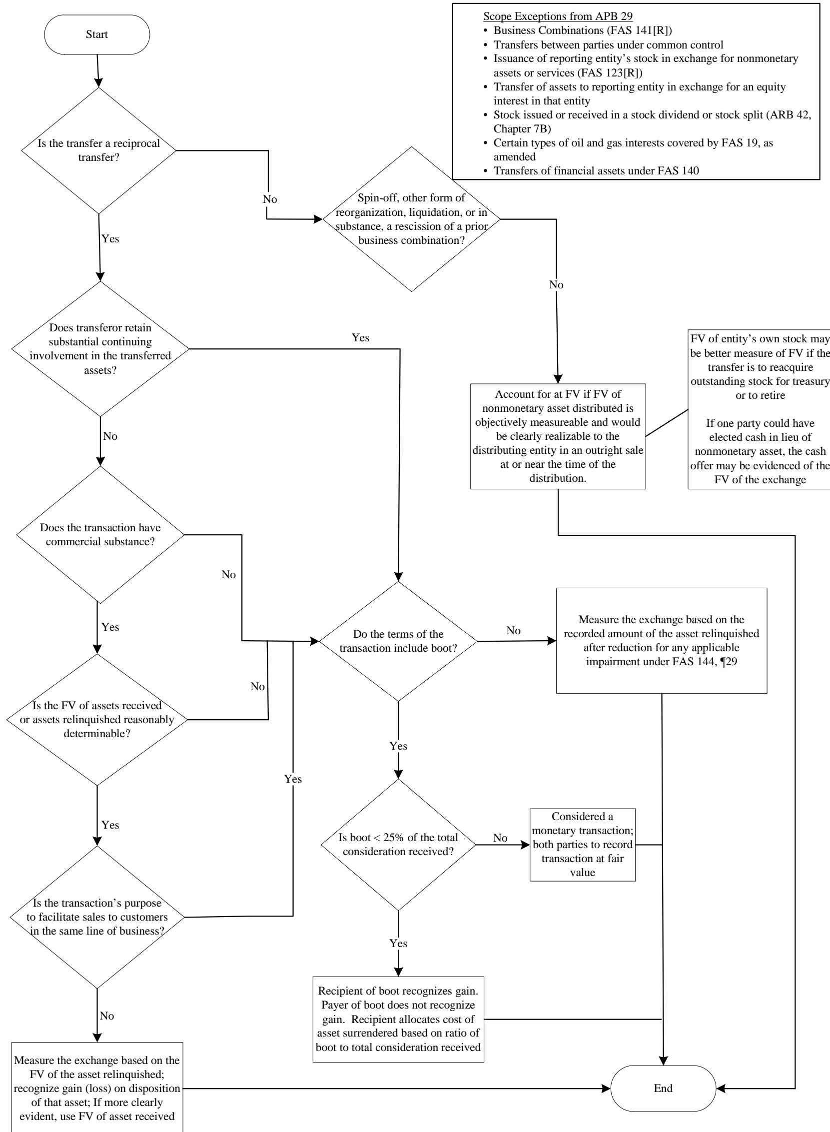
   Example

   a. Straight-line depreciation = $\frac{1}{5}$ = 20% per year

   b. 20% × ($100,000 – $10,000) = $18,000 annual depreciation

2. Accelerated methods—Depreciation expense is higher in the early years of the asset's useful life and lower in the later years. These methods are more appropriate than straight-line if the asset depreciates more quickly or has greater production capacity in the earlier years than it does as it ages. They are also sometimes used on the theory that maintenance and repair costs typically increase as assets age; therefore, in conjunction with accelerated depreciation total ownership costs (depreciation, maintenance and repairs) will approximate straight-line.

   a. Declining balance—Annual depreciation is computed by multiplying the book value at the beginning of the fiscal year by a multiple of the straight-line rate of depreciation as computed above.



Formula

Double-declining balance (ceases when the book value = the estimated salvage value)

$2 \times$ Straight-line depreciation rate $\times$ Book value at the beginning of the year

Example

Year	*Net book value, beginning of year*	*Double-declining balance depreciation computed as 2 × SL rate × beginning NBV*	*Net book value, end of year*
1	$100,000	$40,000	$60,000
2	60,000	24,000	36,000
3	36,000	14,400	21,600
4	21,600	8,640	12,960
5	12,960	2,960	10,000 limited by salvage value
Total		$90,000	

b. Sum-of-the-years' digits (SYD) depreciation

Formula

(Cost – Estimated salvage value) × Applicable percentage

$$\text{Applicable percentage} = \frac{\text{Number of years of estimated life remaining at the beginning of the year}}{\text{SYD}}$$

$$\text{SYD} \quad \frac{n(n+1)}{2} \quad \text{where n = estimated useful life}$$

Example

$$\text{SYD} = \frac{5(5+1)}{2} = 15$$

This formula yields the sum of each year of the estimated useful life

$$1 + 2 + 3 + 4 + 5 = 15$$

Year	*Remaining estimated useful life at beginning of year*	*SYD*	*Applicable percentage*	*Annual depreciation*
1	5	15	33.33%	$30,000
2	4	15	26.67	24,000
3	3	15	20.00	18,000
4	2	15	13.33	12,000
5	1	15	6.67	6,000
Totals			100.00%	$90,000

3. Present value methods—Depreciation expense is lower in the early years and higher in the later years. The rate of return on the investment remains constant over the life of the asset. Time value of money formulas are used.
   a. Sinking fund—Uses the future value of an annuity formula.
   b. Annuity fund—Uses the present value of an annuity formula.

Partial-year depreciation. When an asset is either acquired or disposed of during the year, the full-year depreciation calculation is prorated between the accounting periods involved.

Example of partial-year depreciation

Ginger Corporation, a calendar-year entity, acquired a machine on June 1, 2009, which cost $40,000 with an estimated useful life of four years and a $2,500 salvage value. The depreciation expense for each full year of the asset's life is calculated as

	Straight-line	*Double-declining balance*					*Sum-of-years' digits*				
Year 1	37,500* ÷ 4 = 9,375	50%	×	40,000	=	20,000	4/10	×	37,500*	=	15,000
Year 2	9,375	50%	×	20,000	=	10,000	3/10	×	37,500	=	11,250
Year 3	9,375	50%	×	10,000	=	5,000	2/10	×	37,500	=	7,500
Year 4	9,375	50%	×	5,000	=	2,500	1/10	×	37,500	=	3,750
	37,500					37,500					37,500

* *(40,000 – 2,500)*

Because the first full year of the asset's life does not coincide with the company's fiscal year, the amounts shown above must be prorated as follows:

	Straight-line	*Double-declining balance*					*Sum-of-years' digits*				
2009	7/12 × 9,375 = 5,469	7/12	×	20,000	=	11,677	7/12	×	15,000	=	8,750
2010	9,375	5/12	×	20,000	=	8,333	5/12	×	15,000	=	6,250
		7/12	×	10,000	=	5,833	7/12	×	11,250	=	6,563
						14,166					12,813
2011	9,375	5/12	×	10,000	=	4,167	5/12	×	11,250	=	4,687
		7/12	×	5,000	=	2,917	7/12	×	7,500		4,375
						7,084					9,062
2012	9,375	5/12	×	5,000	=	2,083	5/12	×	7,500	=	3,125
		7/12	×	2,500	=	1,458	7/12	×	3,750	=	2,188
						3,541					5,313
2013	5/12 × 9,375 = 3,096	5/12	×	2,500	=	1,042	5/12	×	3,750	=	1,562
	37,500					37,500					37,500

As an alternative to proration, an entity may follow any one of several simplified conventions.

1. Record a full year's depreciation in the year of acquisition and none in the year of disposal.
2. Record one-half year's depreciation in the year of acquisition and one-half year's depreciation in the year of disposal.

Depreciation method based on actual physical usage—Units of production. Depreciation is based upon the number of units produced by the asset in a given year.

$$\text{Depreciation rate} = \frac{\text{Cost less salvage value}}{\text{Estimated number of units to be produced by the asset over its estimated useful life}}$$

$$\text{Units of production depreciation} = \text{Depreciation rate} \times \text{Number of units produced during the current year}$$

Other depreciation methods. In addition to the foregoing, a group (composite) method is sometimes used. This method averages the service lives of a number of assets using a weighted-average of the units and depreciates the group or composite as if it were a single unit. A group consists of similar assets, while a composite is made up of dissimilar assets.

$$\text{Depreciation rate} = \frac{\text{Sum of the straight-line depreciation of individual assets}}{\text{Total asset cost}}$$

Depreciation expense: Depreciation rate × Total group (composite) cost

Gains and losses are not recognized on the disposal of an asset but are netted into accumulated depreciation.

Depletion. Depletion is the annual charge for the use of natural resources. The depletion base includes all development costs such as exploring, drilling, excavating, and other preparatory costs. The amount of the depletion base charged to periodic income is determined by the following formula:

$$\frac{1}{\text{Total expected recoverable units}} \times \text{Depletion base} \times \text{Units sold}$$

The unit depletion rate is revised frequently due to the uncertainties surrounding the recovery of natural resources. The revision is made prospectively; the remaining undepleted cost is allocated over the remaining expected recoverable units.

Example of depletion

The Cheyenne Oil Company drills a well in the Denver Basin oil field. It incurs the following development costs to do so:

Land acquisition	$172,000
Land preparation (road and drill pad)	38,000
Well drilling	301,000
Trunk line construction	29,000
Estimated site restoration cost	50,000
Total	$590,000

A considerable amount of extraction equipment is also positioned at the well, but since it can be moved among well sites and is therefore not a fixed part of this well, it is depreciated separately.

The entire $590,000 is capitalized. Cheyenne's geologists calculate that the well has proven reserves of 250,000 barrels of crude oil. In the first year of production, the well produces 45,000 barrels of oil. The depletion charge for the first year of operation follows:

$$\frac{1}{\text{250,000 barrels of proven reserves}} \times \$590{,}000 \times 45{,}000 \text{ barrels produced}$$

$$= \$106{,}200, \text{ which is the depletion charge of } \$2.36 \text{ per barrel extracted}$$

During the second year of the well's operation, Cheyenne's engineers revise the remaining number of proven reserves upward by 20,000 barrels, based on improved oil recovery techniques. Also, due to new environmental laws, the estimated site restoration cost increases by $10,000, increasing the depletion base to $600,000. Total production for the second year is 62,000 barrels of oil. The depletion charge for the first year is not retroactively changed, but changes in cost and estimated total production are rather accounted for prospectively. The depletion calculation for the second year follows:

$$\frac{1}{\text{225,000 barrels of proven reserves remaining}} \times \$493{,}800 \times 62{,}000 \text{ barrels produced}$$

$$= \$136{,}069, \text{ which is the depletion charge of } \$2.19 \text{ per barrel extracted}$$

These depletion expenses leave $357,731 of capitalized costs yet to be amortized over remaining proven reserves of 163,000 barrels, representing a future depletion charge of $2.19 per barrel.

Income tax methods. Income tax deductions for depreciation, including accelerated deductions under Section 179 are not in accordance with generally accepted accounting principles because, in general, they are not based on estimated useful lives and do not allocate cost to future periods benefited on a systematic and rational basis. Therefore, differences between financial statement and income tax depreciation result in temporary differences between the carrying values of the long-lived assets for income tax and financial reporting purposes. These temporary differences are taken into account in the calculation of deferred income taxes, as discussed in Chapter 17.

Pre-1981 depreciation. Assets placed in service prior to 1981 are depreciated based on the asset's useful life and cannot be depreciated below their salvage value. The depreciation method used depends upon the type of property and whether it was new or used when it was placed in service.

Accelerated Cost Recovery System. Assets placed in service between 1981 and 1986 are depreciated under the Accelerated Cost Recovery System (ACRS). ACRS ignores salvage

value. Thus, the asset's entire income tax basis is depreciable over the specified recovery period to be used for each class of asset. Property is placed into classes and the depreciation method and life for each class is specified. Election of optional depreciation methods was also permitted. Depreciation deductions are calculated by multiplying the asset's unadjusted basis by the specified depreciation percentage for the related time period. The depreciation percentage will depend upon the asset's class, recovery year, depreciation method and convention.

Modified Accelerated Cost Recovery System. For assets placed in service after 1986, income tax depreciation is calculated using the Modified Accelerated Cost Recovery System (MACRS) which also ignores salvage value and divides assets into classes. Depreciation deductions are calculated by multiplying the asset's unadjusted basis by the appropriate depreciation percentage. The percentages are based on the type of property, class life, depreciation method, and convention. Depreciation deductions are limited for certain assets such as listed property (primarily automobiles). Optional depreciation methods may also be elected.

Additional deductions available in year placed in service. In order to provide incentives to businesses to invest in long-lived, tangible assets, the Internal Revenue Code (IRC) includes provisions that provide for aggressive deductibility of their costs in the year of acquisition. These deductions are taken prior to computing depreciation as described above and, of course, the amount of the deductions reduces the depreciable basis of the affected assets.

Internal Revenue Code Section 179 allows taxpayers to deduct, in the tax year placed in service, up to $128,000 of costs of qualified acquisitions for tax years beginning in 2008. Absent future legislative adjustments, this amount will be increased by an inflation adjustment in the years 2009-2010 and then reverts to a maximum annual deduction of $25,000 for tax years beginning in 2011 and thereafter without adjustment for inflation. The availability of this benefit begins phasing out, dollar-for-dollar, for companies acquiring more than $510,000 of qualified property during tax years beginning in 2008. This phase-out is also inflation adjusted for 2009-2010, after which it is scheduled to revert to a non-inflation-adjusted annual limitation of $200,000 in 2011.

Income tax depreciation will differ in amount from financial statement depreciation because of differences in treatment of salvage value, recovery methods, recovery periods, and the use of conventions for assets placed in service during the year.

The difference between income tax depreciation and financial statement depreciation is reported as a reconciling item (referred to as a "Schedule M-1 adjustment") on a corporation's US federal income tax return.

Impairment and disposal. ASC 360, *Property, Plant, and Equipment,* applies to long-lived assets of businesses and not-for-profit organizations. Long-lived assets include assets to be held or used, or to be disposed of.

The GAAP rules for measuring and recording impairment of assets are not uniform for all assets or for all specialized industries. The table below distinguishes between those assets subject to the general impairment standard and those for which different, specialized rules apply.

Subject to General Impairment Standard (ASC 360-10-35)

Assets associated with discontinued operations
Cable television plant
Capitalized interest costs
Capitalized motion picture film costs
Development stage enterprises' assets
Financial institutions' depositor-relationship, borrower-relationship, and credit cardholder intangibles

Real estate
Software developed or obtained for internal use
Title plant costs of title insurance and title abstract companies, and title agents
Web site development costs

Subject to Specialized Impairment Standard(s)

Broadcasters' program rights
Computer software to be sold, leased, or otherwise marketed
Deferred income tax assets
Equity method or cost-method investments
Financial institutions' servicing assets
Financial instruments
Goodwill
Intangible assets of motor carriers
Loans receivable
Mortgage servicing rights
Recording masters in the recorded music industry

Split between General and Specialized Impairment Standards

Subject to general impairment standard	*Subject to specialized impairment standard*
Public utilities and certain other regulated enterprises	Abandoned plants and disallowed plant costs of regulated enterprises
Intangibles that are amortized	Intangibles that are not amortized
Lessee capital leases Lessor assets subject to operating leases	Lessor direct financing, sales-type, and leveraged leases
Proved properties and wells of oil and gas producing companies with related facilities and equipment that are accounted for using the successful efforts method of accounting	Unproved properties of oil and gas producing companies
All insurance assets except deferred insurance policy acquisition costs	Deferred insurance policy acquisition costs

Impairment of long-lived assets to be held and used. *Impairment* is the condition that exists when the carrying amount of a long-lived asset (or asset group, as defined in the statement) exceeds its fair value. Impairment losses are only recognized when the carrying amount of the impaired asset (or asset group) is not recoverable. Recoverability is determined by comparing the carrying amount of the asset (or asset group) on the date it is being evaluated for recoverability to the sum of the *undiscounted* cash flows expected to result from its use and eventual disposition. It is important to note that under ASC 360-10-35, an asset's carrying value can exceed its fair value (thus technically it could be considered to be impaired) and yet, if the carrying value is recoverable from expected future cash flows from its use and disposition, as defined, no impairment loss is recognized.

ASC 360-10-35 uses "events and circumstances" criteria to determine when, if at all, an asset (or asset group) is evaluated for recoverability. Thus, there is no set interval or frequency for recoverability evaluation, unlike the annual requirement for testing goodwill for impairment. ASC 360-10-35 provides a list of examples of events or changes in circumstances that indicate the carrying amount of an asset (asset group) *may* not be recoverable and thus is to be evaluated for recoverability.

1. A significant decrease in the market price of a long-lived asset (asset group)
2. A significant adverse change in the extent or manner in which a long-lived asset (asset group) is being used or in its physical condition

3. A significant adverse change in legal factors or in the business climate that could affect the value of a long-lived asset (asset group), including an adverse action or assessment by a regulator
4. An accumulation of costs significantly in excess of the amount originally expected for the acquisition or construction of a long-lived asset (asset group)
5. A current period operating or cash flow loss combined with a history of operating or cash flow losses or a projection or forecast that demonstrates continuing losses associated with the use of a long-lived asset (asset group)
6. A current expectation that, more likely than not, a long-lived asset (asset group) will be sold or otherwise disposed of significantly before the end of its previously estimated useful life

The list of events and circumstances above is not intended to be all-inclusive. Rather, it is intended to provide examples of situations that warrant evaluation of an asset or group of assets for recoverability to determine whether an impairment loss must be recognized. Financial statement preparers are required to consider, for each interim and annual reporting period, the applicability of these indicators or others that might be applicable in the circumstances. Reliance should not be placed on "disclosure checklists" for this purpose as they are not designed to be used to determine the correct application of GAAP recognition and measurement requirements.

Under ASC 360-10-35, if the carrying amount of an asset or asset group (in use or under development) is evaluated and found not to be recoverable (carrying amount exceeds the gross, undiscounted cash flows from use and disposition), then an impairment loss must be recognized. The impairment loss is measured as the excess of the carrying amount over the asset's (or asset group's) fair value.

Fair value (as defined in the Master Glossary)[1] is the price that the reporting entity would receive to sell the asset on the measurement date in an orderly transaction between market participants in the principal (or most advantageous) market for the asset. In order to measure fair value, management must determine the asset's (or group of assets') highest and best use which may not coincide with the manner that the reporting entity is currently using it. Fair value measurements are discussed and illustrated in detail in Chapter 6.

In conjunction with the recoverability evaluation, it may also be necessary to review the appropriateness of the method of depreciation (amortization) and depreciable (amortizable) lives of the asset or group of assets. If, as a result of that review the remaining useful life of the asset (group) is revised, the revised useful life is used to develop the cash flow estimates used to evaluate recoverability. Changes to the accounting method (e.g., from straight-line to accelerated depreciation), however, would be made prospectively after the application of ASC 360.

ASC 360 introduced the concept of the *asset group*, defined as the lowest level for which identifiable cash flows are largely independent of the cash flows of other assets and liabilities.

An asset group could be

- The whole company
- An operating segment as defined in the Master Glossary
- A reporting unit as defined in the Master Glossary

---

[1] *ASC 820 has been deferred to fiscal years beginning after November 15, 2008, and interim periods within those fiscal years. The deferral applies to nonfinanical assets and liabilities, except for those items recognized or disclosed at fair value in an entity's statements on a recurring basis (at least annually).*

- A business
- A part of a business (such as a division or department)

By reference to asset groups shown in the diagram in the section of Chapter 2 under the caption *Alternative Balance Sheet Segmentation*

- Asset group (a) is a single division of a subsidiary
- Asset groups (b) and (c) are each separate businesses that comprise another division of the same subsidiary
- Asset group (d) is an entire subsidiary consisting of a single business
- Asset group (e) is a product line that is part of a larger business and, after the disposal of disposal group (f), will constitute an entire operating segment
- Asset groups (g) and (h) are each separate businesses that comprise a subsidiary

If a long-lived asset cannot be assigned to any asset group because it does not have identifiable cash flows largely independent of other long-lived assets individually or in asset groups (such as a corporate headquarters), then that asset is evaluated for recoverability by reference to all assets and liabilities of the entity.

The assets and liabilities in the group that are neither long-lived assets nor goodwill are separately identified. Since those assets and liabilities are not subject to the provisions of ASC 360, the GAAP applicable to their valuation is applied *before* applying ASC 360 to the group. For example, allowances for uncollectible accounts receivable and inventory obsolescence are recorded as necessary.

In assessing the composition of asset groups, there must be awareness of the interrelationship between ASC 360 and ASC 350, *Intangibles—Goodwill and Other*. Goodwill can only be assigned to an asset group that is being evaluated for recoverability if the asset group is either a reporting unit or includes a reporting unit.

For the purposes of recoverability evaluation, future cash flows are defined as cash inflows less the associated cash outflows directly associated with and that are expected to arise as a direct result of the use and eventual disposition of the asset group excluding interest that is recognized as a period expense when incurred.

The estimate of future cash flows

- Is based on all available evidence
- Incorporates assumptions that marketplace participants would use in their estimates of fair value when that information is available without undue cost or effort; otherwise, the entity incorporates its own assumptions, including the "highest and best use" of the asset (or group)
- Is to be consistent with assumptions used by the entity for comparable periods such as internal budgets and projections, accruals related to incentive compensation plans, or information communicated to others
- Is made for the remaining estimated useful life of the asset (or the primary asset of an asset group) to the entity

  NOTE: The primary asset is the long-lived asset being depreciated (or intangible asset being amortized) that is the most significant component asset from which the group derives its cash-flow generating capacity. The primary asset cannot be land or nonamortized intangible assets. If the primary asset does not have the longest useful life of the long-lived assets in the group, cash flow estimates must assume that the entire group will be sold at the end of the primary asset's useful life.

- Takes into account future expenditures necessary to complete an asset under development including interest capitalized under ASC 835-20

- Includes future outflows necessary to maintain the existing service potential of all or a component of the asset or group of assets
- Excludes cash flows for future capital expenditures that increase the service potential of a long-lived asset or group of assets
- Is required to take into account the likelihood of possible cash flow outcomes if alternative courses of action are being contemplated, or if ranges of cash flows are estimated to occur under different scenarios

NOTE: ASC 360 indicates that, when uncertainties exist with respect to timing and amount of future cash flows, using an expected present value technique will be the appropriate way to estimate fair value. Nonfinancial assets measured at fair value on a nonrecurring basis will be subject to ASC 820 in fiscal years beginning after November 15, 2008, and interim periods within those fiscal years.

If an asset group is found to have sustained an impairment loss, the loss is only applied to reduce the carrying amounts of the long-lived asset or assets in the group. In general, the loss is allocated to the long-lived assets in the group based on their relative carrying values. However, the carrying value of any individual asset in the group that has a fair value that is separately identifiable without "undue cost or effort" is not to be reduced below that fair value.

After recognition of impairment losses, the adjusted carrying amounts of the impaired long-lived assets constitute their new cost bases. Depreciation (amortization) is recognized prospectively over their remaining estimated useful lives. The adjustment to carrying values to reflect an impairment loss may never be restored.

Example of impairment (Refer to the diagram in Chapter 2 under the section, *Alternative Balance Sheet Segmentation.*)

The Parent Holding Company (PHC) owns and operates seven businesses, primarily engaged in the manufacturing and distribution of food and beverages. All of the businesses are headquartered in the same building that is owned by PHC. Additional facts are as follows:

- Due to general economic conditions and the failure, in 2009, of several high-tech start-ups in the city in which PHC is headquartered, the local commercial real estate market is depressed. PHC's headquarters building has eight years remaining in its expected useful life and its carrying value is $4,500,000. PHC has substantial excess space in the building, which it does not expect to need in the foreseeable future. PHC management expects the real estate market to remain depressed for the next two years and when the market recovers, it will consider selling the building and either leasing or purchasing a smaller facility in the area.
- Subsidiary 2 operates a South American bottling plant that produces a line of carbonated beverages that is sold exclusively on that continent. A large increase in sugar prices during 2009 has resulted in lower margins and, due to partial price increases, a 30% decrease in units sold during the year. The plant operates in a building that Subsidiary 2 leases under an operating lease with five years remaining. The primary asset owned by Subsidiary 2 is what it refers to as its "bottling line" which consists of equipment that mixes ingredients, adds carbon dioxide, and fills and caps the bottles. The bottling line has a remaining useful life of four years. The other assets in the asset group have remaining useful lives of seven years. Subsidiary 2 has been profitable for the past three years (2006 – 2008) but is showing a small operating loss for 2009. Additional information regarding Subsidiary 2 follows:

	Bottling line (primary asset)	*Asset B*	*Asset C*	*Totals*
Net book value	$87,000	$19,000	$17,000	$123,000
Remaining life	4 years	7 years	7 years	
Expected cash inflows, net of outflows				
2010				4,000
2011				6,000
2012				7,000
2013				8,000
From assumed disposition—end of 2013				75,000
Total expected net operating cash flows				$100,000

- PHC is in the process of preparing its consolidated financial statements for the year ended December 31, 2009. Thus far, normal depreciation of PHC and its subsidiaries' fixed assets has been recorded and impairment has not yet been considered.

Analysis.

Step 1—*Identify asset groups.* This has been diagrammed in the exhibit in Chapter 2. Note that the headquarters building cannot be assigned to any specific asset group since it does not generate independent cash flows. Therefore, its potential impairment is assessed at the PHC level on a consolidated basis.

Step 2—*Consider the applicability of impairment indicators.* Assess each of PHC's asset groups (and on a consolidated basis), as to whether the example events and circumstances provided by ASC 360 or any other events and circumstances indicate that PHC's long-lived assets may be impaired. Based on the decline in the local real estate market, it would be presumed that the market price of the headquarters building has declined, and thus the building should be evaluated for recoverability. Analysis of the situation of Subsidiary 2 is more complex. Two of the factors in ASC 360 warrant consideration. First, it could be argued that the increase in sugar prices constitutes a significant adverse change in the business climate. This might be mitigated if management believed the price increase to be a short-term condition and assuming this belief was supportable by past experience. Second, the current period operating loss should be considered. Since there has not been a history of such losses, the relevance of this factor depends on management's forecast of future results. If Subsidiary 2 were forecast to continue to experience operating losses, this would indicate that the asset group needs to be evaluated for recoverability. For the purposes of this example, we will assume that continuing losses are forecast.

Step 3—*Evaluate recoverability*. Two recoverability evaluations are required, one for the headquarters building and the other for the asset group represented by Subsidiary 2. Since the headquarters building is not allocable to an asset group, its recoverability is evaluated using consolidated cash flows that include the cash flows of Subsidiary 2. Thus, the recoverability evaluation for Subsidiary 2 is performed first.

Subsidiary 2's recoverability evaluation is performed by reference to the four-year remaining useful life of the bottling line, its primary asset. The cash flows used to evaluate recoverability are required to assume that the asset group will be sold in its entirety at the end of four years.

Comparison of the sum of the undiscounted expected cash flows from use and disposition of $100,000 to the carrying amount of $123,000 indicates that the carrying amount of the asset group will not be fully recoverable. Therefore, the asset group is impaired.

The recoverability evaluation for the building is performed using an estimate of expected cash flows, weighted for the probabilities as to whether management will pursue the sale of the facility when the local economy recovers in two years, versus retaining it for the remaining eight years of its expected useful life. In addition, depending on different scenarios of future economic conditions and business performance by PHC's businesses, different levels of cash flows could result both from operations and from disposition. Acknowledging the inherent uncertainties asso-

ciated with predicting future results and the subjectivity involved in the estimation process, management formulated its best judgment regarding the probabilities of the best, worst, and most-likely scenarios.

Estimate of Future Cash Flows

Course of action	*Use of the asset (consolidated basis)*	*Disposition of the asset*	*Total*	*Probability assessment*	*Probability-weighted possible cash flows*
Sale at the end of 2 years	$100,000	$3,500,000	$3,600,000	20%	$720,000
	130,000	4,600,000	4,730,000	60%	2,838,000
	150,000	4,600,000	4,750,000	20%	950,000
				100%	$4,508,000
Sale at the end of 8 years	$410,000	$4,000,000	$4,410,000	20%	$882,000
	550,000	4,700,000	5,250,000	60%	3,150,000
	620,000	4,800,000	5,420,000	20%	1,084,000
				100%	$5,116,000

Upon review of the analysis above, management determined that it is 70% probable that it will sell the building at the end of two years. Consequently, the expected cash flows from the use and disposition of the building are as follows:

Course of action	*Probability-weighted possible cash flows*	*Probability assessment for course of action*	*Undiscounted expected cash flows*
Sale at the end of 2 years	$4,508,000	70%	$3,155,600
Sale at the end of 8 years	5,116,000	30%	1,534,800
		100%	$4,690,400

Comparison of the undiscounted expected cash flows or $4,690,400 per above to the $4,500,000 carrying value of the building at December 31, 2009, indicates that the carrying value of the building is expected to be fully recoverable, and thus the building is not impaired.

As a result of the above analysis, management may decide upon one of the alternative courses of action. If so, the expected cash flows from that course of action would be used in the recoverability evaluation since it would no longer be necessary to probability-weight the outcomes.

Step 4—*Compute impairment, if any*. Market information regarding the asset group of Subsidiary 2 is not available "without undue cost and effort." Management elects to use the traditional present value of estimated cash flows method to estimate fair value because it believes that uncertainty regarding the timing and amounts of cash flows is minimal (but, if this were not the case, management would use an *expected present value* technique to make this estimate). This estimation method is referred to in ASC 820 as a *discount rate adjustment* technique. Using this technique requires

- A single set of most-likely cash flows that includes assumptions regarding the likelihood of occurrence or nonoccurrence of events that potentially influence the estimated amounts
- A discount rate approximating a market rate of return based on observable rates of return for comparable assets traded in the same market as the asset or group of assets being measured

The 8% interest rate used for this illustration is assumed to be a rate commensurate with the risks involved (unlike the risk-free rate sometimes used in applying an expected present value technique). The computation is as follows:

Year	Net cash flows	Present value at 8%	Carrying value of asset group	Impairment adjustment required
2010	$ 4,000	$ 3,704		
2011	6,000	5,144		
2012	7,000	5,557		
2013–Use	8,000	5,880		
2013–Sale	75,000	55,127		
	$100,000	$75,412	$123,000	$47,588

Asset	Carrying value	Pro rata allocation factor	Allocation of impairment loss	Tentative adjusted carrying amount
Bottling line	$ 87,000	71%	$33,660	$53,340
Asset B	19,000	15%	7,351	11,649
Asset C	17,000	14%	6,577	10,423
Total	$123,000	100%	$47,588	$75,412

Note that the adjusted carrying amount is captioned "tentative." This is because Subsidiary 2 was able to obtain a quoted market price of $16,000 for Asset B. ASC 360 specifies that assets are not to be reduced to an amount below their fair value. To obtain the proper result, the impairment loss requires reallocation among the assets comprising the asset group.

Asset	Tentative adjusted carrying amount	Pro rata reallocation factor	Reallocation of excess impairment loss	Adjusted carrying amount
Bottling line	$53,340	84%	$(3,640)	$49,700
Asset C	10,423	16%	(711)	9,712
Subtotal	63,763	100%	(4,351)	
Asset B	11,649		4,351	16,000
Total	$75,412		$ --	$75,412

Step 5—*Record the impairment adjustment*. The entry to record impairment in the accounting records of Subsidiary 2 is as follows:

Impairment loss (operating section of income statement)	47,588	
Accumulated depreciation—Machinery and equipment		47,588

To adjust the carrying value of the bottling line and related assets to reflect an impairment loss for 2009.

***Other impairment considerations*.** Besides the foregoing, other issues arise as a consequence of applying the impairment rules.

Going concern. The example above included an estimate of cash flows at the entity level to assess whether the building was impaired. If the estimate had indicated that the building was impaired, management must consider whether the cash flows estimated for at least the ensuing year will be sufficient for the entity to continue as a going concern. Disclosure in the financial statements of management's plans may be required under SAS 59, *The Auditor's Consideration of an Entity's Ability to Continue as a Going Concern.*

Significant estimates. If, in the example above, the expected cash flows used to assess the recoverability of the building were closer to the building's $4,500,000 carrying value, consideration is given to the applicability of ASC 275, *Risks and Uncertainties*. The assumptions used in the cash flow estimates could be considered significant estimates for which it is reasonably possible changes could occur in the near term (the ensuing year) and, consequently, disclosure would be required.

Treatment of certain site restoration/environmental exit costs. ASC 360-10-55 discusses how, for the purpose of performing the recoverability evaluation under ASC 360, to treat the costs of future site restoration or closure (referred to as "environmental exit costs") that may be incurred if the asset is sold, abandoned, or ceases operations. To conform to ASC 360, references to an "asset" are also applicable to an "asset group."

ASC 410-20, discussed earlier in this chapter, requires asset retirement obligations recognized as liabilities to be included as part of the capitalized cost of the related asset and, to avoid double-counting, the cash settlement of those liabilities to be excluded from the expected future cash flows used to evaluate recoverability under ASC 360. If the asset retirement costs have not yet been recognized under ASC 410-20 because the obligation is being incurred over more than one reporting period during the useful life of the asset, then the cash flows for those unrecognized costs are to be included in the expected future cash flows.

The cash flows for environmental exit costs that are not recorded as liabilities under ASC 410-30, *Environmental Obligations,* may not occur until the end of the asset's life if the asset ceases to be used or may be delayed indefinitely as long as management retains ownership of the asset and chooses not to sell or abandon it. Consequently, management's intent regarding future actions with respect to the asset is to be taken into account in determining whether to include or exclude these cash flows from the computation of the expected future cash flows used to evaluate recoverability under ASC 360. If management is contemplating alternative courses of action to recover the carrying amount of the asset or if a range is estimated for the amount of possible future cash flows, the likelihood (probability) of these possible outcomes is to be considered in connection with the recoverability evaluation under ASC 360.

ASC 360-10-55 provides examples illustrating situations where cash flows for environmental exit costs not recognized as liabilities under ASC 410-30 are either included in or excluded from the undiscounted expected future cash flows used to evaluate a long-lived asset or group of assets for recoverability under ASC 360.

Deferred income taxes. Impairment losses are not deductible for US federal income tax purposes. Consequently, financial statement recognition of these losses will result in differences between the carrying amounts of the impaired assets used for financial reporting purposes and income tax purposes. These differences are considered temporary differences and are accounted for under the provisions of ASC 740 as discussed in Chapter 17.

Comparison of accounting and impairment rules. The following diagram summarizes and compares the rules affecting the accounting for tangible and intangible long-lived assets.

Summary and Comparison of Accounting and Impairment Rules

<table>
<tr><th>Attribute</th><th>PP&E*</th><th>Amortizable intangibles</th><th>Nonamortizable intangibles</th><th>Goodwill</th></tr>

* *Includes property, plant, and equipment, internal-use software, and Web site development costs.*

Long-lived assets to be disposed of by sale. An asset may be disposed of individually or as part of a disposal group. A disposal group is a group of assets to be disposed of in a single transaction as a group and the liabilities directly associated with those assets that will be transferred with those assets (e.g., environmental obligations, warranty obligations associated with a product line, etc.).

Long-lived assets (or disposal groups) are classified as held-for-sale in the period in which *all* of the following six criteria are met:

1. Management possessing the necessary authority commits to a plan to sell the asset (disposal group)
2. The asset (disposal group) is immediately available for sale on an "as is" basis (i.e., in its present condition subject only to usual and customary terms for the sale of such assets)
3. An active program to find a buyer and other actions required to execute the plan to sell the asset (disposal group) have commenced
4. An assessment of remaining actions required to complete the plan indicates that it is unlikely that significant changes will be made to the plan or that the plan will be withdrawn
5. Sale of the asset (disposal group) is probable, as that term is used in the context of ASC 450-20 (i.e., likely to occur), and transfer of the asset (disposal group) is expected to qualify for recognition as a completed sale within one year

   NOTE: Certain exceptions to the one-year requirement are set forth in ASC 360 for events and circumstances beyond the entity's control that extend the period required to complete the sale.

6. The asset (disposal group) is being actively marketed for sale at a price that is reasonable in relation to its current fair value

A newly acquired long-lived asset (disposal group) that is being held for sale is to be classified as held-for-sale on the date of acquisition if

- It meets criteria 5. above (subject to the same exceptions noted in 5.), *and*
- Any other of the required criteria that are not met at the date of acquisition will probably be met within a short period (approximately three months or less) of acquisition.

If the criteria are met after the balance sheet date but prior to issuance of the entity's financial statements, the long-lived asset is to continue to be classified as held-and-used at the balance sheet date. Appropriate subsequent events disclosures would be included in the financial statements in accordance with AICPA Statement on Auditing Standards 1, AU Section 560, *Subsequent Events*.

Long-lived assets (disposal groups) classified as held-for-sale are measured at the lower of their carrying amount or fair value less cost to sell. A loss is recognized for any initial or subsequent write-down to fair value less cost to sell. A gain is recognized for any subsequent increase in fair value less cost to sell, but recognized gains may not exceed the cumulative losses previously recognized. Long-lived assets that are classified as held-for-sale are presented separately on the balance sheet.

Cost to sell consists of costs that directly result from the sales transaction that would not have been incurred if no sale were transacted. Cost to sell includes brokerage commissions, legal fees, title transfer fees, and other closing costs that must be incurred prior to transfer of legal title to assets. Prior to measurement of fair value less cost to sell, the entity adjusts the carrying amounts of any assets included in the disposal group not covered by ASC 360 including any goodwill.

The entity may not accrue, as part of cost to sell, expected future losses associated with operating the long-lived asset (disposal group) while it is classified as held-for-sale. Costs associated with the disposal, including costs of consolidating or closing facilities, are only recognized when the actual costs are incurred. If the exception to the one-year requirement applies (permitted when there are certain events and circumstances beyond the entity's control), and the sale is expected to occur in more than one year, the cost to sell is discounted to its present value.

Long-lived assets (disposal groups) held for sale are not to be depreciated (amortized) while being presented under the held-for-sale classification. Interest and other expenses related to the liabilities of a held-for-sale disposal group are accrued as incurred.

If, at any time after meeting the criteria to be classified as held-for-sale, the asset (disposal group) no longer meets those criteria, the long-lived asset (disposal group) is to be reclassified from held-for-sale to held-and-used, measured at the *lower of*

- Carrying value prior to classification as held-for-sale, adjusted for any depreciation (amortization) that would have been recognized had the asset (disposal group) continued to be classified as held-and-used, or
- Fair value at the date of the subsequent decision not to sell the asset (disposal group).

The adjustment required to the carrying amount of an asset (disposal group) being reclassified from held-for-sale to held-and-used is included in income from continuing operations in the period that the decision is made not to sell. FASB concluded that impairment losses from long-lived assets to be held and used, gains or losses recognized on long-lived assets to be sold, and other costs associated with exit or disposal activities (as defined in ASC 420 and discussed in detail in Chapter 3) should be accounted for consistently. Therefore, if the entity reports a measure of operations (e.g., income from operations), these amounts are reported in operations unless they qualify as discontinued operations, as explained below. The income statement classification of these amounts is to be consistent with the accounting policy for classifying the depreciation of the underlying assets per the following examples:

Machinery and equipment used in production	Cost of goods sold
Office equipment	General and administrative
Trucks and delivery equipment	General and administrative or, if a separate category of expenses, selling expense
Combination factory/office building	Allocate between cost of goods sold, and general and administrative in the same manner as depreciation

If a component of an entity (as defined below) is reclassified as held-and-used, the results of that component that had previously been reported in discontinued operations are reclassified and included in income from continuing operations for all periods presented.

Upon removal of an individual asset or liability from a disposal group classified as held-for-sale, the remaining part of the group is to be evaluated as to whether it still meets all six of the criteria to be classified as held-for-sale. If all of the criteria are still met, then the remaining assets and liabilities will continue to be measured and accounted for as a group. If not all of the criteria are met, then the remaining long-lived assets are to be measured individually at the lower of their carrying amounts or fair value less cost to sell at that date. Any assets that will not be sold are reclassified as held-and-used as described above.

Example of long-lived assets to be disposed of by sale

The Hewitt Candy Company chooses to stop sales of its candy cane product line, and accordingly shifts the $840,000 carrying cost (i.e., book value) of its candy cane twister equipment

into a held-for-sale account. After several months of trying to close a sale of the equipment, Hewitt's controller notes that the fair value of the twister equipment is now $855,000. However, after projected sale costs that include commissions, legal fees, and title transfer fees are included, the net fair value is only $825,000. The controller accordingly writes down the equipment cost to $825,000 with the following entry:

Loss on fair value adjustment	15,000	
Equipment held-for-sale		15,000

After another two months, the controller notes that the equipment's fair value, net of estimated disposition costs, has increased to $860,000. Though this represents a gain of $35,000 over the adjusted carrying cost of the equipment, he can only recognize a gain up to the amount of all previously recorded losses, which he does with the following entry:

Equipment held-for-sale	15,000	
Gain on fair value adjustment		15,000

Six months after the twister equipment is classified as held-for-sale, Hewitt's management concludes that it will wait for better market conditions to sell the equipment. Hewitt's controller reclassifies the equipment as held-and-used with the following entry:

Equipment	840,000	
Equipment held-for-sale		840,000

Prior to its classification as held-for-sale, the equipment had been depreciated on a straight-line basis over a ten-year life span using an original equipment base cost of $1.2 million, so $60,000 would otherwise have been incurred while the equipment was classified as held-for-sale; this would have reduced the equipment's net carrying cost (i.e., book value) from $840,000 to $780,000. Since this is lower than the estimated fair value of $860,000 as of the date when the decision was made to halt sale activities, the controller records the following entry:

Depreciation—equipment	60,000	
Accumulated depreciation—equipment		60,000

After four more months, Hewitt receives an unsolicited cash offer of $875,000 for the twister equipment, which it accepts. During these additional four months, the equipment has been depreciated by a further $40,000. Hewitt's controller records the sale with the following entry:

Cash	875,000	
Accumulated depreciation—equipment	460,000	
Equipment held-and-used		1,200,000
Gain on equipment sale		135,000

Long-lived assets to be disposed of other than by sale. Long-lived assets may be abandoned, exchanged, or distributed to owners in a spin-off. Until the actual disposal occurs, the assets continue to be classified on the balance sheet as "held and used." During that period prior to disposal, they are subject to conventional impairment rules applicable to assets held and used.

Abandoned assets are considered disposed of under ASC 360 when they cease to be used. Temporary idling of an asset, however, is not considered abandonment. At the time an asset is abandoned, ASC 360 prescribes that its carrying amount be adjusted to its salvage value, if any, but not less than zero (i.e., a liability cannot be recorded upon abandonment).

If the entity commits to a plan to abandon the asset before the end of its previously estimated useful life, the depreciable life is revised in accordance with the rules governing a change in estimate under ASC 250 and depreciation of the asset continues until the end of its shortened useful life.

If a long-lived asset is to be disposed of either by spinning it off to owners of the company or in an exchange transaction for a similar productive long-lived asset, the disposal is recognized when the actual exchange or spin-off occurs. If that asset (group) is evaluated for recoverability while held and used and before the disposal, the estimates of future cash flows

are to assume that the disposal will not occur and that the asset will continue to be held and used for the remainder of its useful life. Two separate impairment losses might be recognized in this scenario.

1. An impairment loss for the asset while it is held and used
2. An additional impairment loss if, upon exchange or spin-off, which are recorded under ASC 845 at the asset's recorded amount, the recorded amount/carrying value exceeds fair value

Discontinued operations. ASC 360 introduced the concept of a "component of an entity." A component of an entity is distinguishable from the rest of the entity because it has its own operations and cash flows. It may be a reportable segment or operating segment (as defined by ASC 280), a reporting unit (as defined in the Master Glossary, a subsidiary, or an asset group.

If a component of an entity is either classified as held-for-sale or has been disposed of during the period, the results of its operations are to be reported in discontinued operations if *both* of the following conditions are met:

- The operations and cash flows of the component have been or will be eliminated from the ongoing operations of the entity as a result of the disposal transaction
- The entity will not have significant continuing involvement in the operations of the component after the disposal transaction

The assessment period. The assessment of these conditions in light of certain fact situations has been the source of some confusion in practice. ASC 205-20-55 attempts to provide clarification and examples of appropriate application. Management's assessment is to be based on all facts and circumstances including management's intent and ability to (1) eliminate the disposed component's cash flows from its ongoing operations and (2) not have significant continuing involvement in the operations of the disposed component. The assessment is to include significant events or circumstances that occur during the period from the balance sheet date to the date of issuance of the financial statements.

The assessment period commences at the date that the component initially meets the criteria to be classified as held-for-sale (discussed earlier in this chapter) or is disposed of. The assessment period ends one year from the date that the component is actually disposed of. During the year between disposal and the end of the assessment period, management is to consider whether any significant events or circumstances had occurred that potentially would change its current assessment. If such an event or circumstance occurs, management is to perform a reassessment to determine if it still expects to meet the two conditions. If the results of the reassessment are that management no longer expects to meet the two conditions by the end of the assessment period, the disposed component's operations are not to be presented as discontinued operations. If the reassessment indicates the opposite, that management expects to meet both conditions by the end of the assessment period, the component's operations are to be presented as discontinued operations. Each change in assessment that occurs during the assessment period will require reclassification of the operations for all periods presented in comparative financial statements.

If events or circumstances occur that are beyond the control of the reporting entity that extend the period required to meet the two conditions, the assessment period may extend beyond one year from the date of disposal provided that management (1) responds to the situation by taking the necessary actions, and (2) expects to successfully meet the two conditions.

The following discussion will analyze each of the conditions separately from the standpoint of management of the "ongoing entity," defined as the remaining operations of a reporting entity after it has disposed of a component or classified a component as held-for-sale.

Elimination of the component's operations and cash flows. Management of the ongoing entity is to assess whether any continuing cash flows have been generated or are expected to be generated. Continuing cash flows are cash inflows and/or outflows generated by the ongoing entity that are associated with activities involving the component that was disposed of or classified as held-for-sale. Cash inflows and/or outflows are assessed for this purpose in the same manner as under ASC 360 in assessing the recoverability of assets to be held and used.

Direct vs. indirect cash flows. If continuing cash flows have occurred or are expected to occur, their nature and significance must be evaluated to determine whether they are considered direct or indirect. The evaluation of whether the cash flows are direct or indirect is to be made by management by considering its expectations based on the best information available. If all of the significant continuing cash flows are direct, the first condition in ASC 360 is not met and the operations of the component are to be presented as part of continuing operations in the financial statements of the ongoing entity. If, however, all of the significant continuing cash flows are indirect, those cash flows are considered to have been eliminated from the ongoing entity and the component will have met the first of the two conditions for classification as a discontinued operation in the income statement of the ongoing entity.

Examples of cash flows that are considered indirect include but are not limited to

1. Interest income earned from seller financing associated with the disposal
2. Contingent consideration associated with a business combination
3. Dividends earned on investments
4. Royalties received based on passive interests in the operations of the disposed component

Cash flows are direct if they result from the ongoing entity's substantive continuation of the component's revenue-producing and/or cost-generating activities subsequent to the disposal transaction.

Significant cash inflows of the ongoing entity are direct if they result from a

1. Migration of revenues from the disposed component after the disposal transaction or
2. Continuation of revenue-producing activities by the ongoing entity through its active involvement with the disposed component after the disposal transaction

Significant cash outflows of the ongoing entity are direct if they result from a

1. Migration of costs from the disposed component after the disposal transaction or
2. Continuation of cost-generating activities by the ongoing entity through its active involvement with the disposed component after the disposal transaction

Migration of revenues and costs. Migration in this context refers to the expectation of management that the ongoing entity will continue to sell products or services similar to those of the disposed component to the disposed component's specific customers and that, in so doing, will continue to generate related revenues and/or incur related expenses. ASC 205-20-55 indicates that there is a rebuttable presumption that revenues and/or costs have migrated to the ongoing entity if, after the disposal transaction, the ongoing entity continues to sell a similar product or service, as defined in the Consensus. This presumption can be overcome by an analysis of specific facts and circumstances such as differences between the products or services or the markets in which they are provided.

Continuation of revenue-producing and cost-generating activities. Continuation of activities occurs when the ongoing entity remains actively involved with the disposed compo-

nent after the disposal occurs. This can be evidenced, for example, by the continuation of predisposal purchases or sales of products or services between the ongoing entity and the disposed component or a related party.

Determining significance of continuing cash flows. ASC 205-20-55 prescribes a with-and-without approach to determining whether continuing cash flows are considered significant. The determination of significance is to be made separately for gross cash inflows and gross cash outflows. Naturally, if gross cash inflows are determined to be significant, it is not necessary to determine the significance of gross cash outflows since it will already have been determined that the operations of the disposed-of component do not qualify for classification as discontinued operations in the financial statements of the ongoing entity.

Management makes the determination of the significance of cash inflows by comparing its estimate of the ongoing entity's cash inflows expected to result from the migration of the disposed component's sales after the disposal with a hypothetical estimate of what the cash inflows of the disposed component would have been had the disposal transaction not occurred. For the purpose of this estimate, the hypothetical cash inflows of the disposed component are to include cash inflows arising from external, third-party transactions and intercompany transactions as if they had been transactions between unrelated parties.

Significance of continuing involvement. The Master Glossary defines continuing involvement as the ability of the ongoing entity to influence the operating and/or financial policies of the disposed component. This determination is to be based on both quantitative and qualitative assessments made from the standpoint of the disposed component. The ongoing entity's retention of risk or ability to obtain benefits from the ongoing operations associated with the disposed component is not, by itself, conclusive of the ability to influence. Management is to evaluate individually and in the aggregate, ownership interests, contractual arrangements, and other arrangements. Ownership interests include common stock, in-substance common stock as defined in the Master Glossary, or a call option to acquire an interest in the disposed component. Ownership interests consisting of only common stock accounted for under the cost method or only of in-substance common stock do not constitute significant continuing involvement.

In evaluating contractual or other arrangements, the following factors are to be considered:

1. Significance of the contract or arrangement in the context of the disposed component's overall operations.
2. The extent of involvement of the ongoing entity in the disposed component's operations.
3. The rights that the contract or arrangement conveys to each of the parties.
4. The pricing terms included in the contract or arrangement.

The following circumstances are not considered to constitute continuing cash flows or continuing involvement:

1. Resolution of transaction-related contingencies—Subsequent resolution of contingencies related to the disposal transaction such as adjustments to the purchase price and enforcement of any indemnification provisions in the disposal agreement.
2. Resolution of operating contingencies—Subsequent resolution of contingencies related to the operations of the disposed component that existed prior to the disposal such as environmental and product warranty obligations that were retained by the seller (the ongoing entity).

3. Settlement of employee benefit plan obligations—Settlement of pension and other postemployment benefit-related obligations that are directly related to the disposal transaction.

In a period in which a component of an entity is either classified on the balance sheet as held-for-sale or has been disposed of, the entity's income statement *for current and prior periods* is to report the component's results of operations (including gains or losses related to transfer of the asset from the held and used to the held-for-sale category) as discontinued operations, net of applicable income taxes or benefit. Future losses may not be anticipated and accrued and are to be recognized in the period in which they are incurred. Placement in the income statement is illustrated in Chapter 3.

The gain or loss on disposal is permitted to be disclosed either on the face of the statement of income or in the notes to the financial statements.

In subsequent periods, certain adjustments may arise that affect amounts previously reported in discontinued operations. Examples of such adjustments include

- Resolution of contingencies associated with the terms of the disposal such as purchase price adjustments and indemnification issues with the purchaser
- Resolution of contingencies associated with the operation of the component prior to its disposal such as environmental or product warranty obligations retained by the seller
- Settlement of employee benefit plan obligations directly associated with the disposal transaction (generally settlements and curtailments of plan liabilities as contemplated by ASC 715)

When adjustments of this nature occur, they are classified separately in discontinued operations of the current period and the notes to the financial statements are to disclose the nature and amount of these adjustments.

Assets and liabilities of a disposal group classified as held-for-sale are presented separately in their respective sections of the balance sheet. Offsetting of these amounts is not permitted.

Example of discontinued operations reporting

The Hewitt Candy Company sells its entire candy cane production line, recognizing a gain of $155,000 on the transaction prior to applicable taxes of $54,000. During the year in which the sale was completed, Hewitt lost $23,000 on its operation of the candy cane line, while it also lost $72,000 during the preceding year. Applicable tax reductions during these years were $8,000 and $25,000, respectively. It reports these results in the following portion of its income statement:

	20X0	*20X1*
Discontinued operations:		
Loss from operations of discontinued candy cane division (net of applicable taxes of $25,000 and $8,000)	$(47,000)	$(15,000)
Gain on disposal of candy cane division (net of applicable taxes of $54,000)	--	101,000

A clause in the sale agreement stipulates that Hewitt must reimburse the buyer for any maintenance problems found in the equipment. In the following year, the two parties negotiate a payment by Hewitt of $39,000 to address claims made under this clause. The applicable tax reduction associated with this payment is $14,000. It reports these results in the following portion of its income statement:

	20X0	*20X1*	*20X2*
Discontinued operations:			
Loss from operations of discontinued candy cane division (net of applicable taxes of $25,000 and $8,000)	$(47,000)	$(15,000)	--
Gain on disposal of candy cane division (net of applicable taxes of $54,000)	--	101,000	--
Adjustment to gain on disposal of candy cane division (net of applicable taxes of $14,000)	--	--	$(25,000)

Long-lived assets temporarily idled. The only reference in ASC 360 to the temporary idling of long-lived assets is the provision that prohibits recognizing temporary idling as abandonment. At a minimum, however, if material assets are temporarily idled, the following considerations apply:

1. Idling constitutes a "significant adverse change in the extent or manner in which…" the asset (or asset group) is being used, which is an indicator requiring a recoverability evaluation under ASC 360.
2. The estimates of future cash flows used in performing the recoverability evaluation are to consider, on a probability-weighted basis, the range of outcomes under consideration by management regarding when the asset will be returned to service, sold, or abandoned.
3. Idle property and equipment is to be clearly and unambiguously captioned and segregated on the balance sheet from both the "held-and-used" and "held-for-sale" categories since it does not qualify for either classification, with appropriate disclosure of the relevant circumstances.
4. As part of the ongoing review of the appropriateness of useful lives, the remaining useful life of the idle equipment is to be reassessed.
5. Evaluation by management of whether temporary suspension of depreciation or amortization of the asset is warranted until it is returned to service.

Foreclosed assets obtained in troubled debt restructurings. In general, assets obtained by a lender pursuant to foreclosure are recorded at their fair values at the time of the restructuring. To the extent that the foreclosed assets include long-lived assets that will be sold in full satisfaction of the debt, those assets are to be recorded in accordance with ASC 360 at fair value, less cost to sell. If the amount recognized does not fully satisfy the debt, the lender records a loss computed as

Recorded investment in the receivable – Fair value, less cost to sell = Loss

To the extent that the loss is not offset by a valuation allowance, it is included in net income for the period of the restructuring.

The recorded investment in the receivable may have been recorded net of a valuation allowance for uncollectibility or as face amount of the receivable adjusted for such items as accrued interest and unamortized premium, discount, finance charges, or loan acquisition costs. The recorded investment in the receivable may also reflect previous direct write-downs.

If the fair value of the foreclosed assets only partially satisfy the outstanding debt, the creditor is to follow ASC 310 (discussed in detail in Chapters 15 and 25) after first reducing the recorded investment in the receivable by the fair value less cost to sell of the foreclosed assets.

Note that substance over form is an important consideration in determining the applicability of this accounting protocol. Even if formal foreclosure proceedings do not occur, if a troubled debt restructuring results in the lender obtaining physical custody of assets of the borrower that had been pledged as collateral to satisfy all or a portion of the outstanding

debt, the transaction is accounted for in the same manner as a foreclosure, as previously described.

Subsequent to the restructuring, the lender accounts for foreclosed assets in the same manner as assets acquired in exchange for cash. ASC 310-40-55 specifies that the valuation allowance for a loan collateralized by a long-lived asset is not to be carried over as a separate element of the cost basis of that long-lived asset received in full satisfaction of a receivable in a troubled debt restructuring. The valuation allowance for the loan also is not to be included in the amount of cumulative losses previously recognized when computing the amount of gain that can be recognized under ASC 360 if the value of the collateral subsequently increases.

Reporting and disclosures. With respect to the impairment of long-lived assets to be held and used, the following disclosures are required:

1. A description of the impaired long-lived asset (or asset group) and the facts and circumstances that led to the impairment
2. The amount of the impairment loss and the caption in the income statement (or not-for-profit statement of activities) in which it is included, if not presented separately on the face of the income statement
3. The method or methods used to determine fair value (e.g., quoted market prices as described in the forthcoming FASB standard on fair value measurements, market prices for similar assets, or other valuation techniques)
4. For public companies, the segment in which the impaired long-lived asset or asset group is reported under ASC 280

With respect to long-lived assets and disposal groups to be disposed of, and other exit and disposal activities, disclosures for the period in which the activity is initiated and any subsequent periods until completion of the activity are to include

1. A description of the exit or disposal activity, including
   a. The facts and circumstances that led to the expected exit or disposal,
   b. The expected manner and timing of the activity, including its expected date of completion,
   c. If not separately presented on the face of the balance sheet, the carrying amount or amounts of the major classes of assets and liabilities included as part of a disposal group (public companies are also required to disclose which segment or segments includes each disposal group)
2. The gain or loss recognized for any initial or subsequent write-downs to fair value less cost to sell and, if not separately presented on the face of the income statement, the caption in the income statement or the statement of activities that includes the gain or loss
3. The following information for each major category of costs to be incurred in connection with the activity (e.g., onetime termination benefits, contract termination costs, and other costs):
   a. Costs incurred during the period
   b. Cumulative costs incurred from inception to balance sheet date
   c. Total costs expected to be incurred
   d. A reconciliation of changes in the liability during the period including
      (1) Liability at the beginning of the period
      (2) Costs incurred and charged to expense during the period

(3) Costs paid or otherwise settled during the period
(4) Adjustments made to the liability, if any, and the reasons the adjustments were necessary

4. The income statement (or statement of activities) captions that include the costs in 3.
5. If any costs incurred that are associated with exit or disposal activities have not been accrued because the fair value of the liability is not reasonably estimable, that fact and the reasons such an estimate cannot be made
6. With respect to discontinued operations, if applicable
   a. The amounts of revenue and pretax profit or loss reported in discontinued operations
   b. For each discontinued operation that generates continuing cash flows
      (1) The nature of activities that result in the continuing cash flows
      (2) The period of time that the continuing cash flows are expected to be generated
      (3) The principal factors that led to the conclusion that the expected cash flows are not direct cash flows of the disposed component
   c. For each discontinued operation in which the ongoing entity will engage in a continuation of activities
      (1) In the period in which operations are initially classified as discontinued, the types of continuing involvement that the ongoing entity will have after the disposal transaction
      (2) If there will be a continuation of revenues and expenses between the ongoing entity and the discontinued component that were eliminated in consolidation prior to the disposal, the amount of the intercompany revenues and expenses that were eliminated for all periods presented in the financial statements.
7. If assets are reclassified from the held-for-sale category to the held-and-used category during the period, a description of the facts and circumstances that led to the decision to change the plan to sell the asset or group of assets and the effect on the results of operations for the period in which the decision is made and any prior periods presented
8. For each reportable segment of a public company, the following information about the costs of exit or disposal activities:
   a. Costs incurred during the period
   b. Cumulative costs incurred from inception to balance sheet date, net of any adjustments to the liability, with the reasons the adjustments were necessary
   c. Total costs expected to be incurred

Intangible Assets

The range of intangibles is perhaps more clearly understood today than it was in the past, and there is more pressure to improve the relevance of financial reporting in light of changing business and economic conditions. For manufacturing companies the primary assets typically are tangible, such as buildings and equipment. For financial institutions the major assets are financial instruments. For high-technology, knowledge-based companies, however, the primary assets are intangible (e.g., patents and copyrights) and for professional service firms the key assets may be "soft" resources such as knowledge bases and client re-

lationships. Overall, enterprises for which intangible assets constitute a large and growing component of total assets are a rapidly growing part of the economy. Intangible assets are defined as both current and noncurrent assets that lack physical substance. Specifically excluded, however, are financial instruments and deferred income tax assets. Goodwill is not considered an identifiable intangible asset, and accordingly, under ASC 350-20, is accounted for differently from identifiable intangibles. Goodwill is the preeminent unidentifiable intangible, and this characteristic (i.e., the lack of identifiability) has been determined by the FASB to be the critical element in the definition of goodwill. Accordingly, identifiable intangible assets that are reliably measurable are recognized and reported separately from goodwill.

Leasehold improvements. Leasehold improvements result when tangible physical enhancements are made to property by or on behalf of the lessee of real estate. By law, when improvements are made to real property and those improvements are permanently affixed to the property, the title to those improvements automatically transfers to the owner of the property. The rationale behind this is that the improvements, when permanently affixed, are inseparable from the rest of the real estate.

As a result of this automatic title transfer, the lessee's interest in the improvements is not a direct ownership interest but rather it is an intangible right to use and benefit from the improvements during the term of the lease. Consequently, the capitalized costs incurred by a lessee in constructing improvements to property that it leases represent an intangible asset analogous to a license to use them. Thus, when allocating the costs of leasehold improvements to the periods benefited, the expense is referred to as amortization (as used in the context of amortization of intangibles) and not depreciation.

A frequently encountered issue with respect to leasehold improvements relates to determination of the period over which they are to be amortized. Normally, the cost of long-lived assets is charged to expense over the estimated useful lives of the assets. However, the right to use a leasehold improvement expires when the related lease expires, irrespective of whether the improvement has any remaining useful life. Thus, the appropriate useful life for a leasehold improvement is the lesser of the useful life of the improvement or the term of the underlying lease. ASC 840-10-35-9 reinforces this concept by requiring that leasehold improvements acquired in a business combination or leasehold improvements completed well after commencement of a lease agreement be amortized over the lesser of the useful life of the leasehold improvement or a time period that includes required lease periods as well as reasonably assured lease renewal periods.

Some leases contain a fixed, noncancelable term and additional renewal options. When considering the term of the lease for the purposes of amortizing leasehold improvements, normally only the initial fixed noncancelable term is included. There are exceptions to this general rule that arise out of the application of GAAP to the lessee's accounting for the lease. If a renewal option is a bargain renewal option, then it is probable at the inception of the lease that it will be exercised and, therefore, the option period is included in the lease term for purposes of determining the amortizable life of the leasehold improvements. Additionally, under the definition of the lease term there are other situations where it is probable that an option to renew for an additional period would be exercised. These situations include periods for which failure to renew the lease imposes a penalty on the lessee in such amount that a renewal appears, at the inception of the lease, to be reasonably assured. Other situations of this kind arise when an otherwise excludable renewal period precedes a provision for a bargain purchase of the leased asset or when, during periods covered by ordinary renewal options, the lessee has guaranteed the lessor's debt on the leased property.

In deciding whether to include the period covered by a renewal option in the calculation of the amortizable life of the leasehold improvements, the lessee must be consistent with the interpretation of renewal options included in the minimum lease payment calculations made to determine whether the lease is a capital or operating lease.

Example

Marcie Corporation occupies a warehouse under a five-year operating lease commencing January 1, 2009, and expiring December 31, 2013. The lease contains three successive options to renew the lease for additional five-year periods. The options are not bargain renewals as they call for fixed rentals at the prevailing fair market rents that will be in effect at the time of exercise. When the initial calculation was made to determine whether the lease is an operating lease or a capital lease, only the initial noncancelable term of five years was included in the calculation. Consequently, for the purpose of determining the amortizable life of any leasehold improvements made by Marcie Corporation, only the initial five-year term is used. If Marcie Corporation decides, at the beginning of year four of the lease, to make a substantial amount of leasehold improvements to the leased property, it could be argued that it would now be probable that Marcie would exercise one or more of the renewal periods, since not doing so would impose the substantial financial penalty of abandoning expensive leasehold improvements. This would trigger accounting for the lease by treating the period or periods for which it is likely that the lessee will renew as a new agreement and require testing to determine whether the lease, prospectively, qualifies as a capital or operating lease.

The SEC has provided the following guidance on the proper accounting treatment by a lessee for incentives or allowances provided by a lessor to a lessee under an operating lease[2]:

1. The incentives are not permitted to be netted against the leasehold improvements they were intended to subsidize. Instead, they are to be recorded as deferred rent and amortized as reductions to lease expense over the lease term.
2. The leasehold improvements are to be recorded gross, at their cost, and amortized as discussed above.
3. The lessee's cash flow statement is to reflect the cash received from the lessor as an incentive or allowance as cash provided by operating activities and the acquisition of the leasehold improvements as cash used for investing activities.

Lease accounting is discussed in detail in Chapter 16.

Software developed for internal use. ASC 350-40 provides guidance on accounting for the costs of internally developed software. Software must meet two criteria to be accounted for as internally developed software. First, the software's specifications must be designed or modified to meet the reporting entity's internal needs, including costs to customize purchased software. Second, during the period in which the software is being developed, there can be no plan or intent to market the software externally, although development of the software can be jointly funded by several entities that each plan to use the software internally.

In order to justify capitalization of related costs, it is necessary for management to conclude that it is probable that the project will be completed and that the software will be used as intended. Absent that level of expectation, costs must be expensed currently as research and development costs (discussed in detail later in this chapter). Entities which engage in both research and development of software for internal use and for sale to others must carefully identify costs with one or the other activity, since the former is (if all conditions are met) subject to capitalization, while the latter is expensed as research and development costs

---

[2] *Letter from SEC Chief Accountant to the chairman of the AICPA Center for Public Company Audit Firms (CPCAF) dated February 7, 2005; http://www.sec.gov/info/accountants/staffletters/cpcaf020705.htm*

until technological feasibility is demonstrated, per ASC 985-20. (See Chapter 25 for a discussion of software developed internally for sale or lease.)

Costs subject to capitalization. Cost capitalization commences when an entity has completed the conceptual formulation, design, and testing of possible project alternatives, including the process of vendor selection for purchased software, if any. These early-phase costs (referred to as "preliminary project stage" in ASC 350-40) are analogous to research and development costs and must be expensed as incurred. These cannot be later restored as assets if the development proves to be successful.

Costs incurred subsequent to the preliminary project stage that meet the criteria under GAAP as long-lived assets are capitalized and amortized over the asset's expected economic life. Capitalization of costs begins when both of two conditions are met. *First,* management having the relevant authority authorizes and commits to funding the project and believes that it is probable that it will be completed and that the resulting software will be used as intended. *Second,* the conceptual formulation, design, and testing of possible software project alternatives (i.e., the preliminary project stage) have all been completed.

Costs capitalized include those of the application development stage of the software development process. These include coding and testing activities and various implementation costs. In particular, the standard notes that such costs are limited to (1) external direct costs of materials and services consumed in developing or obtaining internal-use computer software; (2) payroll and payroll-related costs for employees who are directly associated with and who devote time to the internal-use computer software project to the extent of the time spent directly on the project; and (3) interest cost incurred while developing internal-use computer software, consistent with the provisions of ASC 835-20.

General and administrative costs, overhead costs, and training costs are expensed as incurred. Even though these may be costs which are associated with the internal development or acquisition of software for internal use, under GAAP those costs relate to the period in which they are incurred. The issue of training costs is particularly important, since internal-use computer software purchased from third parties often includes, as part of the purchase price, training for the software (and often fees for routine maintenance as well). Per the standard, when the amount of training or maintenance fees is not specified in the contract, entities are required to allocate the cost among training, maintenance, and amounts representing the capitalizable cost of computer software. Training costs are recognized as expense as incurred. Maintenance fees are recognized as expense ratably over the maintenance period.

ASC 350-40 provides examples of when computer software is acquired or developed for internal use. Some of these are: when modifications are made to software controlling robots acquired for use in the manufacturing process; software is developed for cash management, payroll processing, or accounts payable system purposes; a bank develops an online account status inquiry system for customers to utilize; a travel agency invests in software to give it access to an airline reservation system; a communications provider develops computerized systems to manage customer services such as voice mail; or when a publisher invests in computerized systems to produce a product which is then sold to customers.

On the other hand, software which does not qualify under the standard as being for internal use includes software sold by a robot manufacturer to purchasers of its products; the cost of developing programs for microchips used in automobile electronic systems; software developed for both sale to customers and internal use; computer programs written for use in research and development efforts; and costs of developing software under contract with another entity.

Impairment. Impairment of capitalized internal-use software is recognized and measured in accordance with the provisions of ASC 360 in the same manner as tangible long-

lived assets and other amortizable intangible assets. Circumstances which might suggest that an impairment has occurred and that would trigger a recoverability evaluation include (1) a realization that the internal-use computer software is not expected to provide substantive service potential; (2) a significant change in the extent or manner in which the software is used; (3) a significant change has been made or is being anticipated to the software program; or (4) the costs of developing or modifying the internal-use computer software significantly exceed the amount originally expected. These conditions are analogous to those generically set forth by ASC 360.

In some instances, ongoing software development projects will become troubled before being discontinued. ASC 350-40 provides that management needs to assess the likelihood of successful completion of projects in progress. When it becomes no longer probable that the computer software being developed will be completed and placed in service, the asset should be written down to the lower of the carrying amount or fair value, if any, less costs to sell. Importantly, it is a rebuttable presumption that any uncompleted software has a zero fair value. ASC 350-40 provides indicators that the software is no longer expected to be completed and placed in service. These include (1) a lack of expenditures budgeted or incurred for the project; (2) programming difficulties that cannot be resolved on a timely basis; (3) significant cost overruns; (4) information indicating that the costs of internally developed software will significantly exceed the cost of comparable third-party software or software products, suggesting that management intends to obtain the third-party software instead of completing the internal development effort; (5) the introduction of new technologies which increase the likelihood that management will elect to obtain third-party software instead of completing the internal project, and (6) a lack of profitability of the business segment or unit to which the software relates or actual or potential discontinuation of the segment.

Amortization. As for other long-lived assets, the cost of computer software developed or obtained for internal use should be amortized in a systematic and rational manner over its estimated useful life. The intangible nature of the asset contributes to the difficulty of developing a meaningful estimate, however. Among the factors to be weighed are the effects of obsolescence, new technology, and competition. Management would especially need to consider if rapid changes are occurring in the development of software products, software operating systems, or computer hardware, and whether it intends to replace any technologically obsolete software or hardware.

Amortization commences for each module or component of a software project when the software is ready for its intended use, without regard to whether the software is to be placed in service in planned stages that might extend beyond a single reporting period. The standard stipulates that computer software is deemed ready for its intended use after substantially all testing has been completed.

Other matters. In some cases internal-use software is later sold or licensed to third parties, notwithstanding the original intention of management that the software was acquired or developed solely for internal use. In such cases, ASC 350-40 provides that any proceeds received are to be applied first as a reduction of the carrying amount of the software. No profit is recognized until the aggregate proceeds from sales exceed the carrying amount of the software. After the carrying value is fully recovered, any subsequent proceeds are recognized in revenue as earned.

Example of software developed for internal use

The Da Vinci Invention Company employs researchers based in countries around the world. The far-flung nature of its operations makes it extremely difficult for the payroll staff to collect timesheets, so the management team authorizes the design of an in-house, Web-based timekeeping system. The project team incurs the following costs:

Cost type	*Charged to expense*	*Capitalized*
Concept design	$ 2,500	
Evaluation of design alternatives	3,700	
Determination of required technology	8,100	
Final selection of alternatives	1,400	
Software design		$ 28,000
Software coding		42,000
Quality assurance testing		30,000
Data conversion costs	3,900	
Training	14,000	
Overhead allocation	6,900	
General and administrative costs	11,200	
Ongoing maintenance costs	6,000	
Totals	$57,700	$100,000

Thus, the total capitalized cost of this development project is $100,000. The estimated useful life of the timekeeping system is five years. As soon as all testing is completed, Da Vinci's controller begins amortizing using a monthly charge of $1,666.67. The calculation follows:

$100,000 capitalized cost ÷ 60 months = $1,666.67 amortization charge

Once operational, management elects to construct another module for the system that issues an e-mail reminder for employees to complete their timesheets. This represents significant added functionality, so the design cost can be capitalized. The following costs are incurred:

Labor type	*Labor cost*	*Payroll taxes*	*Benefits*	*Total cost*
Software developers	$11,000	$ 842	$1,870	$13,712
Quality assurance testers	7,000	536	1,190	8,726
Totals	$18,000	$1,378	$3,060	$22,438

The full $22,438 amount of these costs can be capitalized. By the time this additional work is completed, the original system has been in operation for one year, thereby reducing the amortization period for the new module to four years. The calculation of the monthly straight-line amortization follows:

$22,438 capitalized cost ÷ 48 months = $467.46 amortization charge

The Da Vinci management then authorizes the development of an additional module that allows employees to enter time data into the system from their cell phones using text messaging. Despite successfully passing through the concept design stage, the development team cannot resolve interface problems on a timely basis. Management elects to shut down the development project, requiring the charge of all $13,000 of programming and testing costs to expense in the current period.

After the system has been operating for two years, a Da Vinci customer sees the timekeeping system in action and begs management to sell it as a stand-alone product. The customer becomes a distributor, and lands three sales in the first year. From these sales Da Vinci receives revenues of $57,000, and incurs the following related expenses:

Expense type	*Amount*
Distributor commission (25%)	$14,250
Service costs	1,900
Installation costs	4,300
Total	$20,450

Thus, the net proceeds from the software sale is $36,550 ($57,000 revenue less $20,450 related costs). Rather than recording these transactions as revenue and expense, the $36,550 net proceeds are offset against the remaining unamortized balance of the software asset with the following entry:

	Debit	Credit
Revenue	$57,000	
Fixed assets—software		$36,550
Commission expense		14,250
Service expense		1,900
Installation expense		4,300

At this point, the remaining unamortized balance of the timekeeping system is $40,278, which is calculated as follows:

Original capitalized amount	$100,000
+ Additional software module	22,438
– 24 months amortization on original capitalized amount	(40,000)
– 12 months amortization on additional software module	(5,610)
– Net proceeds from software sales	(36,550)
Total unamortized balance	$40,278

Immediately thereafter, Da Vinci's management receives a sales call from an application service provider who manages an Internet-based timekeeping system. The terms offered are so good that the company abandons its in-house system at once and switches to the ASP system. As a result of this change, the company writes off the remaining unamortized balance of its timekeeping system with the following entry:

Accumulated depreciation	45,610	
Loss on asset disposal	40,278	
Fixed assets—software		85,888

Web site development costs. The costs of developing a Web site, including the costs of developing services that are offered to visitors (e.g., chat rooms, search engines, e-mail, calendars, and so forth), are often quite significant. The SEC staff had expressed the opinion that a large portion of those costs should be accounted for in accordance with ASC 350-50, *Web Site Development Cost,* which sets forth certain conditions which must be met before costs may be capitalized.

Per ASC 350-50, costs incurred in the planning stage must be expensed as incurred. The cost of software used to operate a Web site must be accounted for consistent with ASC 350-50, unless a plan exists to market the software externally, in which case ASC 985-20 governs. Costs incurred to develop graphics (broadly defined as the "look and feel" of the Web page) are included in software costs, and thus accounted for under ASC 350-50 or ASC 985-20, as noted in the foregoing. Costs of operating Web sites are accounted for in the same manner as other operating costs analogous to repairs and maintenance.

ASC 350-50-55 includes a detailed exhibit stipulating how a variety of specific costs are to be accounted for consistent with this standard.

Initial recognition and measurement of intangibles assets. Intangibles acquired individually or with a group of other assets[3] are initially recognized and measured based on their fair values. Fair value, consistent with ASC 820, is determined based on the assumptions that market participants would use in pricing the asset. Even if the reporting entity does not intend to use an intangible asset in a manner that is its highest and best use, the intangible is nevertheless measured at its fair value. Although the implementation guidance with respect to initial accounting for an exchange transaction refers to determining the cost of the assets acquired, ASC 845 notes that, generally, cost is measured based on the fair value of the consideration provided or the fair value of the net assets acquired, whichever is more reliably measureable.

The aggregate amount assigned to a group of assets acquired is to be allocated to the individual assets acquired based on their relative fair values. Goodwill is prohibited from being recognized in an asset acquisition.

Although a reporting entity can purchase intangibles that were developed by others, US GAAP continues to maintain a strict prohibition against capitalizing costs of internally developing, maintaining, or restoring intangibles, including goodwill. The only exceptions to this general rule are leasehold improvements, software developed for internal use, and Web site development costs, as discussed previously in this chapter.

---

[3] *See discussion of* ***accounting for assets acquired in a group*** *earlier in this chapter.*

Amortization and impairment considerations. Many intangible assets are based on rights that are conveyed legally by contract, statute, or similar means. For example, governments grant franchises or similar rights to taxi companies, cable companies, and hydroelectric plants; and companies and other private-sector organizations grant franchises to automobile dealers, fast-food outlets, and professional sports teams. Other rights, such as airport landing rights, are granted by contract. Some of those franchises or similar rights are for finite terms, while others are perpetual. Many of those with finite terms are routinely renewed, absent violations of the terms of the agreement, and the costs incurred for renewal are minimal. Many such assets are also exchangeable, and the prices at which they trade reflect expectations of renewal at minimal cost. However, for others, renewal is not assured, and their renewal may entail substantial cost.

Trademarks, service marks, and trade names may be registered with the government for a period of twenty years and are renewable for additional twenty-year periods as long as the trademark, service mark, or trade name is used continuously. (Brand names, often used synonymously with trademarks, are typically not registered and thus the required attribute of control will be absent.) The US government now grants copyrights for the life of the creator plus fifty years. Patents are granted by the government for a period of seventeen years but may be effectively renewed by adding minor modifications that are patented for additional seventeen-year periods. Such assets also are commonly exchangeable.

If no legal, regulatory, contractual, competitive, economic, or other factors limit the useful life of an intangible asset to the reporting entity, the useful life of the asset is considered to be indefinite (which, of course, is not the same as unlimited or infinite).

Identifiable intangible assets having indefinite useful economic lives supported by clearly identifiable cash flows are not subject to regular periodic amortization. Instead, the carrying amount of the intangible is tested for impairment annually, and again between annual tests if events or circumstances warrant such a test. An impairment loss is recognized if the carrying amount exceeds the fair value. Furthermore, amortization of the asset commences when evidence suggests that its useful economic life is no longer deemed indefinite.

Under the ASC 350-30-35-3, the reporting entity is to consider its own historical experience in renewing or extending similar arrangements in determining the assumptions regarding renewal or extension, in particular.

1. The entity's expected use of the asset
2. The expected useful life of another asset or asset group to which the useful life of the intangible asset may be related
3. Any provisions contained in applicable law, regulation, or contract that may limit the useful life
4. The entity's own historical experience in renewing or extending similar arrangements if such experience is consistent with the intended use of the intangible asset by the reporting entity, and irrespective of whether those similar arrangements contained explicit renewal or extension provisions. In the absence of such historical experience, management is to consider the assumptions that market participants would use about the renewal or extension consistent with their highest and best use of the asset, and adjusted for relevant entity-specific factors.
5. The effects of obsolescence, demand, competition, and other economic factors such as
    a. Stability of the industry
    b. Known technological advances,

   c. Legislative action that results in an uncertain or changing regulatory environment, and
   d. Expected changes in distribution channels

6. The level of maintenance expenditures that would be required to obtain the expected future cash flows from the asset.

An income approach is commonly used to measure the fair value of an intangible asset. The period of expected cash flows used to measure fair value of the intangible, adjusted for applicable entity-specific factors, is to be considered by management in determining the useful life of the intangible for amortization purposes.

ASC 350-30-35 provides guidance about when it is appropriate to combine into a single "unit of accounting" for impairment testing purposes, separately recorded indefinite-life intangibles, whether acquired or internally developed.

The assets may be combined into a single unit of accounting for impairment testing if they are operated as a single asset and, as such, are inseparable from one another. The standard provides indicators to use in evaluating the individual facts and circumstances to exercise judgment.

Indicators that indefinite-lived intangibles are to be combined as a single unit of accounting

1. The intangibles will be used together to construct or enhance a single asset.
2. If the intangibles had been part of the same acquisition, they would have been recorded as a single asset.
3. The intangibles, as a group, represent "the highest and best use of the assets" (e.g., they could probably realize a higher sales price if sold together than if they were sold separately). Indicators pointing to this situation are
   a. The unlikelihood that a substantial portion of the assets would be sold separately, or
   b. The fact that, should a substantial portion of the intangibles be sold individually, there would be a significant reduction in the fair value of the remaining assets in the group.
4. The marketing or branding strategy of the entity treats the assets as being complementary (e.g., a trademark and its related trade name, formulas, recipes, and patented or unpatented technology can all be complementary to an entity's brand name).

Indicators that indefinite-lived intangibles are not to be combined as a single unit of accounting

1. Each separate intangible generates independent cash flows.
2. In a sale, it would be likely that the intangibles would be sold separately. If the entity had previously sold similar assets separately, this would constitute evidence that combining the assets would not be appropriate.
3. The entity is either considering or has already adopted a plan to dispose of one or more of the intangibles separately.
4. The intangibles are used exclusively by different asset groups (as defined in the Master Glossary).
5. Differing useful economic lives.

ASC 350-30-35 provides guidance regarding the "unit of accounting" determination.

1. Goodwill and finite-lived intangibles are not permitted to be combined in the "unit of accounting" since they are subject to different impairment rules.
2. If the intangibles collectively constitute a business, they may not be combined into a unit of accounting.
3. If the unit of accounting includes intangibles recorded in the separate financial statements of consolidated subsidiaries, it is possible that the sum of impairment losses recognized in the separate financial statements of the subsidiaries will not equal the consolidated impairment loss.

   NOTE: Although counterintuitive, this situation can occur when

   1. *At the separate subsidiary level, an intangible asset is impaired since the cash flows from the other intangibles included in the unit of accounting that reside in other subsidiaries cannot be considered in determining impairment, and*
   2. *At the consolidated level, when the intangibles are considered as a single unit of accounting, they are not impaired.*

4. Should a unit of accounting be included in a single reporting unit, that same unit of accounting and associated fair value is to be used in computing the implied fair value of goodwill for measuring any goodwill impairment loss.

Identifiable intangible assets, such as franchise rights, customer lists, trademarks, patents and copyrights, and licenses are to be amortized over their expected useful economic life, even if that life exceeds the former forty-year ceiling, with required impairment reviews of their recoverability when necessitated by changes in facts and circumstances in the same manner as set forth in ASC 360 for tangible long-lived assets. ASC 360 also requires consideration of the intangible's residual value (analogous to salvage value for a tangible asset) in determining the amount of the intangible to amortize. Residual value is defined as the value of the intangible to the entity at the end of its (entity-specific) useful life reduced by any estimated disposition costs. The residual value of an amortizable intangible is assumed to be zero unless the intangible will continue to have a useful life to another party after the end of its useful life to its current holder, and one or both of the following criteria are met:

1. The current holder has received a third-party commitment to purchase the intangible at the end of its useful life, *or*
2. A market for the intangible exists and is expected to continue to exist at the end of the asset's useful life as a means of determining the residual value of the intangible by reference to marketplace transactions.

A broadcast license which, while nominally subject to expiration in five years, might be indefinitely renewable at little additional cost to the broadcaster. If cash flows can be projected indefinitely, and assuming a market exists for the license, no amortization is to be recorded until such time as a finite life is predicted. However, impairment is required to be tested at least annually to ensure that the asset is carried at no more than its fair value.

The foregoing examples all addressed identifiable intangibles, which are recognized in the financial statements when purchased separately or in connection with a business combination. There are other intangibles, which are deemed to not be identifiable because they cannot be reliably measured. The Statement uses technological know-how and an assembled workforce as examples of such intangible assets. Intangibles that cannot be separately identified are considered integral components of goodwill.

Goodwill. The Master Glossary provides the following definition of goodwill:

Goodwill is an asset representing the future economic benefits arising from other assets acquired in a business combination that are not individually identified and separately recognized.

Goodwill is generally afforded special accounting treatment because it is neither separately identifiable nor transferable. Goodwill arising from combinations between two or more not-for-profit organizations or in an acquisition of a for-profit enterprise by a not-for-profit organization continues to be outside the scope of ASC 805, while FASB continues work on a separate project currently on its agenda regarding these types of transactions.

Initially, goodwill is recognized in a business combination at the acquisition date, as the excess of 1. over 2. below:

1. The aggregate of
   a. The consideration transferred; generally accounted for at fair value at the acquisition date,
   b. The fair value of any noncontrolling interest in the acquiree, and
   c. If the business combination was achieved in stages (sometimes referred to as step-acquisition), the acquisition-date fair value of the equity interest in the acquiree previously held by the acquirer.
2. The net of the amounts of identifiable assets acquired and liabilities assumed measured at the acquisition date in accordance with ASC 805.

Goodwill is not to be amortized. Goodwill is, however, subject to unique impairment testing techniques. Therefore, ASC 360 is not applied to goodwill and goodwill associated with acquisitions of tangible property and equipment is not tested for impairment in tandem with that property and equipment.

The impairment test for goodwill is performed at the level of the reporting unit. A reporting unit is an operating segment or one level below an operating segment. The diagram in the section of Chapter 2 captioned, *Alternative Balance Sheet Segmentation* illustrates how different groupings in a business can be characterized as reporting units and is accompanied by definitions of reporting units, operating segments, and other organizational groupings. The reporting entity may internally refer to reporting units by such terms as business units, operating units, or divisions. Determination of reporting units is largely dependent on how the business is managed and its structure for reporting and management accountability. The Statement acknowledges that an entity may have only one reporting unit which would, of course, result in the goodwill impairment test being performed at the entity level. This can occur when the entity has acquired a business that it has integrated with its existing business in such a manner that the acquired business is not separately distinguishable as a reporting unit.

On the date an asset is acquired or a liability is assumed, it is to be assigned to a reporting unit if it meets both of the following conditions:

1. The asset will be used in or the liability is related to the operations of a reporting unit
2. The asset or liability will be considered in determining the fair value of the reporting unit

The methodology used is to be reasonable and supportable and is to be applied similarly to how aggregate goodwill is determined in a purchase business combination. Net assets include assets and liabilities that are recognized as "corporate" items if they, in fact, relate to the operations of the reporting unit (e.g., environmental liabilities associated with land owned by a reporting unit, and pension assets and liabilities attributable to employees of a reporting unit). Executory contracts (e.g., operating leases, contracts for purchase or sale, construction contracts) are considered part of net assets only if the amount reflected in the acquirer's financial statements is based on a fair value measurement subsequent to entering

into the contract. To illustrate, if an acquiree had a preexisting operating lease on either favorable or unfavorable terms as compared to its fair value on the date of acquisition, the acquirer would recognize, in its purchase price allocations, an asset or liability for the fair value of the favorable or unfavorable terms, respectively. ASC 350 distinguishes between accounting for this fair value of an otherwise unrecognized executory contract and prepaid rent or rent payable which generally have carrying values that approximate their fair values.

The annual goodwill impairment test may be performed at any time during the fiscal year as long as it is done consistently at the same time each year. Each reporting unit is permitted to establish its own annual testing date. Additional impairment tests are required between annual impairment tests if: (1) warranted by a change in events and circumstances, *and* (2) it is more likely than not that the fair value of the reporting unit is below its carrying amount. If indicators exist requiring impairment testing of goodwill, impairment testing of nonamortizable intangibles, and/or recoverability evaluation of tangible long-lived assets or amortizable intangibles, the other assets are tested/evaluated first and any impairment loss recognized prior to testing goodwill for impairment.

ASC 350 provides examples of events or circumstances that require goodwill of a reporting unit to be tested for impairment between annual tests.

1. A significant adverse change in legal factors or in the business climate
2. An adverse action or assessment by a regulator
3. Unanticipated competition
4. A loss of key personnel
5. An expectation that it is more likely than not that a reporting unit or a significant portion of it will be sold or otherwise disposed of *or* the allocation of a portion of goodwill to a business to be disposed of
6. The necessity of performing an ASC 360 recoverability test of a significant asset group within a reporting unit
7. The recognition of a goodwill impairment loss in the financial statements of a subsidiary that is a component of a reporting unit

Similar to the list of events and circumstances in ASC 360, this list is not intended to be all-inclusive. Other indicators may come to the attention of management that would indicate that goodwill impairment testing be performed between annual tests.

Performing the impairment test. Goodwill is impaired when its implied fair value is less than its carrying amount. The actual determination of whether goodwill is impaired is made as follows:

1. Compare the fair value of the reporting unit as a whole to its carrying value including goodwill. If the reporting unit's fair value exceeds its carrying value, goodwill is not impaired and no further computations are required. If, however, the carrying value of the reporting unit exceeds its fair value, the second step of the impairment test is required.
2. Determine whether and by how much goodwill is impaired as follows:
   a. Estimate the *implied fair value* of goodwill.
   b. Compare the implied fair value of goodwill to its carrying amount.
   c. If the carrying amount of goodwill exceeds its implied value, it is impaired and is written down to the implied fair value.

The implied fair value of goodwill is the excess of the fair value of the reporting unit as a whole, over the fair values that would be assigned to its assets and liabilities in a purchase business combination.

Consistent with long-standing practice in GAAP, upon recognition of an impairment loss, the adjusted carrying amount of goodwill becomes its new cost basis, and future restoration of the written down amount is prohibited.

The *fair value of a reporting unit* is defined in the Master Glossary as the price that would be received to sell the unit as a whole in an orderly transaction between market participants at the measurement date. The determination of the implied fair value of goodwill is based on the assumption that the fair value of a reporting unit as a whole will differ from the fair value of its identifiable net assets. This is the general principle that gives rise to goodwill in the first place. The acquirer assigns additional value to the acquiree (as evidenced by a purchase price that exceeds the collective fair values of the assets and liabilities to be acquired) based on the acquirer's perceived ability to take advantage of synergies and other benefits that flow from its control over the acquiree.

Market capitalization of a publicly traded business unit is computed based on a quoted market price per share that does not consider any advantages that might inure to an acquirer in a situation where control is obtained. For this reason, ASC 350 cautions that the market capitalization of a reporting unit with publicly traded stock may not be representative of its fair value. Presumably, estimating the fair value of a privately held business using earnings multiples derived from publicly traded companies in the same line of business might have the same limitation.

ASC 350 also prescribes that when a significant portion of a reporting unit is comprised of an acquired entity, the same techniques and assumptions used to determine the purchase price of the acquisition are to be used to measure the fair value of the reporting unit unless such techniques and assumptions are not consistent with the objective of measuring fair value.

For the purposes of determining the fair value of a reporting unit, the relevant facts and circumstances are to be carefully evaluated with respect to whether to assume that the reporting unit could be bought or sold in a taxable or nontaxable transaction. The factors to consider in making the evaluation are set forth in ASC 350-20-35.

1. The assumptions that marketplace participants would make in estimating fair value
2. The feasibility of the assumed structure considering
    a. The ability to sell the reporting unit in a nontaxable transaction, and
    b. Any limits on the entity's ability to treat a sale as a nontaxable transaction imposed by income tax laws or regulations, or corporate governance requirements.
3. Whether the assumed structure would yield the best economic after-tax return to the (hypothetical) seller for the reporting unit.

If a reporting unit is not wholly owned by the reporting entity, the fair value of that reporting unit and the implied fair value of goodwill are to be determined in the same manner as prescribed by ASC 805. If the reporting unit includes goodwill that is solely attributable to the parent, any impairment loss would be attributed entirely to the parent. If, however, the reporting unit's goodwill is attributable to both the parent and the noncontrolling interest, the impairment loss would need to be allocated to both the parent and the noncontrolling interest in a rational manner. The same logic applies to gain or loss on disposal of all or a portion of a reporting unit. When that reporting unit is disposed of, the gain or loss on disposal is to be attributed to both the parent and to the noncontrolling interest.

For the purpose of goodwill impairment testing, the carrying value of a reporting unit is to include deferred income taxes irrespective of whether fair value of the reporting unit was determined assuming taxable or nontaxable treatment.

ASC 350 permits the carryforward of a previous determination of the fair value of the reporting unit if *all three* of the following conditions are met:

1. There has been no significant change in the composition of the assets and liabilities of the reporting unit.
2. The previously computed fair value of the reporting unit exceeded its carrying amount by a substantial margin (undefined by the FASB).
3. Based on any events occurring or changes in circumstances since the previous computation, the likelihood is remote that the reporting unit's current value is below its carrying amount.

The *fair value of an asset (or liability)* is the amount at which the asset (or liability) could be sold (transferred) in an orderly transaction between market participants at the measurement date. Quoted market prices in active markets are considered the best evidence of fair value and are to be used if available. If quoted market prices are not available, the estimate of fair value is to be based on the best information available including prices for similar assets and liabilities or the results of applying available valuation techniques. Such techniques include expected present value methods, option pricing models, matrix pricing, option-adjusted spread models, and fundamental analysis. The weight to be given to evidence gathered in the valuation process is to be proportional to the ability to objectively observe it. When an estimate is in the form of a range of either the amount or timing of estimated future cash flows, the likelihood of possible outcomes is to be considered (i.e., probability weightings are assigned in order to estimate the most likely outcome).

The measurement techniques and assumptions used to estimate the fair values of the reporting unit's net assets are to be consistent with those used to measure the fair value of the reporting unit as a whole. For example, estimates of the amounts and timing of cash flows used to value the significant assets of the reporting unit are to be consistent with those assumptions used to estimate such cash flows at the reporting unit level when a cash flow model is used to estimate the reporting unit's fair value as a whole.

For the purpose of computing the implied fair value of reporting unit goodwill, assumptions must be made as to the income tax bases of the reporting unit's assets and liabilities in order to compute any relevant deferred income taxes. If the computation of the reporting unit's fair value in step 1 of the goodwill impairment test assumed that the reporting unit was structured as a taxable transaction, then new income tax bases are used. Otherwise the existing income tax bases are used (ASC 350-20-35).

Example of the impairment test

Spectral Corporation acquires FarSite Binocular Company for $5,300,000; of this amount, $3,700,000 is assigned to a variety of assets, with the remaining $1,600,000 assigned to goodwill, as noted in the following table:

Purchase price	$ 5,300,000
– Accounts receivable	(450,000)
– Inventory	(750,000)
– Production equipment	(1,000,000)
– Acquired formulas and processes	(1,500,000)
= Goodwill	$ 1,600,000

The asset allocation related to acquired formulas and processes is especially critical to the operation, since it refers to the use of a proprietary lens coating system that allows FarSite's binoculars to yield exceptional clarity in low-light conditions. This asset is being depreciated over ten years.

One year after the acquisition date, the FarSite division has recorded annual cash flow of $1,450,000; assuming the same cash flow for the next five years, the present value of the expected cash flows, discounted at the corporate cost of capital of 8%, is roughly $5,789,000. Also, an in-

dependent appraisal firm assigns a fair value of $3,600,000 to FarSite's identifiable assets. With this information, the impairment test follows:

FarSite division's fair value	$5,789,000
– Fair value of identifiable assets	(3,600,000)
= Implied fair value of goodwill	$2,189,000

Though the implied fair value of FarSite's goodwill has increased, Spectral's controller cannot record this increase.

A few months later, Spectral's management learns that a Czech optics company has created a competing optics coating process that is superior to and less expensive than FarSite's process. Since this will likely result in a reduction in FarSite's fair value below its carrying amount, Spectral conducts another impairment test. Management assumes that the forthcoming increase in competition will reduce the expected present value of its cash flows to $3,900,000. In addition, the appraisal firm now reduces its valuation of the acquired formulas and processes asset by $1,200,000. The revised impairment test follows:

FarSite division's fair value	$3,900,000
– Fair value of identifiable assets	(2,400,000)
= Implied fair value of goodwill	1,500,000
– Carrying amount of goodwill	1,600,000
= Impairment loss	$ (100,000)

Since the implied fair value of goodwill is $100,000 less than its current carrying amount, Spectral's controller uses the following entry to record reduction in value:

Impairment loss	100,000	
Goodwill		100,000

In addition, Spectral's controller writes down the value of the acquired formulas and processes by the amount recommended by the appraisal firm with the following entry:

Impairment loss	1,200,000	
Accumulated depreciation		1,200,000

A year later, FarSite's research staff discovers an enhancement to its optical coating process that will restore FarSite's competitive position against the Czech firm. However, Spectral's controller cannot increase the carrying cost of the acquired formulas and processes or goodwill to match their newly increased fair value and implied fair value, respectively.

Negative goodwill—ASC 805. Under ASC 805,[4] management of the acquirer is required to reassess whether it correctly identified all of the assets acquired and liabilities assumed and, if applicable, recognize the additional assets or liabilities identified in that reassessment. In addition, acquirer management is to review the procedures it used to measure the amounts of all of the following items recognized at the acquisition date under ASC 805, if applicable:

1. Identifiable assets acquired and liabilities assumed,
2. Noncontrolling interest in the acquiree,
3. The acquirer's previously held equity interest in the acquiree in a business combination achieved in stages, and
4. The consideration transferred.

The purpose of conducting the review is to ensure that all information available at the acquisition date was properly considered in the measurement process.

After conducting the completeness reassessment and measurement review described above, if an excess still remains, the acquirer is to recognize that excess as a gain on the acquisition date and that gain is not characterized as an extraordinary gain.

---

[4] *To be applied prospectively to business combinations with acquisition dates on or after the beginning of the first annual reporting period beginning on or after December 15, 2008.*

Other goodwill considerations. Other provisions included in ASC 350 include the following:

- Equity method goodwill continues to be recognized under ASC 323 and is not subject to amortization. This goodwill is not tested for impairment under ASC 350, but rather, is tested under ASC 323. This test considers whether the fair value of the underlying investment has declined and whether that decline is "other than temporary."
- Goodwill of a reporting unit that is fully disposed of is included in the carrying amount of the net assets disposed of in computing the gain or loss on disposal.
- If a significant portion of a reporting unit is disposed of, the goodwill of that unit is required to be tested for impairment. In performing the impairment test, only the net assets to be retained after the disposal are included in the computation. If, as a result of the test, the carrying amount of goodwill exceeds its implied fair value, the excess carrying amount is allocated to the carrying amount of the net assets disposed of in computing the gain or loss on disposal and, consequently, is not considered an impairment loss.

In order to provide financial statement users with transparent information about goodwill, separate line item treatment is required as follows:

- **Balance sheet (statement of financial position)**—The aggregate amount of goodwill included in assets is captioned separately from other assets and may not be combined with other intangibles.
- **Income statement**—The aggregate amount of goodwill impairment losses is captioned separately in the operating section unless associated with discontinued operations.

Research and Development Costs

Research and development (R&D) are defined as follows:

1. Research is the planned search or critical investigation aimed at the discovery of new knowledge with the hope that such knowledge will be useful in developing a new product or service or a new process or technique or in bringing about a significant improvement to an existing product or process.
2. Development is the translation of research findings or other knowledge into a plan or design for a new product or process or for a significant improvement to an existing product or process whether intended for sale or use.

There are three ways in which R&D costs are incurred by a business.

1. Purchase of R&D from other entities
2. Conducting R&D for others under a contractual arrangement
3. Conducting R&D activities for the benefit of the reporting entity

The accounting treatment relative to R&D depends upon the nature of the cost. R&D costs incurred in the ordinary course of operations consist of materials, equipment, facilities, personnel, and indirect costs that can be attributed to research or development activities. These costs are expensed in the period in which they are incurred unless they have alternative future uses.

Examples of such R&D costs include

1. Laboratory research to discover new knowledge
2. Formulation and design of product alternatives
    a. Testing for product alternatives
    b. Modification of products or processes

3. Preproduction prototypes and models
    a. Tools, dies, etc. for new technology
    b. Pilot plants not capable of commercial production
4. Engineering activity until the product is ready for manufacture

Examples of costs that are not considered R&D would include

1. Engineering during an early phase of commercial production
2. Quality control for commercial production
3. Troubleshooting during a commercial production breakdown
4. Routine, ongoing efforts to improve products
5. Adaptation of existing capacity for a specific customer or other requirements
6. Seasonal design changes to products
7. Routine design of tools, dies, etc.
8. Design, construction, startup, etc. of equipment except that used solely for R&D

In many cases, entities will pay other parties to perform R&D activities on their behalf. In applying substance over form in evaluating these arrangements, a financial reporting result cannot be obtained indirectly if it would not have been permitted if accomplished directly. Thus, if costs incurred to engage others to perform R&D activities that, in substance, could have been performed by the reporting entity itself, those costs must be expensed as incurred. On the other hand, if the payment is to acquire intangibles for use in R&D activities, and these assets have other uses, then the expenditure is capitalized and accounted for in accordance with ASC 350.

When R&D costs are incurred as a result of contractual arrangements, the nature of the agreement dictates the accounting treatment of the costs involved. The key determinant is the transfer of the risk associated with the R&D expenditures. If the business receives funds from another party to perform R&D and is obligated to repay those funds regardless of the outcome, a liability must be recorded and the R&D costs expensed as incurred. In order to conclude that a liability does not exist, the transfer of the financial risk must be substantive and genuine.

Example of research and development

The TravelBins Corporation is developing a hard-shell plastic ski case on wheels. It assigns two staff to the design of the case, as well as a product design consultant, and also contracts with a Portuguese firm to develop suitable molds for the main case and ancillary parts. The company works its way through 17 product development and production activities before it is satisfied that the new ski case is ready for general distribution. The following matrix shows where costs are charged as various steps are completed:

Step No.	*Activity*	*Charge to R& D expense*	*Charge to production overhead*	*Move to inventory*	*Capitalize*
1	Cost of product design consultant	xxx			
2	Salaries related to design of the ski case	xx			
3	Purchase of design computers and rapid prototyping machines				xxx
4	Allocation of indirect development costs	xxx			
5	Cost of preliminary test molds	xxx			
6	Cost of building in which test facility is housed				xxx
7	Cost of resin pellets acquired for test runs			xxx	
8	Scrapped cases from test runs	xxx			
9	Good-quality cases from test runs			xxx	
10	Cost of independent stress test firm	xxx			
11	Patent filing cost				xxx
12	Cost to defend patent				xxx

Step No.	*Activity*	*Charge to R& D expense*	*Charge to production overhead*	*Move to inventory*	*Capitalize*
13	Cost of final mold				xxx
14	Machine set-up time		xxx		
15	Quality control during commercial production		xxx		
16	Routine mold adjustments		xxx		
17	Production engineering to reduce scrap rate		xxx		

The cost of design computers and building are capitalized, since they can be used independently from the product development process. The cost of the final mold is capitalized and amortized over the life of the mold, while patent costs are capitalized and amortized over the life of the product (which may extend past the life of the first mold). The cost of the plastic resin and good-quality ski cases can be transferred to inventory for use in regular production and for sale to customers, respectively.

Research and Development Costs—ASC 805

Intangible assets acquired in a business combination that are used in research and development activities are to be recognized as indefinite-lived intangibles until the associated research and development efforts are either completed or abandoned. This treatment is afforded R&D assets irrespective of whether they are considered to have an alternative future use.

While these assets are considered to have an indefinite life, they are not to be amortized but, rather, are to be tested for impairment annually, or more frequently if events or changes in circumstances indicate the assets might be impaired. Upon completion or abandonment of the R&D efforts, management is to determine the remaining useful life of the assets and commence amortization in accordance with the guidance in ASC 350.

Temporarily idling of R&D assets is treated consistently with other temporarily idled assets; that is, they are not to be accounted for as abandoned.

In order to operationalize these changes, ASC 805 provides a scope exception for tangible and intangible R&D assets acquired in a business combination. The standard provides the following accounting rules for R&D assets after their initial recognition, based on whether they are tangible or intangible:

1. Tangible assets acquired in a business combination that are used in R&D activities are to be accounted for in accordance with their nature,
2. Intangible assets acquired in a business combination that are used in R&D activities are accounted for in accordance with ASC 350.

Nonrefundable advance payments related to future R&D activities. Entities conducting R&D activities may make payments in advance for goods or services to be used in R&D activities. Often, these payment arrangements involve a specific R&D project and the R&D activities to be performed generally have no alternative future use at the time the arrangements are entered into. All or a portion of the advance payment may be nonrefundable to the entity conducting the R&D activities. For example, if the R&D project does not advance to a stage where the goods or services that were paid for in advance are necessary, the entity conducting the R&D activities will not recover its advance payments.

Nonrefundable advance payments are to be deferred and capitalized. As the related goods are delivered and services performed, the capitalized amounts are to be recognized as expense. On a continuous basis, management is to evaluate whether it expects the goods to be delivered or services rendered and to charge the capitalized advance payments to expense when there no longer is an expectation of future benefits.

This is limited to nonrefundable advance payments for goods to be used or services to be rendered in future R&D activities pursuant to an executory contractual arrangement where the goods or services have no alternative future use.

Sponsored research and development activities. ASC 810-30-55 discusses the accounting for a transaction in which a sponsor creates a wholly owned subsidiary with cash and rights to certain technology originally developed by the sponsor, and receives from the newly created subsidiary two classes of stock. The sponsor then distributes one of the classes of stock (e.g., Class A) to its stockholders. This class of stock has voting rights. Under a purchase option, the sponsor has the right, for a specified period of time, to repurchase all the Class A stock distributed to the stockholders for an exercise price approximating the fair value of the Class A shares. The class retained by the sponsor (e.g., Class B) conveys essentially no financial interest to the sponsor and has no voting rights other than certain blocking rights. The certificate of incorporation prohibits the subsidiary from changing its capital structure, from selling any significant portion of its assets, and from liquidating or merging during the term when the purchase option is outstanding.

The sponsor and the subsidiary enter into a development contract that requires the subsidiary to spend all the cash contributed by the sponsor for research and development activities mutually agreed upon with the sponsor. The subsidiary has no employees other than its CEO. The subsidiary contracts with the sponsor to perform, on behalf of the sponsor, all of the research and development activities under the development contract.

The sponsor accounts for the research and development contract as follows:

- The sponsor reclassifies the cash contributed to the subsidiary as restricted cash when the Class A shares are distributed to its stockholders.
- The distribution of the Class A shares by the sponsor to its stockholders is accounted for as a dividend based on the fair value of the shares distributed.
- In the financial statements of the sponsor, the Class A shares are presented similar to a minority interest.
- The sponsor recognizes research and development expense as the research and development activities are conducted.
- The research and development expense recognized by the sponsor is not allocated to the Class A shares in determining net income or in calculating earnings per share.
- If the Class A purchase option is exercised, the sponsor accounts for the purchase as the acquisition of a minority interest.
- If the Class A purchase option is not exercised by its expiration date, the sponsor reclassifies the Class A stock to additional paid-in capital as an adjustment of the original dividend.

The effect of the above guidance is quite similar to what would be achieved by consolidating the subsidiary. The consolidation of many special-purpose entities used in R & D arrangements is discussed and illustrated at length in Chapter 13.

PERSPECTIVE AND ISSUES

The appropriate accounting for noncurrent (or long-term) investments in equity and debt securities is normally dependent upon the degree of marketability (liquidity) of the investment, management's intentions regarding the holding period, and (in the case of equity investments only) the investor's ownership percentage.

For "passive" investments in marketable equity securities, generally defined as those circumstances where the investor holds less than a 20% interest in the investee, ASC 320, *Investments—Debt and Equity Securities*, requires that the investment be reported at fair value. Such equity investments must be classified at the acquisition date as being held for trading purposes or as being "available-for-sale." While fair value (what was historically referred to as "mark-to-market" or "fair market value") accounting is prescribed in either case, only for trading securities will the change in fair value be reflected on the income statement in the current period. For investments in equity securities that are classified as "available-for-sale," unrealized gains and losses are classified in an equity account referred to as accumulated other comprehensive income, after being reported as a component of other comprehensive income per ASC 220, *Receivables—Comprehensive Income*. If however, there is a decline in fair value of the "available-for-sale" securities that is considered "other-than-temporary," this adjustment is charged to net income in the current period.

A special situation arises when an entity acquires loans that had been originated by another entity, and an intervening decline occurs in the obligor's creditworthiness. Under ASC 310-30, *Receivables—Loans and Debt Securities Acquired with Deteriorated Credit Quality,* the accounting for these acquired loans—which may be either loans receivable or debt securities—will be based on the expected future cash flows to be received, rather than on the nominal or contractual amounts of the obligations. The acquirees of these loans will often be financial institutions, but the requirements of ASC 310-30 are equally applicable to all entities, including not-for-profit organizations that invest in loans or debt securities.

When an investor has significant influence over an investee, the investor is no longer considered to be a passive investor, and the equity method must be used to account for the investment. Generally, significant influence is deemed to exist when the investor owns between 20 to 50% of the investee's voting shares, although ASC 323, *Investments—Equity Method and Joint Ventures,* contemplates circumstances where such influence is present with under 20% ownership, or conversely is absent with holdings of 20% or greater. Over 50% is a strong indicator of control, and full consolidation of the investee's financial statements is mandatory unless the investor lacks control. The equity method involves increasing the

original cost of the investment by the investor's pro rata share of the investee's net income, and decreasing it for the investor's share of the investee's net losses and for dividends paid.

Equity method accounting has been referred to as "one-line consolidation," because the net result of applying ASC 323 on reported net income and on net worth should be identical to what would have occurred had full consolidation been applied. Thus, to the extent that the cost of acquiring the investment exceeds the fair value of the investor's share of the investee's underlying net assets, the excess must be accounted for in a manner analogous to the accounting prescribed for goodwill. Therefore, ASC 350, *Intangibles–Goodwill and Other,* impacts the application of the equity method of accounting because the portion of the purchase cost identified as representing goodwill is not subject to amortization.

This chapter also discusses the accounting for investments in marketable equity securities with readily determinable fair values and in debt securities as prescribed by ASC 320. Under ASC 320, fair value-based reporting was embraced to a greater extent than previously, although the use of the accumulated other comprehensive income account did postpone income statement recognition of some of these changes in value, resulting in a smoothing effect on net income. Debt securities for which the reporting entity's management has both the intent and ability to hold to maturity are accounted for under ASC 320 at their amortized historical cost; and while unrealized gains and losses on these investments are excluded from reported net income, they are subject to more disclosure in the financial statements than had been the case in the past. Problematic in adhering to the model prescribed by ASC 320 and the related interpretive literature is the determination of whether a given decline in value is temporary or "other than temporary" in nature, an issue which for available-for-sale and held-to-maturity investments results in substantially differing financial reporting consequences.

The advent of ASC 825-10-25, *Financial Instruments—Fair Value Option,* may make these operational difficulties moot should management avail itself of elections available under that standard to measure certain specified financial assets and liabilities at fair value with changes in fair value recognized currently in net income. ASC 825-10-25, when effective (or adopted early) will give management unprecedented flexibility in electing to measure eligible financial assets and financial liabilities at fair value on a contract-by-contract basis. Comprehensive coverage of this important pronouncement along with ASC 820, *Fair Value Measurements and Disclosures,* is provided in Chapter 6.

ASC 320 applies to most industries except those for which fair value reporting is strictly required, such as brokers and dealers in securities, investment companies, and employee benefit plans. Furthermore, ASC 320 does not apply to not-for-profits, the accounting for which is governed by the provisions of ASC 958-320, *Not-for-Profit Entities Investments—Debt and Equity Securities,* which prescribes fair value reporting for all categories of investments, including debt instruments that are being held to maturity. The graphic below summarizes the distinctions for financial reporting purposes of varying levels of ownership in and/or control of an investee entity.

Equity Investments

Percentage of voting ownership

Presumed level of economic influence

Minor	Little or no influence	Significant Influence	Voting Control

Valuation basis used in investor balance sheet when investor does not control investee

Cost method (ASC 323) or fair value election (ASC 825-10-25)	Equity method (ASC 323) or fair value election (ASC 825-10-25)

Consolidated balance sheet presentation

Voting interest entities

Cost method (ASC 323) or optional fair value election (ASC 825-10-25)	Equity method (ASC 323) or optional fair value election (ASC 825-10-25)	Consolidation (ASC 810) *Investor is presumed to control subsidiary and is thus considered its parent*

Variable interest entities ASC 810

Consolidation (ASC 810) *Primary beneficiary is considered parent and VIE is considered subsidiary*

DEFINITIONS OF TERMS

Analogous entity. An enterprise, such as certain limited liability companies, that has governance provisions that are functionally equivalent to those of a corporation.

Available-for-sale securities. Investments (debt or equity) that are classifiable neither as held-to-maturity nor as trading.

Collaborative arrangement. A contractual agreement between two or more parties to conduct specified joint operating activities in which the parties are active participants that are exposed to risks and entitled to rewards based on the commercial success of the activities. The activities that are the subject of the arrangement (referred to as "endeavors") are not primarily conducted through a separate legal entity created for that purpose.

Corporate joint venture. A corporation formed, owned, and operated by two or more businesses (venturers) as a separate and discrete business or project (venture) for their mutual benefit.

Cost method. A method of accounting for an investment whereby the investor recognizes only dividends received from the investee as income.

Differential. The difference between the carrying value of a common stock investment and the book value of the underlying net assets of the investee.

Equity method. An accounting method used by an investor that obtains significant influence but does not possess control of the investee. Application of the equity method includes recognition of the investor's proportionate share of the investee's net income or loss, dividends, and any changes in the investment percentage in the investee by the investor.

Equity method goodwill. The excess of the cost of the acquired interest in an investee over the sum of the amounts assigned to the investee's identifiable net assets.

Held-to-maturity securities. Investments in debt securities that the entity has both the ability and the intent to hold to maturity.

Investee. An enterprise that issued voting stock that is held by an investor.

Investee capital transaction. The purchase or sale by the investee of its own common shares, which alters the investor's ownership interest and is accounted for by the investor as if the investee were a consolidated subsidiary.

Investor. A business enterprise that holds an investment in voting stock of another enterprise.

Joint venture. A legal entity owned and operated by two or more businesses referred to as the venturers organized for the purpose of a separate business activity or project that mutually benefits the venturers.

Life settlement contract. A contract between the owner of a life insurance policy and a third-party investor where (1) the investor does not have an insurable interest in the life of the insured, (2) the investor conveys consideration to the policy owner in an amount that exceeds the policy's cash surrender value, and (3) upon the death of the insured, the face value of the policy is paid to the investor.

Other comprehensive income. Revenues, expenses, gains and losses that under generally accepted accounting principles are included in comprehensive income but excluded from net income.

Protective rights. Rights granted by contract or law that entitle a minority owner to veto or block certain actions of the majority owner. In the context of ASC 810-10-25, all rights that vest with a minority owner are considered protective in nature; however, if the protective rights are not also considered to be "substantive participation rights" (see definition below), then the existence of protective rights will not overcome the presumption that the holder of the majority voting interest controls the entity. Examples of protective rights

that are not also considered substantive participating rights include but are not limited to the minority interest holder having the ability to block the following actions by the majority interest holder:

1. Amendments to the investee's articles of incorporation or LLC articles of organization
2. Pricing on transactions between the majority voting interest holder and the investee and other related party transactions
3. Liquidation of the investee or a decision to enter the investee into bankruptcy or other receivership
4. Acquisitions and dispositions of assets not expected to occur in the ordinary course of business
5. Issuance or repurchase of equity interests

Significant influence. The ability of the investor to affect the financial or operating policies of the investee; it is presumed to exist when there is at least 20% voting common stock ownership by the investor.

Substantive kick-out rights. Limited partners' ability dissolve (liquidate) a limited partnership or otherwise remove the general partners. To be considered substantive, kick-out rights must meet *both* the following criteria:

1. The kick-out rights can be exercised by a single limited partner or a vote of a simple majority (or lower percentage)[1] of the limited partners, voting interests held by parties
   a. Other than the general partners,
   b. Entities under common control with the general partners, or
   c. A general partner and other parties acting on behalf of the general partners or a general partner.
2. The limited partners who hold the kick-out rights are not limited from exercising those rights by any significant barriers including, but not limited to
   a. The kick-out rights are subject to conditions making it unlikely that they will be exercisable (e.g., conditions that narrowly limit the timing of the exercise).
   b. Financial penalties or operational barriers associated with dissolving (liquidating) the limited partnership or replacing the general partners that would act as a significant disincentive for dissolution (liquidation) or removal.
   c. The absence of an adequate number of qualified replacement general partners or the inadequacy of the compensation for the purpose of attracting a qualified replacement.
   d. The absence of an explicit, reasonable mechanism in the limited partnership agreement or in the applicable laws and regulations, by which the limited partners holding the rights can call for and conduct a vote to exercise their rights.
   e. The inability of the limited partners holding the rights to obtain the information necessary to exercise them.

Substantive participating rights. Substantive participating rights are legal or contractual provisions that provide partners, individually or in the aggregate, with effective involvement in significant partnership financial and operating decisions expected to be made in

[1] *The examples of the voting tests that operationalize this requirement are set forth in ASC 810-20-25.*

the ordinary course of conducting the partnership's business.[2,3] When the owners of a corporation or analogous entity with minority voting rights possess substantive participating rights, the minority owners will be considered to have overcome the presumption that the owner of the majority of the voting rights controls the investee entity.

In ASC 810-10-25, there are two examples (not considered to be all-inclusive) of minority rights to effectively participate in corporate actions that are both protective rights and substantive participating rights:

1. Selecting, terminating, and setting the compensation of management responsible for implementation of the investee's policies and procedures, and
2. Operating and capital decisions of the investee, including budgets, in the ordinary course of business.

Trading securities. Investments (debt or equity) which the entity intends to sell in the near term, and which are usually acquired as part of an established strategy to buy and sell, thereby generating profits based on short-term price movements.

Undistributed investee earnings. The investor's share of investee net income in excess of dividends paid.

CONCEPTS, RULES, AND EXAMPLES

Fair Value Measurements, Disclosures, and Elections

As early as June 1998, FASB stated that "Fair value is the most relevant measure for financial instruments and the only relevant measure for derivative instruments" (now codified as ASC 815-10-10-1). FASB's work in this area since that time has largely focused on removing the technical barriers and incrementally converging with international standards.

It has since issued ASC 820, *Fair Value Measurements and Disclosures,* and ASC 825-10-25, *Financial Instruments—The Fair Value Option.* ASC 820 furthered the cause of fair value by establishing a single definition to replace the disparate definitions that had previously existed throughout GAAP and providing a framework for informing financial statement readers about the source and level of subjectivity (or observability) of the inputs used in the measurement process.

ASC 825-10-25 provides management with unprecedented flexibility in electing, on a contract-by-contract basis, to use fair value to measure specified financial assets *and liabilities* in the financial statements of the reporting entity with the effects of changes in fair value being recognized currently in net income (or other performance indicator, as applicable).

Not surprisingly, both standards contain substantial additional disclosure requirements to inform financial statement readers of a myriad of details, to enable assessment of the extent and manner to which fair value measurements are used throughout the financial statements.

In March 2008, FASB issued ASC 815-10-50, *Derivatives and Hedging–Disclosure,* to require extensive new disclosures regarding how and why the reporting entity uses derivative instruments; how those instruments and any related hedged items are accounted for; and how they affect financial position, financial performance, and cash flows.

Chapter 6 provides comprehensive coverage of the important topic of fair value. It is recommended that readers/researchers refer to Chapter 6 in tandem with this chapter (and

---

[2] *The concept of participating rights is not the same as "protective rights." To some extent, all rights possessed by partners, including participating rights, are protective in nature. However, some rights are protective of the partners' interests while not entitling the partners to participate in routine decision making.*

[3] *The ordinary course of business excludes self-dealing transactions with the other partners.*

with respect to other financial instruments covered in Chapter 8) to better understand the interplay between these standards and other applicable authoritative literature.

Equity Securities

The accounting for investments in equity securities has been debated for many years. Historical cost had traditionally been prescribed for investments where the investor did not exercise control (i.e., had no more than a 50% voting interest). The threshold for the use of historical cost was later reduced to only those circumstances where significant influence was not a factor, presumptively defined as under a 20% voting interest. The equity method, promulgated by ASC 323, is the prescribed method of accounting for investments where significant influence over investee actions is held by the investor.

The trend in recent accounting thought favors a market (or fair) value approach. There are many reasons why users of financial statements as well as standard setters (including the SEC) have increasingly focused on the fair value approach, including the enhanced availability of fair value information, and the concern that adherence to the historical cost model provided management and investors with less relevant decision information, which may have contributed to business failures, particularly those of financial institutions.

ASC 320 is applicable to almost all reporting entities, except those whose specialized accounting practice has already been to account for all investments at fair value. ASC 320 is also inapplicable to not-for-profit enterprises, although a separate standard, ASC 958-320, requires not-for-profits to account for all investments in debt and equity securities at fair value, with the changes in value taken into reported changes in net assets currently. All marketable equity securities (except those accounted for by the equity method, discussed later in this chapter) are to be classified at acquisition as being either for trading purposes or as available-for-sale. Trading securities are those that are acquired with the intention of being sold in the near term with the general objective of realizing profits from short-term price movements. While a time criterion is not established, a persistent practice of active and frequent trading would be suggestive of the fact that new acquisitions of marketable equity securities are intended to be traded. If management does not commit to an intention to trade, and it cannot be demonstrated that the securities are being held for trading, the investments are to be categorized as available-for-sale.

The distinction between these classifications is important. While equity securities in either category are reported at fair value, it is only the changes in value for the trading securities that are recognized in net income of the current period. Thus, holding gains and losses are accounted for as if realized, in the case of trading securities. In contrast, changes in value for securities held in the available-for-sale portfolio are not recognized in net income of the period in which they occur. The only exceptions will be for entities for which specialized industry accounting practices have long prescribed a pure mark-to-market approach, with all changes in fair value reflected in current income. These industries include securities broker-dealers, employee benefit plans, and investment companies.

Under ASC 320, fair value of an equity security is considered to be determinable if it is quoted in an organized trading exchange or, generally, in over-the-counter trading. Restricted stock is, by definition, not traded and hence fair values are not readily determinable, but stock that is subject to "Rule 144" or similar restrictions, which are due to expire within one year, is not deemed to be restricted for purposes of applying ASC 320. Stock traded only on foreign exchanges is included in the definition if the markets are comparable in breadth and scope to those in the US. Fair values for investments in mutual funds are generally considered to be determinable.

For available-for-sale equity securities, balance sheet presentation is identical to that for trading securities—current fair value. However, unless there has been a permanent impairment in the value of those securities, the change in fair value is excluded from current net income. Instead, the change in value is reported as a separate component of stockholders' equity captioned "accumulated other comprehensive income," with the current period's change being included in other comprehensive income.

ASC 320 imposed this mode of reporting changes in the fair value of available-for-sale equity securities because of the expectation that most investments intended to be held for an indeterminate period will experience predominantly temporary fluctuations that, over time, may tend to largely offset. Thus, the belief was that interim fluctuations in value would not necessarily be indicative of the long-term economic impact from holding the investments, and accordingly, including these changes currently in net income could be misleading.

While others have argued that the goal of periodic financial reporting should be to report the economic events of the period being presented, without concealing or "smoothing" the results, FASB ultimately agreed with those who favored the longer-term view. Notwithstanding substantial sentiment in favor of adopting a pure fair value approach, with gains and losses on all financial instruments being reported in current period net income, FASB's deliberations resulted in a standard that preserved many attributes of traditional historical cost concepts; the subsequent adoption of ASC 220, requiring the display of comprehensive income, somewhat ameliorated the potentially misleading implications of omitting these changes from net income. However, making the determination of the accounting for certain transactions dependent upon management intent, rather than on objectively verifiable circumstances, remains a concern for the accounting profession, as well as posing a challenge for auditors.

While this argument was persuasive when ASC 320 was issued, it has largely fallen out of favor with users of financial statements who increasingly, although not universally, favor the transparency of full fair value accounting for financial instruments, with all changes in fair value reflected currently in net income.

Example of accounting for investments in equity securities

Assume that Ralph Corporation purchases the following equity securities for investment purposes during 2009:

Security description	*Acquisition cost*	*Value at year-end*
1,000 sh. Bell Steel common	$ 34,500	$ 37,000
2,000 sh. Whammer pfd. "A"	125,000	109,500
1,000 sh. Hilltopper common	74,250	88,750

Assume that, at the respective dates of acquisition, management of Ralph Corporation designated the Bell Steel and Hilltopper investments as being for trading purposes, while the Whammer shares were designated as having been purchased for long term investment purposes. Accordingly, the entries to record the purchases were as follows:

Investment in equity securities—held-for-trading	108,750	
Cash		108,750
Investment in equity securities—available-for-sale	125,000	
Cash		125,000

At year-end, both portfolios are adjusted to fair value; the decline in Whammer preferred stock, series A, is judged to be a temporary market fluctuation rather than a permanent decline. The entries to adjust the investment accounts at December 31, 2009, are

Investment in equity securities—held-for-trading	17,000	
Gain on holding equity securities		17,000
Unrealized loss on securities—available-for-sale (other comprehensive income)	15,500	
Investment in equity securities—available-for-sale		15,500

Thus, the change in value of the portfolio of trading securities is recognized currently in net income, whereas the change in the value of the available-for-sale securities is reflected directly in a component of stockholders' equity captioned "accumulated other comprehensive income," after being reported in other comprehensive income.

Transfers between Available-for-Sale and Trading Categories

A major reason for the development of ASC 320 was the concern that under the prior rules there had been too many instances where management had been able to deliberately affect reported net income by careful selection of portfolio securities to be sold in a given period. The practice, typically known as "gains trading," was widely blamed for misleading financial reporting, primarily by financial institutions (which generally hold much more substantial investment portfolios than do industrial enterprises). In a gains trading situation, reporting entities seeking additional net income would sell securities from the nontrading portfolio having low carrying values versus current market values; since these had not previously been marked-to-market, the gain would be reported in current income. In a variation on this process, securities held in a trading account, but suffering declining value, would be transferred to a nontrading portfolio, thus averting a charge against net income.

ASC 320 was intended to curtail the abuses described above. However, by basing accounting on management's expression of its intent, ASC 320 failed to fully preclude such abuses, apart from imposing more stringent limitations on transfers among classifications and prohibiting the use of the "held-to-maturity" classification once it has been "tainted" by sales out of that portfolio.

Under ASC 320, transfers from one of the three portfolio classifications to any other are expected to be very uncommon. Thus, securities purchased for the trading portfolio would be so classified because it was management's intent to seek advantage in short-term price movements; the fact that management does not in fact dispose of those investments quickly would not necessarily mean that the original categorization was improper or that an expressed changed intent should be honored by an accounting entry. While transfers out of the trading category are not completely prohibited, these would have to be supported by facts and circumstances making the assertion of changed intent highly credible.

Transfers among portfolios are accounted for at fair value as of the date of the transfer. Generally, investments in the trading category transferred to the available-for-sale category warrant no further recognition of gain or loss, as the investments have already been marked to market. The only exception is that, if the investment accounts, as a practical matter, have not been updated for fair values since the latest balance sheet date, any changes since that time will need to be recognized at the date the transfer occurs. The fair value at the date of transfer becomes the new "cost" of the equity security in the available-for-sale portfolio.

Example of a transfer between trading and available-for-sale portfolios

Ralph Corporation's investment in Hilltopper common stock was assigned to the trading portfolio and at December 31, 2009, was marked to its fair value of $88,750. Assume that in April 2010 management now determines that this investment will not be traded, but rather will continue to be held indefinitely. Under the criterion established by ASC 320, this investment now belongs in the available-for-sale portfolio. Assume also that the fair value at the date this decision is made is $92,000, and that no book adjustments have been made since the one that recognized the value increase to $88,750. The entry to record the transfer from the trading to the available-for-sale portfolio is

Investment in equity securities—available-for-sale	92,000	
Investment in equity securities—held-for-trading		88,750
Gain on holding equity securities		3,250

Unrealized gains and losses on trading securities are always recognized in income, and in this example the additional increase in fair value since the last "mark-to-market" adjustment, $3,250, is recognized at the time of the transfer to the available-for-sale portfolio. Further gains after this date, however, will not be recognized in net income, but rather will be included in other comprehensive income per ASC 220.

For securities being transferred into the trading category, any unrealized gain or loss (recorded in the accumulated other comprehensive income account, as illustrated above) is deemed to be realized at the date of the transfer. Also, any fair value changes since the date of the most recent balance sheet may need to be recognized at this time.

Example of a transfer between available-for-sale and trading portfolios

The investment in Whammer preferred stock was held in the available-for-sale portfolio and in March 2010 was adjusted to a fair value of $112,000 (as illustrated above). The increase from adjusted cost ($109,500, after a permanent impairment in value had been recognized) was reflected in other comprehensive income, rather than in net income, given that the security was not at the time being held for trading. Now assume that, in June 2010, a decision is made to try to sell the investment in the short term. This means that the holding of Whammer stock will be treated as being in the trading portfolio. Further, the value of the shares held at the date of this decision is $114,700. The entry to record the transfer from available-for-sale to trading and the "realization" of the increased value at that date is as follows:

Investment in equity securities—held-for-trading	114,700	
Unrealized gain on securities—available-for-sale (other comprehensive income)		2,500
Investment in equity securities—available-for-sale	112,000	
Gain on holding equity securities (an income statement account)		5,200

The recognized gain at the time of transfer, in this case, is the sum of the previously unrecognized gain that had been recorded in the additional equity account ($2,500) plus the further gain not yet given any recognition in the investor's financial statements ($2,700). Note that the elimination of the additional equity representing the previously reported unrealized gain will be included in comprehensive income in the current period as a debit, since the additional equity account is being reversed at this time. On the other hand, had there been a decline since the date of the last balance sheet, the gain to be recognized at the date of this transfer would have been the net of the previous, unrecognized gain, and the later loss; if the loss exceeded the earlier gain, a net loss would be recognized at this point. Any further gains or losses after the transfer to the trading portfolio will be handled as earlier described (i.e., recognized in income currently).

Presentation of Investments in Equity Securities

Investments in equity securities that are held for trading are presented as current assets in classified balance sheets. Investments that are available for sale may be either current or noncurrent, depending upon the reporting entity's intentions. For purposes of reporting in the statement of cash flows, all purchases and sales of trading securities must be included in the operations section, while those of available-for-sale investments are to be shown as part of investing activities.

ASC 320 requires specific disclosures of the components of a reporting entity's portfolios of investments. For available-for-sale securities, a classification by type of security is necessary: equity securities will be grouped together in this disclosure, and thus distinguished from debt securities. Furthermore, aggregate fair values, gross unrealized holding gains and gross unrealized holding losses are also to be disclosed as of the date of each balance sheet being presented.

For each income statement presented, proceeds from the sales of available-for-sale securities and gross realized gains and losses must be disclosed. Further, the basis upon which the gains or losses were determined (e.g., average cost, specific identification, etc.) must be disclosed. In addition, the notes must identify gross gains or losses included in net income

resulting from transfers of securities from the available-for-sale to the trading portfolio, and the net change in unrealized gains or losses recognized by an adjustment of the accumulated other comprehensive income account.

Fair Value Considerations

Changes in fair value after the balance sheet date. Under GAAP, events occurring after the balance sheet date are generally not reflected in the balance sheet. However, disclosure may be necessary if, absent that information, the user of the financial statements would be misled. While not addressed explicitly by ASC 320, presumably material changes in fair value occurring subsequent to the date of the balance sheet but prior to issuance of the financial statements should be disclosed.

Sometimes changes in value can be indicative of the underlying cause of the price fluctuations. Of most interest here would be declines in value of available-for-sale securities held at the balance sheet date which suggest that an "other than temporary" impairment has occurred. If the decline actually occurred after year-end as evidenced by a bankruptcy filing, then the event would be disclosed but not reflected in the year-end balance sheet. However, in some instances, the subsequent decline would be seen as a "confirming event" which provided evidence that the classification or other treatment of an item on the balance sheet was incorrect. Thus, if a decline in the fair value of available-for-sale securities at the balance sheet date had been accounted for as temporary (and hence reported in other comprehensive income) a further decline after the balance sheet date might suggest that the decline as of the balance sheet date had, in fact, been a permanent impairment. Note that any further value decline after year-end would not be recorded in the financial statements; the only question to be addressed is whether the decline that occurred prior to year-end should have been treated as a permanent impairment rather than as a temporary market fluctuation.

If it is clear that the impairment at year-end had, in fact, been other than temporary in nature, then the financial statements are to be adjusted to reflect this loss in net income. Absent sufficient basis to reach this conclusion, the appropriate course of action is to not adjust the statements, but merely to disclose the (material) change in fair value that occurred subsequent to year-end including, if appropriate, a statement to the effect that the later decline was deemed to be an other-than-temporary impairment, and will be reflected in the net income of the next year's financial statements. It should also be made clear that the decline occurring prior to year-end was not considered to be an other-than-temporary impairment at that time.

The FASB staff noted that when an entity has decided to sell a security classified as available-for-sale having a fair value less than cost at year-end, and it does not reasonably expect a recovery in value before the sale is to occur, then a write-down for an other than temporary decline is prescribed. This would most obviously be necessary if the actual sales transaction, anticipated at year-end, occurs prior to the issuance of the financial statements.

Deferred income tax effects of changes in the fair value of debt and marketable equity securities. Unrealized gains or losses on holdings of marketable securities are not recognized for income tax purposes until realized through a sale. Thus, the gains or losses that are included in the financial statements (either in the income statement or in other comprehensive income) are temporary differences as defined by the Master Glossary. Under the Glossary, the income tax effects of all temporary differences are recognized in the financial statements as deferred income tax assets or deferred income tax liabilities, with an additional requirement that an allowance be provided for deferred income tax assets that are "more likely than not" not going to be realized. Accordingly, adjustments to the carrying value of debt or equity investments included in either the trading or available-for-sale portfolios for changes in fair value will give rise to deferred income taxes, as will any recognition of "other-than-temporary" declines in the value of debt securities being held to maturity.

For gains or losses recognized in connection with holdings of investments classified as trading, since the fair value changes are recognized in net income currently, the deferred income tax effects of those changes will also be presented in the income statement.

Example of deferred income taxes on investments in debt and marketable equity securities

Odessa Corp. purchased Zeta Company bonds for the purpose of short-term speculation, at a cost of $100,000. At year-end, the bonds had a fair value of $75,000. Odessa has a 40% effective income tax rate. The entries to record the fair value adjustment and the related income tax effect are

Loss on holding of trading securities	25,000	
Investment in debt securities—trading portfolios		25,000
Deferred income tax benefit	10,000	
Provision for income taxes		10,000

On the other hand, if the investment in Zeta Company bonds had been classified (at the date of acquisition, or subsequently if the intentions had been revised) as available-for-sale, the adjustment to fair value would have been reported in other comprehensive income, and not included in net income. Accordingly, the income tax effect of the adjustment would also have been included in other comprehensive income. The entries would have been as follows:

Unrealized loss on securities—available-for-sale	25,000	
Investment in debt securities—available-for-sale (other comprehensive income)		25,000
Deferred income tax benefit	10,000	
Unrealized loss on securities—available-for-sale (other comprehensive income)		10,000

Finally, if the investment in Zeta Company bonds had been made with the intention and ability to hold to maturity, recognition of the decline in value would have depended upon whether it was judged to be temporary or other than temporary in nature. If the former, no recognition would be given to the decline, and hence there would be no deferred income tax effect either. If deemed to be other than temporary, the investment would need to be written down, with the loss included in net income. Accordingly, the income tax effect would also be reported in the income statement. The entries would be as follows:

Loss on decline of securities—held-to-maturity	25,000	
Investment in debt securities—held-to-maturity		25,000
Deferred income tax benefit	10,000	
Provision for income taxes		10,000

An other-than-temporary decline in value in securities available for sale would also have been recognized in net income (not merely in other comprehensive income), and accordingly the income tax effect of that loss would have been reported in net income.

As with all other transactions or events giving rise to deferred income tax assets, an evaluation must be made as to whether the entity would be "more likely than not" to ultimately realize the income tax benefit so recorded. To the extent that it was concluded that some or all of the deferred income tax asset would not be realized, an allowance would be recorded, with the offset being either to the current income tax provision (if the income tax effect of the timing difference was reported in net income) or to other comprehensive income (if the income tax effect had been reported there).

Deferred income taxes will also be recorded in connection with unrealized gains recognized due to changes in the fair value of debt or equity investments. Deferred income tax liabilities will be reported in the balance sheet, and the corresponding income tax provision will be reported in the income statement (for fair value gains arising from holdings of securities in the trading portfolio) or in other comprehensive income (for fair value changes relative to available-for-sale investments).

Sale of equity securities with a put option. In certain circumstances, a reporting entity sells marketable securities that it holds, but writes a put option such that the acquirer may force it to repurchase the securities. ASC 860 holds that the existence of the put, or the probability that it will be exercised, only affects the determination of whether the transfer is to be accounted for as a sale or as a borrowing if the marketable security is not readily obtainable. In most typical situations, the existence of the put will not impact sale recognition (using the criteria of ASC 860), but in relatively rare circumstances, when the put as written is "deep in money" that it makes it probable that the transferee (buyer) will exercise it, sale recognition may not be warranted. The likelihood of put option exercise is assessed only when the put is written; it is not to be reassessed later. Thus, the accounting for the sale of the securities is determined at the date of sale, and is not subject to later revision.

Accounting for hedges of the foreign currency risk inherent in an available-for-sale equity security. Some investments, such as those registered on foreign exchanges, have inherent foreign exchange risk associated with them. If these investments are categorized as available-for-sale, value changes may include the effects of both market and exchange rate changes. In some cases, the entity will enter into foreign exchange hedging to protect against exchange rate risk; the issue then is whether transaction gains or losses on forward contract should be included in contra equity account for available-for-sale securities' unrealized gains or losses. It was agreed that the gain or loss is to be shown in the same (other comprehensive income) account if it is associated with the securities' price change. Foreign exchange risk is inherent only if two conditions are met: securities are not traded on an exchange denominated in reporting entity's functional currency; and dividends or other cash flows are all denominated in foreign currency.

Debt Securities

Historically, accounting for marketable investments in debt securities was not well developed in the professional literature. In fact, the principal guidance concerning long-term investments in debt instruments was found in ASC 320-10-35, which stipulated that the amortized cost method be used, absent a substantial, other-than-temporary decline in value.

ASC 320 applies to both equity and debt instruments held as investments, and prescribes fair value accounting for all except debt instruments being held to maturity. For those investments, amortized historical cost is generally preserved as the measurement principle.

ASC 320 requires that investments in debt securities be classified upon acquisition as belonging to one of three portfolios: trading, available-for-sale, or held-to-maturity. The first of these is characterized by frequent purchase and sale activities, with the general objective of realizing profits from short-term price movements, which in the case of investments in debt instruments will largely be the result of changes in market interest rates but which may also be affected by market perceptions of credit risk. Since intention is the prime criterion applied, even a paucity of sales activity does not necessarily mean that specific debt securities acquired during a period do not belong in the trading portfolio.

The held-to-maturity category is the most restrictive of the three; debt instruments can be so classified only if the reporting entity has both the positive intent and the ability to hold the securities for that length of time. A mere intent to hold an investment for an indefinite period is not adequate to permit such a classification. On the other hand, a variety of isolated causes may necessitate transferring an investment in a debt security from the held-to-maturity category without calling into question the investor's general intention to hold other similarly classified investments to maturity. Among these are declines in the creditworthiness of a particular investment's issuer or a change in income tax law or regulations. On the other hand, sales of investments that were classified as held-to-maturity for other reasons will

raise doubts about the entity's assertions regarding these and other similarly categorized securities. For this reason, transfers from or sales of held-to-maturity securities should be very rare.

Accounting for debt securities that are held for trading and those that are available for sale is based on fair value. For balance sheet purposes, increases or decreases in value are reflected by adjustments to the asset account; such adjustments are to be determined on an individual security basis. Changes in the values of debt securities in the trading portfolio are recognized in net income immediately, while most changes in the values of debt securities in the available-for-sale category are reported in other comprehensive income rather than being included in net income. The only exception is for declines that are deemed to be other than temporary, in which case the loss is recognized currently in net income. Once the investment is written down for a decline that is other than temporary, subsequent increases are reported only in changes to the contra equity account; increases cannot be accounted for as "recoveries" of previous declines. (See "Other-than-Temporary Impairment of Investments Available for Sale" in the discussion of equity investments, above, for an example.)

There has been some concern that ASC 320 could not be applied to restructured loans that qualified as debt securities. However, ASC 320-10-55-2 made it clear that ASC 320 applies to all loans which qualify as debt securities.

Transfers of debt securities among categories. Transfer of any given security between categories is accounted for at fair value. If the transfer is from the trading category, there is no further income statement effect since the fair value-based gains or losses have already been reported. If the transfer is to the trading category, the unrealized gain or loss is recognized immediately. Depending on whether the transfer is from the available-for-sale or the held-to-maturity category, such unrealized gain or loss would have been included in the accumulated other comprehensive income account on the balance sheet, after having been reported as an element of other comprehensive income, or would not have been reported at all prior to the transfer.

If the debt security is being transferred from held-to-maturity to the available-for-sale category, the unrealized gain or loss, not previously reflected in the investment account, will be added to the appropriate accumulated other comprehensive income account at the date of transfer and reported in other comprehensive income. If a security is being transferred from available-for-sale to held-to-maturity, the unrealized holding gain or loss previously accrued will continue to be maintained in the accumulated other comprehensive income account, but now will be amortized to income over the period until maturity as an adjustment of yield, using the effective interest method. The fair value as of the date of transfer to the held-to-maturity classification, net of any subsequent amortization of the discrepancy between fair value and maturity or par value as of the transfer date, will be the new "cost" for purposes of the disclosures required by ASC 320.

Example of accounting for debt securities

Marcie Corporation purchases the following debt securities as investments in 2009:

Issue	*Face value*	*Price paid**
Dukane Chemical 8% due 2013	$200,000	$190,000
Forwall Pharmaceutical 9.90% due 2025	500,000	575,000
Luckystrike Mining 4% due 2011	100,000	65,000

* *Accrued interest is ignored in these amounts; the normal entries for interest accrual and receipt are assumed.*

Management has informed us that Marcie's objectives differed among the various investments; the Dukane bonds are considered to be suitable as a long-term investment, with the intention that they will be held until maturity. The Luckystrike bonds are a speculation; the significant

discount from par value was seen as very attractive, despite the low coupon rate. Management believes the bonds were depressed because mining stocks and bonds have been out of favor, but believes the economic recovery will lead to a surge in market value, at which point the bonds will be sold for a quick profit. The Forwall Pharmaceutical bonds are deemed a good investment, but with a maturity date sixteen years in the future, management is unable to commit to holding these to maturity.

Based on the foregoing, the appropriate accounting for the three investments in bonds would be as follows:

Dukane Chemical 8% due 2013

Account for these as held-to-maturity; maintain at historical cost, with discount ($10,000) to be amortized over term to maturity (assumed to be four years, for an amortization of $2,500 per year).[4]

Forwall Pharmaceutical 9.90% due 2025

Account for these as available-for-sale, since neither the held-for-trading nor held-to-maturity criteria apply. These are to be reported at fair value at each balance sheet date, with any unrealized gain or loss included in the additional/contra equity account, unless an "other-than-temporary" decline occurs.

Luckystrike Mining 4% due 2011

As an admitted speculation, these are accounted for as part of the trading category, and also reported at fair value on the balance sheet. All adjustments to carrying value will be included in net income each year, irrespective of whether the fluctuations are deemed to be temporary.

Transfers between categories are to be accounted for at fair value at the date of the transfer. Consider the following events.

1. Marcie management decides in 2010, when the Forwall bonds have a fair value of $604,500, that the bonds will be disposed of in the short term, hopefully when the price hits $605,000. The bonds are presently carried on the books at $580,000, which was the fair value at the time the year-end 2009 financial statements were being prepared. Based on this description of the decision, the bonds are to be transferred to the trading portfolio at a "cost" of $604,500. The entry to record this would be the following:

Investment in debt securities—held-for-trading	604,500	
Unrealized gain on holding debt securities as investment	5,000	
Investment in debt securities—available-for-sale		580,000
Gain on holding debt securities		29,500

   The previously unrealized gain (reflected in the write-up of the investment from original cost, $575,000, to the fair value at year-end 2009, $580,000) is now "realized" for financial reporting purposes, as is the further rise in value from $580,000 to $604,500 at the time the portfolio transfer takes place.

2. Assume that at year-end 2009 the investment in the Forwall bonds is still held, and the fair value has declined to $602,000. Management's intentions regarding this holding have not changed since the decision to transfer to held-for-trading. The year-end adjustment will be

Loss on holding debt securities	2,500	
Investment in debt securities—held-for-trading		2,500

   The market decline is reflected in net income in 2009, since the bonds are in the held-for-trading portfolio.

---

[4] *Technically, GAAP requires that the discount be amortized using an effective interest method that produces a constant percentage yield over the life of the bond. In the case of Dukane Chemical, this would result in amortization of approximately $2,452 in 2009, $2,484 in 2010, $2,516 in 2011, and $2,548 in 2013 using annual compounding and an effective annual rate of 1.291%. For the purposes of this example, straight-line amortization has been used because the results are not materially different.*

3. Now, assume that in 2010, management determines that a major investment in plant renewal and expansion will likely be necessary by the year 2012, based on a detailed capital budget prepared. With this in mind, Marcie Corporation determines that the holding of Forwall Pharmaceutical bonds would be an excellent vehicle to provide for these future cash needs, and accordingly concludes to hold these to maturity. At the time this decision is made, the fair value of the bonds is quoted at $603,000. The entry to record the transfer from held-for-trading to held-to-maturity is as follows:

Investment in debt securities—held-to-maturity	603,000	
Investment in debt securities held-for-trading		602,000
Gain on holding debt securities		1,000

The bonds are again transferred at fair value, which in this case gives rise to a $1,000 recognized gain.

4. In 2010 Marcie management also made a decision about its investment in Dukane Chemical bonds. These bonds, which were originally designated as held-to-maturity, were accounted for at amortized historical cost. Assume the amortization in 2009 was $2,000 (because the bonds were not held for a full year), so that the book value of the investment at year-end 2009 was $192,000. In 2010, at a time when the value of these bonds was $198,000, management concluded that it was no longer certain that they would be held to maturity, and therefore transferred this holding to the available-for-sale portfolio. The entry to record this would be

Investment in debt securities—available-for-sale	198,000	
Unrealized gain on holding debt securities as investment		6,000
Investment in debt securities—held-to-maturity		192,000

The transfer is at fair value, but since the bonds are being transferred into the available-for-sale category (for which unrealized gains and losses are recorded in an additional or contra equity account), the gain at this date, $6,000, is not recognized in net income, but rather will be reported in other comprehensive income.

5. In 2011, for the same reason management determined to hold the Forwall Pharmaceuticals bonds to maturity, it also reverses its prior decision regarding the Dukane Chemical bond holding. It now professes an intention to hold these until their maturity, in 2013. At the date this decision is made, the Dukane bonds are quoted at $195,000. Assume that the value at year-end 2010 had been $198,000, so no adjustment was needed at that time to the carrying value of the investment. Again the transfer will be recorded at fair value.

Investment in debt securities—held-to-maturity	195,000	
Unrealized gain on holding debt securities as investment	3,000	
Investment in debt securities—available-for-sale		198,000

The unrealized gain previously recognized in an equity account is partially eliminated, since fair value at the date of this transfer is less than the previously recorded amount. The change in this equity account must be reported as other comprehensive income for the period in which this portfolio reclassification occurs. The remaining balance in the additional/contra equity account (whether a net debit or credit) is accounted for as additional premium or discount, and is amortized over the remaining term to maturity. GAAP mandates that the effective yield method be used, but for this example, assume that the discount will be amortized over the remaining two years on the straight-line basis (if this difference from the effective yield method is not material, this would be an acceptable practice). Thus, the actual discount as measured by the spread between the new carrying value, $195,000, and face value to be received at maturity, $200,000, plus the additional discount measured by the unrealized gain reported in the equity section of $3,000, gives a total discount amounting to $8,000 to be amortized over the remaining two years. This $8,000, when added to the $2,000 discount amortized in 2010 (when the bonds were in the original held-to-maturity portfolio), equals $10,000, which is the discount between the face value, $200,000 and the price paid by Marcie Corporation ($190,000).

Note that the illustrated reclassification of the Dukane Chemical bonds from the held-to-maturity to the available-for-sale portfolios would, in most instances, have serious adverse consequences for Marcie. Under ASC 320, classification as held-to-maturity can only occur

when, at acquisition, management has both the intent and the ability to maintain the investment until maturity. A sale prior to maturity is taken as an indication that its intent was not truly present, and accordingly, use of the held-to-maturity classification for any other investments will be precluded, unless the sale before maturity is precipitated by certain events. These are

1. Evidence of a substantial deterioration in the issuer's creditworthiness, placing the entity at jeopardy from any further holding of the investment
2. A tax law change affecting the tax-exempt status of the investment holding
3. A major business acquisition or disposition necessitating portfolio changes to maintain the entity's interest rate risk posture
4. For banks or thrifts, a change in regulatory capital requirements such that a significant downsizing is necessitated, including disposition of the bond portfolio, and
5. A significant increase in risk weighting (under bank and thrift capital rules) of the held-to-maturity investments, again necessitating dispositions of these investments

Other isolated, nonrecurring, and unusual events and circumstances might also suffice to justify disposal of these investments without "tainting" the remaining held-to-maturity portfolio or precluding its future use by the entity, but these would be rare occurrences.

While a transfer from the held-to-maturity to the available-for-sale portfolios would not be a sale, it would be demonstrative of an intent or willingness to dispose of the investment, which would be equally suggestive of an earlier misrepresentation of management's intent regarding those investments. While ASC 320 is silent on this, the same strictures affecting an outright sale of these portfolio investments should be assumed to apply to a transfer to the available-for-sale category. In other words, while not prohibited, such transfers would be very rare and carry an accounting risk for the reporting entity.

Certain transactions that do not impede further use of the held-to-maturity classification. According to ASC 320-10-25-18, transactions involving held-to-maturity investments that are not accounted for as sales do not call into question the classification of investments as held-to-maturity. It should be noted, however, that the most common such transaction, the "wash sale," is explicitly required under ASC 860-10-55 to given sale treatment and, accordingly, will cause the reporting entity to abandon held-to-maturity treatment of other investments held or later acquired. One example of transaction that might avoid sale recognition, and hence preserve use of the held-to-maturity classification by the entity, is bond swaps. However, if intent is to not hold the new security received until maturity, then intent regarding other bond holdings, etc., will be questioned. Desecuritizations will not be treated as sales under ASC 320-10-25-18.

Presentation in the financial statements. Trading securities must always be grouped with current assets in classified balance sheets, and held-to-maturity investments will be noncurrent (unless the maturity date is within one year). Available-for sale securities may conceivable be classified as either current or noncurrent.

If declines in value are deemed to meet ASC 320's definition of *other than temporary*, then these are to be included in net income in the current period. However, subsequent recoveries cannot be recognized in net income. If available-for-sale investments are written down for such impairments that later reverse, the recovery is accounted for as an increase in fair value to be reflected in the other comprehensive income account, on the balance sheet only. If held-to-maturity investments are similarly written down and later recover some or all of the lost value, the fair value increase will not be reported in the balance sheet at all, although disclosure will generally be made in the notes.

For purposes of reporting in the statement of cash flows, all purchases and sales of trading securities must be included in the operations section, while those of available-for-sale and held-to-maturity investments are to be shown as part of investing activities.

ASC 320 requires specific disclosures of the components of a reporting entity's portfolios of investments. For available-for-sale securities and (separately) for held-to-maturity securities, classification by type of security is necessary; categories of issuers, such as US Treasury, other US agencies, state and municipal governmental units, foreign governmental units, corporations, mortgage-backed, and others are suggested. Aggregate fair values, gross unrealized holding gains, and gross unrealized holding losses must also be disclosed, by major security type, as of the date of each balance sheet being presented.

For the available-for-sale and held-to-maturity portfolios, information about contractual maturities must be presented as of the date of the latest balance sheet presented and must be grouped into at least four categories: within one year; one to five years; five to ten years; and, over ten years. Both fair values and amortized cost of debt securities in each maturity category must be presented.

For each income statement presented, proceeds from the sales of available-for-sale securities, and the gross realized gains and losses resulting from those sales, also must be disclosed. Further, the basis upon which the gains or losses were determined, (e.g., average cost, specific identification, etc.) must be disclosed. In addition, the notes must identify gross gains or losses included in net income resulting from transfers of securities from the available-for-sale to the trading portfolio, and the net change in unrealized gains or losses recognized by an adjustment of the contra equity account.

For sales or transfers from securities categorized as held-to-maturity, the amortized cost amounts, the related gains or losses realized or unrealized, and the circumstances surrounding the decision to sell or to reclassify the investment, are all to be disclosed in the notes to the financial statements for each period for which an income statement is being presented. There is, of course, a presumption that sales or transfers from the held-to-maturity portfolio will be rare occurrences.

Impairment

Other-than-temporary declines in fair value. In general, the determination of whether an investment is impaired hinges on a judgment as to whether a decline in fair value is temporary in nature or is "other than temporary."

While the term " other than temporary" is used in the standards dealing both with passive investments (ASC 320) and those where significant influence over the investee exists (ASC 323), this term previously was not formally defined in the authoritative literature, but is described in ASC 320-10-15.

Scope of ASC 320-10-15. The standard excludes the following:

1. Investments that, absent an election under ASC 825-10-25 to use fair value, would be accounted for using the equity method of accounting
2. Investments in consolidated subsidiaries
3. Investments in derivative instruments subject to ASC 815, *Derivatives and Hedging*.
4. Investments held by reporting entities subject to specialized industry accounting principles that stipulate that substantially all investments in debt and equity securities be recognized at fair (or market) value with changes in fair value recognized in net income as they occur. These reporting entities include
   a. Brokers and dealers in securities
   b. Employee benefit plans
   c. Investment companies

5. Investments held by not-for-profit organizations subject to ASC 958-320, *Not-for-Profit Entities—Investments—Debt and Equity Securities,* where the investments are not held by an investor that reports a performance indicator as defined in the Master Glossary.

Subject to the above exclusions, ASC 320-10-15 applies to investments in

1. Debt securities
2. Equity securities with readily determinable fair values
3. Equity investments accounted for under the cost method

The standard elaborates by providing the following additional scope guidance:

1. It applies to all equity securities held by insurance companies
2. Investors are not permitted to "look through" the form of investment to the type of securities that are held by the investee. For example, if the investor holds shares of a mutual fund that invests primarily in debt securities, the assessment of impairment under the standard would not be made for the portfolio of debt securities held by the mutual fund but rather would be made for the mutual fund shares themselves, which are considered equity securities.
3. If the application of ASC 815-15-25 results in bifurcating an investment into a host instrument and an embedded derivative, the host instrument would be evaluated for impairment under the standard if it falls within the standard's scope.
4. The standard applies to debt and equity securities that are within the scope of ASC 958-320 and that are held by an investor and that reports a performance indicator.

The standard establishes a multistep decision process to determine if an investment has been impaired, evaluate whether the impairment is other than temporary, and if determined to be impaired, measure the impairment loss. It also establishes a discrete model for assessing impairment of cost-method investments which present unique challenges since reasonable estimation of their fair value is often not practical or cost effective.

The model set forth in the standard for investments other than those accounted for using the cost method is as follows:

Step 1—Determine whether the investment is impaired. An investment is impaired if its fair value is less than its cost. Cost as defined for this purpose includes adjustments made to the cost basis of an investment for accretion, amortization, previous other-than-temporary impairments, and hedging.[5]

The unit of account used to determine impairment is the individual security level, defined as the level and method of aggregation that the reporting entity uses to measure realized and unrealized gains and losses on its debt and equity securities. For example, management may aggregate all equity securities of an issuer that have the same CUSIP number[6] that were purchased in separate trade lots and use an average cost convention to compute realized or unrealized gains or losses.

In assessing impairment of debt securities, the investor is not permitted to combine separate contracts such as guarantees or other credit enhancements.

[5] *ASC 815-25-35 indicates that, with respect to a qualifying fair value hedge, the change in fair value of the hedged item that is attributable to the hedged risk is recorded as an adjustment to the carrying amount of the hedged item and is recognized currently in net income.*

[6] *A CUSIP number is a nine-digit alpha numeric identifier used to identify securities traded in public markets. CUSIP is an acronym that stands for "Committee on Uniform Securities Identification Procedures."*

The assessment of whether an investment is impaired is to be made for each interim and annual reporting period, subject to special provisions that apply to cost-method investments discussed separately below.

After comparing fair value to cost, if cost exceeds fair value, the investment is considered impaired and the evaluator is to then proceed to step 2 to determine whether the impairment is "other than temporary."

Step 2—Evaluate whether the impairment is other than temporary. Instead of providing stand-alone guidance to the evaluator, step 2 of the standard contains cross-references to other authoritative literature (which contain further cross-references) to be applied to the specific facts and circumstances as applicable:

- ASC 320-10-35
- ASC 320-10-55
- SEC SAB 59 (Topic 5M in the codification of Staff Accounting Bulletins), *Other-Than-Temporary Impairment of Certain Investments in Debt and Equity Securities*
- SAS 92, *Auditing Derivative Instruments, Hedging Activities, and Investments in Securities* (AU §332)
- AUG *Auditing Derivative Instruments, Hedging Activities, and Investments in Securities*

In synthesizing the guidance contained in these sources, it is important to understand first and foremost that FASB used the phrase "other than temporary" to convey its intent that an impairment in the fair value of a security need not be permanent to be recognized and recorded in the financial statements. Thus, there is a rebuttable presumption that impairment of a security is other than temporary and will require recognition in the period that the impairment occurs.

Management is to evaluate all available evidence regarding the realizability of an investment starting with the premise that the investment may be required to be written down. Many objective and subjective factors can influence this decision and the applicability and relative importance of these factors will vary between types of investments, between reporting entities, and between accounting periods. Professional judgment will naturally be involved given the fact that, in making these judgments, management considers its knowledge and past experience, its evaluation of the extent and duration of the effects of current events, and its expectations and assumptions regarding the future.

Examples of factors that might, either individually or in combination, be indicative of a decline in fair value being other than temporary include, but are not limited to

- Fair value is significantly less than cost and
  - The decline in fair value is due to adverse conditions related to the specific security, to the industry, or to a geographic area
  - The decline has existed for an extended period of time
  - Management does not have both the intent and ability to hold the security for a sufficient period of time to allow for any anticipated recovery in fair value
- The security has been downgraded by a rating agency
- The financial condition of the issuer has worsened
- The issuer has reduced or eliminated dividends
- Scheduled interest payments have not been made
- Subsequent to the end of the reporting period, the reporting entity recorded losses associated with the security
- The occurrence of specific events that might influence the issuer's operations, such as changes in technology that may reduce its earnings potential or the discontinuance of a portion of the business that may affect future earnings potential

In addition to the foregoing, impairment of debt securities can be caused by numerous factors including, but not limited to

- Increases in market interest rates
- Changes in foreign exchange rates

- Changes in perceptions by market participants of the value of credit enhancements such as financial guarantee insurance caused, for example, by a ratings downgrade on the insurer of the securities
- Illiquidity in credit markets that renders the investment unsalable or only saleable in secondary markets at a deep discount from face value

Unless there is persuasive evidence to support a realizable value that equals or exceeds the investment's carrying value, the reporting entity is required to write down the investment to fair value and recognize an impairment loss as a charge to net income in the period in which the investment becomes impaired.

If the impaired security is a debt instrument that was not impaired at acquisition, and the investor believes that, at a subsequent balance sheet date, it is probable that the investor will be unable to collect all amounts due according to the contractual terms of the debt, an other-than-temporary impairment is considered to have occurred.

Generally, if the holder of an available-for-sale debt security decides to sell it at a loss shortly after the balance sheet date and management does not expect the fair value of the security to recover prior to the expected time of sale, the other-than-temporary impairment loss would be recognized as a charge to net income in the period in which the decision is made to sell the security.

Step 3—If the impairment is other than temporary, recognize an impairment loss equal to the difference between the investment's cost and its fair value. If, as a result of step 2, management judges the impairment to be other than temporary, the reporting entity recognizes an impairment loss as a charge to net income for the entire difference between the investment's cost and its fair value at the balance sheet date. The impairment measurement is not to include any partial recoveries that might have occurred subsequent to the balance sheet date but prior to issuance of the financial statements.

The reduced carrying amount of the investment becomes that investment's new cost basis. This new cost basis is not to be changed for any subsequent recoveries in fair value. Subsequent recoveries in the fair value of available-for-sale securities are to be included in other comprehensive income; subsequent decreases in fair value are to be evaluated as to whether they are other than temporary in nature; if considered temporary, the decrease is recorded in other comprehensive income; if considered other than temporary, the decrease is to be recognized as a component of net income for the period as previously described.

Example of other-than temporary impairment of an available-for-sale security

In January 2010 new information comes to the attention of Ralph Corporation management regarding the viability of Whammer Corp. Based on this information, it is determined that the decline in Whammer preferred stock is probably not a temporary one, but rather is other than temporary (i.e., the asset is impaired). ASC 320 prescribes that such a decline be reflected in net income, and the written-down value be treated as the new cost basis. The fair value has remained at the amount last reported, $109,500. Accordingly, the entry to recognize the fact of the investment's permanent impairment is as follows:

Loss on holding equity securities	15,500	
Unrealized loss on securities—available-for-sale (other comprehensive income)		15,500

Any subsequent recovery in this value would not be recognized in net income unless realized through a sale of the investment to an unrelated entity in an arm's-length transaction, as long as the investment continues to be categorized as "available-for-sale," as distinct from "held-for-trading." However, if there is an increase in value (not limited to just a recovery of the amount of the loss recognized above, of course) the increase will be added to the investment account and shown in a separate account in stockholder's equity, since the asset is to be marked to fair value on the balance sheet.

It should be noted that the issue of other-than-temporary impairment does not arise in the context of investments held for trading purposes, since unrealized holding gains and losses are immediately recognized without limitation. In effect, the distinction between realized and unrealized gains or losses does not exist for trading securities.

Example of temporary impairment

In March 2010 further information comes to management's attention, which now suggests that the decline in Whammer preferred was indeed only a temporary decline; in fact, the value of Whammer now rises to $112,000. Since the carrying value after the recognition of the impairment was $109,500, which is treated as the cost basis for purposes of measuring further declines or recoveries, the increase to $112,000 will be accounted for as an increase to be reflected in the additional stockholders' equity account, as follows:

Investment in equity securites—available-for-sale	2,500	
Unrealized gain on securities—available-for-sale (other comprehensive income)		2,500

Note that this increase in value is not recognized in current net income, since the investment is still considered to be available-for-sale, rather than a part of the trading portfolio. Even though the previous decline in Whammer stock was realized in current net income, because judged at the time to be a permanent impairment in value, the recovery cannot be recognized in net income. Rather, the change in value will be included in other comprehensive income and then displayed in an additional equity account.

Subsequent accounting for debt securities after recognition of other-than-temporary impairment. After recognizing a loss from other-than-temporary impairment with respect to a debt security, the investor is to treat the security as if it had been purchased on the measurement date on which the impairment was recognized. If the security had been originally purchased at a premium, the impairment charge will either reduce or eliminate the premium or if the impairment is large enough cause the reporting entity to record a discount. If the security had been purchased at its face amount or a discount, the impairment charge will result in recording or increasing the discount.

After recording the adjustment for the impairment, the adjusted premium or discount is to be amortized prospectively over the remaining term of the debt security based on the amount and timing of future estimated cash flows.

Cost-method investments. By their nature, cost-method investments normally do not have readily determinable fair values. Consequently, the standard provides a different model for determining whether a cost-method investment is other-than-temporarily impaired. The determination is made as follows:

1. If the investor has estimated the investment's fair value (e.g., for the purposes of the disclosures required by ASC 825-10-50), that estimate is to be used to determine if the investment is impaired for those reporting periods in which the investor estimates fair value. If the fair value is less than cost, the investor would proceed to step 2 of the impairment protocol described previously.
2. For reporting periods in which the investor has not estimated the fair value of the investment, the investor is required to evaluate whether an event or change in circumstances has occurred during the period that may have a significant adverse effect on the fair value of the investment. Such events and circumstances are referred to as impairment indicators and include, but are not limited to

    a. A significant deterioration in the earnings performance, credit rating, asset quality, or business prospects of the investee
    b. A significant adverse change in the economic, regulatory, or technological environment of the investee
    c. A significant adverse change in the general market condition of either the geographic area or the industry in which the investee operates

d. A solicited or unsolicited bona fide offer to purchase, an offer by the investee to sell, or a completed auction process for the same or similar security for an amount less than the cost of the investment
e. Factors exist that raise significant concerns regarding the ability of the investee to continue as a going concern, such as negative cash flows from operations, working capital deficiencies, or noncompliance with debt covenants or statutory capital requirements.

If an impairment indicator is present, the investor is required to estimate the investment's fair value and compare the estimated fair value to the cost of the investment. If the fair value is less than cost, the investor is to proceed to step 2, as previously described, to evaluate whether the impairment is other than temporary.

Additionally, if a cost-method investment had previously been evaluated under step 2 as to whether impairment was other than temporary, and the investor had previously concluded that the investment was not other-than-temporarily impaired, the investor is required to continue to make this evaluation by estimating the investment's fair value in each subsequent interim and annual reporting period until either (1) the investment's fair value recovers to an amount that equals or exceeds the cost of the investment, or (2) the investor recognizes an other-than-temporary impairment loss.

Equity-method investments. The authoritative requirements stated above do not include in their scope investments accounted for under the equity method of accounting. In early 2004, the EITF discontinued its deliberations on providing a model to use with respect to other-than-temporary impairment of equity-method investments. At the EITF's March 17-18, 2004 meeting, the SEC observer stated that registrants were to continue to "rigorously assess equity-method investments for impairment" and further indicated that the staff of the SEC would, as it had done in the past, continue to object to what it characterized as inappropriate impairment analyses for such investments such as using an ASC 360-10-35 undiscounted cash flow approach.

The only guidance in authoritative GAAP with respect to this determination is provided by ASC 323-10-35:

> *A series of operating losses of an investee or other factors may indicate that a decrease in value of the investment has occurred which is other than temporary and which should be recognized even though the decrease in value is in excess of what would otherwise be recognized by application of the equity method.*

In the authors' opinion, the following can be surmised from this discussion:

1. An investor that holds an equity-method investment should pay close attention to this issue and monitor whether any events or changes in circumstances have occurred that may be indicative of impairment.
2. Similar to the model for cost-method investments, if any impairment indicators have been identified, management should use its best efforts to estimate the fair value of its investment and compare it to the carrying amount,
3. If the carrying amount exceeds the fair value, management should consider all evidence that is available without undue cost and effort in order to assess the underlying causes of this condition and whether it considers the impairment to be other than temporary in nature.
4. If impairment is not considered to be other than temporary, management should consider voluntarily making the same disclosures as discussed in the next section that apply to other types of investments that have similar circumstances.

Disclosures. The standard restates and expands certain disclosure requirements from previous standards, primarily to provide financial statement users with a better understanding of why impairments of investments have not been deemed other than temporary (i.e., why a loss associated with the impairment had not been recognized as a charge to current period net income).

The required disclosures are extensive and need to be fully understood by preparers of financial statements. At the date of each annual balance sheet presented, the following quantitative information must be disclosed in a tabular format aggregated by category of investment:

1. The aggregate amount of unrealized losses (that is, the amount by which cost or amortized cost exceeds fair value), and
2. The aggregate related fair value of investments with unrealized losses.

These disclosures are to be further segregated by those investments that have been in a continuous unrealized loss position for less than twelve months and those that have been in a continuous unrealized loss position for twelve months or longer. For purposes of making this distinction, the balance sheet date of the reporting period in which the impairment is identified is used to determine the duration. When interim financial statements are not prepared, the reference point would be the annual balance sheet date of the period during which the impairment was identified. The continuous unrealized loss position ends when either (1) there is recognition of a charge to net income of an other-than-temporary impairment, or (2) the investor becomes aware of a recovery of fair value during the period to at least the cost of the investment.

As of the date of the most recent annual balance sheet, additional narrative must be presented, such that financial statement users will be able to understand the quantitative disclosures, as well as the positive and negative information that management of the reporting entity considered in concluding that impairments were not other than temporary. These disclosures can be aggregated by investment categories, although individually significant unrealized losses generally are not to be aggregated. Disclosure or discussion elements would include

1. The nature of the investment(s)
2. The cause(s) of the impairment(s)
3. The number of investment positions that are in an unrealized loss position
4. The severity and duration of the impairment(s)
5. Other evidence considered by management in reaching the conclusion that the impairment is not other than temporary, for example, citing industry analyst reports, sector credit ratings, volatility of the security's fair value, and/or any other information that management considers relevant.

When the investment(s) is accounted for under the cost method, the reporting entity is required to disclose the following additional information, when applicable, as of each date for which a balance sheet is presented in its *annual* financial statements:

1. The aggregate carrying amount of all cost-method investments,
2. The aggregate carrying amount of cost-method investments that the investor did not evaluate for impairment, and
3. The fact that the fair value of a cost-method investment is not estimated if there are no identified events or changes in circumstances that may have a significant adverse effect on the fair value of the investment, and either

a. Management determined, as provided under ASC 825-10-50, that it is not practicable to estimate the fair value of the investment, or
b. The investor is exempt from estimating fair value per ASC 825-10-50.

The Equity Method of Accounting for Investments

The equity method, sometimes referred to as "one-line consolidation," permits an entity (investor) owning a percentage of the common stock of another entity (investee) to incorporate its pro rata share of the investee's operating results into its net income. However, rather than include its share of each component (e.g., sales, cost of sales, operating expenses, etc.) in its financial statements, the investor only includes its share of the investee's net income as a separate line item in its income. Note that there are exceptions to this one-line rule. The investor's share of investee extraordinary items and prior period adjustments retain their identities in the investor's income and retained earnings statements and are separately reported if material in relation to the investor's income. It should be noted that the final bottom-line impact on the investor's financial statements is identical whether the equity method or full consolidation is employed; only the amount of detail presented within the statements will differ.

The equity method is not a substitute for consolidation; it is employed where the investor has significant influence over the operations of the investee but lacks control. In general, significant influence is inferred when the investor owns between 20% and 50% of the investee's voting common stock. Any ownership percentage over 50% presumably gives the investor actual voting control, making full consolidation of financial statements necessary. The 20% threshold stipulated in ASC 323 is not absolute; circumstances may suggest that significant influence exists even though the investor's level of ownership is less than 20%, or that it is absent despite a level of ownership above 20%. In considering whether significant influence exists, ASC 323-10-15 identifies the following factors: (1) opposition by the investee, (2) agreements under which the investor surrenders shareholder rights, (3) majority ownership by a small group of shareholders, (4) inability to obtain desired information from the investee, (5) inability to obtain representation on investee board of directors, etc. Whether sufficient contrary evidence exists to negate the presumption of significant influence is a matter of judgment. Judgment requires a careful evaluation of all pertinent facts and circumstances, over an extended period of time in some cases.

Some investors used to use the equity method in those rare instances in which the investor owned over 50% of the investee's voting common shares but consolidated statements were deemed to be inappropriate (usually because consolidated statements would mask important differences in the financial or operating characteristics as between the investor-parent and the investee-subsidiary). However, this once popular "nonhomogeneity" justification for not consolidating has been eliminated. This left only temporary control, noncontrol, and foreign exchange restrictions and related reasons as justification for not consolidating majority-owned subsidiaries. ASC 360 eliminated temporary control as a justification for nonconsolidation. As a practical matter, absence of control by the parent is the only remaining reason to not consolidate a majority-owned investee.

Complexities in the use of the equity method arise in several areas.

1. *Differences between the cost at which the investor acquired its shares and the investor's proportionate share of the net assets of the investee*. The cost of the investment to the investor might not be equal to the fair value of the investor's share of the investee's net assets. ASC 323 requires these differences to be accounted for in the same manner as if the investee were a consolidated subsidiary. This requires analysis to determine whether the differences are attributable to (a) specific tangible

assets whose fair values exceed their carrying values as recorded in the accounting records of the investee, or (b) specifically identifiable intangible assets that are not recognized in the accounting records of the investee because they were internally developed. Any excess remaining after allocating the differences to (a) and/or (b) is analogous to goodwill in a business combination accounted for under the acquisition method (formerly referred to as the purchase method). Since the ultimate income statement effects of applying the equity method of accounting must generally be the same as full consolidation, an adjustment must be made to account for these differentials.

2. *Deferred income tax accounting*. The equity method is not a recognized tax accounting method under the US Internal Revenue Code (IRC). For income tax purposes, the investor's share of the investee's net income is not recognized until realized through either the payment of dividends or through the sale of the investment. This gives rise to a future taxable temporary difference between the carrying value of the equity-method investment for financial reporting purposes and the income tax basis of the investment. The temporary difference will give rise to recognition of a deferred income tax liability.
3. *Measurement of an equity-method investment when the investor acquires its interest in stages.* Revisions to equity-method measurement rules that apply when the investor acquires its interests in the investee in stages (or steps) are designed to ensure that equity method accounting treats such staged acquisitions in a manner similar to the way they are treated in the context of business combinations.

Absent these complicating factors, the use of the equity method by the investor is relatively straightforward: the original cost of the investment is increased by the investor's proportionate share of the investee's net income and is decreased by the investor's proportionate share of the investee's net losses and by dividends received. The basic procedure is illustrated below.

Example of the equity method—a simple case ignoring deferred income taxes

On January 2, 2009, R Corporation (the investor) acquired 40% of E Company's (the investee) voting common stock on the open market for $100,000. Unless demonstrated otherwise, it is assumed that R Corporation can exercise significant influence over E Company's operating and financing policies. On January 2, E's stockholders' equity consists of the following:

Common stock, par $1, 100,000 shares authorized, 50,000 shares issued and outstanding	$ 50,000
Additional paid-in capital	150,000
Retained earnings	50,000
Total stockholders' equity	$250,000

Note that the cost of E Company common stock was equal to 40% of the book value of E's net assets. Assume also that there is no difference between the book value and the fair value of E Company's assets and liabilities. Accordingly, the balance in the investment account in R's records represents exactly 40% of E's stockholders' equity (net assets). Assume further that E Company reported a 2009 net income of $30,000 and paid cash dividends of $10,000. Its stockholders' equity at year-end would be as follows:

Common stock, par $1, 100,000 shares authorized, 50,000 shares issued and outstanding	$ 50,000
Additional paid-in capital	150,000
Retained earnings	70,000
Total stockholders' equity	$270,000

R Corporation would record its share of the increase in E Company's net assets during 2009 as follows:

Investment in E Company	12,000	
Equity in E income		12,000
($30,000 × 40%)		
Cash	4,000	
Investment in E Company		4,000
($10,000 × 40%)		

When R's balance sheet is prepared at December 31, 2009, the balance reported in the investment account would be $108,000 (= $100,000 + $12,000 – $4,000). This amount represents 40% of the book value of E's net assets at the end of the year (40% × $270,000). Note also that the equity in E income is reported as a separate caption in R's income statement, typically as a component of income from continuing operations before income taxes.

In computing the deferred income tax effects of income recognized by applying the equity method, the investor must make an assumption regarding the means by which the undistributed earnings of the investee will be realized by the investor. The earnings can be realized either through later dividend receipts or by disposition of the investment at a gain. The former assumption would result in income taxes at the investor's marginal income tax rate on ordinary income (net of the 80% dividends received deduction permitted by the Internal Revenue Code for intercorporate investments of less than 80% but at least 20%; a lower deduction of 70% applies if ownership is below 20%). The latter option would be treated as a capital gain, which is currently taxed at the full corporate income tax rate, since the preferential corporate capital gains rate was eliminated by the 1986 Tax Reform Act.

Example of the equity method—a simple case including deferred income taxes

Assume the same information as in the example above. In addition, assume that R Corporation has a combined (federal, state, and local) marginal income tax rate of 34% on ordinary income and that it anticipates realization of E Company earnings through future dividend receipts.

R Corporation's current income tax expense associated with its investment is computed based on its current dividends received less the dividends received deduction under IRC §243. Since R owns a 40% interest in E, the applicable percentage for the dividends received deduction is 80%. Note that the dividends received deduction constitutes a permanent difference under ASC 740 that never reverses. The provision for income taxes currently payable is computed as follows:

Dividends received	$4,000
Less— dividends received deduction (80%)	3,200
Taxable income from investment in E	800
× current combined federal and state tax rate	× 34%
Income taxes currently payable	$ 272

To compute deferred income taxes under the liability method used in ASC 740, at each reporting date we must determine the temporary difference between the carrying amount of the investment for financial reporting purposes and its tax basis. In this case, this is done as follows:

Carrying value of equity-method investment for financial reporting purposes	
Original cost	$100,000
Equity method earnings	12,000
Dividends	(4,000)
	108,000
Income tax basis	
Original cost	100,000
Temporary difference	$ 8,000

Since R expects to realize this difference in the future through the receipt of dividends, it adjusts the difference for the permanent difference that arises from benefit of the dividends received deduction of 80% of $8,000 or $6,400 thus leaving $1,600 that would be subject to the effective rate that R expects to apply to reversal of the temporary difference, which, as provided in the assumptions above, is 34%. Applying the 34% expected future effective tax rate to the $1,600 taxable portion of the temporary difference would yield a deferred income tax expense (and related liability) of $544. The entry to record these items at December 31, 2009, is as follows:

Income tax expense—Current	272	
Income tax expense—Deferred	544	
Income taxes currently payable		272
Deferred income tax liability		544

To record provision for income taxes for the year ended 12/31/2009 attributable to equity-method investment in E

The deferred income tax liability is originally computed with reference to the projected income tax effect of the "temporary difference reversal." It may be subsequently adjusted for a variety of reasons, including changed income tax rates and altered management expectations (see Chapter 17 for a complete discussion).

Notwithstanding ASC 740's requirement that deferred income taxes be adjusted for changed expectations at each subsequent balance sheet date, the actual income tax effect of the temporary difference reversal may still differ from the deferred income tax provided. This difference may occur because the actual income tax effect is a function of the entity's other current items of income and expense in the year of reversal (while ASC 740 requires the use of a projected effective income tax rate, actual rates may differ). It may also result from a realization of the investee's earnings in a manner other than anticipated (assuming that income tax rates on "ordinary" income differ from those on capital gains).

Example of income tax effects resulting from the sale of an equity-method investment

Assume that in 2010, before any further earnings or dividends are reported by the investee, the investor sells the entire investment for $115,000. The income tax impact is

Selling price	$115,000
Less income tax basis (original cost)	100,000
Gain	$ 15,000
Capital gain rate (marginal corporate rate)	× 34%
Income tax liability	$ 5,100

The entries to record the sale, the income tax thereon, and the reversal of the previously provided deferred income taxes on the undistributed 2009 earnings of the investee are as follows:

1.	Cash	115,000	
	Investment in E Company		108,000
	Gain on sale of investment		7,000
2.	Income tax expense—Current	5,100	
	Deferred income tax liability	544	
	Income taxes payable—Current		5,100
	Income tax benefit—Deferred		544

Note that if the realization through a sale of the investment had been anticipated at the time the 2009 balance sheet was prepared, the deferred income tax liability would have been adjusted (possibly to reflect the entire $5,100 amount of the ultimate obligation), with the offset included in 2009's ordinary income tax expense. The above example explicitly assumes that the sale of the investment was not anticipated prior to 2010.

Differences in fiscal year. If the investor and investee have different fiscal years, ASC 323 permits the investor to use the most recent financial statements available as long as the lag in reporting is consistent from period to period. Analogizing from ASC 810, the lag period is not to exceed three months.

If the investee changes its fiscal year-end to reduce or eliminate the lag period, ASC 810-10-45 stipulates that the change be treated as a voluntary change in accounting principle under ASC 250 (discussed in detail in Chapter 5). Although ASC 250 requires such changes to be made by retrospective application to all periods presented, it provides an exception if it is not practical to do so.

Accounting for a differential between cost of an equity-method investment and the investor's proportionate share of net assets. The preceding examples ignored one of the

major complexities of the equity method; namely, the ASC 323 requirement that the investor account for any differential between its cost and its proportionate share of the fair value of the investee's net identifiable assets consistent with the accounting for a business combination under the purchase method prescribed by ASC 805.

In almost all instances, the price paid by an investor to acquire shares of an investee will differ from the corresponding underlying book value (i.e., the investee's net assets per its GAAP-basis financial statements). The differential can be broken down into the following components from the authoritative literature on business combinations:

1. Tangible and intangible assets recognized in the accounting records of the investee at carrying values that are below their fair values
2. Identifiable intangible assets not recognized in the accounting records of the investee because of the longstanding prohibition in GAAP against recognizing internally developed intangibles (with the notable exception of internal-use software). These might include in-process research and development assets, customer lists, and other amortizable or nonamortizable intangibles as discussed in detail in Chapters 11 and 13).
3. Goodwill

Clearly, this means that premiums or discounts versus underlying book values must be identified, analyzed, and dealt with in the accounting for the investment under the equity method. It also means that assets or liabilities not recognized by the investee must be identified and assigned, on a memo basis, the appropriate shares of the investor's purchase cost.

In the simplest example of applying this principle, if fixed assets having appreciated fair values are identified, part of the price paid by the investor must be allocated (in a notational sense only—since the entire investment is presented as a single caption in the investor's financial statements, consistent with the "one-line consolidation" aspect of equity method accounting) to the "step-up" in the values of those assets. Since those assets (other than land) are subject to depreciation, the investor must amortize a part of the investment cost against its share of investee earnings. This can require a costly and time-consuming effort on the part of the investor, particularly when a range of assets having varying depreciable lives is involved, as would almost always be the case.

Under ASC 323, any premium paid by the investor that cannot be identified as being attributable to appreciated recognized tangible and intangible assets or unrecognized internally developed intangible assets of the investee is analogous to goodwill. While under prior rules this goodwill component would have been amortized, under ASC 350 this is subject not to amortization but rather to impairment testing. The impairment testing regime to be applied is not, however, that specified in ASC 350, which only pertains to testing by entities which actually record an asset explicitly as goodwill (i.e., the acquirer in a business combination accounted for under ASC 805). Equity method investors will continue to assess impairment of investments in investees by considering whether declines in the fair values of those investments, versus carrying values, may be other than temporary in nature as discussed previously in this chapter.

Under the authoritative literature on business combinations that has been in effect since mid-2001, there is an enhanced requirement, applicable to purchase method business combinations (now referred to as the acquisition method) and equity-method investments, to identify intangible assets that must be given separate recognition from goodwill. Previous practice was less stringent, because all intangibles were subject to amortization, with the result that many would-be identifiable intangibles, such as customer relationships, were not separately identified. These overlooked but nevertheless existent intangibles were effectively combined with goodwill and amortized over the period, not exceeding forty years, that is was

permissible to assign as the economic life of goodwill. This is no longer permissible. Accordingly, analyzing the purchase cost of an equity-method investment, an investor needs to identify the portions of the premium paid that relate to identifiable intangibles per ASC 350, as well as to goodwill, with appropriate treatments regarding varying amortizable lives or, in some instances, amortization not being recognized due to the assets having indefinite lives.

Although infrequently encountered in practice, the amount paid by the investor for its interest in the investee may imply that there had been a discount, analogous to a bargain purchase in the GAAP that relates to business combinations. In the rare instances where this occurs, this would be treated in the same manner as negative goodwill. Of critical importance when this is the case, is the date on which the investor obtained its interest in the investee as the rules accorded negative goodwill have changed recently. These are discussed in greater detail in Chapter 13.

In the following examples, the accounting for equity-method investments involving both positive goodwill and negative goodwill are presented.

Example of complex case ignoring deferred income taxes—goodwill

Foxen Corporation (FC) acquired 40% of Besser, Inc.'s (BI) shares on January 2, 2009, for $140,000. BI's assets and liabilities at that date had the following book and fair values:

	Book values	*Fair values*
Cash	$ 10,000	$ 10,000
Accounts receivable (net)	40,000	40,000
Inventories (FIFO cost)	80,000	90,000
Land	50,000	40,000
Plant and equipment (net of accumulated depreciation)	140,000	220,000
Total assets	$320,000	$400,000
Liabilities	$ (70,000)	$ (70,000)
Net assets (stockholders' equity)	$250,000	$330,000

The first order of business is the calculation of the differential, as follows:

FC's cost for 40% of BI's common	$140,000
Book value of 40% of BI's net assets ($250,000 × 40%)	(100,000)
Total differential	$ 40,000

Next, the $40,000 is allocated to those individual assets and liabilities for which fair value differs from book value. In the example, the differential is allocated to inventories, land, and plant and equipment, as follows:

Item	*Book value*	*Fair value*	*Difference debit (credit)*	*40% of difference debit (credit)*
Inventories	$ 80,000	$ 90,000	$10,000	$ 4,000
Land	50,000	40,000	(10,000)	(4,000)
Plant and equipment	140,000	220,000	80,000	32,000
Differential allocated				$32,000

Assuming that there are no unrecognized identifiable intangibles included in the allocation, the difference between the allocated differential of $32,000 and the total differential of $40,000 is goodwill of $8,000. Goodwill, as shown by the following computation, represents the excess of the cost of the investment over the fair value of the net assets acquired.

FC's cost for 40% of BI's common	$140,000
40% of the fair value of BI's net assets ($330,000 × 40%)	(132,000)
Excess of cost over fair value (goodwill)	$ 8,000

It is important to note that the allocation of this differential is not recorded formally by either FC or BI. Furthermore, FC, the investor, does not remove the differential from the investment account and recategorize it in its own respective asset categories, since the use of the equity method (one-line consolidation) does not involve the recording of individual assets and liabilities of the investee in the financial statements of the investor. FC leaves the differential of $40,000 in the

investment account, as a part of the balance of $140,000 at January 2, 2009. Accordingly, information pertaining to the allocation of the differential is maintained by the investor, but this information is outside the formal accounting system, presumably on a spreadsheet maintained for this purpose.

After the differential has been allocated, the amortization pattern is developed. To develop the pattern in this example, assume that BI's plant and equipment have ten years of useful life remaining and that BI depreciates its fixed assets on a straight-line basis. FC would prepare the following amortization schedule covering the years 2009 through 2011:

	Differential	*Remaining*		*Amortization*	
Item	*debit (credit)*	*useful life*	*2009*	*2010*	*2011*
Inventories (FIFO)	$ 4,000	Sold in 2009	$4,000	$ --	$ --
Land	(4,000)	Indefinite	--	--	--
Plant and equipment (net)	32,000	10 years	3,200	3,200	3,200
Goodwill	8,000	Not relevant	--	--	--
Totals	$40,000		$7,200	$3,200	$3,200

Note that the entire differential allocated to inventories is amortized in 2009 because the cost flow assumption used by BI is FIFO. If BI had been using LIFO instead of FIFO, no amortization would take place until BI sold some of the inventory included in the LIFO layer that existed at January 2, 2009. Since this sale could be delayed for many years under LIFO, the differential allocated to LIFO inventories would not be amortized until BI sold more inventory than it manufactured/purchased. Note, also, that the differential (in this example, a negative valuation amount) allocated to BI's land is not amortized, because land is not a depreciable asset. The goodwill component of the differential is not amortized, but instead is evaluated along with the investment as a whole as to whether it is other-than-temporarily impaired.

The amortization of the differential is recorded formally in the accounting system of FC. Recording the amortization adjusts the equity in BI's income that FC recorded based upon BI's income statement. BI's income must be adjusted because it is based upon BI's book values, not upon the cost that FC incurred to acquire its interest in BI. FC would make the following entries in 2009, assuming that BI reported net income of $30,000 and paid cash dividends of $10,000:

1.	Investment in BI	12,000	
	Equity in BI income		12,000
	$30,000 net income × 40% proportionate share		
2.	Equity in BI income (amortization of differential)	7,200	
	Investment in BI		7,200
3.	Cash	4,000	
	Investment in BI		4,000
	Record dividends received by investor $10,000 × 40%		

The balance in the investment account on FC's records at the end of 2009, after giving effect to these entries is $140,800 [$140,000 + $12,000 – ($7,200 + $4,000)], and BI's stockholders' equity is $250,000 + net income of $30,000 – dividends of $10,000 = $270,000. The investment account balance as reflected by FC, the investee of $140,800 is not equal to $108,000 (40% of $270,000). However, this difference can easily be reconciled, as follows:

Balance in investment account at December 31, 2009		$140,800
40% of BI's net assets at December 31, 2009		108,000
Difference at December 31, 2009		$ 32,800
Differential at January 2, 2009	$40,000	
Differential amortized during 2009	(7,200)	
Unamortized differential at December 31, 2009		$ 32,800

With the passing years, the balance in the investment account approaches the amount representing 40% of the book value of BI's net assets, as the differential is amortized as a component of equity method income or loss. However, since a part of the differential was allocated to land, which is not depreciating, and to goodwill, which is not subject to amortization, the carrying value will most likely never exactly equal the equity in the investee's net assets. However, if the investee disposes of the land, the investor must also eliminate the associated portion of the differential.

If the carrying value of the investment becomes impaired and the impairment is considered other than temporary, the goodwill portion of the differential may also be eliminated. Thus, under certain conditions the investor's carrying value may subsequently be adjusted to equal the underlying net asset value, although this outcome is relatively unlikely to occur.

To illustrate how the sale of land would affect equity method procedures, assume that BI sold the land in the year 2015 for $80,000. Since BI's cost for the land was $50,000, it would report a gain of $30,000, of which $12,000 (= $30,000 × 40%) would be recorded by FC, when it records its 40% share of BI's reported net income, ignoring income taxes. However, from FC's viewpoint, the gain on sale of land should have been $40,000 ($80,000 – $40,000) because the cost of the land from FC's perspective was $40,000 at January 2, 2009 (since the allocated fair value of the land was below its book value). Therefore, in addition to the $12,000 share of the gain recorded above, FC should record an additional $4,000 gain [($40,000 – $30,000) × 40%] by debiting the investment account and crediting the equity in BI's income account. This $4,000 debit to the investment account will eliminate the $4,000 differential allocated to land on January 2, 2009, since the original differential was a credit (the fair value of the land was $10,000 less than its book value).

Adjustments to the goodwill portion of the differential are somewhat more complex. ASC 323 requires that that difference between cost and underlying book value be accounted for as if the investee were a consolidated subsidiary. An investor is therefore required to determine the individual components that comprise the differential as illustrated above, and this may result in the identification of part of the differential as goodwill (referred to as "equity method goodwill"). Under GAAP, goodwill associated with a business combination is required to be evaluated annually for impairment. FASB decided, however, that equity-method investments would continue to be tested for impairment in accordance with ASC 323 (i.e., the equity-method investment as a whole, not the underlying net assets, are to be evaluated for impairment) and that equity method goodwill will not be treated as being separable from the related investment. Accordingly, goodwill is not to be tested for impairment in accordance with the current goodwill and intangible assets standard, ASC 350.

Example of adjustment of goodwill for other-than-temporary impairment of an equity-method investment—ignoring income taxes

Building on the facts from the previous example, BI's reported net income in 2010 and loss in 2011 are $15,000 and ($12,000), respectively. No dividends are paid by BI after 2009. FC's carrying value, before considering possible impairment in value, as of year end 2011 is computed as follows:

Carrying value of investment, December 31, 2009	$140,800
FC's interest in BI's 2010 net income ($15,000 × 40%)	6,000
Amortization of differential between fair value and carrying value	(3,200)
Carrying value, December 31, 2010	143,600
FC's interest in BI's 2011 net loss ($12,000 × 40%)	(4,800)
Amortization of differential between fair value and carrying value	(3,200)
Carrying value, December 31, 2011, before considering additional charge for impairment	$135,600

If, at December 31, 2011, FC determines that the fair value of its investment in BI has declined to $130,000, and this decline in value is judged to be other than temporary in nature, then FC must, per ASC 323, recognize a further loss amounting to $5,600 for the year. Notice that this fair value decline is assessed with reference to the fair (presumably, but not necessarily, market) value of the investment in BI. It would not be determined with specific reference to the value of BI's business operations, in the manner that the implied fair value of goodwill is assessed in connection with business combinations accounted for by the presentation of consolidated financial statements, although a permanent decline in value of the investment would likely be related to the value of BI's operations.

While the standard is silent on this issue, it is reasonable that any recognized decline in value be assigned first to the implicit goodwill component of the investment account. In this example,

since the decline, $5,600, is less than the $8,000 goodwill component of the differential, it will be fully absorbed, and future periods' amortization of the differential assigned to other assets will not be affected. On the other hand, if the value decline had exceeded $8,000, the excess would logically have been allocated to the underlying nonmonetary assets of the investee, such that the remaining differential previously identified with plant and equipment might have been reduced or eliminated, thereby altering future amortization on a prospective basis.

The impact of interperiod income tax allocation in the foregoing example is similar to that demonstrated earlier in the simplified example. Under prior GAAP, a complication arose with regard to the portion of the differential allocated to goodwill: since equity method goodwill is not amortizable for income tax purposes it represented a permanent (not a temporary) difference that would not give rise to deferred income taxes. Under current GAAP goodwill rules, unless goodwill has been reduced for financial reporting purposes due to impairment there will be no book-tax difference and hence no deferred income tax issue to be addressed. The other components of the differential in the foregoing example are all temporary differences, with normal deferred income tax implications.

Example of complex case ignoring deferred income taxes—computation of negative goodwill

The facts in this example are similar to those in the immediately preceding examples, but in this instance the price paid by the investor, Lucky Corp., is less than its proportionate share of the investee's net assets, at fair value. This is analogous to negative goodwill in a business combination, and the accounting for the negative differential between cost and fair value follows that mandated for bargain purchases either under the business combinations and goodwill standards, ASC 805 and ASC 350 or, if the stock is acquired after its effective date, under the bargain purchase provisions of ASC 805.

Assume that Lucky Corp. acquired 40% of Compliant Company's shares on January 2, 2009, for a cash payment of $120,000. Compliant Company's assets and liabilities at that date had the following book and fair values:

	Book values	*Fair values*
Cash	$ 10,000	$ 10,000
Accounts receivable (net)	40,000	40,000
Inventories (FIFO cost)	80,000	90,000
Land	50,000	40,000
Plant and equipment (net of accumulated depreciation)	140,000	220,000
Total assets	$320,000	$400,000
Liabilities	$ (70,000)	$ (70,000)
Net assets (stockholders' equity)	$250,000	$330,000

The first step is to compute the differential, which is as follows:

Lucky's cost for 40% of Compliant's common stock	$120,000
Book value of 40% of Compliant's net assets ($250,000 × 40%)	(100,000)
Total differential	$ 20,000

Next, the $20,000 is allocated, on a preliminary basis, to those individual assets and liabilities for which fair value differs from book value. In the example, the differential is initially allocated to inventories, land, and plant and equipment, as follows:

Item	*Book value*	*Fair value*	*Difference debit (credit)*	*40% of difference debit (credit)*
Inventories	$ 80,000	$ 90,000	$10,000	$ 4,000
Land	50,000	40,000	(10,000)	(4,000)
Plant and equipment	140,000	220,000	80,000	32,000
Differential allocated				$32,000

The difference between the allocated differential of $32,000 and the actual differential of $20,000 is negative goodwill of $12,000. Negative goodwill, as shown by the following computation, represents the excess of the fair value of the net assets acquired over the cost of the investment.

Lucky's cost for 40% of Compliant's common stock	$120,000
40% of the fair value of Compliant's net assets ($330,000 × 40%)	(132,000)
Excess of fair value over cost (negative goodwill)	$ 12,000

Although the topic is not addressed explicitly by ASC 350, the investor's handling of negative goodwill should track how this would be dealt with by a parent company preparing consolidated financial statements following a "bargain purchase" business combination. It is important to note that the treatment of negative goodwill in this regard will depend on the date on which the investor obtained its interest.

Example of negative goodwill under ASC 350

The $12,000 amount preliminarily identified in the previous example as negative goodwill is to be offset, on a pro rata basis, against all of the acquired assets other than cash and cash equivalents, trade receivables, inventory, financial instruments that are required by U.S. generally accepted accounting principles (GAAP) to be carried on the balance sheet at fair value, assets to be disposed of by sale, and deferred income tax assets. In the present example, the assets qualifying for having negative goodwill allocated against their respective fair values are land and plant and equipment. The negative goodwill, $12,000, will therefore be assigned as follows:

Item	*Preliminary value assignment (40% of fair value)*	*Preliminary differential assigned*	*Proportion of qualified costs*	*Allocation of negative goodwill*	*Net differential*
Inventories	$ 36,000	$ 4,000	0.0%	0	4,000
Land	16,000	(4,000)	15.4%	(1,848)	(5,848)
Plant and equipment	88,000	32,000	84.6%	(10,152)	21,848
Total	$140,000	$32,000	100.0%	(12,000)	$20,000

Note that, in the above table, inventories are not qualified to be assigned a portion of the negative goodwill. Both land and plant and equipment, however, are allocated some of the amount preliminarily identified as negative goodwill, notwithstanding that land has already been written down because its fair value was lower than the investee's carrying (i.e., book) value for that asset. The net differential, after offsetting of negative goodwill, is $20,000, which is the excess of the purchase cost, $120,000, over the book value of the underlying net assets of Compliant Company at the date of the transaction.

In this example, the net differential assigned to plant and equipment, $21,848, will be amortized over the next ten years (the average remaining useful life of that asset group), for a charge of $2,185 per year against the earnings from the investee. Land, of course, is not depreciable and thus the total differential, a negative $5,848, will remain until the investee disposes of the land. The amount assigned to inventory, $4,000, will be taken into net income in 2009 because of the FIFO costing convention.

Since the entire amount preliminarily identified as negative goodwill has been successfully offset against qualifying assets, no amount remains to be recognized as an extraordinary gain in 2009, the year in which the investment is made. In the (extremely unlikely) event that the bargain purchase was of such a magnitude that even after offsetting the preliminary amount determined to be negative goodwill there remained an unabsorbed balance, that would have to be reported by Lucky Corp. as an extraordinary gain in 2009, in order to conform to the GAAP requirements applicable to negative goodwill.

Effective prospectively for equity-method investments where the acquisition date is on or after the beginning of the first annual reporting period beginning on or after December 15, 2008, the treatment of negative goodwill arising from a bargain purchase has dramatically changed. Instead of allocating the negative goodwill to certain qualifying assets as illustrated above, any negative goodwill that exists on the acquisition date is to be immediately recognized as a gain in net income of the period of acquisition. Unlike the prior requirements, the gain is not to be characterized as an extraordinary gain but rather is to be included in income from continuing operations. Analogizing to ASC 805, management of the investor, prior to recognizing a gain on a bargain purchase, is to reassess whether it correctly identified all of the investee assets and liabilities and make any adjustments necessitated by the reassessment.

Management of the investor is then required to review the procedures it used to measure the amounts recognized at acquisition of the interest in the investee. The objective of the review/reassessment is to ensure the all available information that exists on the date the interest is acquired has been appropriately considered in making the necessary measurements.

Investor share of investee losses in excess of the carrying value of the investment. As demonstrated in the foregoing paragraphs, the carrying value of an investment which is accounted for by the equity method is increased by the investor's share of investee earnings and reduced by its share of investee losses and by dividends received from the investee. Sometimes the losses are so large that the carrying value is reduced to zero, and this raises the question of whether the investment account should be allowed to "go negative," or whether losses in excess of the investment account should be recognized in some other manner.

In general, an equity-method investment would not be permitted to have a negative (i.e., credit) balance, since this would imply that it represented a liability. In the case of normal corporate investments, the investor would enjoy limited liability and would not be held liable to the investee's creditors should, for instance, the investee become insolvent. For this reason, excess losses of the investee would not be reflected in the financial statements of the investor. The practice is to discontinue application of the equity method when the investment account reaches a zero balance, with adequate disclosure being made of the fact that further investee losses are not being reflected in the investor's earnings. If the investee later returns to profitability, the investor ignores its share of earnings until the previously ignored losses have been fully offset; thereafter, normal application of the equity method is resumed.

There are, however, limited circumstances in which further investee losses would be reflected. Often the investor has guaranteed or otherwise committed to indemnify creditors or other investors in the investee entity for losses incurred, or to fund continuing operations of the investee. Having placed itself at risk in the case of the investee's insolvency, continued application of the equity method is deemed to be appropriate, since the net credit balance in the investment account (reportable as a liability entitled "losses in excess of investment made in investee") would indeed represent an obligation of the investor.

The other situation in which investee losses in excess of the investor's actual investment in common stock of the investee are to be reflected is somewhat more complicated. When the investor has investments consisting of both common stock holdings accounted for under ASC 323, and other investments in or loans to the investee, such as in its preference shares (including mandatorily redeemable preferred stock) or debt obligations of the investee, there will not only be further application of ASC 323, but also possible interaction between the provisions of ASC 323 and those of ASC 310 and/or ASC 320. In addition, there will be the question of the appropriate proportion of the investee's loss to be recognized by the investor—that is, should the investor's share of further investee losses be computed based only on its common stock ownership interest, or would some other measure of economic interest be more relevant?

ASC 323-10-35 addresses the accounting to be applied under the circumstances described in the foregoing paragraph. A principal concern was that an anomaly could develop if, for example, the common shareholdings were being accounted for by application of the equity method (including a suspension of the method when the carrying value declined to zero due to investee losses) while investments in the same investee's debt or preferred shares were being carried at fair value per ASC 320 (assuming that the debt was not being carried at amortized cost due to classification as a held-to-maturity investment). A parallel concern invokes the accounting for loans under ASC 310-10-35 when investee debt is being held by the investor.

According to ASC 323-10-35, the adjusted basis of the other investments (preferred stock, debt, etc.) are to be adjusted for the equity method losses, after which the investor is to apply ASC 310-10-35 and ASC 320 to the other investments, as applicable. Those equity method losses are applied to the other investments in reverse order of seniority (that is, the respective priority in liquidation). This sequence is logical because it tracks the risk of investor loss: common shareholders' interests are the first to be eliminated, followed by those of the preferred shareholders, and so on—with debt having the highest claim to investee assets in the event of liquidation. If the investee later becomes profitable, equity method income subsequently recorded (if, as described earlier, any unrecognized losses have first been exceeded) is applied to the adjusted basis of the other investments in reverse order of the application of the equity method losses (i.e., equity method income is applied to the more senior securities first).

In applying this standard, the cost basis of the other investments is taken to mean the original cost of those investments adjusted for the effects of other than temporary write-downs, unrealized holding gains and losses on ASC 320 securities classified as trading, and amortization of any discount or premium on debt securities or loans. The adjusted basis is defined as the cost basis, as adjusted for the ASC 310-10-35 valuation allowance account for an investee loan and for the cumulative equity method losses applied to the other investments.

The interaction of ASC 323 and ASC 310-10-35 and ASC 320 could mean, for example, that investee losses are recognized via a reduction in carrying value of preferred shares, which might then be immediately upwardly adjusted to recognize fair value as of the balance sheet date in accordance with ASC 320. In a situation such as this, the equity method downward adjustment would be a loss recognized currently in net income, while the upward revaluation to fair value would typically be credited to other comprehensive income, and thus excluded from current period net income (unless defined as being held for trading purposes, which would be unusual).

ASC 323-10-35 addressed only the situation where the investor had the same percentage interests in common stock and all the other equity or debt securities of the investee. However, a further complication can arise when the investor's share in the common stock of the investee is not mirrored in its investment in the other debt or equity securities of the investee that it also holds. While this possibility is discussed in ASC 323, GAAP is not definitive regarding the mechanism by which the investor's share of further losses should be recognized in such situations. What is clear, however, is that merely applying the investor's percentage interest in the investee's common stock to the period's loss would not be appropriate in these cases.

In the absence of definitive guidance, two approaches are deemed to be justifiable. The first is to eliminate the carrying value of first, the common stock and then, the other securities of the investee (including loans made to the investee), in reverse order of seniority, as set forth under ASC 323-10-35. The percentage of the investee's loss to be absorbed against each class of investment other than common stock would be governed by the proportion of that investment held by the investor—and emphatically not by its common stock ownership percentage. The logic is that, if the investor entity were to be harmed by the investee's further losses (once the common stock investment were reduced to zero carrying value), the harm would derive from being forced to take a reduced settlement in a liquidation of the investee, at which point the percentage ownership in separate classes of stock or in holdings of classes of debt would determine the amount of the investor's losses.

The second acceptable approach also takes into account the investor's varying percentage interests in the different equity and debt holdings. However, rather than being driven by the investee's reported loss for the period, the investor's loss recognition is determined by

the period-to-period change in its claim on the net assets of the investee, as measured by book value. This approach implicitly assumes that fair values upon a hypothetical liquidation of the investee would equal book values—an assumption which is obviously unlikely to be borne out in any actual liquidation scenario. Nonetheless, given the enormous difficulty of applying this measurement technique to the continuously varying fair values of the investee's assets and liabilities, this was deemed to be a necessary compromise.

Thus, both methods of computing the excess investee losses to be recognized by an investor having more than just a common stock interest in the investee depend on the varying levels of those other investment vehicles. These two alternative, acceptable approaches are described and illustrated below.

Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of all investments are identical

Assume the following facts: Dardanelles Corporation owns 25% of the common stock of Bosporus Company. Dardanelles also owns 25% of Bosporus' preferred shares, and 25% of its commercial debt. Bosporus has $50,000 of debt and $100,000 of preferred stock outstanding.

As of 1/1/2009 the carrying (i.e., book) value of Dardanelles' investment in Bosporus common stock was $12,000, after having applied the equity method of accounting in prior periods, per ASC 323. In 2009, 2010, and 2011, Bosporus incurs net losses of $140,000, $50,000 and $30,000, respectively.

As of 1/1/2009, the carrying (book) values of Dardanelles' investment in Bosporus' preferred stock and commercial debt were $25,000 and $12,500, respectively. Due to its continuing losses, the market or fair value of Dardanelles' outstanding preferred shares and its commercial debt decline over the years 2009-2011; Bosporus' portion of these values are as follows:

	Fair value of preferred shares, consistent with ASC 320	*Fair value of commercial debt, consistent with ASC 310-10-35*
1/1/2009	N/A	N/A
12/31/2009	$20,000	$12,000
12/31/2010	9,500	8,000
12/31/2011	2,000	7,000

The following table indicates the adjustments that would be made on the books of Dardanelles to record its share of Bosporus' losses in 2009-2011:

	Common stock	*Preferred stock*		*Commercial debt*	
	Book value	*Book value*	*Fair value*	*Book value*	*Fair value*
1/1/2009	$ 12,000	$ 25,000	N/A	$ 12,500	N/A
2009 loss (25% × 140,000 = 35,000)	(12,000)	(23,000)		--	
		2,000	$20,000	12,500	$12,000
Adjust pfd. stk. to FMV and debt to FV		18,000		(500)	
12/31/2009 values	0	20,000		12,000	
2009 loss (25% × 50,000 = 12,500)		(2,000)		(10,500)	
		18,000	9,500	1,500	8,000
Adjust pfd. stk. to FMV and debt to FV		(8,500)		--	
12/31/2010 values	0	9,500		1,500	
2010 loss (25% × 30,000 = 7,500)		--		(1,500)	
		9,500	2,000	0	7,000
Adjust pfd. stk. to FMV and debt to FV		(7,500)		--	
12/31/2011 values	$ 0	$ 2,000		$ 0	

Actual journal entries and explanations for the foregoing are given as follows:

12/31/09	Investee losses	35,000	
	Investment in Bosporus common stock		12,000
	Investment in Bosporus preferred stock		23,000

To record Dardanelles' share of Bosporus' loss for the year; the excess over the carrying value of the common stock is used to reduce the carrying value of the preferred shares

Date	Account	Debit	Credit
12/31/09	Investment in Bosporus preferred stock	18,000	
	Unrealized gain on securities available for sale (other comprehensive income)		18,000
	Since the fair value of the preferred shares is $20,000, per ASC 320 the carrying value must be upwardly revalued and the adjustment is included in other comprehensive income for the year		
	Loss from impairment of loan	500	
	Investment in Bosporus commercial debt		500
	As required by ASC 310-10-35, the impairment of the loan to Bosporus must be recognized by a charge against current period net income		
12/31/10	Investee losses	12,500	
	Investment in Bosporus preferred stock		2,000
	Investment in Bosporus commercial debt		10,500
	To record Dardanelles' share of Bosporus' loss for the year; the excess over the remaining carrying value of the preferred stock (without consideration of the ASC 320 adjustment) is used to reduce the carrying value of the commercial debt held		
	Unrealized gain on securities available for sale (other comprehensive income)	8,500	
	Investment in Bosporus preferred stock		8,500
	Since the fair market value of the preferred shares is not $9,500, the adjustment booked in the prior period must be partially reversed, this adjustment is included in other comprehensive income for the year		
12/31/11	Investee losses	1,500	
	Investment in Bosporus commercial debt		1,500
	To record Dardanelles' share of Bosporus' loss for the year; the maximum to be recognized is the carrying value of the commercial debt since the carrying value of common and preferred stock investments have already been reduced to zero		
	Unrealized gain on securities available for sale (other comprehensive income)	7,500	
	Investment in Bosporus preferred stock		7,500
	Since the fair value of the preferred shares are now $2,000, the carrying value must be further reduced, with the adjustment included in other comprehensive income		

It should be noted in the foregoing example that in year 2011 there will be $6,000 of unrecognized investee losses, since as of the end of that year the carrying value of all the investor's investments in the investee will have been reduced to zero, except for the fair value of the preferred stock which is presented pursuant to ASC 320. Also note that the carrying value of the commercial debt is reduced for an impairment in 2009 because the fair value is lower than the cost basis; in later years the fair value exceeds the cost basis, but under ASC 310-10-35 net upward adjustments would not be permitted.

Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of investments vary—first method: investee's reported loss used as basis for recognition

When the percentage interest in common stock of the investee is not mirrored by the level of ownership in its other securities, the process of recognizing the investor's share of investee losses becomes much more complex. Per ASC 323, there are two acceptable approaches, both of which are illustrated here. The first approach is to recognize the investor's share of investee losses by reducing the various investments held in the investee (common and preferred stock and commercial debt, in this example) by the relevant percentages applicable to each class of investment.

In the following, the same facts as in the preceding example are continued, except that the percentage of ownership in the equity and debt instruments is as follows:

	Percentage ownership by Dardanelles Corporation
Common stock	25%
Preferred stock	50%
Commercial debt	100%

Note that the fair values of the securities held (using the new assumed percentages of ownership of each class) are as follows:

	Fair value of preferred shares, consistent with ASC 320	*Fair value of commercial debt, consistent with ASC 310-10-35*
1/1/2009	N/A	N/A
12/31/2009	$40,000	$48,000
12/31/2010	19,000	32,000
12/31/2011	4,000	28,000

Given the foregoing, the period-by-period adjustments are summarized in the following table:

	Common stock	*Preferred stock*		*Commercial debt*	
	Book value	*Book value*	*Fair value*	*Book value*	*Fair value*
1/1/2009	$ 12,000	$ 50,000	N/A	$50,000	N/A
2009 loss = $140,000					
Eliminate @ 25% ratio	(12,000)				
Reduce preferred @ 50% ratio		(46,000)			
		4,000	$40,000		$48,000
Adjust pfd. stk. to FMV and debt to FV		36,000		(2,000)	
12/31/2009 values	0	40,000		48,000	
2010 loss = $50,000					
Eliminate preferred @50% ratio		(4,000)			
Reduce commercial debt @ 100% ratio				(42,000)	
		36,000	19,000	6,000	32,000
Adjust pfd. stk. to FMV and debt to FV		17,000		--	
12/31/2010 values	0	19,000		6,000	
2011 loss = $30,000					
Reduce commercial debt @ 100% ratio				(6,000)	
			4,000	0	7,000
Adjust pfd. stk. to FMV and debt to FV		(15,000)		--	
12/31/2011 values	$ 0	$ 4,000		$ 0	

Journal entries and explanations for the adjustments that would be made consistent with the foregoing fact pattern are as follows:

12/31/09	Investee losses	58,000	
	Investment in Bosporus common stock		12,000
	Investment in Bosporus preferred stock		46,000
	To record Dardanelles' share of Bosporus' loss for the year; the excess over the carrying value of the common stock is used to reduce the carrying value of the preferred shares based on Dardanelles' 50% ownership interest in the preferred stock outstanding		
	Investment in Bosporus preferred stock	36,000	
	Unrealized gain on securities available for sale (other comprehensive income)		36,000
	Since the fair value of the preferred shares is $40,000, per ASC 320 the carrying value must be upwardly revalued and the adjustment is included in other comprehensive income for the year		
	Loss from impairment of loan	2,000	
	Investment in Bosporus commercial debt		2,000
	As required by ASC 310-10-35, the impairment of the loan to Bosporus must be recognized by a charge against current period net income		
12/31/10	Investee losses	46,000	
	Investment in Bosporus preferred stock		4,000
	Investment in Bosporus commercial debt		42,000
	To record Dardanelles' share of Bosporus' loss for the year; the excess over the remaining carrying value of the preferred stock (without consideration of the ASC 320 adjustment) is used to reduce the carrying value of the commercial debt held		

12/31/10	Unrealized gain on securities available for sale (other comprehensive income)	17,000	
	Investment in Bosporus preferred stock		17,000
	Since the fair value of the preferred shares is not $19,000, the adjustment booked in the prior period must be partially reversed, this adjustment is included in other comprehensive income for the year		
12/31/11	Investee losses	6,000	
	Investment in Bosporus commercial debt		6,000
	To record Dardanelles' share of Bosporus' loss for the year; the maximum to be recognized is the carrying value of the commercial debt since the carrying value of common and preferred stock investments have already been reduced to zero		
	Unrealized gain on securities available for sale (other comprehensive income)	15,000	
	Investment in Bosporus preferred stock		15,000
	Since the fair value of the preferred shares are now $4,000, the carrying value must be further reduced, with the adjustment included in other comprehensive income		

It should be noted in the foregoing example that the limitation on loss recognition each year is given by reference to the investor's percentage interests in the various classes of equity or debt held. The 2009 loss is allocated between the common and preferred interests. A $12,000, 25% interest in the common stock equates to a total of $48,000 of common stock ($12,000 ÷ 25%). Therefore, if the full $140,000 loss were first allocated to reduce the book value of the common stock, $48,000 would have been applied to reduce that book value to zero. That would leave $92,000 of loss ($140,000 – $48,000) that remains to be allocated to the preferred interests. $92,000 × the 50% preferred interest of the investor is $48,000. Since the carrying value of the preferred stock investment is greater than this amount, the full loss is recognized by the investor proportional to its interest.

Similarly, the investee loss of $50,000 in 2010 is first used to eliminate the remaining carrying value (before the ASC 320 adjustment) of the preferred stock investment, at a 50% ratio. The total of the preferred interests is computed by dividing the remaining carrying value of the preferred stock, $4,000, by the 50% interest that it represents. Therefore, the $8,000 of the $50,000 loss would be allocated to the preferred interests, thus leaving $42,000 to allocate to the commercial debt. Since Dardanelles owns all of this debt issue, the limitation on loss recognition would be the lesser of the remaining loss ($42,000) or the carrying value of the debt (before the ASC 310-10-35 adjustment) of $48,000.

Finally, note that in year 2011 there will be $24,000 of unrecognized investee losses, since as of the end of that year the carrying value of all the investor's investments in the investee will have been reduced to zero (except for the fair value of the preferred stock which is presented pursuant to ASC 320).

Example of accounting for excess loss of investee when other investments are also held in same entity, when proportions of investments vary—second method: investee's reported change in net assets used as basis for recognition

The alternative, equally acceptable approach to investee loss recognition when various equity and debt interests are held in the investee, at varying percentage ownership levels, ignores the investee's reported loss for the period in favor of an indirect approach, making reference to the change in the investor's interest in the investee's reported net assets (net book value). In theory, the results will often be very similar if not identical, but investee capital transactions with other owners (e.g., issuing another series of preferred shares) could impact the loss recognition by the investor under some circumstances. Furthermore, since the investor's cost of its investments in the investee will normally vary from the investee's book value of those investments (e.g., if the investments were acquired in the secondary market), the losses computed by this method may differ from those computed by the first of the two alternative approaches.

To illustrate, again assume all the facts above, including the percentage interests in the immediately preceding example. Also, the condensed balance sheets of Bosporus Corporation as of the relevant dates are given as follows:

	1/1/09	12/31/09	12/31/10	12/31/11
Total assets	$270,000	$135,000	$ 90,000	$ 50,000
Commercial debt	50,000	50,000	50,000	50,000
Other liabilities	20,000	25,000	30,000	20,000
Preferred stock	100,000	100,000	100,000	100,000
Common stock + retained earnings	100,000	(40,000)	(90,000)	(120,000)
Total liabilities and equity	$270,000	$135,000	$ 90,000	$ 50,000

The investor's share of the investee's net assets at these respective dates and the changes to be recognized therein as the investor's share of investee losses for the years 2009–2011 are given below.

	1/1/09	12/31/09	12/31/10	12/31/11
		(At investee's book values)		
Investor's shares of:				
Commercial debt (100%)	$ 50,000	$ 50,000	$ 50,000	$ 30,000
Preferred stock (50%)	50,000	30,000	5,000	0
Common stock + retained earnings (25%)	25,000	0	0	0
Total share of investee's net assets	$125,000	$ 80,000	$ 55,000	$ 30,000
Change in share from prior year (investor's share of investee loss for year)		$(45,000)	$(25,000)	$(25,000)

In terms of how the actual investee losses should be recorded by the investor, the standard is not explicit, but there is no reason to depart from the approach illustrated above. Thus, the investment in Bosporus common stock would be eliminated first, then the investment in the preferred stock, and finally the investment in the debt securities. The provisions of ASC 310-10-35 and ASC 320 would have to be adhered to as well, again similar to the illustration above.

One part of the foregoing analysis that may need elaboration is the decision, in 2011, to absorb all the excess investee losses against the investor's interest in the commercial debt. In many cases the commercial debt will be secured or for other reasons have preference over the other liabilities (which would tend to include accruals, trade payables, etc.). Therefore, in an actual liquidation situation the unsecured creditors would be eliminated before the commercial debtholders. However, the purpose of this computation—determining how much of the investee's losses should be reported by the investor—is not predicated on an actual liquidation, but rather is based on a going concern assumption and conservatism. Since the investor in this example owns a major position in the common stock, half of the preferred stock, and all of the debt, presumably if the ongoing losses were indicative of imminent demise the investor would have already put the investee into liquidation or taken other dramatic steps. Since this has not occurred, the appropriate computational strategy, it is believed, is to allocate further losses against the investor's remaining interest, which is in the commercial debt. (If actual liquidation were being contemplated, it would be necessary to consider an even greater write-down of the carrying value of this investment.)

Note that the loss recognized each period differs from that under the previous approach, since the allocation is based on the book values of the various interests on the investee's balance sheet, not the cost basis from the investor's perspective, as detailed below.

	Common stock	Preferred stock		Commercial debt	
	Book value	Book value	Fair value	Book value	Fair value
1/1/2009	$12,000	$50,000	N/A	$ 50,000	N/A
2009 change in investor's share of investee's net book value = –45,000					
Eliminate carrying value of common	(12,000)				
Reduce carrying value of preferred		(33,000)			
		17,000	$40,000		$48,000
Adjust pfd. stk. to FMV and debt to FV		23,000		(2,000)	
12/31/2009 values	0	40,000		48,000	
2010 change in investor's share of investee's net book value = –25,000					
Reduce carrying value of commercial debt		(17,000)		(8,000)	
		23,000	19,000	40,000	32,000
Adjust pfd. stk. to FMV and debt to FV		(4,000)		(8,000)	

	Common stock	*Preferred stock*		*Commercial debt*	
	Book value	*Book value*	*Fair value*	*Book value*	*Fair value*
12/31/2010 values	0	19,000		32,000	
2011 change in investor's share of investee's net book value = –25,000					
Reduce carrying value of commercial debt				(25,000)	
			4,000	7,000	7,000
Adjust pfd. stk. to FMV and debt to FV		(15,000)		--	
12/31/2011 values	$ 0	$ 4,000		$ 7,000	

Journal entries and explanations for the adjustments that would be made consistent with the foregoing fact pattern would be similar to those shown earlier in this section and therefore will not be repeated here.

Accounting for subsequent investments in an investee after suspension of equity method loss recognition. As discussed, recognition of investee losses by the investor is suspended when the investment account is reduced to zero, subject to the further reduction in the carrying value of any other investments (preferred stock, debt, etc.) in that investee, as circumstances warrant. In some cases, after the recognition of investee losses is suspended, the investor will make a further investment in the investee, and the question arises whether recognition of some or all of the previously unrecognized investee losses should immediately be given recognition, up to the amount of the additional investment.

ASC 323-10-S99 addresses the situation where the increased investment in the equity method investee triggered a need to consolidate (i.e., the 50% ownership threshold was exceeded), and cites the SEC's position against further loss recognition. ASC 323-10-35-29 deals with the situation where the increased investment did not cause control to be assumed, but rather where equity method accounting was specified both before and after the further investment is made (e.g., the investor owned 30% of the investee's common stock previously, and then increased the interest to 35%) has been dealt with.

ASC 323-10-35-29 holds that recognition of some or all of the previously unrecognized ("suspended") losses is conditioned on whether the new investment represents funding of prior investee losses. To the extent that it does, the previously unrecognized share of prior losses will be given recognition (i.e., reported in the investor's current period net income). Making this determination requires the use of judgment and is fact-specific, but some of the considerations would be as follows:

- Whether the additional investment is acquired from a third party or directly from the investee, since it is unlikely that funding of prior losses occurs unless funds are infused into the investee;
- The fair value of the consideration received in relation to the value of the consideration paid for the additional investment, with an indicated excess of consideration paid over that received being suggestive of a funding of prior losses;
- Whether the additional investment results in an increase in ownership percentage of the investee, with investments being made without a corresponding increase in ownership or other interests (or, alternatively, a pro rata equity investment made by all existing investors) being indicative of the funding of prior losses; and
- The seniority of the additional investment relative to existing equity of the investee, with investment in subordinate instruments being suggestive of the funding of prior losses.

When additional investments are made in an investee that has experienced losses, the corollary issue of whether the investor has committed to further investments may arise. If such is the case, then yet-unrecognized (suspended) investee losses may also need to be rec-

ognized in investor net income currently—in effect, as a loss contingency which is deemed probable of occurrence.

Example of subsequent investments in investee with losses in excess of original investment

R Corp. invested $500,000 in an investee, E Company, representing a 40% ownership interest. Investee losses caused R Corp. to completely eliminate the carrying value of this investment, and the recognition of R Corp.'s share of a further $200,000 of E Company losses ($200,000 × 40% = $80,000) was suspended. Later, R Corp. invested another $100,000 in E Company. Application of the criteria above led to the conclusion that one-half of its investment was in excess of the value of the consideration received, and thus the entry to record the further investment would be

Investment in E Company stock	50,000	
Loss on equity-method investment in E Company	50,000	
Cash		100,000

If it is determined, however, that R Corp. has "otherwise committed" to further investment in E Company, the investor might have to recognize losses up to the full amount of the suspended losses. The entry might therefore be

Investment in E Company stock	20,000	
Loss on equity-method investment in E Company	80,000	
Cash		100,000

Intercompany transactions between investor and investee. Transactions between the investor and the investee may require that the investor make certain adjustments when it records its share of the investee earnings. According to the realization concept, profits can be recognized by an entity only when realized through a sale to outside (unrelated) parties in arm's-length transactions (sales and purchases) between the investor and investee. Similar problems, however, can arise when sales of fixed assets between the parties occur. In all cases, there is no need for any adjustment when the transfers are made at book value (i.e., without either party recognizing a profit or loss in its separate accounting records).

In preparing consolidated financial statements, all intercompany (parent-subsidiary) transactions are eliminated. However, when the equity method is used to account for investments, only the profit component of intercompany (investor-investee) transactions is eliminated. This is because the equity method does not result in the combining of all income statement accounts (such as sales and cost of sales), and therefore will not cause the financial statements to contain redundancies. In contrast, consolidated statements would include redundancies if the gross amounts of all intercompany transactions were not eliminated.

Another distinction between the consolidation and equity method situations pertains to the percentage of intercompany profit to be eliminated. In the case of consolidated statements, the entire intercompany profit is eliminated, regardless of the percentage ownership of the subsidiary. However, according to Accounting Interpretation 1 of ASC 323, only the investor's pro rata share of intercompany profit is to be eliminated in equity accounting, whether the transaction giving rise to the profit is "downstream" (a sale to the investee) or "upstream" (a sale to the investor). An exception is made when the transaction is not "arm's-length" or if the investee company was created by or for the benefit of the investor. In these cases, 100% profit elimination would be required, unless realized through a sale to a third party before year-end.

Example of accounting for intercompany transactions

Continue with the basic facts set forth in an earlier example and also assume that E Company sold inventory to R Corporation in 2009 for $2,000 above E's cost. Thirty percent of this inventory remains unsold by R at the end of 2009. E's net income for 2009, including the gross profit on the inventory sold to R, is $15,000; E's income tax rate is 34%. R should make the following journal entries for 2009 (ignoring deferred income taxes):

		Debit	Credit
1.	Investment in E Company	6,000	
	Equity in E income		6,000
	$15,000 × 40%		
2.	Equity in E income (amortization of differential)	3,200	
	Investment in E Company		3,200
3.	Equity in E income	158	
	Investment in E Company		158
	$2,000 × 30% × 66% × 40%		

The amount in the last entry needs further elaboration. Since 30% of the inventory remains unsold, only $600 of the intercompany profit remains unrealized at year-end. This profit, net of income taxes, is $396. R's share of this profit ($158) is included in the first ($6,000) entry recorded. Accordingly, the third entry is needed to adjust or correct the equity in the reported net income of the investee.

Eliminating entries for intercompany profits in fixed assets are similar to those in the examples above. However, intercompany profit is realized only as the assets are depreciated by the purchasing entity. In other words, if an investor buys or sells fixed assets from or to an investee at a price above book value, the gain would only be realized piecemeal over the asset's remaining depreciable life. Accordingly, in the year of sale the pro rata share (based on the investor's percentage ownership interest in the investee, regardless of whether the sale is upstream or downstream) of the unrealized portion of the intercompany profit would have to be eliminated. In each subsequent year during the asset's life, the pro rata share of the gain realized in the period would be added to income from the investee.

Example of eliminating intercompany profit on fixed assets

Assume that Investor Co., which owns 25% of Investee Co., sold to Investee a fixed asset, having a five-year remaining life, at a gain of $100,000. Investor Co. is in the 34% marginal income tax bracket. The sale occurred at the end of 2009; Investee Co. will use straight-line depreciation to amortize the asset over the years 2010 through 2014.

The entries related to the foregoing are

		Debit	Credit
2009			
1.	Gain on sale of fixed asset	25,000	
	Deferred gain		25,000
	To defer the unrealized portion of the gain		
2.	Deferred income tax benefit	8,500	
	Income tax expense		8,500
	Income tax effect of gain deferral		

Alternatively, the 2009 events could have been reported by this single entry.

	Debit	Credit
Equity in investee income	16,500	
Investment in Investee Co.		16,500

		Debit	Credit
2010 through 2014 (each year)			
1.	Deferred gain	5,000	
	Gain on sale of fixed assets		5,000
	To amortize deferred gain		
2.	Income tax expense	1,700	
	Deferred income tax benefit		1,700
	Income tax effect of gain realization		

The alternative treatment would be

	Debit	Credit
Investment in Investee Co.	3,300	
Equity in investee income		3,300

In the above example, the income tax currently paid by Investor Co. (34% × $25,000 taxable gain on the transaction) is recorded as a deferred income tax benefit in 2009 since

current income taxes will not be due on the book gain recognized in the years 2010 through 2014. Under provisions of ASC 740, deferred income tax assets are recorded to reflect the income tax effects of all future deductible temporary differences. Unless Investor Co. could demonstrate that future taxable amounts arising from existing future taxable temporary differences exist (or, alternatively, that a net operating loss (NOL) carryback could have been elected), this deferred income tax asset will be offset by an equivalent valuation allowance in Investor Co.'s balance sheet at year-end 2009. Thus, the deferred income tax asset might not be recognizable, net of the valuation allowance, for financial reporting purposes unless other future taxable temporary differences not specified in the example generate future taxable income to offset the net deductible effect of the deferred gain.

NOTE: The deferred income tax impact of an item of income for book purposes in excess of tax is the same as a deduction for income tax purposes in excess of book.

Investee income items separately reportable by the investor. In the examples thus far, the investor has reported its share of investee income, and the adjustments to this income, as a single item described as equity in investee income. However, when the investee has extraordinary items and/or prior period adjustments that are material, the investor is to report its share of these items separately on its statements of income and retained earnings.

Example of accounting for separately reportable items

Assume that both an extraordinary item and a prior period adjustment reported in an investee's income and retained earnings statements are individually considered material from the investor's viewpoint.

Statement of income	
Income before extraordinary item	$ 80,000
Extraordinary loss from earthquake (net of income taxes of $12,000)	(18,000)
Net income	$ 62,000
Statement of changes in retained earnings	
Retained earnings at January 1, 2009, as originally reported	250,000
Add restatement for prior period adjustment—correction of an error made in 2008 (net of income taxes of $10,000)	20,000
Retained earnings at January 1, 2009, restated	$270,000

If an investor owned 30% of the voting common stock of this investee, the investor would make the following journal entries in 2009:

1.	Investment in investee company	24,000	
	Equity in investee income before extraordinary item		24,000
	$80,000 × 30%		
2.	Equity in investee extraordinary loss	5,400	
	Investment in investee company		5,400
	$18,000 × 30%		
3.	Investment in investee company	6,000	
	Equity in investee prior period adjustment		6,000
	$20,000 × 30%		

The equity in the investee's prior period adjustment should be reported on the investor's statement of changes in retained earnings which is often presented in a more all-encompassing format with the statement of changes in stockholders' equity, and the equity in the extraordinary loss is reported separately in the appropriate section on the investor's statement of income.

Obtaining significant influence subsequent to initial investment. An investor that holds an investment accounted for using the cost method may subsequently qualify to use the equity method of accounting. This can occur, for example, if the investor acquires additional voting shares or if the investor's voting percentage increases as a result of repurchase of voting stock by the investee.

Accounting prior to the effective date of ASC 805 and ASC 810-10-65. Under long-standing GAAP, ASC 323 required that the investor adopt the equity method by retroactively restating the results of operations and retained earnings for all prior periods presented. If the retroactive adjustment was made on or after adoption of ASC 350, the goodwill related to that investment, including goodwill related to step purchases made prior to adoption of ASC 350, were not to be amortized in determining the amount of the retroactive adjustment. Differences between the carrying amount of the investment in common stock of the investee and the investor's proportionate share of the underlying net assets of the investee that did not relate to specific accounts of the investee were to be treated as nonamortizable goodwill under ASC 350.

ASC 805 and ASC 810-10-65 require that the accounting for equity-method investments acquired in stages (step-by-step) would be accounted for in a manner consistent with step-by-step acquisitions of consolidated subsidiaries. Consequently, when the investor obtains significant influence it didn't previously have, through the means described above, ASC 323 requires that, upon qualifying to use the equity method, the investor is to adjust the investment, results of operations, and retained earnings retroactively *on a step-by-step basis.* This is accomplished by remeasuring the previous cost-method investment in the investee to its fair value at the date the investor qualified to use the equity method (analogous to the acquisition date in a business combination) and recognizing the resulting gain or loss, if any, in current net income. After making this adjustment, the difference between the carrying value of the aggregate investment (the sum of the remeasured cost-method investment and the newly acquired investment) will undoubtedly differ from the investor's proportionate share of the underlying equity in the investee's net assets, with this difference being ascribed to goodwill. The accounting for this equity method goodwill would be as described above for post-ASC 350 goodwill; that is, it would not be amortized in accordance with the provisions of ASC 350.

On a going-forward basis, the investor would apply the equity method of accounting to its investment as previously described, including evaluation, if applicable, of whether any impairment is other-than-temporary in nature.

If the investor's voting interest were to subsequently increase again, but continue to constitute a noncontrolling interest in the investee, the step-by-step method would be reapplied whereby the investor would restate all prior holdings, irrespective of when they were acquired, to their fair value on the date that the additional increase in voting interest occurred and then prospectively apply the equity method in the current and future reporting periods.

Accounting for a partial sale or additional purchase of an equity-method investment. This section covers the accounting issues that arise when the investor sells some or all of its equity in the investee, or acquires additional equity in the investee.

Example of accounting for a discontinuance of the equity method

Assume that an investor owns 10,000 shares (30%) of XYZ Company common stock for which it paid $250,000 ten years ago. On July 1, 2009, the investor sells 5,000 XYZ shares for $375,000. The balance in the investment in XYZ Company account at January 1, 2009, was $600,000. Assume that the original differential between cost and book value has been fully amortized. To calculate the gain (loss) upon this sale of 5,000 shares, it is first necessary to adjust the investment account so that it is current as of the date of sale. Assuming that the investee had net income of $100,000 for the six months ended June 30, 2009, the investor would record the following entries:

1.	Investment in XYZ Company	30,000	
	Equity in XYZ income		30,000
	$100,000 × 30%		
2.	Income tax expense	2,040	
	Deferred income tax liability		2,040
	$30,000 × 20% × 34%		

The gain upon sale can now be computed, as follows:

Proceeds upon sale of 5,000 shares	$375,000
Book value of the 5,000 shares ($630,000 × 50%)	315,000
Gain from sale of XYZ common	$ 60,000

Two entries will be needed to reflect the sale: one to record the proceeds, the reduction in the investment account, and the gain (or loss) and the other to record the related income tax effects. Remember that the investor must have computed the deferred tax effects of the undistributed earnings of the investee that it had recorded each year, on the basis that those earnings either would eventually be paid as dividends or would be realized as capital gains. When those dividends are ultimately received or when the investment is disposed of, the previously recorded deferred income tax liability must be reversed.

To illustrate, assume that the investor in this example provided deferred income taxes at an effective rate for dividends (considering the 80% exclusion) of 6.8%. The realized capital gain will be taxed at an assumed 34%. For income tax purposes, this gain is computed as $375,000 – $125,000 = $250,000, yielding an income tax effect of $85,000. For accounting purposes, the deferred income taxes already provided are 6.8% × ($315,000 – $125,000), or $12,920. Accordingly, an additional income tax expense of $72,080 is incurred upon the sale, due to the fact that an additional gain was realized for book purposes ($375,000 – $315,000 = $60,000; income tax at 34% = $20,400) and that the deferred income tax previously provided for at dividend income rates was lower than the real capital gains rate [$190,000 × (34% – 6.8%) = $51,680 extra income tax due]. The entries are as follows:

1.	Cash	375,000	
	Investment in XYZ Company		315,000
	Gain on sale of XYZ Company stock		60,000
2.	Deferred income tax liability	12,920	
	Income tax expense	72,080	
	Income taxes payable—current		85,000

The gains (losses) from sales of investee stock are reported on the investor's income statement in the "Other income and expense" section, assuming that a multistep income statement is presented.

In this example, the sale of investee stock reduced the percentage owned by the investor to 15%. In such a situation, the investor would discontinue use of the equity method. The balance in the investment account on the date the equity method is suspended ($315,000 in the example) will be accounted for on the basis of fair value, under ASC 320; presumably being reported in the available-for-sale investment portfolio. This accounting principle change does not require the computation of a cumulative effect or any retroactive disclosures in the investor's financial statements. In periods subsequent to this principles change, the investor records cash dividends received from the investment as dividend income and subjects the investment to the appropriate GAAP used to assess "other-than-temporary" impairment. Any dividends received in excess of the investor's share of postdisposal net income of the investee are credited to the investment, rather than to income.

The process of discontinuing the use of the equity method and adopting ASC 320, as necessitated by a reduction in ownership below the significant influence threshold level, does not require retroactive application. However, the opposite situation having the 20% ownership level equaled or exceeded again (or for the first time) is more complex. ASC 323 stipulates that this change in accounting principle (i.e., to the equity method) requires that the investment account, results of operations (all periods being presented, current and prior), and

retained earnings of the investor company be retroactively adjusted. If the date on which the additional interest is acquired is on or after the beginning of the first annual reporting period beginning on or after December 15, 2008, the retroactive adjustment is made on a step-by-step basis as prescribed in ASC 805 for business combinations made in stages.

Example of accounting for a return to the equity method of accounting—Pre-ASC 805

Continuing the same example, XYZ Company reported net income for the second half of 2009 and all of 2010 respectively, of $150,000 and $350,000; XYZ paid dividends of $100,000 and $150,000 in December of those years. In January 2011, the investor purchased 10,000 XYZ shares for $700,000, increasing its ownership to 45% and thereby necessitating a return to equity method accounting, including retroactive adjustment. The relevant entries are as follows:

		Debit	Credit
1.	Cash	15,000	
	Income from XYZ dividends		15,000
2.	Income tax expense	1,020	
	Income taxes payable—current		1,020
	To record dividend income and income taxes thereon at current effective income tax rate ($15,000 × .068) in 2009		
3.	Cash	22,500	
	Income from XYZ dividends		22,500
4.	Income tax expense	1,530	
	Income taxes payable—current		1,530
	To record dividend income and income taxes thereon ($22,500 × .068) in 2009		
5.	Investment in XYZ Company	700,000	
	Cash		700,000
	To record additional investment in XYZ Company		
6.	Investment in XYZ Company	37,500	
	Retained earnings		34,950
	Deferred income tax liability		2,550
	To adjust investment to reflect equity method accounting		

Entry 6. is the cumulative effect adjustment for 15% of XYZ Company's undistributed earnings for the second half of 2009 and all of 2010. This adjustment is computed as follows:

Income earned in 2009 subject to equity method	
2009 income ($100,000 + $150,000)	$250,000
Less income earned through June 30 which is reflected in the investment account through previous use of the equity method	(100,000)
2009 income subject to equity method adjustment	$150,000
Income earned in 2010 subject to the equity method	350,000
Total income subject to the equity method	$500,000
Less dividends declared in 2009 and 2010	(250,000)
Increase in investee equity since suspension of equity method (undistributed income)	$250,000
Investor's equity during the period July 1, 2009, through December 31, 2010 (cumulative effect) ($250,000 × 15%)	$ 37,500

Besides showing the cumulative effect as a prior period adjustment on the retained earnings statement, the investor also must retrospectively adjust the 2009 and 2010 financial statements to reflect the use of the equity method. This means that the dividend income of $15,000 in 2009 and $22,500 in 2010 is to be eliminated to reflect the equity method. Accordingly, the term "dividend income" is eliminated and "equity in investee income" is substituted. Since the equity method was used for half of the year 2009 and equity in investee income was accrued through June 30, the term should already appear on 2009's income statement. However, the equity in investee income will be increased by $22,500, the investor's share of the income for the last six months of 2009 ($150,000 × 15%). The net effect on 2009's income before income taxes is a $7,500 increase ($22,500 increase in equity in investee income less a $15,000 decrease in dividend income). For 2010, the net effect on income before income taxes is $30,000. This results from adding equity in investee income of $52,500 ($350,000 × 15%) and eliminating dividend income of $22,500. In

addition to the income statement, the balance sheets at December 31, 2009 and 2010, are adjusted as follows (before income tax effects):

1. Add $7,500 to the investment in investee and the retained earnings balances at December 31, 2009.
2. Add $37,500 to the investment in investee and the retained earnings balances at December 31, 2010.

Investor accounting for investee capital transactions. According to ASC 323, investee transactions of a capital nature that affect the investor's share of the investee's stockholders' equity are accounted for as if the investee were a consolidated subsidiary. These transactions principally include situations where the investee purchases treasury stock from, or sells unissued shares or reissues treasury shares it holds to, outside shareholders. (If the investor participates in these transactions on a pro rata basis, its percentage ownership will not change and no special accounting will be necessary.) Similar results are obtained when holders of outstanding options or convertible securities acquire investee common shares.

When the investee engages in one of the above capital transactions, the investor's ownership percentage is changed. This gives rise to a gain or loss, depending on whether the price paid (for treasury shares acquired) or received (for shares issued) is greater or lesser than the per share carrying value of the investor's interest in the investee. However, since no gain or loss can be recognized on capital transactions, these purchases or sales will affect additional paid-in capital and/or retained earnings directly, without being reflected in the investor's income statement. This method is consistent with the treatment that would be accorded to a consolidated subsidiary's capital transaction. An exception is that, under certain circumstances, the SEC will permit income recognition based on the concept that the investor is essentially selling part of its investment.

Example of accounting for an investee capital transaction

Assume R Corp. purchases, on 1/2/09, 25% (2,000 shares) of E Corp.'s outstanding shares for $80,000. The cost is equal to both the book and fair values of R's interest in E's underlying net assets (i.e., there is no differential to be accounted for). One week later, E Corp. buys 1,000 shares of its stock from other shareholders for $50,000. Since the price paid ($50/share) exceeded R Corp.'s per share carrying value of its interest, $40, R Corp. has in fact suffered an economic loss by the transaction. Also, its percentage ownership of E Corp. has increased as the number of shares held by third parties has been reduced.

R Corp.'s new interest in E's net assets is

$$\frac{\text{2,000 shares held by R}}{\text{7,000 shares outstanding}} \times \text{E Corp. net assets}$$

$$.2857 \times (\$320{,}000 - \$50{,}000) = \$77{,}143$$

The interest held by R Corp. has thus been diminished by $80,000 – $77,143 = $2,857. Therefore, R Corp. should make the following entry:

Additional paid-in capital (or retained earnings)	2,857	
Investment in E Corp.		2,857

R Corp. charges the loss against additional paid-in capital if such amounts have accumulated from past transactions of a similar nature; otherwise the debit is to retained earnings. Had the transaction given rise to a gain it would have been credited to additional paid-in capital only (never to retained earnings) following the rule that transactions in one's own shares cannot produce net income.

Note that the amount of the charge to additional paid-in capital (or retained earnings) in the entry above can be verified as follows: R Corp.'s share of the posttransaction net equity (2/7) times the "excess" price paid ($50 – $40 = $10) times the number of shares purchased = 2/7 × $10 × 1,000 = $2,857.

Investor's proportionate share of other comprehensive income items. ASC 323-10-35-37 holds that an investor's proportionate share of an investee's equity adjustments for other comprehensive income items (e.g., fair value adjustments to available-for-sale investments) is to be offset against the carrying value of the investment in the investee entity at the time significant influence is lost. To the extent that the offset results in a carrying value of the investment that is less then zero, an investor will (1) reduce the carrying value of the investment to zero; and (2) record the remaining balance in income.

Exchanges of equity-method investments. According to ASC 845, an exchange of an equity-method investment for another such investment is to be accounted for at book value, without gain or loss recognition (other than what may be necessary to record impairment, of course).

Significant influence in the absence of ownership of voting common stock. ASC 323 was written to apply to investments in voting common stock of an investee, and authoritative guidance has been sorely lacking regarding the accounting for investments in other investment vehicles, such as options and warrants, and complex licensing and/or management agreements, where significant influence might also be present. These nontraditional modes of investment, providing the investor with significant influence, have become more common over the years, and thus the need for guidance became acute. ASC 323-10-15-13 addresses the accounting for these alternative investments.

ASC 323-10-15-13 states that a reporting entity that has the ability to exercise significant influence over the operating and financial policies of an investee is to apply the equity method only when it has an investment(s) in common stock and/or an investment that is in-substance common stock. In-substance common stock is an investment in an entity that has risk and reward characteristics that are substantially similar to the investee's common stock. Whether or not significant influence is wielded is a fact question, and criteria are not suggested in this consensus.

Management is to consider certain characteristics when determining whether an investment in an entity is substantially similar to an investment in that entity's common stock. These are conjunctive constraints: thus, if the entity determines that any one of the following characteristics indicates that an investment in an entity is not substantially similar to an investment in that entity's common stock, the investment is not in-substance common stock.

1. **Subordination.** It must be determined whether the investment has subordination characteristics substantially similar to the investee's common stock. If there are substantive liquidation preferences, the instrument would not be deemed substantially similar to common stock. On the other hand, certain liquidation preferences are not substantive (e.g., when the stated liquidation preference that is not significant in relation to the purchase price of the investment), and would be discounted in this analysis.
2. **Risks and rewards of ownership.** A reporting entity must determine whether the investment has risks and rewards of ownership that are substantially similar to an investment in the investee's common stock. If an investment is not expected to participate in the earnings (and losses) and capital appreciation (and depreciation) in a manner that is substantially similar to common stock, this condition would not be met. Participating and convertible preferred stocks would likely meet this criterion, however.
3. **Obligation to transfer value.** An investment is not substantially similar to common stock if the investee is expected to transfer substantive value to the investor and the common shareholders do not participate in a similar manner. For example, if the investment has a substantive redemption provision (for example, a mandatory

redemption provision or a non-fair-value put option) that is not available to common shareholders, the investment is not substantially similar to common stock.

In some instances it may be difficult to assess whether the foregoing characteristics are present or absent. ASC 323-10-15-13 suggests that, in such circumstances, management of the reporting entity (the investor) is also to analyze whether the future changes in the fair value of the investment are expected to be highly correlated with the changes in the fair value of the investee's common stock. If the changes in the fair value of the investment are not expected to be highly correlated with the changes in the fair value of the common stock, then the investment is not in-substance common stock.

According to ASC 323-10-15-13, the determination of whether an investment vehicle is in-substance common stock must be made upon acquisition, if the entity has the ability to exercise significant influence. The assessment is to be revisited if one or more of these occur.

1. The contractual terms of the investment are changed resulting in a change to any of its characteristics described above.
2. There is a significant change in the capital structure of the investee, including the investee's receipt of additional subordinated financing.
3. The reporting entity obtains an additional interest in an investment in which the investor has an existing interest. As a result, the method of accounting for the cumulative interest is based on the characteristics of the investment at the date at which the entity obtains the additional interest (that is, the characteristics that the entity evaluated in order to make its investment decision), and will result in the reporting entity applying one method of accounting to the cumulative interest in an investment of the same issuance.

The mere fact that the investee is suffering losses is not a basis for reconsideration of whether the investment is in-substance common stock.

Upon implementation of ASC 323-10-15-13, for investments in which the entity has the ability to exercise significant influence over the operating and financial policies of the investee, the reporting entity is to make an initial determination about whether existing investments are in-substance common stock. The initial determination is to be based on circumstances that existed on the date of adoption, rather than on the date that the investment was made.

Equity Investments in Corporate Joint Ventures and Noncorporate Entities

In practice, for legal, tax, and financial purposes, a wide variety of noncorporate entities and structures are used to operate businesses, to hold investments in real estate or in other entities, or to undertake discrete projects as joint ventures. These include partnerships (e.g. limited partnerships [LP], general partnerships [GP], limited liability partnerships [LLP],) and limited liability companies (LLC). Practice questions persistently arise regarding whether directly or by analogy, authoritative GAAP literature that applies to corporate structures is also applicable to investors in noncorporate entities.

A series of pronouncements provide guidance regarding different fact situations. The following is an overview of their provisions arranged by type of entity and containing citations to relevant GAAP. Each citation refers to the relevant pronouncement as amended by subsequently issued pronouncements.

Corporate joint ventures. Venturers are to account for their investments in corporate joint ventures using the equity method (ASC 323-10-05-4; ASC 970-323-25-9).

General partnerships. There is a rebuttable presumption that a general partner that has a majority voting interest is in control of the partnership. If voting rights are indeterminate under the provisions of the partnership agreement or applicable law, the general partner with a majority of the financial interests in the partnership's profits or losses would be presumed to have control. If this presumption is not overcome, the general partner with voting control or the majority financial interest would consolidate the partnership in its financial statements and the other noncontrolling general partners would use the equity method (ASC 323, ASC 970-323).

Partners holding lesser interests may possess substantive participating rights (as defined in the Master Glossary) granted by a contract, lease, agreement with other partners, or court decree. When the other partners have such rights, the presumption of control by the general partner with the majority voting interest or majority financial interest is overcome. Under those circumstances, the controlling general partner would consolidate the partnership and the noncontrolling general partner would consolidate the partnership and the noncontrolling general partners would use the equity method (ASC 970-323, ASC 810-20-25-19).

Limited partnerships. The structure of many limited partnerships consists of one investor serving as general partner and having only a small equity interest and the other investors holding limited partnership (or equivalent) interests. The proper accounting for such structures is ASC 970-323, *Real Estate Investments—Equity Method and Joint Ventures,* which formally deals only with certain real estate investments but has been applied by analogy to other investments. ASC 810-10-25 provides expanded guidance to the appropriate accounting in those circumstances where the majority owner lacks control due to the existence of "substantial participating rights" by minority owners.

If the investor/holder is an entity that is required under GAAP to measure its investment in the limited partnership (LP) at fair value with changes in fair value reported in the income statement, then it follows that applicable specialized guidance with respect to accounting for its investment.

If the investee entity is a variable interest entity (VIE) under the provisions of ASC 810, the holders of interests in the entity are to use the GAAP applicable to those interests. If the investor has a controlling financial interest in the VIE, the investor is deemed to be the entity's primary beneficiary (analogous to a parent company) and is required to consolidate the investee in its financial statements.

Noncontrolling interest holders in an LP that is a VIE are to account for their interests using the equity method or the cost method. Limited partner interests that are so minor that the limited partner has virtually no influence over operating and financial policies of the partnership would be accounted for using the cost method (ASC 970-323). In order to be considered to be this minor, the SEC Staff has indicated that an interest would not be permitted to exceed 3-5% (ASC 323-30-S99). In practice, this benchmark is also generally accepted for non-SEC registrants since it represents the most authoritative guidance currently available with respect to making this determination.

If the LP is not a VIE and the partners are not subject to specialized industry fair value accounting rules, a determination is made as to whether a single general partner or multiple general partners control the LP. If a single general partner controls the LP, that partner is to consolidate the LP, all other general partners are to apply the equity method of accounting to their investments, and the limited partners will use either the cost method (for minor investments) or the equity method, as previously discussed.

If more than one general partner controls the partnership, ASC 810-20 provides the framework for analyzing the respective legal and contractual rights and privileges associated with each owner/investor's interests to determine control. For the purpose of applying ASC

810-20, entities under common control are considered to be a single general partner. No guidance is offered, however, in ASC 810-20 as to how to determine which of several general partners is to consolidate the partnership.

ASC 810-20 integrates certain concepts from ASC 810 into what had been only fragmentary guidance. ASC 810 introduced the concept of "kick-out rights" which, when held by limited partners, gave them the right to eject the general partner(s) of the partnership, thereby (often) preventing the general partner(s) from exercising control. ASC 810-20 holds that there is a refutable presumption that general partners in a partnership have control, regardless of their actual ownership percentage, which can be overcome if the limited partners have certain defined abilities.

If the limited partners have the *substantive ability* to dissolve (liquidate) the limited partnership or otherwise remove the general partners without cause—which is referred to as "kick-out rights"—then the general partners will be deemed to lack control over the partnership. In such cases, consolidated financial reporting would not be appropriate, but equity method accounting would almost inevitably be warranted. To qualify, the kick-out rights must be exercisable by a single limited partner or a simple majority (or fewer) of limited partners. Thus, if a super-majority of limited partner votes is required to remove the general partner(s), this would not constitute a substantive ability to dissolve the partnership and would not thwart control by the general partner(s).

There is a range of possible qualifying requirements to exercise kick-out rights that could lead to the conclusion that nominal kick-out rights are ineffective in precluding the general partner(s) from exercising control. ASC 810-20 offers a series of illustrative examples to help the preparer interpret this guidance, and should be consulted to benchmark any real-world set of circumstances. Examples of barriers to the exercise of kick-out rights include

1. Conditions that make it unlikely the rights will be exercisable (e.g., conditions that narrowly limit the timing of the exercise)
2. Financial penalties or operational barriers associated with dissolving (liquidating) the limited partnership or replacing the general partners that would act as a significant disincentive for dissolution (liquidation) or removal
3. The absence of an adequate number of qualified replacements for the general partners or the lack of adequate compensation to attract a qualified replacement
4. The absence of an explicit, reasonable mechanism in the limited partnership agreement or in the applicable laws or regulations, by which the limited partners holding the rights can call for and conduct a vote to exercise those rights
5. The inability of the limited partners holding the rights to obtain the information necessary to exercise them

A limited partner's unilateral right to withdraw is pointedly not equivalent to a kick-out right. However, if the partnership is contractually or statutorily bound to dissolve upon the withdrawal of one partner, that would equate to a kick-out right.

ASC 810-20 also addresses "participating rights" held by the limited partners, which it contrasts to "protective rights" as these were first defined in ASC 810. Limited partners' rights (whether granted by contract or by law) that would allow the limited partners to block selected limited partnership actions would be considered protective rights and would not overcome the presumption of control by the general partners(s). Among the actions cited by ASC 810-20 as illustrating protective (not participating) rights are

1. Amendments to the limited partnership agreement
2. Pricing on transactions between the general partners and the limited partnership and related self-dealing transactions

3. Liquidation of the limited partnership initiated by the general partners or a decision to cause the limited partnership to enter bankruptcy or other receivership
4. Acquisitions and dispositions of assets that are not expected to be undertaken in the ordinary course of business (Note that limited partners' rights relating to acquisitions and dispositions expected to be made in the ordinary course of the limited partnership's business are participating rights.)
5. Issuance or repurchase of limited partnership interests

The presence of protective rights would not serve to overcome the presumption of control by the general partner(s). Substantive participating rights, on the other hand, do overcome the presumption of general partner control. Such rights could include

1. Selecting, terminating, and setting the compensation of management responsible for implementing the limited partnership's policies and procedures
2. Establishing operating and capital decisions of the limited partnership, including budgets, in the ordinary course of business

ASC 810-20 is emphatic in stating that determination of whether the presumption of general partner control is overcome is a "facts and circumstances" assessment to be made in each unique situation. For example, depending on which decisions are required to be put to a full vote of the partnership (as opposed to being reserved for the general partner), the limited partners may be found to have substantive participating rights. Another important factor weighing on this determination: the relationships among limited and general partners (using ASC 850 related-party criteria).

The assessment of the extent of limited partners' rights and the impact those have on the presumption of general partner(s) control over the partnership (for consolidated financial reporting purposes) is to be made upon initial acquisition of the general partner's interest or formation of the partnership, and again at each financial reporting (balance sheet) date.

Limited partnerships controlled by the general partners. As previously stated, the general partners are collectively presumed to be in control of the limited partnership and, if this is substantively the case, the accounting for the general partners depends on whether control of the entity rests with a single general partner. If a single general partner controls the limited partnership, that general partner consolidates the limited partnership in its financial statements. If no single general partner controls the limited partnership, each general partner applies the equity method to account for its interest (ASC 810-20).

Noncontrolling limited partners are to account for their interests using the equity method or by the cost method. As previously discussed, limited partner interests that are so minor (not to exceed 3 to 5 percent) that the limited partner has virtually no influence over operating and financial policies of the partnership would be accounted for using the cost method (ASC 970-323).

Limited partnerships controlled by the limited partners. If the presumption of control by the general partners is overcome by applying ASC 810-20 and the limited partners control the partnership, the general partners would use the equity method to account for their interests in the partnership.

If there is a controlling limited partner, that partner would consolidate the limited partnership in its financial statements. Noncontrolling limited partners would follow the same guidance provided above that applies when the general partners control the partnership (i.e., use the equity method unless the interest is minor—in which case the cost method would be used).

Limited liability companies that maintain a specific ownership account for each investor. When an LLC maintains individual equity accounts for each member, similar to the

structure of a limited partnership, the investor/member is to analogize to the guidance above that applies to accounting for investments in limited partnerships using either the cost method or equity method (ASC 272 and, by reference, ASC 970-323 and ASC 323-30-S99). In the discussion of ASC 272, it was indicated that it might be appropriate to apply this guidance by analogy to other entities that have similar specifically identifiable ownership account structures.

ASC 272 provides an exception to this general rule. Its scope does not include investments in LLCs used as securitization vehicles under ASC 860 that continue to be held by a transferor in a securitization transaction accounted for as a sale. These interests are accounted for as debt securities and categorized as either available-for-sale or trading securities under ASC 320 and are subject to specialized requirements regarding recognition of interest income and impairment (ASC 325-40).

Limited liability companies that are functionally equivalent to corporations ("analogous entities"). Some LLCs have governance structures that have characteristics that closely resemble those of corporations. These LLCs are not included in the scope of ASC 272 summarized above. Instead, membership interests in these LLCs are subject to different criteria to determine the proper accounting treatment to be used in the investor/member's financial statements.

The applicable GAAP relative to LLCs that are analogous entities is ASC 810-10-25. Under ASC 810-10-25, there is a similar rebuttable presumption that the majority voting interest holder(s) are in control of the investee. Management is to exercise judgment based on the relevant facts and circumstances as to whether one or more minority shareholders or members possess rights that individually or in the aggregate provide them with effective participation in the significant decisions expected to be made in the "ordinary course of business." If the minority owner or owners possess substantive participating rights, the presumption of control by the majority owners is overcome and the minority owner or owners are considered to be in control.

Again, the controlling interest holder would be required to consolidate, and the noncontrolling interest holders would apply either the equity method or cost method, depending on the extent of their respective holdings.

Display in the reporting entity's financial statements when the investee is not a corporation. Under some circumstances, investor-venturers account for undivided interests in assets by means of pro rata consolidation, including a fraction of each asset category of the investee in the investor's balance sheet, typically commingled with the investor's own assets. This has most commonly occurred in the case of construction joint ventures, and is not a procedure formally defined under GAAP. In ASC 810-10-45, the issue addressed is whether proportional consolidation can be used to account for an investment in a partnership or a joint venture, as an alternative to full consolidation, equity method accounting, or historical cost.

The standard states that the pro rata method of consolidation is not appropriate for an investment in an unincorporated legal entity, except when the investee is in either the construction industry or an extractive industry, where there is a longstanding practice of its use. An entity is considered to be in an extractive industry only if its activities are limited to the extraction of mineral resources (such as oil and gas exploration and production) and not if its activities involve such related pursuits as refining, marketing, or transporting the extracted mineral resources.

Collaborative Arrangements

A collaborative arrangement (sometimes referred to in practice as "line-item" joint ventures or "virtual" joint ventures) is a contractual agreement between two or more parties (participants) to jointly conduct business activities for their mutual benefit without the formation of a separate entity in which to conduct the activities. These types of arrangements are commonly used for such purposes as producing motion pictures; designing and developing hardware and/or software; or developing new pharmaceutical drugs.

Determining the proper accounting treatment for the various activities included in these endeavors is the subject of EITF 07-1, *Accounting for Collaborative Arrangements* ratified by FASB on December 12, 2007, effective for annual and interim financial statements issued for fiscal years beginning after December 15, 2008.

Joint operating activities. As previously mentioned, collaborative arrangements are used to conduct many different types of business activities. For example, two or more parties may agree to collaborate on joint operation of a facility such as a hospital or long-term care nursing facility. Two professional services firms (e.g., architects, engineers, consultants) may choose to jointly submit a proposal to obtain a new engagement that neither would have the capacity and/or capability to perform on its own. A movie studio may collaborate with another studio because it wants to produce a film starring an actor that is under contract with another studio or two studios may wish to spread the cost (and, of course, the risk) of producing a film. Frequently, in the pharmaceutical industry, two companies engage in a joint operating activity to research, develop, market, manufacture, and/or distribute a drug candidate including the process of obtaining all necessary regulatory approvals in one or more geographic markets.

A collaborative arrangement may involve various types of activities conducted or supervised by the participants including, but not limited to research, development, branding, promotion, sales, marketing, order processing, package design, manufacturing, and distribution. In some collaborative arrangements, a legal entity may be used for certain specified activities or in certain geographic jurisdictions due, for example, to legal restrictions imposed by the jurisdiction.

The participants' roles and responsibilities vary between arrangements but can be structured where certain responsibilities are shared between the participants and other responsibilities are solely the responsibility of one of the participants.

Scope. Under EITF 07-1, an activity (referred to as an "endeavor") that is the subject of a joint operating arrangement is characterized as a collaborative arrangement within the scope of the pronouncement if

1. The endeavor involves two or more parties
2. Both (all) of the parties are
    a. Active participants in the endeavor *and*
    b. Exposed to significant risks and rewards that depend on the endeavor's commercial success.
3. The endeavor is not *primarily* conducted through a separate legal entity created for it.

Active involvement. In evaluating whether a participant is active with respect to an endeavor, management is to consider the arrangement's specific facts and circumstances. Examples of involvement that could constitute active participation include, but are not limited to

1. Directing and executing the activities of the endeavor,
2. Participating on a steering committee or other oversight or governance body,
3. Possessing a legal or contractual right to the intellectual property that underlies the endeavor.

Solely providing financial resources to an endeavor would not constitute an active level of involvement for the purposes EITF 07-1.

Significant risks and rewards. Management of a participant is to exercise its best judgment in evaluating whether the participant is exposed to significant risks and entitled to significant rewards. Consideration is to be given to the terms and conditions of the arrangement and the facts and circumstances surrounding it including

- The stage of the endeavor's life cycle at which the participant is commencing its involvement
- Management's expectations regarding the duration and extent of its financial participation in relation to the total expected duration and total expected value of the endeavor

Examples of terms and conditions of an arrangement that may indicate that a participant is not exposed to significant risks or entitled to significant rewards include

- Market rates are paid for services provided by the participant
- Ability of a participant to exit the arrangement without cause and recover all or most of its cumulative economic participation through the exit date
- Limits on the rewards that a participant is entitled to receive
- Allocation of initial profits from the endeavor to only one participant

Frequently, a collaborative arrangement will involve the license of intellectual property with the participants to the arrangement exchanging consideration with respect to the license at the arrangement's inception. The existence of terms of this nature are not necessarily indicative of the participants not being exposed to significant risks or entitled to significant rewards.

Timing of determination or redetermination. A participant may become involved in a collaborative arrangement at any time during the life cycle of the endeavor. From the perspective of a participant, determination of whether an endeavor is a collaborative arrangement is to be made at the inception of the arrangement or when the participant initially becomes involved in the arrangement based on the facts and circumstances existing at that time. A participant is to reevaluate whether the arrangement continues to qualify as a collaborative arrangement any time there is a change in a participant's role in the arrangement or a change in a participant's exposure to risks or entitlement to rewards from the arrangement.

Accounting for transactions conducted in a separate legal entity. Any transactions associated with the endeavor that are conducted in a separate legal entity are to be accounted for under other applicable accounting pronouncements such as

- Consolidation of voting interest entities—ASC 810,
- Consolidation of variable interest entities—ASC 810
- Joint ventures—See discussion in previous section of this chapter

Accounting for transactions with unrelated third parties. A participant in a collaborative arrangement is to recognize revenue earned and costs incurred in transactions with third parties (parties that are not participants to the collaborative arrangement) in its income statement based on whether the participant is serving as a principal or an agent in the transaction under ASC 605-45. If the transacting participant is considered a principal in the trans-

action, the revenues and costs are recorded gross. If the transacting participant is considered an agent in the transaction, the revenues and costs are recorded net. Under no circumstances is a participant in a collaborative arrangement permitted to use the equity method of accounting to account for its activities associated with the collaborative arrangement.

ASC 605-45 (discussed in detail in Chapter 10) does not provide a "bright-line" test that definitively would characterize the role of a participant in a transaction. Rather, it provides a series of indicators of gross reporting and a series of indicators of net reporting, the purpose of which is to enable management to analyze the facts and circumstances associated with the transaction to make a well-reasoned determination.

Indicators of gross reporting (principals).

- **Participant is primary obligor.** Under ASC 605-45, this is considered to be a "strong indicator" of the participant's role in the transaction.
- **Participant has authority, within reasonable limits, to establish price.** Even when subject to reasonable, preestablished economic constraints, if the participant has the authority to negotiate price with the customer, this may indicate that the participant possesses risks and rewards of a principal to the transaction.
- **Participant involvement in determining specifications.** If the participant has the authority to determine the nature, type, characteristics, or specifications of the products and/or services ordered by the customer, this may be indicative of the participant having primary responsibility for fulfillment. For the purposes of analyzing the applicability of this indicator, the evaluator considers whether the participant makes physical alterations to the product or performs services that add value sufficient to increase the selling price to the customer.
- **Participant performance.** The participant changes the product or performs part of the service.
- **Participant discretion in supplier selection.**
- **Participant exposed to inventory risks.** The participant bears inventory risk in one or both of the following manners:
  - General inventory risk either before the customer places the order or upon the return of the inventory by the customer
  - Specific risk of physical inventory loss after the customer places the order or during shipping of the inventory
- **Participant bears credit risk.**

Indicators of net reporting (agents).

- **Participant in not the primary obligor.** The supplier of the goods or services, not the participant, is the primary obligor in the transaction.
- **Participant earnings are fixed.** The amount the participant earns is fixed.
- **Participant is not exposed to credit risk.** The supplier and not the participant bears credit risk in connection with the transaction.

Accounting for transactions between participants. In evaluating the income statement characterization of transactions between participants to a collaborative arrangement, management is to consider

- The nature of the arrangement
- The contractual terms of the arrangement
- The nature of the participant's business operations
- Whether the transactions are included in the scope of other authoritative GAAP literature on income statement classification, either directly or by analogy

If no authoritative GAAP is identified that is relevant directly or by analogy, management is to elect a reasonable and rational accounting policy to be consistently applied to all such similar transactions.

Disclosure. The following disclosures apply to the entire endeavor characterized as a collaborative arrangement, even if a portion of the endeavor is being conducted through the use of a legal entity.

A participant to a collaborative arrangement is required to disclose in the initial interim or annual period of its participation in the arrangement and all annual periods thereafter

1. Its accounting policy for collaborative arrangements,
2. Information regarding the nature and purpose of the collaborative arrangements in which it participates,
3. Its rights and obligations under the collaborative arrangements,
4. For each period for which an income statement is presented, the income statement classification and amounts attributable to transactions arising from the collaborative arrangement between the participants.

Disclosures are to be made separately for each individually significant collaborative arrangement in which the reporting entity participates.

Curiously, the standard did not require disclosure of the nature, classification, and amounts of revenues and costs recognized in the income statement from transactions between the participant and third parties. The authors believe that management should voluntarily include such disclosures to supplement the disclosures listed above, as that information is exceedingly relevant to users of the financial statements to enable them to assess the relative significance of the arrangements to the reporting entity's financial performance.

Transition. EITF 07-1 is to be adopted through retrospective application to all prior periods presented for all collaborative arrangements existing as of the effective date of the consensus. If it is not practical to retrospectively apply the consensus, management is to disclose both the reasons why reclassifications were not made and the effect of the reclassification on the current period in accordance with ASC 250-10-45. The determination of whether retrospective application is practical is to be made on an arrangement-by-arrangement basis. In the period of initial application, a participant is to disclose

1. A description of the prior period information that has been retrospectively adjusted, if applicable, and
2. The effect of the change on revenue, operating expenses, and any other affected financial statement line items.

Matters for which guidance is not provided. Although the consensus is quite complex, the EITF took great pains to point out several matters that are not covered by the consensus and that require careful scrutiny of other authoritative literature and the exercise of professional judgment. The scope of 07-1 specifically excludes

1. Arrangements for which the accounting treatment is addressed by other authoritative literature,
2. Guidance regarding matters such as
    a. Determining the appropriate units of accounting
    b. Determining the appropriate recognition requirements for a given unit of accounting,
    c. The timing of when recognition criteria are considered to have been met.

Example of a collaborative arrangement

Leonard Sporting Goods Company (LSG) and Maureen Metals LLC. (MML) contractually agree to codevelop a new set of golf clubs using a special alloy and what they believe to be a revolutionary design. The terms of their Joint Development Agreement (JDA) are as follows:

LSG responsibilities

- Conducting all necessary research and development activities associated with the design of the club faces and shafts
- Developing the branding strategy, and designing the logo and product packaging
- Engaging a contract manufacturer and performing or supervising all manufacturing, warehousing, logistics, and order processing functions
- Carrying necessary inventories and insuring them against casualty loss
- Establishing prices, and performing all invoicing, credit checks, and collection activities

MML responsibilities

- Conducting all necessary research and development on the development of the experimental alloy
- Handling all press relations and conducting the advertising campaign
- Filing of all patents associated with the product, its design, and materials
- Marketing the product in its home state and six surrounding states; sales orders originating in those states are to be forwarded to LSG for processing, and shipment with LSG responsible for performing all of the activities specified above. In the specified states, MML has limited discretion regarding the pricing of the product.

Other provisions of the JDA include

- All costs and operating profits are to be split by the participants 50%/50%.
- The participants will co-own the intellectual property arising out of the project.
- Due to legal considerations in the Grand Duchy of Leslie, all sales in that jurisdiction are required to be made by a legal entity duly established within its borders. Consequently, when orders are placed for shipment to the Duchy, LSG sells the golf clubs to Duchy Golf Sales Co. (DGS), a corporation chartered in the Duchy to enable DGS to then transact with the sporting goods retailer located in the Duchy. DGS is owned 50% each by LSG and MML who each invested $10,000 upon its incorporation on January 2, 2009.
- On a quarterly basis each participant is to provide the other participant a full accounting for its activities with respect to the endeavor and whichever participant has advanced a net amount in excess of its proportionate share of the operating results is entitled to receive an "equalization payment" from the other participant.

The following summarizes the transactions associated with the endeavor for calendar year 2009, including the final activities necessary to commence production of the product and deliver it to sporting good stores in time for the 2009 holiday selling season.

(000s omitted)	*Total endeavor results (excluding JV)*	*50% of endeavor results*	*Joint venture DGS*
Sales	$9,200	$4,600	$500
Cost of sales	5,000	2,500	300
Gross profit	4,200	2,100	200
Operating expenses			
Advertising and promotion	500	250	
Bad debts	200	100	
Branding, package and logo design	300	150	
Legal and patent filing fees	600	300	50
Research and development			
Alloy and metallurgy	200	100	
Club faces and shafts	300	150	

	Total endeavor results (excluding JV)	*50% of endeavor results*	*Joint venture DGS*
Shipping and delivery	600	300	20
Total operating expenses	2,700	1,350	70
Income from operations	$1,500		$130
× share of operating results allocable to each participant	×50%		
	$ 750	$ 750	

The annual "equalization" payment was computed as follows, based on the transactions reported by the participants:

(000s omitted)	*Initially recorded in the accounting records of* LSG	MML
Sales	$9,200	$ --
Cost of sales	5,000	--
Gross profit	4,200	--
Operating expenses		
Advertising and promotion	--	500
Bad debts	200	--
Branding, package and logo design	300	--
Legal and patent filing fees	--	600
Research and development		
Alloy and metallurgy	--	200
Club faces and shafts	300	--
Shipping and delivery	600	--
Total operating expenses	1,400	1,300
Income (loss) from operations prior to equalization	2,800	(1,300)
Share of operating results per agreement	750	750
Equalization payment (receivable) payable	$2,050	$(2,050)

Analysis

1. *Determine applicability of EITF 07-1.* The endeavor involves 2 parties that are both actively involved and that share equally in both risks and rewards. The existence of the separate entity (DGS) does not disqualify the arrangement since the joint operating activities are not *primarily* conducted through the separate entity. Thus, from the perspective of the participants, the arrangement is considered a collaborative arrangement within the scope of EITF 07-1 for the year ended December 31, 2009.
2. *Determine the accounting for the transactions in the separate legal entity.* DGS has no parent company that controls it via ownership as a voting interest entity or via other financial control as a variable interest entity. Thus, under ASC 323, each participant is to record its investment in DGS and apply the equity method to account for its investment in the joint venture as follows:

	Debit	Credit
1/2/2009		
Investment in DGS	10,000	
Cash		10,000
To record initial investment in Duchy Golf Sales Co. joint venture		
12/31/2009		
Investment in DGS	65	
Equity in earnings of investee (income statement)		65
To record 50% interest in the earnings of the joint venture for the year		

3. *Apply ASC 605-45 to determine which of the participants is principal and which is agent.* Analysis under the provisions of ASC 605-45 yields the following results:

	Indicator (G=Gross; N=Net)	*LSG*	*MML*
a.	Is primary obligor	G	N
b.	Has authority, within reasonable limits, to establish price	G	N*
c.	Involved in determining specifications of product or service	G	N
d.	Changes the product or performs part of the service	G	N

	Indicator (G=Gross; N=Net)	LSG	MML
e.	Has discretion in selection of suppliers	G	N
f.	Exposed to inventory risks		
	1. General risk before order placed; upon customer return	G	N
	2. Specific risk after order placed or during shipping	G	N
g.	Exposure to credit risk	G	G
h.	Earnings fixed vs. variable	G	G

**In six states, MML has limited discretion with respect to sales price*

Under ASC 605-45, the party that is the primary obligor is a strong indicator of the party that serves as principal to the transactions. In addition, all of the other indicators point towards LSG being the principal. This is irrespective of the fact that MML does have limited authority in certain markets to negotiate price. Even in those limited states, LSG serves as the principal to the transaction. Both participants bear credit risk equally and are not limited to a percentage commission since they share equally in the commercial success of the endeavor, thus the applicability of indicators g. and h. is neutral between the parties. Based on the analysis of the above factors, management of both particpants concluded that LSG is the principal to the transactions associated with the collaborative arrangement and MML functions as an agent.

Note that, in this fact situation, LSG is the principal for all sales other than those made through the joint venture. In some collaborative arrangements, this will not be the case and management will be required to analyze differing sales arrangements to determine separately for each type of arrangement, the party that is the principal. As can be discerned from the analysis above, this involves the exercise of judgment in light of the specific facts and circumstances.

4. *Determine the applicable GAAP for the transactions and elect an appropriate accounting policy to be disclosed and followed consistently.* Management of LSG and MML summarized the various activities, revenues and expenses associated with the arrangement as follows:

	Functional classification					*Ongoing, major central operations?*	
Natural classification	*Particip. with primary responsibility under JDA*	*Directly earned or incurred as principal in transactions with third-party customers*	*Design and development of product, co-owned intellectual property*	*Development of co-owned marketing-related intangibles*	*Marketing*	*LSG*	*MML*
Sales to sporting goods stores	LSG	x				x	
R&D laboratory services; licensing	N/A						x
Advertising and promotion of product	MML				x	x	
Branding, logo, package design	LSG			x		x	
Credit, collections, bad debts	LSG	x				x	
Filing for patents	MML		x			x	x
Manufacturing, delivery, fulfillment	LSG	x				x	
R&D–Clubs	LSG		x			x	
R&D–Metals	MML		x			x	x

Based on the foregoing analysis, LSG's management determines that since it is the principal under ASC 605-45, LSG is required to present in its income statement, 100% of the sales, and cost of sales, and other related operating expenses that it incurred in connection with the

endeavor. It is unable to find any authoritative GAAP that directly or by analogy would address how to account for the equalization payments it is required to make or entitled to receive. It analyzes the components of the payment and reflects them in LSG's income statement as follows:

Components of Equalization Payment to MML	
Presented as additional cost of sales; in effect the sharing of its gross profit with MML results in LSG realizing a reduced margin on its sales of these codeveloped products	
a. MML share of gross profit	$2,100
Reimbursements to MML for LSG share of expenses:	
These functions were performed under the JDA by MML; LSG elects to present these as operating expenses; none of the advertising expenses were capitalizable as direct response advertising or required to be deferred prior to the first time the advertising takes place under LSG's accounting policies it adopted under ASC 720-35, ***Advertising Costs***	
b. Advertising and promotion	250
c. Legal and patent filing fees	300
LSG records the reimbursement to MML for the metallurgical research and development as additional research and development expense analogous with outsourced contract R&D since its laboratory did not have the experience or capability to perform such research	
d. Research and development alloy and metallurgy	100
Reimbursement from MML for MML share expenses	
LSG elects to present these reimbursements as reductions of its recorded expenses retaining their character; it believes its arrangement with MML to share half of the endeavor's results provides it the benefit of reduced costs and that the benefits it receives from the equalization payment should be characterized in its income statement as reductions of the expenses it would otherwise have borne on its own without MML's participation.	
e. Bad debts	(100)
f. Branding, package and logo design	(150)
g. Research and development—Club faces and shafts	(150)
h. Shipping and delivery	(300)
Net equalization payment	$2,050

Leonard Sporting Goods Company
Statement of Income
Ignoring income taxes and other transactions (000s omitted)
Year ended 12/31/2009

	Prior to application of EITF 07-1		*Effects of equalization payment*	*Adjusted income statement*
Sales	$9,200			$9,200
Cost of sales				
Sales to third parties	5,000			5,000
Reimbursement to MML as agent		a	$ 2,100	2,100
Total cost of sales	5,000		2,100	7,100
Gross profit	4,200		(2,100)	2,100

	Prior to application of EITF 07-1		*Effects of equalization payment*	*Adjusted income statement*
Operating expenses				
Advertising and promotion	--	b	250	250
Bad debts	200	e	(100)	100
Branding, package and logo design	300	f	(150)	150
Legal and patent filing fees	--	c	300	300
Research and development				
Alloy and metallurgy	--	d	100	100
Club faces and shafts	300	g	(150)	150
Shipping and delivery	600	h	(300)	300
Total operating expenses	1,400		(50)	1,350
Income (Loss) from operations	2,800		(2,050)	750
Equity interest in income of investee	65			65
Pretax income	$2,865		$(2,050)	$ 815

MML's management analyzed the facts and circumstances associated with the collaborative arrangement. As a research laboratory, performing research and development activities for other entities under contractual arrangements is part of MML's ongoing major and central operations.[7] MML management reached the conclusion that, since LSG is the principal in the transactions with third parties, MML, as an agent, should not recognize revenue or the related cost of that revenue at their gross amounts nor should it present expenses in the operating expense category in its income statement that are related to these transactions that it considers peripheral. Following this line of reasoning management classifies the activity related to the arrangement as follows:

Maureen Metals LLC
Statement of Income
Ignoring income taxes and other transactions (000s omitted)
Year ended December 31, 2009

Revenues from collaborative arrangement			
MML share of gross profit			$2,100
Related expenses net of reimbursements			
Advertising and promotion	$500	$(250)	250
Bad debts			100
Branding, package and logo design			150
Shipping and delivery			300
			800
Net revenues from collaborative arrangement			1,300
Intellectual property design and development			
Legal and patent filing fees	$600	$(300)	300
Research and development			
Metallurgical	200	(100)	100
Club faces and shafts			150
			550
Income from operations			750
Equity interest in income of investee			65
Pretax income			$ 815

[7] *The phrase "ongoing, major or central operations" is used in CON 5,* ***Recognition and Measurement in Financial Statements of Business Enterprises*** *to differentiate activities from those that are incidental or peripheral to the reporting entity. Frequently, financial results from incidental or peripheral activities are presented in "other income and expense" if they are unusual or infrequent in nature whereas the results from ongoing, major, or central operations are shown as components of operating income and expense.*

Note MML management's position that the costs of developing the intellectual property and protecting it by filing for patents are part of its "ongoing, major, or central operations." Thus, those expenses are not considered directly related to its earnings as agent from the transactions occurring after the product was fully developed and shipments commenced. Although the details are presented for illustrative purposes, the net revenues from the collaborative arrangement could be shown as the first line in the income statement and MML management could elect to voluntarily disclose the details in the notes to the financial statements to better inform the reader regarding the nature and results of the activities associated with the collaborative arrangement.

Investments in Life Settlement Contracts

A life settlement contract is an agreement executed between a third-party investor and the owner of a life insurance policy where (1) the investor does not have an insurable interest in the life of the insured, (2) the investor pays an amount in excess of the policy's cash surrender value to the policy owner, and (3) upon the death of the insured, the face value of the policy is paid to the investor. These investments may be facilitated by a broker or transacted directly between the investor and the policy owner.

ASC 325-30 requires the investor to elect to account for these investments using either the "investment method" or the "fair value method." This irrevocable election is made in one of two ways.

1. On an instrument-by-instrument basis supported by documentation prepared concurrently with acquisition of the investment, or
2. Based on a preestablished, documented policy that automatically applies to all such investments.

The investment method. The investor recognizes the initial investment at the transaction price plus all initial direct external costs. Continuing costs (payments of policy premiums and direct external costs, if any) necessary to keep the policy in force are capitalized. Gain recognition is deferred until the death of the insured. At that time the investor recognizes in net income (or other applicable performance indicator) the difference between the carrying amount of the investment and the policy proceeds.

The investor is required to test the investment for impairment upon the availability of new or updated information that indicates that, upon the death of the insured, the expected proceeds from the insurance policy may not be sufficient for the investor to recover the carrying amount of the investment plus anticipated gross future premiums (undiscounted for the time value of money) and capitalizable external direct costs, if any. Indicators to be considered include, but are not limited to

1. A change in the life expectancy of the insured
2. A change in the credit standing of the insurer

As a result of performing an impairment test, if the undiscounted expected cash inflows (the expected proceeds from the policy) are less than the carrying amount of the investment plus the undiscounted anticipated gross future premiums and capitalizable external direct costs, an impairment loss is recognized. The loss is recorded by reducing the carrying value of the investment to its fair value. The fair value computation is to employ current interest rates.

The fair value method. The initial investment is recorded at the transaction price. Each subsequent reporting period, the investor remeasures the investment at fair value and recognizes changes in fair value in current period net income (or other relevant performance indicators for reporting entities that do not report net income). Cash outflows for policy premiums and inflows for policy proceeds are to be included in the same financial statement line item as the changes in fair value are reported.

Balance sheet presentation. On the face of its balance sheet, the investor is required to differentiate between investments remeasured at fair value and those accounted for using the investment method. This may be accomplished by either

1. Presenting separate line items for each type of investment, or
2. Parenthetical disclosure

Examples of balance sheet presentation alternatives

1. Separate line items

Investments in life settlement contracts measured at	
Fair value	$xxx,xxx
Initial investment and accumulated costs	$xxx,xxx

2. Parenthetical disclosure

Investments in life settlement contracts	$xxx,xxx
(Portion stated at fair value $xxx,xxx)	

Income statement presentation. Investment income attributable to fair value remeasurements is presented on the face of the income statement separately from investment income attributable to contracts accounted for using the investment method. This may be accomplished by either

1. Presenting separate line items for investment income attributable to each type of investment, or
2. Parenthetical disclosure

Examples of income statement presentation alternatives

1. Separate line items

Investment income from life settlement contracts measured at	
Fair value	$xx,xxx
Initial investment and accumulated costs	$xx,xxx

2. Parenthetical disclosure

Investment income from life settlement contracts	$xxx,xxx
(Portion from contracts carried at fair value $xxx,xxx)	

Cash flow statement presentation. Cash inflows and outflows attributable to investments in life settlement contracts are to be classified based on the nature and purpose for which the contracts were acquired.

Disclosure of accounting policy. In addition to other applicable GAAP disclosures, the investor is to disclose the policy it follows to account for life settlement contracts including the classification in the cash flow statement of cash inflows and outflows associated with these contracts.

Disclosures when using the investment method. For life settlement contracts accounted for under the investment method, the investor is required to disclose the following information based on the remaining life expectancy of the insured individuals:

1. By year, for each of the first five fiscal years ending after the balance sheet date, in total for the years succeeding those first five years, and in the aggregate
   a. The number of life settlement contracts in which it has invested
   b. The carrying value of those contracts
   c. The face value (death benefits) of the life insurance policies covered by those contracts

2. By year, for each of the first five fiscal years ending after the date of the most recent balance sheet presented, the life insurance premiums expected to be paid in order to keep the life insurance policies related to the life settlement contracts in force.
3. If management becomes aware of new or updated information that causes it to change its estimates of the expected timing of its receipt of the proceeds from the investments, it is to disclose the nature of the information and its related effect on the timing of the expected receipt of the policy proceeds. This disclosure is to include significant effects of the change in estimate on the disclosure described in 1. above.[8]

Disclosures when using the fair value method. For life settlement contracts accounted for under the fair value method, the investor is required to disclose the following information based on the remaining life expectancy of the insured individuals:

1. The method(s) and significant assumptions used to estimate the fair value of the contracts, including any mortality assumptions
2. By year, for each of the first five fiscal years ending after the balance sheet date, in total for the years succeeding those first five years, and in the aggregate
   a. The number of life settlement contracts in which it has invested
   b. The carrying value of those contracts
   c. The face value (death benefits) of the life insurance policies covered by those contracts
3. The reasons for changes in its estimates of the expected timing of it s receipt of the proceeds from the investments including significant effects of the change in estimates on the information disclosed in 5. above

Other disclosures. For each reporting period for which and income statement is presented

- The gains or losses recognized on investments sold during the period, and
- Unrealized gains or losses recognized during the period with respect to investments that are still held at the balance sheet date.

Other Guidance on Investments and Related Matters

Accounting for transfers of assets that are derivative instruments but that are not financial assets. ASC 815-10-40 addressed the accounting for certain assets that under ASC 815 are derivative instruments, but that are not financial assets as defined in ASC 860. ASC 860 applies only to transfers of financial assets, even though it is used to account for extinguishments of all liabilities (whether financial or nonfinancial). Prior to this consensus, it had been unclear how transfers of assets that are derivative instruments but that are not financial assets were to be accounted for. ASC 815-10-40 prescribes that transfers of assets that are derivative instruments and subject to the requirements of ASC 815, but that are not financial assets, are to be accounted for by analogizing to ASC 860. An example would be a transfer to another entity of a derivative instrument, such as a forward contract to purchase gold that requires physical settlement, which is subject to the requirements of ASC 815.

Structured notes. Structured notes are debt obligations that are coupled with derivatives, most often related to interest rates or foreign currency exchange rates, such that a prescribed increase or decrease in the reference rate will have a large impact on some defined

[8] *This disclosure requirement does not impose an obligation on management to actively seek out new or updated information in order to update the assumptions used in determining the remaining life expectancy of the life settlement contracts.*

attribute of the debt obligation, such as its interest rate, maturity value or maturity date. In some instances, two or more such instruments may be acquired, having essentially opposite characteristics, such that, for example, a change in a reference interest rate will cause the fair value on one holding to increase and the other to decrease, by equal amounts. In some instances, this may have been arranged in order to be able to achieve a recognizable loss on the one (losing) investment by selling it, while holding the other (winning) one as an available-for-sale security with unrealized gains reported in other comprehensive income. ASC 320 effectively ends this practice by requiring that the related investments be accounted for as a unit while held, but if one is sold the (joint) carrying amount must be allocated based on relative fair values as of the date of sale, consistent with guidance in ASC 860. The consequence is that neither gain nor loss, recognized or included in stockholders' equity, will result from such transactions.

Recognition of interest income and impairment on purchased and retained beneficial interests in securitized financial assets. When a reporting entity sells a portion of an asset that it owns, the portion retained becomes an asset separate from the portion sold and separate from the assets obtained in exchange. This is the situation when financial assets such as loans are securitized with certain interests being retained (e.g., a defined portion of contractual cash flows). The entity must allocate the previous carrying amount of the assets sold based on the relative fair values of each component at the date of sale. In most cases, the initial carrying amount (i.e., the allocated cost) of the retained interest will be different from the fair value of the instrument. Furthermore, cash flows from those instruments may be delayed depending on the contractual provisions of the entire structure (for example, cash may be retained in a trust to fund a cash collateral account). The issue addressed by ASC 325-40 was how interest income and impairment should be recognized for retained interests in securitizations that are classified as available-for-sale or as held-to-maturity.

The standard states that the holder of the beneficial interest is to recognize the excess of all cash flows anticipated at the acquisition transaction date over the initial investment as interest income using the effective yield method. The holder is to update the estimate of cash flows over the life of the beneficial interest. If the estimated cash flows change (but there is still an excess over the carrying amount), the adjustment is accounted for as a change in estimate with the amount of the periodic accretion adjusted over the life of the beneficial interest. If the fair value of the beneficial interest declines below its carrying amount, the reporting entity would apply the impairment guidance in ASC 320. If it is not practicable for a holder/transferor to estimate the fair value of the beneficial interest at the securitization date, interest income is recognized using the cash basis rather than the effective yield method.

If, based on current information and events that the reporting entity anticipates a market participant will use in determining the current fair value of the beneficial interest, there is a change in estimated cash flows, the amount of accretable yield is to be recalculated. If the change in estimated cash flows is adverse, an other-than-temporary impairment would be found to have occurred.

Accounting for freestanding derivative financial instruments indexed to, and potentially settled in, the stock of a consolidated subsidiary. ASC 815 contains a framework for accounting for freestanding derivative instruments that are indexed to, and potentially settled in, a company's own stock. It does not, however, provide guidance on the accounting for freestanding derivative instruments that are indexed to, and potentially settled in, a subsidiary's stock. ASC 810 addresses how such contracts should be classified and measured in the consolidated financial statements.

The stock of a subsidiary is not equity of the parent; therefore, derivatives indexed to and to be settled in stock of a subsidiary do not meet ASC 815's exclusion criteria. If deriv-

atives meet the criteria of ASC 815 (e.g., for net settlement, etc.), these must be accounted for under the provisions of ASC 815. The consensus also discusses a number of exceptions based on the criteria set forth in ASC 815.

Option or forward strike prices and premiums could be indicative of impairments of the parent's investment in subsidiaries—which would need to be assessed using ASC 360. A parent's contract to purchase a subsidiary's (minority held) common stock is not recorded until settled; during the period of the contract, income continues to be allocated to the minority interest. A contract to sell shares in a subsidiary, likewise, is recorded when settled; until that time, income would not be allocated to outside interests (counterparties to the derivative).

Implications of Accounting for Investments on the Reporting of Comprehensive Income

ASC 220 expanded reporting of the changes in items (other than investments by or distributions to owners) that are reported in the equity section of the balance sheet. Among these items are unrealized gains or losses on securities held in the available-for-sale portfolio, and accordingly changes in these gains or losses must be reported in the statement of comprehensive income or via the other allowable reporting mechanisms described in Chapter 3. These changes may be reported net of income tax or gross, with the income tax effect separately presented within other comprehensive income.

The major complicating factor arising from reporting changes in the unrealized gains or losses of available-for-sale securities derives from the "recycling" of gains or losses when the underlying securities are later sold or transferred into the trading portfolio; either of these events necessitates recognition of the entire gain or loss in net income, including any unrealized gain or loss that might have previously been reported in other comprehensive income (but not in net income). To avoid "double counting" the gain or loss, the amount of gain or loss previously reported in other comprehensive income must be reversed simultaneously with the recognition in net income.

Example of "recycling" between accumulated other comprehensive income and net income

To illustrate the "recycling" problem, consider an investment by Zenobia Co. in $500,000 face amount of Vaught Corp. bonds due July 1, 2019, carrying coupons of 8%. The purchase, for a total of $530,000, occurs on July 1, 2009, and the bonds are deemed available for sale, as defined by ASC 320. Per that standard, periodic interest income must be computed by the effective yield method based on the acquisition cost (i.e., the face value net of any premium or discount), but the difference, if any, between amortized cost and fair value as of the balance sheet date must be reported as a contra or additional equity account, with changes being taken into other comprehensive income for the period.

The yield to maturity on the Zenobia bonds is approximately 7.15%; for simplicity, the premium will be amortized straight-line ($1,500 per semiannual interest payment period) in this example, rather than by the effective yield method as is actually required.

Assume that the bonds have a fair value of $522,000 as of year-end 2009 and $527,000 as of year-end 2010. As of March 31, 2011, the value of the bonds is $528,000, at which time they are in fact sold.

Given the foregoing, as of December 31, 2009, the amortized cost basis of the investment would be $530,000 – $1,500 = $528,500. Since the fair value at that date is $522,000, an unrealized loss of $528,500 – $522,000 = $6,500 must be recorded in other comprehensive income, before any income tax effects (which will be ignored here, again for simplicity). Interest income for the half-year ended December 31, 2009, was $20,000 – $1,500 = $18,500 under the simplifying assumption of straight-line amortization, and this would be included in earnings.

At year-end 2010, the bonds have an amortized cost basis of $528,500 – $3,000 = $525,500 vs. a fair value of $527,000. Interest income for the year ended December 31, 2010, included in earnings, was $40,000 – $3,000 = $37,000. A positive adjustment (i.e., income) of $8,000 must be

reported in other comprehensive income for 2010 in order to carry the bonds at fair value as of the year-end.

For the three-month period ended March 31, 2011, further premium amortization of $750 must be recorded (along with an interest accrual), which will reduce the bond's amortized cost basis to $525,500 – $750 = $524,750 as of the date of the sale, which is made at the market value of $528,000. For purposes of reporting results of operations for the quarter ended March 31, 2011, a positive other comprehensive income adjustment of $1,750 must be reflected—this is necessary to bring the carrying value of the bonds up to their fair value as of that date. However, since the bonds are sold and a realized gain of $3,250 is to be reported in earnings, a "reclassification adjustment" of the same amount must be included as a negative (i.e., expense) item in other comprehensive income for that period, which will thus cause the net other comprehensive income item pertaining to the bonds held in the available-for-sale portfolio to be a negative $1,500 for the period ended March 31, 2011.

The foregoing is summarized in the following table (it is assumed that the 2011 transaction is reported at year-end):

Zenobia Co.
Selected Portions of Combined Statements of Earnings and Comprehensive Income
(ignoring income tax effects)
December 31, 2009, 2010, and 2011

December 31, 2009

Certain Loans or Debt Securities Acquired in Transfers

The preceding discussion has not differentiated between securities investments acquired directly from the issuer and those obtained on the secondary market, since this distinction has not heretofore held implications for financial reporting. However, ASC 310-30, *Receiv-*

ables—Loans and Debt Securities Acquired with Deteriorated Credit Quality, imposes for the first time new accounting requirements for debt instruments acquired in transfers when the purchase price reflects a change in the debtor's credit standing since the original issuance of the instrument. This standard is applicable to all acquirers of loans or debt securities (bonds, securitized loans, etc.), not merely financial institutions, although relatively fewer of commercial or industrial entities would tend to be making such purchases.

Debt instruments (whole loans or loan participations, as well as securities) will generally trade in the secondary market at prices that vary from the amount at which they were issued originally. The prices may be higher or lower than the face amount, depending on the confluence of several factors. Because interest rates change almost continually, it is rare that market rates will correspond to the nominal rate on any given loan or debt security, even if the loan or instrument originally carried a market yield. Furthermore, many instruments are issued at premiums or discounts at inception, for various reasons. In the secondary market, prices will be adjusted continually to reflect current market conditions as they pertain to the loan's (or security's) coupon rate and the credit standing of the issuer/borrower, within the context of market rates of interest and other factors. If current rates are higher than the instrument's coupon (i.e., contractual) rate, it will trade at a discount from par value, while if the current rates are below the coupon rate, it will sell for a premium, if other variables are held constant.

Furthermore, the borrower's creditworthiness may well have changed since the loan was originated or the debt instrument was issued. This also impacts the price at which the loan or security will trade, with a decline in credit standing resulting in a drop in value, and an improvement in credit standing causing a rise in the value of the entity's debt. Creditworthiness pertains to the risk of default, and a number of well-regarded private sector companies closely monitor the outstanding debt of publicly held and private corporations and various governmental agencies and political subdivisions. Examples of rating agencies or measures are Moody's, Standard & Poor's and Fitch's, for publicly held companies and the Fair Isaac credit score for private companies.

Yields on debt instruments may also vary because of macrolevel factors, such as market concerns over industry developments, rather than a change in a given issuer's specific risk of default or a change in general interest rates. For example, during the telecom industry bust of the late 1990s and early 2000s, even well-regarded entities saw prices of their traded debt securities drop substantially due to industry-wide concerns.

Loans or debt securities may trade in the secondary market at their original issuance prices as the coincidental result of offsetting changes in the above-noted variables. Thus, market yields may have declined—which, taken alone, would cause a rise in the price of fixed coupon debt instruments—but concurrently the issuer's creditworthiness may have been reassessed downward by rating agencies—which, absent other events, would cause the price of the debt to decline. In tandem, the credit downgrade may have essentially negated the price response to lower market interest rates. In applying ASC 310-30, it is necessary to refer not simply to the price at which the loan or security has been transferred, in relation to its "par" or original issuance price, but also to examine whether there is information to suggest that there has been a change in the issuer's credit quality since inception of the obligation. Only in the latter circumstance will the provisions of this new standard be applied.

ASC 310-30 in greater detail. The purpose of ASC 310-30 is to prescribe the accounting for debt instruments (comprising most loans and debt securities, with certain exceptions) which are acquired via a transfer (i.e., in the secondary market) and which have been affected by changes in credit quality. The standard requires that the accretable yield be determined. This is derived from the relationship between the future cash flows expected to be collected

and the price paid for the acquired instrument. The accretable yield is distinguished from the nonaccretable difference, which is generally the excess of the total of contractual future cash flows over the expected cash flows.

Neither the accretable yield nor the nonaccretable difference can be displayed in the financial statements. For example, consider a loan that contractually is obligated to pay a total of $85,000 in future interest and principal, but which can be purchased for $50,000 and is expected to provide future cash flows of only $73,500. The $23,500 ($73,500 – 50,000) spread between the purchase price and the undiscounted expected future cash flows is the accretable yield. The further $11,500 ($85,000 – 73,500) spread between expected and contractual cash flows, however, is the nonaccretable difference, which cannot be given accounting recognition under ASC 310-30. That is, the loan (which is an investment in the hands of the transferee) cannot be recorded or displayed at the higher, $85,000 amount, with a contra account or valuation allowance pertaining to the pretransfer estimated uncollectible amount being reported. Instead, the purchase cost, $50,000, must be the initial representation of this acquired asset, which is later increased by virtue of the accretion of yield (and reduced by collections).

While ASC 310-30 applies to loans and debt securities, there are important exceptions. Derivative instruments are excluded entirely from the scope of the standard, although debt instruments that contain embedded derivatives are not excluded. Also, debt securities that are accounted for at fair value with changes taken into income currently (i.e., those held in trading portfolios) are exempted, since these are not accreted to face value or to an expected level of future cash flows. Similarly, since changes in the fair values of trading and available-for-sale securities held by not-for-profit organizations both are reflected currently in the changes in net assets (the parallel performance measure for not-for-profit entities, roughly corresponding to net income), these are also exempted. Mortgage loans classified by mortgage bankers as held-for-sale (and presented at fair value) are also exempted from the provisions of ASC 310-30.

ASC 310-30 applies to both specific acquisitions of loans or debt securities (e.g., purchases of single loans, pools of loans, or debt securities) and to acquisitions as part of a business combination accounted for under ASC 805. In the case of business acquisitions, while it was sometimes observed in past practice that the gross amount of the loan would be recorded, together with a contra or valuation allowance for the estimated uncollectible portion, this is no longer permitted. ASC 310-30 is explicit that "carryover" of the selling entity's book values is not permitted. A new cost basis is established and, at the date of acquisition, the asset (investment) must reflect the actual cost of the loan or other instrument, without any "grossing up" and without any contra asset being recorded. Any valuation allowance (contra asset) provided *after* acquisition will reflect only the change in value occurring after that date. The transferee's valuation allowance cannot include any changes in value arising while the asset was in the hands of the former owner/transferor of the loan or security.

Upon acquisition the effective yield is to be computed, based on the expected pattern (i.e., timings and amounts) of future cash flows, so that interest can be accreted on the level-yield basis (a constant rate on a changing base). Over the holding term of the investment, expected cash flows may be altered: they may decline due to perceived impairment or may increase due to upgrading of creditworthiness. The accounting for such changes will vary, with decreases in expectations triggering immediate impairment loss recognition, while increases will generally be reported prospectively over the holding period of the instrument. The precise accounting for changes in expected future cash flows also depends, per ASC 310-30, on whether the instrument is accounted for as a loan (under ASC 310), or as a debt security (under ASC 320). These matters are addressed in the following sections.

Under ASC 310-30, reductions in expected future cash flows will trigger the recognition of a loss in the current reporting period.

Accounting for investments in loans acquired by transfer. Loans acquired by transfer (i.e., in the secondary market) are recorded initially at acquisition cost, consistent with a fundamental tenet of GAAP. If the acquisition price differs from the par or face amount (i.e., there is a premium or a discount) the effective yield has to be computed and used to accrete the discount (or, if a premium, amortize it) over the expected term of the instrument. This process is well established under GAAP and is not new with ASC 310-30.

However, if there is evidence of a decline in creditworthiness since the instrument's inception, such that it is deemed probable at the date of transfer that the full amount of contractual cash flows will not be received, the provisions of ASC 310-30 must be applied. In this context, probable is used in the same way as it is under ASC 450, and only if that rather high threshold criterion is satisfied will this standard be invoked. In such cases, the transferee must estimate cash flows to be received, and accrete the initial carrying amount to that amount, rather than to the gross amount of future contractual cash flows. An uncertainty regarding future cash flows that suggests only a possible shortfall versus contractual amounts owed would not qualify under the standard for the accounting set forth in this discussion. (In such a situation, there would be disclosure of reasonably possible contingent losses, and if at a later date the loss is deemed to have become probable, a loss accrual would be recognized per ASC 450.)

The estimation of the amounts of expected future cash flows, and the timing of those cash flows, is obviously a matter of some complexity and inevitable subjectivity. For example, if payments from a credit-impaired obligor are expected to be made, say, fifteen days late on average, this will impact the computed effective yield on the loan and is to be given explicit consideration in ascertaining the effective yield, subject to the usual materiality threshold concerns. The calculation of accretable yield is made at the acquisition date, but, as described below, may later have to be adjusted as expectations regarding future cash flow amounts change. Subsequent reduced expectations of cash flows will result in the recognition of impairment, while expectations of enhanced or improved cash flows may result in reversal of previously recognized impairment (if any), or increased effective yield over the instrument's remaining holding period.

Basic example of loans acquired via transfer

Assume that Investor Co. acquires a loan with a remaining principal balance of $650,000 on January 1, 2009. The contractual terms of the loan call for interest-only payments, at 9%, annually through December 31, 2013, at which time the full principal balance is due. The debtor's credit rating has been reduced subsequent to the initiation of the borrowing, and the 2008 interest payment was not made when due. Investor Co. pays $500,000 (flat) for the loan and any unpaid interest. The expectation is that the debtor will pay $40,000 at the end of 2009, $60,000 at the end of years 2010 and 2011 (each year), $70,000 at the end of 2012, and $600,000 at the end of 2013. Total projected cash inflows, $830,000, are lower than the contractually due amount, $1,001,000 (including the arrearage for 2008), and the effective yield will be about 12.6%. At transfer, the investment is recorded at cost, as follows:

Investment in loan receivable	500,000	
Cash		500,000

At the end of 2009, immediately prior to receipt of the payment, the entry to record the accretion for the year, at the effective yield, is

Investment in loan receivable	62,974	
Accretion (interest income)		62,974

The collection of the anticipated amount at December 31, 2009, is recorded as follows:

Cash	40,000	
Investment in loan receivable		40,000

Entries for subsequent years' accretion and collections would follow in the same manner. This presumes, of course, that amounts expected to be received indeed are received, and that expectations about the future receipts do not depart from what had been anticipated when the loan was purchased.

The changes in carrying amount and recognition of income over the full five-year period are illustrated in the following chart.

	A	*B*	*C*	*D*	*E*
Year ending December 31	*Beginning carrying amount*	*Cash flows expected to be collected*	*Interest income*	*Reduction (increase) in carrying amount (B–C)*	*Ending carrying amount of loan (A–D)*
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011	528,841	60,000	66,606	(6,606)	535,447
2012	535,447	70,000	67,438	2,562	532,885
2013	532,885	600,000	67,115	532,885	--
		$830,000	$330,000	$500,000	

In the foregoing chart total cash collected, $830,000, consisted of $330,000 in interest, accreted at the 12.6% computed yield, and $500,000 return of investment in the loan receivable. Contrast this result with the examples that follow.

Example with decrease in expected cash flows

If, subsequent to acquisition and computation of effective yield, the expected cash flows associated with a loan are revised downward, ASC 310-30 directs that this be accounted for as an impairment, with the adjustment being such that the previously determined yield percentage is maintained in future periods by applying the constant return to a downwardly adjusted carrying value. While some might argue that a diminished expectation of cash flows would imply a new, lower rate of return, ASC 310-30 instead opts for recognizing an immediate impairment, measured as the then-present value of the stream of cash flow shortfalls being projected. This results in a continuing rate of return equal to the original estimate, but with a step-down in the carrying value of the loan.

To illustrate, using the same basic facts above, assume now that immediately after the 2011 payment is made, Investor Co., revises its expectation of cash flows to be received in 2012 and 2013. It now anticipates zero cash collection in 2011, and only $500,000 at year-end 2013. The present value of these shortfalls—a $70,000 shortage one year hence, followed by a $100,000 shortfall two years later—discounted at the 12.6% yield on the investment computed at the date of transfer, reveals an impairment of $141,039 as of the start of 2012. The entry to record this, given that the investment is treated as a loan rather than as a debt security, is as follows:

Bad debt expense	141,039	
Allowance for uncollectible loan receivable		141,039

The reduced net carrying value of the loan receivable, which is $394,408 immediately following this adjustment, will continue to accrete at 12.6%, as the following table illustrates:

	A	*B*	*C*	*D*	*E*
Year ending December 31	*Beginning carrying amount of loan*	*Cash flows expected to be collected*	*Interest income*	*Reduction (increase) in carrying amount (B–C)*	*Ending carrying amount of loan (A–D)*
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011	528,841	60,000	66,606	(6,606)	
2012*				141,039	394,408
2013	394,408	--	49,675	(49,675)	444,083
2014	444,083	500,000	55,917	444,083	--
		$660,000	$301,039	$500,000	

* *Provision of allowance for estimated uncollectible future cash flows, computed at present value using the effective yield on the loan.*

It will be observed in the foregoing chart that total cash collected, $660,000, consisted of $301,039 in interest, accreted at the 12.6% computed yield, and the recovery of only $358,961 of

the $500,000 investment in the loan receivable. In other words, SOP 03-3 treats the decrease in expected cash flows as a loss of principal, accounted for as a bad debt and a provision of a valuation allowance against the $500,000 loan receivable. Note that the decreased cash flow expectation was *not* accounted for as a lowered future return on the investment (which would have resulted in lower interest income recognition in years 2012 and 2013, in this example, coupled with a full recovery of the principal invested).

Example with decrease in expected cash flows followed by increase in expected cash flows (recovery of uncollectible loan receivable)

If Investor Co., above, first lowers its expectation regarding future cash flows and then partially reverses its estimate, so that some or all (but not more than all) of the allowance of the uncollectible loan receivable proves unneeded, this is accounted for under ASC 310-30 as a reversal of the valuation allowance account (i.e., as a change in an accounting estimate).

To illustrate, consider again the facts in the basic example, and now assume that in 2011 Investor Co. has the expectation that no interest will be collected in 2012 and that only $500,000 will be collected in 2013. In 2012, however, $20,000 is in fact collected, and Investor Co. then expects a full collection of the $600,000 in 2013 (but no recovery of the $50,000 missed payment in 2012).

The entry to record the reduced expectation of future cash flows at the end of 2010 or beginning of 2011 is as shown previously.

Bad debt expense	141,039	
Allowance for uncollectible loan receivable		141,039

In 2012, the collection of the $20,000 (when no collection at all was anticipated) coupled with the renewed expectation of collecting $600,000 in 2013 required that some of the previously provided valuation allowance be reversed. The amount of valuation allowance to be restored, per ASC 310-30, is that amount which will result in interest accretion thereafter at the previously determined 12.6% yield through the final collection of the loan. Assuming that the $20,000 collection in December 2012 came as a surprise, the adjustment will be computed with reference to the final remaining collection, $600,000, expected in December 2013, and to the $20,000 unexpected 2014 collection.

The entry to partially restore the carrying value of the loan, net of the valuation allowance, is as follows:

Allowance for uncollectible loan receivable	108,802	
Bad debt expense		108,802

The computation of the foregoing amount may be somewhat confusing, unless one keeps in mind that the objective of ASC 310-30 is to provide for the reporting of interest income over the full carrying term of the loan receivable, at a constant rate on a changing balance, with that rate being the rate computed at the date of transfer. The only exception, which will be illustrated later in this section, is for situations where the total cash to be collected exceeds the estimate made at the date of transfer; in that case, a higher rate of return is reported in periods after the change in estimate, to avoid the alternative of reporting a gain at the date the new estimate is made. In this example, the anticipated "extra" 2013 collection of $100,000 ($600,000 – $500,000) has a present value at the end of 2012 of $88,802, so this previously provided valuation allowance is no longer needed. Furthermore, the $20,000 collection in 2012 was unexpected, and had previously been fully included in the valuation allowance as being uncollectible, so this too must be reversed. Therefore, the total reversal of valuation allowance is the sum of these two amounts, or $108,802. Alternatively, this can be computed as the adjustment necessary to bring the net carrying value of the loan receivable to the amount of "principal" to be collected in December 2013 (i.e., the present value, discounting at 12.6%, of the expected $600,000 collection).

The net carrying value of the loan receivable will continue to accrete at 12.6%, both after the recognition of the valuation allowance at the end of 2011 and after the partial elimination of the valuation allowance in 2012, as the following table illustrates:

Year ending December 31	A Beginning carrying amount of loan	B Cash flows expected to be collected	C Interest income	D Reduction (increase) in carrying amount (B–C)	E Ending carrying amount of loan (A–D)
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011	528,841	60,000	66,606	(6,606)	
2011*				141,039	394,408
2012	394,408	20,000	49,675	(29,675)	
2012**				(108,802)	532,885
2013	532,885	600,000	67,115	532,885	--
		$780,000	$312,237	$500,000	

* *Provision of allowance for estimated uncollectible future cash flows, computed at present value using the effective yield on the loan.*

** *Restoration of a portion of the previously provided allowance, computed at present value using the effective yield on the loan, relative to expected 2013 collection, plus the $20,000 unanticipated collection in 2012 at full accreted amount.*

It will be observed in the foregoing chart that total cash collected, $780,000, consisted of $312,237 in interest, accreted at the 12.6% computed yield, and the recovery of only $467,763 of the $500,000 investment in the loan receivable. As in the immediately preceding example, ASC 310-30 treats the decrease in expected cash flows as a loss of principal, accounted for as a bad debt and a provision of a valuation allowance against the $500,000 loan receivable. In this case, $32,237 of "principal" (i.e., of the amount recognized at the time of transfer) was lost, which is the net of the $141,039 valuation allowance provision in 2011 and the $108,802 recovery recognized in 2012.

Note that in all of the preceding examples the carrying value of the loan receivable continues to earn the computed 12.6% yield throughout the holding period. This was true if the initially estimated future cash flows were all collected as planned, or if changes to the estimated amounts or timings later were made—as long as the total cash to be collected did not exceed the amount originally (i.e., upon transfer to Invest Co.) estimated. In the next example, the collections exceed what was anticipated when the loan was acquired, and this necessitates a different approach to accounting for the interest yield on the investment.

In all cases where an allowance for uncollectible loan amounts has been provided, if the loan is subsequently foreclosed, the lender must measure the long-lived asset received in full satisfaction of a receivable at fair value less cost to sell as prescribed by ASC 310-40. That standard prescribes that after a troubled debt restructuring, the creditor must account for assets received in satisfaction of a receivable the same as if the assets had been acquired for cash. Accordingly there will be a new cost basis for the long-lived asset received in full satisfaction of a receivable; the valuation allowance would not be carried over as a separate element of the cost basis for purposes of accounting for the long-lived asset under ASC 360 subsequent to foreclosure. This treatment has been confirmed by ASC 310-40.

Example with increase in expected cash flows

Assume again the basic facts of the investment in the loan receivable made by Investor Co. However, after fully collecting the anticipated amounts in 2009 and 2010, Investor revises its estimates of the amounts to be collected in 2011, 2012, and 2013. Specifically, it now expects to receive $75,000 at the end of 2011 and again at the end of 2012, and to collect the full remaining balance, $650,000, at the end of 2013. ASC 310-30 does not permit recognition of a gain or other income upon making this new estimate, but does instead require that the effective yield be recomputed and that future receipts be allocated between interest income and principal reduction consistent with the new accretable yield.

Note that no entry is required at the time of the new estimate of future cash flows because no gain or loss (or reversal of previously recognized loss) is being affected. As with changes in accounting estimates under ASC 250, this is handled strictly on a prospective basis.

Year ending December 31	A Beginning carrying amount of loan	B Cash flows expected to be collected	C Interest income	D Reduction (increase) in carrying amount (B–C)	E Ending carrying amount of loan (A–D)
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011*					
2012	528,841	75,000	88,086	(13,086)	541,927
2013	541,927	75,000	90,265	(15,265)	557,192
2014	557,192	650,000	92,808	557,192	--
		$900,000	$400,000	$500,000	

* *Based on new expectations regarding future cash flows, a new yield is computed in an amount that equates the present value of expected receipts in 2011-13 to the carrying value at the end of 2010, $528,841. This yield is about 16.7%.*

In the foregoing example, $900,000 in cash is ultimately collected, allocated $400,000 to interest income and $500,000 to recovery of the amount recorded at the date of transfer, which was the sum paid for the loan receivable.

Accounting for investments in pools of loans acquired by transfer. Loans that are acquired as a pool present special accounting considerations. Each individual loan must meet the criteria of ASC 310-30 in order to apply the accounting set forth in this standard. Thus, if a group of loans are acquired together and in the aggregate have expected future cash flows in an amount lower than the aggregate contractual cash flows, this does not qualify each of the loans to be accounted for under ASC 310-30. Rather, each loan must be reviewed for impairment due to credit quality, and only those individual loans exhibiting the defined characteristic would be subject to the specified accounting.

After making a determination that each loan in a proposed pool has met the threshold conditions set forth under ASC 310-30 (i.e., that there has been evidence of credit quality deterioration subsequent to the origination, and that it is probable that, as of the transfer date, the transferee will not collect all the contractually required payments), a further determination must be made that the loans share common risk characteristics. Under provisions of ASC 310-30, loans with similar credit risk or risk ratings, and one or more predominant risk characteristics, such as financial asset type, collateral type, size, interest rate, date of origination, term, and geographic location, will be considered to have common risk characteristics. Credit risk can be assessed by reference to publicly available ratings of publicly held companies or by automated ratings such as that produced by Fair Isaac Corporation (FICO scores).

The aggregate cost of the loans to be aggregated is to be apportioned to the loans in the pool in proportion to their respective fair values at date of acquisition. The aggregate accretable yield of the pool is allocated among the loans in this same manner.

Only loans acquired in a given fiscal *quarter* (not year!) are subject to aggregation for financial reporting purposes. Once a pool is established, its integrity must be maintained, and thus loans can only be removed from the pool upon sale, foreclosure, write-off, or settlement. New loans cannot be added to an existing pool. The excess of contractually required cash flows over the acquisition cost of the pool may not be used to offset or absorb changes to anticipated cash flows associated with other loans or pools of loans having other common risk characteristics.

Removal of a loan from a portfolio is effected at the loan's then-carrying value, and accordingly a gain or loss would be reflected in income of the period, measured as the difference between the carrying value and the fair value of the amount received in settlement (e.g., cash or collateral). Any difference between the carrying amount of the loan being removed from the pool and the fair value of the amount received will not impact the percentage yield being used to accrete value on the remainder of the pool.

Example of an investment in a pool of loans acquired by transfer

Garfield Corporation acquires the following seven loans for $600,000 during the same fiscal quarter:

Loan no.	*Fair value*	*Remaining term*	*Interest rate*	*FICO score*
1	$53,000	4 years	9%	450
2	260,000	4 years	6%	800
3	125,000	4 years	10%	600
4	78,000	4 years	8%	480
5	50,000	4 years	7%	730
6	92,000	4 years	10%	390
7	67,000	4 years	9%	340
	$725,000			

Garfield elects to split these loans into two groups—those having Fair Isaac & Co. (FICO) scores below the minimum Fannie Mae acceptance score of 620, and those above it. Accordingly, loan numbers 2 and 5 are shifted into a separate Pool A, with the remaining loans in Pool B. The $600,000 acquisition cost is allocated to the two pools based on the relative fair values of the loans within the pools, as shown below.

Pool no.	*Aggregate fair value*	*Proportion of total fair value*	*Cost allocation*
A	$310,000	43%	$258,000
B	415,000	57%	342,000
	$725,000	100%	$600,000

Garfield expects $117,376 annual payments from the Pool B loans. It determines that the discount rate equating all cash flows expected to be collected with the $342,000 allocated purchase price is 14%. Using the 14% rate, Garfield constructs the following amortization table for Pool B:

Year	*Expected cash receipts*	*Interest income (14%)*	*Reduction of carrying amount*	*Carrying amount*
Inception				$342,000
1	$117,376	$ 47,880	$ 69,496	272,504
2	117,376	38,151	79,225	193,279
3	117,376	27,059	90,317	102,962
4	117,376	14,414	102,962	0
	$469,504	$127,504	$342,000	

At the beginning of Year 3, Garfield writes off the remaining balance of Loan 7. Prior to the final payment, Loan 7 has a carrying value of $31,204, as determined by apportioning the carrying amount of Pool B at the end of Year 2 amongst the five loans in the pool based on their relative fair values at the date of acquisition. This apportionment calculation is shown in the following table:

Loan no.	*Fair value at inception*	*Relative values*	*Apportionment of year 2 carrying amount*
1	$ 53,000	12.77%	$24,684
3	125,000	30.12%	58,217
4	78,000	18.80%	36,327
6	92,000	22.17%	42,847
7	67,000	16.14%	1,204
	$415,000	100.00%	$193,279

Garfield records the loan write-off with the following entry:

Loss on loan write-off	31,204	
Investment in loan receivable		31,204

The following amortization table reflects the removal of Loan 7 from Pool B, along with its proportionate share of the expected cash receipts in Years 3 and 4.

Year	Expected cash receipts	Interest income (14%)	Reduction of carrying amount	Carrying amount
Inception				$342,000
1	$117,376	$ 47,880	$ 69,496	272,504
2	117,376	38,151	79,225	193,279
Write-off			31,204	162,075
3	98,426	22,690	75,736	86,339
4	98,426	12,087	86,339	0
	$431,604	$120,808	$342,000	

Accounting for investments in debt securities acquired by transfer. If the debt instrument acquired in a transfer to be accounted for under ASC 310-30 meets the definition of a security, as set forth in ASC 320 (namely, that it constitutes a share, participation, or other interest that is represented by a registered or bearer instrument or by book entry, and is one of a class or series of participations, interests or obligations), then ASC 310-30 prescribes a slightly different mode of accounting for changes in expected cash flows. In order to conform to ASC 320's requirements, an anticipated downward change in expected future cash flows must be examined to determine whether merely a temporary change in value has occurred, or whether an other than temporary decline has been signaled. While temporary impairment is not impossible, if in fact the transferee of debt securities—the issuer of which had suffered an adverse change in creditworthiness prior to the transfer—now anticipates further reduced cash flows from the security, there is substantial likelihood that the impairment in value is other than temporary. Under ASC 320, other-than-temporary impairment must be recognized by writing down the carrying value of the investment and reflecting the charge in current earnings, whether the security is being held in the available-for-sale portfolio or is being held to maturity.

If, on the other hand, the estimated future cash flows from the debt security are increased from the amounts anticipated at transfer, then similar to what was illustrated above, the accretable yield is to be recomputed and periodic interest income thereafter appropriately adjusted. This is considered a change in accounting estimate under ASC 250.

To illustrate, consider the same facts as set forth above, except now assume that the loan was instead a debt security meeting the definition set forth in ASC 320. When acquired, it was treated as being available for sale, but for this example no changes in value are addressed other than that associated with the changed expectation of cash flows.

Example of reduction in cash flow expectations

The anticipated cash flows occurred in 2009, 2010, and 2011 but at the beginning of 2012 Investor Co. revises its expectations, and now believes that there will be a zero cash collection in 2012, and only $500,000 at year-end 2013. The present value of these shortfalls—a $70,000 shortage at year-end 2012, followed by a $100,000 gap at year-end 2013—discounted at the same 12.6% rate computed as the yield on the investment at transfer, reveals an impairment of $141,039 as of the start of 2012. The entry to record this, given that the investment is treated as a debt security, rather than as a loan, is as follows:

Loss on impairment of investment	141,039	
Investment in available-for-sale debt securities		141,039

Apart from the bookkeeping (writing down the investment directly rather than crediting a contra asset account), the treatment is very similar to that previously presented. Most importantly, the reduced net carrying value of the debt security held as an available for sale security will continue to accrete at 12.6%, as the following table illustrates:

	A	B	C	D	E
Year ending December 31	Beginning carrying amount of investment	Cash flows expected to be collected	Interest income	Reduction (increase) in carrying amount (B–C)	Ending carrying amount of investment (A–D)
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011	528,841	60,000	66,606	(6,606)	
2011*				141,039	394,408
2012	394,408	--	49,675	(49,675)	444,083
2013	444,083	500,000	55,917	444,083	--
		$660,000	$301,039	$500,000	

* *Write-down of carrying value of investment in debt security, due to reduced expectation of future cash flows, which is judged to be an other-than-temporary impairment, computed at present value using the effective yield on the loan.*

The total cash collected, $660,000, is accounted for as interest income, in the total amount $301,039, and recovery of the "principal" of the investment, net of the impairment recorded in 2011, amounting to $358,961.

Example with decrease in expected cash flows followed by increase in expected cash flows

Unlike in the earlier examples, where the investment was accounted for as a loan receivable, here the investment is in a debt security accounted for under ASC 320, which prohibits restoring an other than temporary decline in value. For this reason, the write-down was not reflected through a contra asset (allowance) account, and a later improvement in the outlook for future cash flows must instead be accounted for prospectively as a yield adjustment.

Assume, therefore, that Investor Co., first lowers its expectation regarding future cash flows and then partially reverses its estimate, so that some or all of the amount of future cash flow thought not to be forthcoming now again is expected to be received. Specifically, assume that in 2011 Investor Co. has the expectation that no interest will be collected in 2012 and that only $500,000 will be collected in 2013. In 2012, however, $20,000 is in fact collected, and Investor Co. then expects a full collection of the $600,000 in 2013 (but no recovery of the $50,000 missed payment in 2012).

The entry to record the reduced expectation of future cash flows at the end of 2010 or beginning of 2011 is as shown below.

Loss on impairment of investment	141,039	
Investment in available-for-sale debt securities		141,039

In 2012, the collection of the $20,000 (when no collection at all was anticipated), coupled with the renewed expectation of collecting $600,000 in 2013, requires that the yield through the end of the expected holding period (final payoff, in this case) be recomputed. Assuming that the $20,000 payment for 2012 was received before the financial statements for 2012 have been prepared, it would be appropriate to recompute accretable yield as of the beginning of that year, so that both 2012 and 2013 will report interest income consistent with the pattern of cash flows over that two-year period. The calculated yield on an investment equal to the carrying value at the beginning of 2012 ($394,408), which is expected to generate cash inflows of $20,000 at the end of that year and $600,000 at the end of the next year, is 25.9%, and this is used to accrete yield over the remaining term.

Since this will be reported prospectively, no entry is made as of the beginning of the year (nor would the necessary information have been available), but the entry to record interest income and the accretion for uncollected interest would be as follows:

Cash	20,000	
Investment in available-for-sale debt securities	82,156	
Interest income		102,156

The accretion of value is akin to an amortization of discount, and represents interest earned but not received, based on the most recent estimates of future cash flows. It does not represent a recovery of the previously written down carrying value of the investment because of permanent impairment. The complete analysis can be seen in the chart below.

Year ending December 31	A Beginning carrying amount of investment	B Cash flows expected to be collected	C Interest income	D Reduction (increase) in carrying amount (B–C)	E Ending carrying amount of investment (A–D)
2009	$500,000	$ 40,000	$ 62,974	$ (22,974)	$522,974
2010	522,974	60,000	65,867	(5,867)	528,841
2011	528,841	60,000	66,606	(6,606)	
2011*				141,039	394,408
2012**	394,408	20,000	102,156	(82,156)	476,564
2013	476,564	600,000	123,436	476,564	--
		$780,000	$421,039	$500,000	

* *Write-down of carrying value of investment in debt security, due to reduced expectation of future cash flows, which is judged to be an other-than-temporary impairment, computed at present value using the effective yield on the loan.*

** *Interest is accreted at the new rate of 25.9% hereafter.*

It will be observed in the foregoing chart that total cash collected, $780,000, consisted of $421,039 in interest, accreted, first, at the 12.6% computed yield through the end of 2011, and then at the 25.9% computed yield in light of higher expected cash flows for 2012 and 2013. The remainder of the cash flows, totaling $358,961, was attributable to the recovery of the investment, net of the write-down for impairment in 2011.

In contrast to the example where the investment was accounted for as a loan receivable, here the yield is adjusted prospectively when a recovery in value is observed, and this causes relatively more of the future cash flows to be treated as interest income, and relatively less as recovery of the investment principal.

Note that if no reduction in future cash flows had been anticipated, but if an increase in cash flows was expected at some point during the holding period of the investment, the result, from an accounting standpoint, would be as shown immediately above. The accretable yield would have been computed and recognized prospectively over the remaining holding period of the security.

Disclosure requirements under ASC 310-30. The standard sets forth expanded disclosure requirements pertaining to accounting for prepayments. In addition, disclosure is required, separately for instruments accounted for as loans and for those accounted for as debt securities, of outstanding balances and related carrying amounts at the beginning and end of each reporting period; and of the amount of accretable yield at the beginning and end of each period, with reconciliation of additions, accretion, and disposals of loans and for any reclassification between accretable and nonaccretable yields. Also, for loans acquired during the reporting period, disclosure is required of the contractually required payments receivable, expected cash flows associated therewith, and fair values at acquisition dates. For instruments accounted for as loans (not debt securities), the investor must disclose provisions for uncollectible amounts and reversals thereto made during the period, and the amount of the allowance for uncollectible amounts at both the beginning and end of the reporting period.

Finally, if the income recognition method set forth in ASC 310-30 is not applied to any loans within the scope of the standard—because subsequent developments result in placing the loan on nonaccrual status, or because an indeterminate foreclosure date makes computation of accretable yield impossible, for example—disclosure is required of the carrying amount at acquisition and at the end of the reporting date.

PERSPECTIVE AND ISSUES

Background and Historical Perspective

Historically, one of the most daunting problems facing accountants has been the determination of when it is more informative and meaningful to present the financial statements of multiple enterprises together, as if they were a single economic unit.

US GAAP had traditionally permitted two distinct methods of accounting for business combinations. The purchase accounting method required that the actual cost of the acquisition be recognized, including any excess over the amounts allocable to the fair value of identifiable net assets, commonly known as goodwill. The pooling of interests methods, available only when a set of stringent criteria were all met, resulted in combining the book values of the merging entities, without any adjustment to reflect the fair values of acquired assets and liabilities, and without any recognition of goodwill. Since pooling of interests accounting required that the mergers be achieved by means of exchanges of common stock, the use of this method was largely restricted to publicly held acquirers, which greatly preferred poolings since this averted step-ups in the carrying value of depreciable assets and goodwill recognition, the amortization of which would reduce future reported earnings.

Pooling accounting was widely seen as not being indicative of economic reality, since mergers which were "marriages of equals" rarely, if ever, occurred, notwithstanding that this was the theoretical basis for using this method of accounting. Ultimately, the pooling method was eliminated, but gaining support for this change required a significant compromise by FASB on the related matter of goodwill accounting: under the rules established in ASC 350 goodwill would no longer be amortized, and the impact of business combinations on reported income would often more closely resemble that of the now-banned pooling method than the traditional purchase accounting method. However, although periodic amortization is no longer reported, goodwill must be tested annually for impairment and, when impairment is found to have occurred, goodwill must be written down to fair value, with the adjustment reflected as a charge against the operating income of that period.
